Capitale-flowered Hermas. Pl. 1 1/2 foot. 4 H. quinquedentata (Lin. fili suppl. p. 436.) leaves almost radical, petiolate, ovate, ovate or obovate, obtuse, ciliated, naked above, but clothed with white tomentum beneath; stem sub-tomentose even to the apex. 2. G. Native of the Cape of Good Hope, on the Table Mountain. Bupleürum quinquedentata, Thunb. nov. act. petrop. 14. p. 533. t. 12. fl. cap. 249. Leaves of involucre striated with 3 longitudinal nerves. Corolla white. Stem filiform. Umbels nearly globose.  

Cult. A mixture of peat, sand, and loam is the best soil for the species of Hermas, and they may be either increased by seed or cuttings.  

CLVIII. CONIUM (said by Linnaeus to be from vonæ, or vonæ, konis, or konia, dust or powder; but the application of the term is not evident). Lin. gen. no. 469. Hoffm. umb. p. 99. t. 1. f. 3. Lag. am. nat. 2. p. 103. Koch, umb. p. 155. f. 40.—Cicúta, Tourn. inst. t. 160. Gärtn. fruct. 1. t. 22. Lam. dict. 2. p. 3.  

LIN. Syst. Pentândria, Digýnia. Margin of calyx obsolete. Petals obcordate, somewhat emarginate, with a short infolded edge. Fruit ovate, compressed from the sides; mericarps with 5 prominent equal undulate-crenulated ribs: lateral ones marginating; furrows with many strize, but without vitte. Carphophore bifid at the apex. Seed with a deep narrow furrow, and as if it were complicate.—Biennial poisonous herbs, natives of Europe. Root fusiform. Stem terete, branched. Leaves compound. Involucre of 3-5 leaves; involucels diminidate. Flowers white, all fertile.  

1 C. maculatum (Lin. spec. 349.) leaves of involucels lanceolate, shorter than the umbellules, 2. H. Native throughout the whole of Europe, in cultivated ground, among rubbish, and on dung hills; also of the eastern parts of Asia, North America, and Chili, where it has been introduced; plentiful in some parts of Britain. Schkuhr, handb. t. 62. Bull. herb. t. 63.
UMBELLIFERÆ. CLVIII. CONIUM. CLIX. VICTATIA. CLX. ARRACACHA.

Cicuta maculata, Lam. fl. fr. 3. p. 104. Cicuta major, Lam. dict. 2. p. 3. Coriandrum Cicuta, Crantz, austr. 24. Coriandrum maculatum, Roth, fl. germ. 1. p. 130. Cicuta, Hall. helv. no. 766. Riv. pent. irr. 75. Blackw. t. 451. Lob. icon. 732. f. 1. Cicuta domestica, Mor. umb. 18. c. sect. 9. t. 6. f. 1. Co-rium tenuifoliim, Mill. dict. no. 2. Stem hollow, green, but often of a livid colour, marked with dark spots. Hemlock is obviously distinguished from all other umbelliferous plants by its spotted stem, by the dark and shining green colour of the bottom leaves, and particularly by their disagreeable smell when bruised. According to Linnaeus, sheep eat the leaves, and horses, cows, and goats refuse it. Ray informs us, that the thrush will feed upon the seeds even when corn is to be had. Hemlock has been stigmatised as one of the most noxious of vegetable poisons, has for many years been considered as a highly useful and powerful article of the Materia Medica, and it has been proved that though highly deleterious when imprudently used, yet in small doses it has been productive of considerable benefit in cases which have resisted the usual methods. The first physician who endeavoured to bring hemlock into repute as a medicine was Baron Stoerck, of Vienna, who announced its extraordinary effects in the most inveterate chronic disorders in 1760. The whole plant is a virulent poison, but varying very much in strength, according to circumstances. When taken in an over-dose, it produces vertigo, dimness of sight, difficulty of speech, nausea, fetid evacuations, anxiety, tremors, and paralysis of the limbs. But Dr. Stoerck found that in small doses it may be taken in great safety, and that, without at all disordering the constitution, or even producing any sensible operation, it sometimes proves a powerful remedy in many obstinate disorders. In scirrhous, the internal and external use of hemlock has been found useful, but mercury has been generally used at the same time. In open cancer it often abates the pain, and is free from the constipating effects of opium. It is likewise used in scrofulous tumours, and in other ill-conditioned ulcers. It is also recommended by some in chin-cough, and various other diseases. Its most common and best form is that of the powdered leaves, in the dose at first of 2 or 3 grains a day, which in some cases has been gradually increased to upwards of 2 ounces a day. An extract from the seeds is said to produce giddiness sooner than that from the leaves.

Hemlock should not be gathered unless its peculiar smell be strong. The leaves should be collected in the month of June, when the plant is in flower. The leaflets should be picked off, and the footstalks thrown away. The leaflets are then to be dried quickly in a hot sun, or rather on tin plates before a fire, and preserved in bags of strong brown paper, or powdered and kept in close vessels, excluded from the light; for the light soon dissipates their green colour, and with it the virtues of the medicine. The narcotic seeds are most active and uniform when perfectly ripe. When the fresh root is wound, it yields a bitter and acid juice, which Stoerck found to excite in the tongue swelling, stiffness, violent pain, and transient paralysis. Pfaff is of opinion, that the virtues of the hemlock reside in a volatile principle, which, however, he was not able to obtain separate. Dr. Paris says, that the medicinal activity of the plant resides in a resinous element, which may be obtained in an insulnat form by evaporating an ethereal tincture made with the leaves on the surface of water. It has a rich dark green colour, and tastes of hemlock in perfectiction. A dose of half a grain will produce vertigo and headache.

Var. β, striatum (Tratt. arch. 1. t. 24.) stem diffuse, much branched, very straight; umbels and umbellules proliferous.

CLX. VICTATIA (named after M. Vicat, who has wrote upon poisonous plants). D. C. prod. 4. p. 243.—Sison species, Wall.

Linn. syst. Pentantheria, Digna. Margin of calyx entire. Petals unknown. Styles short, at length diverging. Fruit ovate-oblong. Mericarps almost semi-terete, with 5 filiform ribs: and broad flat furrows containing many small vitre each: commissure narrow. Carpophore thick, rather biform at the apex. Albulmen furnished with a furrow in the commissure, convex on the outside.—A glabrous erect herb, native of Nipal. Leaves petiolate, bipinnatifid; leaflets bipinnatifid: lobes linear, acute, slender. Stems sparingly leafy at the base; the rest naked. Umbels terminal, without any involucrum, of many rays; rays unequal. umbellules of the shorter ones sterile. Involucres wanting, or very small, and of few leaves. Habit of Conium, but the character is near that of Arracacha. Fruit almost like that of the genus Pimpinella, but differs in the seed being curved.

Hemlock-leaved Vicatia. Pl. 1½ foot. Cult. This plant will grow in any soil or situation, and will be easily propagated by seed.

Linn. syst. Pentantheria, Digyna. Margin of calyx obsolete. Petals lanceolate or ovate, entire, with an inflected point, curved above the middle nerve. Stylodium conical, thick; styles diverging, at length reflexed. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal, not crenulato ribs: lateral ribs marginating: vitre many in the furrows. Albulmen nearly semi-terete, furnished with a furrow in the commissure.—Perennial South American herbs, of a salubrious quality. Roots tuberous, thick, edible. Leaves pinnate or bipinnate: leaflets deeply toothed, lower ones triplicate. Umbels opposite the leaves or terminal. Involucrum wanting or of one leaf: involucres of 3 leaves. Flowers polygamous; those of the rays hermaphrodite, and those of the disk male or imperfect. Petals white. This genus is nearly allied to Conium, but differs in the form of the petals, and in the ribs of the fruit being entire, not undulately crenulato.

1 A. esculenta (D. C. prod. 4. p. 244.) leaves pinnate; leaflets 5, broadly ovate, acuminate, deeply pinnatifid, profusely serrated: the 2 lower leaflets petiolate, subterminal; involucrum wanting; ribs of fruit obtuse. 2. F. Native of 3 C.

The first account which reached our country of this interesting and valuable plant was published in the first volume of the Annals of Botany, about the year 1805, from a communication made to the editors of that excellent work by Mr. Vargas, a native of Santa Fe de Bogota, who at that period was residing in London. The arracacha is one of the most useful vegetables in that part of South America; in some parts of the country it is called *apij*, from its resemblance to celery. The roots immediately divide into 4 or 5 branches, and each of these, if the soil be light, and the season favourable, will grow to the size of a cow’s horn. This root yields a food, which is prepared in the same manner as potatoes, is grateful to the palate, and so easy of digestion, that it constitutes the chief aliment of the sick; starch and pastry are made from its fecula; and the roots, reduced to a pulp enter into the composition of certain fermented liquors, supposed to be efficacious as tonics. In the city of Santa Fe, and indeed wherever it can be procured, the arracacha is as universally used as the potatoe is with us. The cultivation of this plant requires a deep black soil, that will easily yield to the descent of the large vertical roots. It is propagated by planting pieces of the root, in each of which is an eye or shoot; these acquire in 3 or 4 months a size sufficient for culinary purposes, though if permitted to continue 6 months in the ground, they attain to immense dimensions, without any injury to their flavour. The colour of the root is white, yellow, or purple, but all the varieties have the same quality. Like the potatoe, the arracacha does not thrive in the hotter regions of America, for in such parts the roots acquire no size, and are indifferent in flavour, and sometimes run altogether to stems. In the countries which are there called temperate, being less hot than those at the foot of the Cordilleras, this vegetable sometimes succeeds; but never so well as in the elevated region of those mountains, where the mean heat is between 58° and 60° of Fahrenheit. Here it is that these roots grow the most luxuriant, and acquire the most delicious taste. Before Vargas this plant was not mentioned by any other American writer, except by Alcedo, who notices it in a few words, at the end of his "Diccionario Geogràphico-historico de las Indias Occidentales O America." According to the late Baron de Schack, the arracacha is an essential article of food, not only to the poor, but to the rich, throughout Santa Fe and New Granada, and is everywhere cultivated as carrots are with us. It is also cultivated abundantly in the Caracas and the adjacent mountainous country. Plants of the arracacha have been introduced to this country, but have not succeeded, although every situation, temperature, and soil have been tried; they have only produced at best a few leaves, and at the end of the year or less have perished altogether. Mr. Shepherd of Liverpool alone has been so fortunate as to have a few plants flowering in his garden.

*Excedent Arracacha*. Fl. Ju. Jul. Cl. 1823. Pl. 1 to 2 ft. 2 A. moschata (D. C. Prod. 4. p. 244.) leaves bipinnate, or tripinnate; leaflets pinnatifid, lobes ovate, acutish, serrated; involucre of 1-3 jagged leaves; ribs of fruit acute. 2 H. Native of South America, in the province de los Pastos, near Teindela, where it is called by the inhabitants *Sucharachaca*. Herb smelling of musk. Conium moschatum, H. B. et Kunth, nov. gen. amer. 5 p. 14. t. 420.

*Musk Arracacha*. Fl. June, July. Clt. 1824. Pl. 2 ft. Cult. These plants are of easy culture if kept from the frost; they may be either increased by seed or dividing at the root.

2 P. Uralsís (Hoffm. l. c.) vittae one in each furrow of the fruit; ribs very acute. 2 H. Native of Siberia, on the Ural Mountains. Liguistícum Gmel. sb. 1. t. 45. This plant differs from *Pleuropósernum Austríacum* in the rays of the umbel being evidently velvety when examined by a lens; the colour of the leaves is more glaucous; the petals more obtuse at the apex, and flat.

*Ural* Pleuropósmum. Pl. 2 to 3 feet.

3 P. Kämtsháchíacu (Hoffm. l. c.) vittae 2 in the furrows of the fruit; ribs somewhat denticulated; membranes almost cohering between themselves. 2 H. Native of Kamtschatka. Petals obovate, with somewhat undulated margins, a little inflexed at the apex. A plant agreeing with this was found about Irkuts in Siberia, but differs in the leaves of the involucre being sometimes multifid, as is sometimes the case in *P. Austríacum*.

*Kamtschatka* Pleuropósmum. Pl. 2 to 3 feet.

4 P. Archangélicá (Ledd. fl. alt. 1. p. 369.) 2 H. Native of Siberia. This plant is not well known. It has the habit exactly of Archangélica officínális, and grows in the same places with it. The fruit is grey or dirty yellow.

Archangélica-like Pleuropósmum. Pl. 4 to 6 feet.

*Cult.* Any common soil will suit these plants; and they may either be increased by dividing at the root or by seed.

**CLXII. HYMENOLE'NA** (from hymen, a membrane, and chlaina, chlaina, a cloak; in reference to the ribs of the fruit...

L. Syst. Pentandria, Digynia. Margin of calyx obsolete. Petals obvate, entire, flat or attenuately inflexed at the apex. Fruit ovate or oblong; mericarps with 5 exerted nearly equal winged ribs; vittae 2 in the commissure, which is flat, and one in each furrow. Seed with a furrow in front, convex on the outside. Carpophore bipartite.—Perennial glabrous herbs, natives of the mountains of Nipaul. Leaves decomposed. Umbels terminal, of many rays. Involuca and involucels of many leaves, which are membranous, and are usually toothed or cut. This genus is allied to Melopospermum on the one hand, and Pleurospérmum on the other; it differs from the first in the commissure being flat, in the ribs being equally winged, and in there being no empty canal before the commissure, &c.; and from the last in the fruit having the membranes joined together, and from both in the obsolete margin of the calyx. Perhaps this genus should be divided into two, from the oblong or ovate fruit of the species, and from the seeds being angular or convex on the outer side; but in most of the species the fruit is not sufficiently known.

1 H. Angelicoödes (D. C. prod. 4. p. 245.) leaves ternate; leaflets tripartite: lobes oval-lanceolate, acuminate, toothed: teeth ovate, mucronate; leaves of involucra and involucels lanceolate-linear, acuminate, entire, with membranous margins. 2. H. Native of Nipaul, on the highest mountains at Kamaon and Gosaingsthan. Ligústicum angelicooides, Wall. mss. Habit, when dried, almost of Ligústicum Scóticum. Fruit oblong, 5 lines long, somewhat compressed from the sides. Seed with very prominent angles, as in Melopospermum, but the commissure is flat and bivittate. Leaves of involucels 6-8 lines long, membranous.

Angelica-like Hymenolaena. Pl. 1 to 2 feet.

2 H. Rotundata (D. C. prod. 4. p. 245.) leaves ternate, rarely trinerved; leaflets ovate-roundish, obtuse, toothed: teeth roundish, hardly mucronate; leaves of involucra 1-2, of the involucels 4-7, linear-lanceolate, acute, membranous, entire. 2. H. Native of Nipaul, on Gosaingsthan and Himalaya. Ligústicum rotundatum, Wall. mss. Petioles broadly dilated at the base, many-nerved, those of the radical leaves very long, and those of the cauline ones gradually shorter, till at length the uppermost ones are very short. Leaves sometimes tripartite.

Roundish-leaved Hymenolaena. Pl. 2 to 3 feet.

3 H. Fumila (D. C. prod. 4. p. 245.) leaves pinnate; leaflets 5, ovate, deeply pinnatifid: lobes equally toothed: teeth roundish, mucronate; stems scape-formed, nearly naked; leaves of involucra 2-3, of the involucels 4-5, lanceolate, acute, membranous, entire. 2. H. Native of Nipaul, at Gosaingsthan. Ligústicum pinnulatum, Wall. mss. Herb a foot high in when in flower. Leaves radical, or 1-2 rising from the base of the stem. Umbels of 7-8 rays. Leaves of involucra sometimes drawn out into a small cut leaf.

Dwarf Hymenolaena. Pl. 1 foot.

4 H. Dentata (D. C. l. c.) radical leaves ternate, with trifid petioles; leaflets bipinnatifid; cauline leaves bipinnate: leaflets ovate, acute, serrated; leaves of involucra 1-3, of the involucels 7-8, lanceolate, acuminate, membranous, undulated-serrulatus. 2. H. Native of Nipaul, at Kamaon and Gosaingsthan. Ligústicum dentatum, Wall. mss. Leaves membranous. Rays of umbel 5-8, angular, somewhat puberulous. Leaves of involucels exceeding the flowers.

Var. β, crassa (D. C. l. c.) cauline leaves pinnate: leaflets tripartite: lobes ovate-oblong, irregularly and deeply toothed; umbels of 15-18 rays: rays scabrous; leaves of involucra 5-6, lanceolate, serrated, of the involucels 7-8, obovate, erose-serrrated, tipped by a mucrone. 2. H. Native of Nipaul.

Toothed-leaved Hymenolaena. Pl. 1 to 2 feet.

5 H. Candollii (D. C. l. c.) leaves pinnate: leaflets petiolate, ovate, deeply pinnatifid: lobes deeply serrated at the apex; peduncules in fascicles; umbels and umbellules crowded; leaves of involucra and involucels many, obovate, obtuse, membranous, large, entire. 2. H. Native of Nipaul, on the Himalaya, at the temple of Boddinath. Ligústicum Candollii, Wall. mss. Herb hardly a foot high, agreeing with Pleurospérmum in habit. Upper leaves membranous, emulating the leaves of the involucra. Leaves of involucrum nearly an inch long.

De Candolle’s Hymenolaena. Pl. 1 foot.

6 H. Brunoni (D. C. l. c.) leaves capillaceously multifid; segments linear, acute; leaves of involucra 5-6, membranaceously dilated, multifid at the apex: of the involucels 6-8, membranous, some of which are undivided, with the middle nerve simple: and others are trifid, with the middle nerve trifurcate. 2. H. Native of the mountains of Nipaul, on the Himalaya, Kamaon, and Gosaingsthan. Ligústicum Brunonii, Wall. mss. There are varieties of this having the leaves of the involucels smaller, length of the flowers, and larger exceeding the flowers.

Brown’s Hymenolaena. Pl. 1 to 2 feet.

7 H. Govaïnana (D. C. prod. 4. p. 246.) leaves pinnate: leaflets deeply pinnatifid: lobes oblong-linear, acute; leaves of involucra 5-7, multifid, much shorter than the rays of the umbels; leaves of involucels membranous at the base and margin, multifid at the apex, and exceeding the flowers. 2. H. Native of the Snowy Mountains of Smirnora. Ligústicum Govaïnánun, Wall. mss. Leaves like those of A’pium. Rays of umbel 7-8, unequal. Stem striated.

Govaï’s Hymenolaena. Pl. 1 foot.

8 H. Benthami (D. C. l. c.) leaves pinnate: leaflets 5-7, ovate, cuneate at the base, coarsely toothed, trifid or tripartite: teeth mucronate; leaves of involucra foliaceous, oblong, deeply toothed, much shorter than the rays of the umbels; involucels about the length of the flowers. 2. H. Native of Nipaul, at Gosaingsthan. Ligústicum Benthami, Wall. mss. Fruit ovate; mericarps somewhat compressed from the back, with broad furrows and narrow winged ribs. Seed convex on the back.

Bentham’s Hymenolaena. Pl. 1 foot.

9 H. obtusísculum (D. C. l. c.) leaves pinnate: leaflets 5-7, ovate, deeply pinnatifid, bluntly toothed: leaves of involucra foliaceous, dilated at the base, and multifid at the apex, a little shorter than the rays of the umbels; leaves of involucels oblong foliaceous, deeply toothed. 2. H. Native of Nipaul, at Gosaingsthan. Ligústicum obtusísculum, Wall. mss. Fruit ovate; mericarps semi-ovate, with broad furrows, and undulate-toothed narrow-winged ribs. Carpophore thick, bipartite. Seed semi-ovate, obtuse on the back.

Bluntish-seeded Hymenolaena. Pl. 1 foot.

Cult. See Pleurospérmum, p. 578. for culture and propagation.

C. Syst. Pentandria, Digynia. Margin of calyx 5-toothed. Petals obvate, somewhat emarginate, with an inflexed point. Fruit contracted from the sides, didymous; mericarps reniformy globose, with 5 filiform, slender, equal ribs: the lateral ribs placed in front of the margins; vitre broad, one in each furrow. Seed involutely semi-lunar.—Perennial herbs. Lower leaves trinervately cut; upper ones often reduced to the scale-formed

3 2

UMBELLIFERÆ. CLXII. HYMENOLENA. CLXIII. PHYSSOSPERMUM. 379
Leaves of involucra and involucres many. Flowers white. The stem does not adhere to the fruit in the young state, but when ripe it does, whence the name is congruous when the fruit is mature.

1 P. aquilegifolium (Koch, l. c.) lower leaves trるために, glabrous; leaflets cuneate-lanceolate, deeply toothed: uppermost ones reduced to the sheaths, each sheath bearing 3 linear, nearly entire leaflets. H. Native of Cornwall, in thickets, among bushes, and in hedges; in great plenty in the neighbourhood of Bodmin. Ligusticum Cornubianum, Lag. spec. p. 329. Smith, engl. bot. t. 683. Smith, icon. pict. t. 11. Phosphospermum commutatum, Spreng. umb. spec. t. 4. fl. 8. exclusive of many synonyms. Danα aquilegifolia, Lag. am. nat. 2. p. 97. ? ex synonyme of Spreng. Cornwall Saxifrage, Petiv. herb. brit. t. 36. f. 9. Castle are so fond of the plant that they eat it down to the ground. The root contains a yellow resinous juice.

4 P. Angelicelgefolium (Guss. ind. sem. 1825. prod. fl. sicc. 1. p. 356.) stem furrowed, nearly naked; radical leaves binate, with the ramifications not divaricate: leaflets of the lower leaves ovate, of the superior ones oval-oblong, 2-3-parted, dentately serrated, glabrous above, and pubescent beneath. H. Native of Sicily, on shady gravelly parts of mountains. Leaves like those of Angelica sylvestris.

Angelica-leaved Phosphospermum. Pl. 2 to 3 ft.

Cult. See Peleospermum, p. 378. for culture and propagation.

CLXIV. SMYRNIUM (from Smyrna, Smyrna, a synonyme of Ἀργος, the odour of myrrh is common to many umbellular plants, among others the Myrrha odorata, for which reason it is so named). Lag. am. nat. 2. p. 101. Koch, umb. p. 133. f. 38, 39. D. C. prod. 4. p. 247.—Smyrnium species, Lin. and Spreng.

Lan. Syst. Pentántia, Digínia. Margin of calyx obsolete. Petals lanceolate or elliptic, entire, acuminate, with an inflexed point. Fruit contracted from the seed, the fleshy from the mericarps being reniformly globose; mericarps with 3 dorsal, rather prominent sharp ribs, and 2 lateral, nearly obliterated marginal ones; vitæ many in the furrows. Carophore bipartite. Seed involute.—Erect, biennial, glabrous herbs. Roots fleshy. Leaves variable. Umbels terminal. Involutione variable. Flowers yellow or greenish-yellow, usually polygamous.

1 S. olsus-tratum (Lin. spec. 376.) stem terete; calule leaves ternate; leaffets ovate, serrated; involucres very short. H. Native of Middle and South Europe, in humid places; as in France, Spain, Italy, Belgium, and Britain. It is rather a maritime plant, and is found near our coast in various places, as about Scarborough Castle, and about Dover; it is common in Anglesea and in all the western counties, and in the flat parts of Gloucestershire, as also in many places of Dorsetshire. It occurs also about many inland towns, as Notting-ham, York, Bury, Newmarket, and about Mackereell's Tower, Norwich. In several places of Cambriageshire, Worcestershire, Kent, and Middlesex. In Scotland upon the coast of Dunglass, on the edge of Berwickshire. Lam. ill. 204. Smith, engl. bot. t. 290. S. Mathioli, Tourn. inst. 316.—Lob. icon. 708. f. 2. Moris. sect. 9. t. 4. The whole herb is of a pale bright green, in flavour something like celyer. Lower leaves binate: upper ones ternate. Petioles inflated. Umbels globose. Flowers greenish white. The plant was formerly eaten in various parts of Europe, either as a salad or pot herb, whence, and from its blacness, the name olsustrum, from olsus and ater. Ray says it was called Alexanders, because in Italy and Germany it had long been denominated herba alexandrina; having been supposed to have been brought from Alexandria. It flowers in May, and by the middle of July the stalks are dried up, but remain laden with large black seeds.

Olsustrum or Common Alexanders. Fl. May. Britain. Pl. 2 to 4 feet.

2 S. apiſfolium (Willd. spec. 1. p. 1468.) stem terete; calule leaves cuneiform, obtuse, trifid, toothed: involucra and involucres wanting. H. Native of Candia. Schultes, syst. 6. p. 440. S. Créticum paludifolium, Tourn. cor. 23. S. Créticum, Mill. dict. no. 4. Perhaps only a variety of the preceding. Stem angular, glabrous. The lower leaves of this plant are much smaller than those of the preceding, and more like those of smallage; the umbels are also smaller, and the seeds are less.

Smallege-leaved Alexanders. Fl. May. Citt. 1731. Pl. 2 to 3 ft.

3 S. rotundifolium (Mill. dict. no. 2.) stem terete; calilne leaves stem-clasping, orbicular, quite entire, or hardly toothed. H. Native of the islands in the Mediterranean; as in Corse, Sicily, Cos, &c. on the mountains. Moretti, pla. ital. dec. 2. p. 9. S. Dodonei, Spreng. umb. spec. 24. exclusive of many of the synonyms. S. Créticum, Math. ed. Valgr. 1570. p. 515. f. 2. S. Mathioli, Presl. del. plag. p. 127. but not of Tourn. S. ranorum, D'Urville, enum. no. 278. S. perfoliatum a, Lam. dict. 3. p. 266. S. Ægypticum, Lin. amen. 4. p. 270. probably belongs to this species, which has 2 single coroaate, quite entire leaves on the floral branches, as in it. Root tuberously fusiform, black on the outside, with a sweet taste. Leaves pale green; lower ones ternately decoumpound: leaflets ovate, deeply serrated, for the most part atteneuated at the base. Lower calule leaf 3-lobed.

Perfoliate-leaved Alexanders. Fl. May, June. Clt. 14 foot. 5 S. Eoroedoiides (H. B. et Kunth, nov. gen. amer. 5, p. 16). leaves somewhat binate; leaves oblong, sharply serrated; umbels of 10-12 rays; involucre and involucels of one seed. 6 H. Native of Mexico, near Moran, at the height of about 4000 feet; and on the Cordilleras de Quahilapa. Sisox agogoeooidoe, Spreng. syst. 1. p. 886. Flowers yellow. Fruit didymous, hardly compressed; vittae small; ribs filiform; funicles broad, recurved; albumen involute.

Gout-weed-like Alexanders. Pl. 1 foot.

† A doubtful species.

6 S.? Lateral (Thunb. fl. cap. 2. p. 206). leaves pinnate and ternate; leaflets obovate, deeply lobed, mucronately toothed; umbels lateral, nearly sessile; involucels few-leaved. 6 G. Native of the Cape of Good Hope. Petals white, inflexed. Fruit globose, pubescent. This plant evidently does not belong to the present genus, but to what genus it belongs is unknown.

Lateral-umbelled Alexanders. Pl. 1 foot.

Cult. The species will grow in any kind of soil in which the seeds may be sown.

CLXV. EULOPHUS (from ev, ev, well, and lophe, lophs, a crest; in reference to the stripes as well as the ribs of the fruit being rather prominent). Nutt. in litt. 1825. D. C. coll. mem. v. p. 69. t. 24. f. M. prod. 4. p. 248.

Lyn. syst. Pentandra, Digynia. Margin of calyx 5-toothed, at last falling off after flowering. Petals unknown. Fruit somewhat contracted from the sides, rather didymous; mericarps ovate, with 5 hardly prominent ribs: the funnels between the ribs furnished with 3 convex stripes each, which are more prominent than the ribs, they are hollow inside, and replete with oil, from sustaining oleiferous canals; commissure bearing 4 similar stripes or vittae. Seed semilunar, filling the mericarp; carpophore bipartite.—Glabrous herbs. Leaves multifid; lobes linear, elongated. Terminal umbels large, of 10 rays, fertile; the lateral ones opposite, and sterile. Involucre and involucels of many linear acute leaves. Flowers many, abortive. This genus is very nearly allied to Physospermum, but differs in the fruit being covered with many vittae, as in Sugiunia.

1 E. Americana (Nutt. in litt.).—Native of North America, in the Arkansa territory. Root composed of fascicles of oblong tubers. Stem terete, fistular.

American Euophus. Pl.

Cult. See Sugiunia above for culture and propagation.

Lyn. syst. Pentandra, Digynia. Margin of calyx entire. Petals obcordate, with a short, inflexed, obtuse point. Stylodium thick, conically cylindrical, parallel; styles filiform, bent upwards. Fruit somewhat didymous; mericarps ovate, contracted at the raphe, scarcely compressed from the sides, with 5 filiform ribs, and flattish-convex funnels, each funnel forming 2-3 vittae. Commisurate flasht, containing 4-6 vittae. Albumen furnished with a funicle inside.—Herb glabrous. Radical leaves on long petioles, which are hardly dilated at the base, ternate; leaflets pinnate: segments pinnatifid: lobes diverging, lanceolate, acute. Stem branched, rather dichotomous, terete. Upper leaves reduced to quite entire, or undivided, elongated ligula. Umbels terminal, without involuca, of 9-10 rays; umbellules 12-15-rayed; involucels of a few small, linear leaves. Flowers white.—This genus is allied to Eulophus and Physospermum from habit and character, but differs from both in the calyx being toothless, in the form of the stylodium, and in the want of involucra. From habit and the somewhat didymous fruit it comes also very near Astoma.

Cult. Sow the seeds in autumn, in the open ground; they will grow in any common soil.

SUBORDER III. COELOSPERMAE (from κοιλος, koilos, hollow, and σπέρμα, sperma, a seed; from the seeds being involucrally curved from the base to the apex, and therefore forming a hollow on the inner side). D. C. prod. 4. p. 249. Albumen involucrally curved from the base to the apex, excavated in front.

Tribe XVII.

CORIANDREÆ (this tribe contains plants agreeing with Coriandrum in important characters). Koch, umb. p. 82. D. C. prod. 4. p. 249. Fruit globose or didymous, with 2 subglobose mericarps. Mericarps with 5 primary, depressed, or flexuous ribs; the lateral ribs placed before the accessory margin; the 4 secondary ribs are more prominent than the primary ones; all wingless. Seeds involute, or curved from the base to the apex, hence they are excavated in front.

Lyn. syst. Pentandra, Digynia. Margin of calyx obolute. Petals obovate, emarginate, with an inflexed point; outer petals nearly equal, or radiating and bifid. Fruit didymous: mericarps somewhat globose ventricose, granularly wrinkled, marked with 5 impressed obsolete stripes: the 2 lateral stripes semicircular, and placed before the accessory margin. Vittae none. Commissure furnished with 2 holes. Seed involute from the base to the apex. Carpophore bipartite, adnate on both sides.—Feitl h. ribs, with suctately angular stems; and decomposed leaves; having five segments. Umbels of 2-3 rays. Involuca and involucels wanting, or of one leaf. Flowers white.

Cult. The seeds only require to be sown in the open border.

CLXVIII. ASTOMA (from a priv. and στομα, stoma, a mouth; this genus differs from Bifora in the want of the 2 holes in the commissure; hence the name). D. C. coll. mem. v. p. 71. t. 17. prod. 4. p. 249. but not of Gray.

Lyn. syst. Pentandra, Digynia. All as in Bifora, but the
fruit is more evidently didymous; the commissure narrow, neither perforated nor dilated at the apex; and the styles rather divergent.—A glabrous herb, at first sight appearing like a species of Seseli. Stem terete, striated, erect, branched. Superior leaves bipinnatifid: with a few linear, nearly subulate, elongated, quite entire segments. Umbels by threes, pedunculate at the tops of the branches: the 2 lateral ones axillary and opposite, 6-8-rayed: but the central umbel is 10-12-rayed. Leaves of involucrum 5-6, lanceolate, entire, acuminate. Umbrellae of 10-12 flowers; involucres of 4-5 leaves. Flowers white, all hermaphrodite. This is an intermediate genus between Bifora and Astréma; from the first it differs in the commissure being imperfect, in the fruit being smaller, and in the involucra and involucels being of many leaves; and from the last in the margin of the calyx being obsolete, in the fruit being without ribs, and exactly didymous.

1 A. seseliófolium (D. C. l. c.). H. Native of Egypt, or rather of Syria, where it was gathered by Donati. Coriandrum seseliófolium, D. C. The fruit of this plant is 5 times smaller than in the other genera of Coriándera, and exactly didymous. Mericarps nearly globose.

Cult. See Bifora, p. 381. for culture and propagation.

CLXIX. ASTREMA (from a priv. and ῥημα, rema, a hole; there are no holes in the commissure, as in the genus Bifora). D. C. coll. memb. v. p. 71. t. 18. prod. 4. p. 250.

Lin. syst. Pentándria, Digínia. Teeth of calyx 5, acute, small, permanent. Petals obovate, emarginate, nearly equal, with an inflexed segment. Fruit nearly didymous; mericarps nearly globose, ventricose: marked with 5 rather prominent small ribs. Vitæ none. Commissure narrow, closed. Seed involute from the base to the apex.—An herb with a furrowed stem, having the angles acute and dentely mucricated under the umbels. Leaves multifid, with linear segments. Umbels and umbrellae of 5-8 rays. Involucera and involucels of many linear-setaceous, undivided leaves. This genus is intermediate between Coriánderum and Bifora. The flowers are equal and the fruit is didymous as in Bifora, and the fruit is spigid, 5-ribbed, and the calyx 5-toothed, as in Coriánderum sativum.

1 A. AMERICAUM (D. C. l. c.). H. Native of North America, in the southern provinces at the Red River. Coriánderum Americanum, Natt. in litt.

American Astréma. Pl. 1 to 2 feet.

Cult. See Bifora, p. 381. for culture and propagation.

1 C. satívum (Lin. spec. p. 367). H. but in gardens sometimes C. Native of corn-fields in the Levant, Tartary, Greece, Italy, and the south of France. The plant, although found wild in Essex, where it has been long cultivated, is not a native of this country. Smith. engl. bot. t. 67. fl. grce. t. 285. Blackw. herb. t. 176. Hayne, arz. gew. 7. t. 13. Brunn. hist. 1. p. 203. Mart. rust. t. 141. Rivin. pent. irr. t. 71. Woody. med. bot. 492. t. 181. Planch. icon. t. 294. Moris. hist. 5. p. 259. sect. 9. t. 11. f. 1. The culture and management of the coriander consists in sowing the seeds on a light rich soil in September. Twenty pounds of seed will sow an acre. When the plants come up, thin them to 6 or 8 inches distance every way, and next spring stir the soil with a pronged hoe. In August the seed will be ripe, and if great care be not used, the largest and best part of the seed will be lost. To prevent this, women and children are employed to cut plant by plant, and to put it immediately into cloths, in which it is carried to some convenient part of the field, and there threshed upon a sail cloth. A few strokes of the flail get the seeds clean out, and the threshers are ready for another bundle in a few minutes. In Essex it is sometimes cultivated with farinæ and tease. See Carum cárvi. The produce of coriander is from 10 to 14 cwt. on an acre. It is used by the distillers for flavouring spirits; by the confectioner for incrusting with sugar; and by the druggists for various purposes, for all of which it is said to have a ready sale. Coriander seeds are strong and disagreeable when fresh; but by drying become sufficiently grateful. They are recommended as carminative and stomachic; they are also used to cover the taste of senna, and in spices as currie powder, and seasoning for black puddings: formerly they were steeped in wine, and then dried to render them milder.

Var. β? microcoryum (D. C. prod. 4. p. 250.) fruit one half smaller than that of the species; segments of the leaves very slender and short. H. Native of Mexico, at Tampico. Perhaps a proper species.

Cult. Sow the seeds in the autumn or spring in the open ground.

CLXXI. CYMBOCA/RPUM (from κυμβος, kymbos, a hollow, and κωρος, koros, a fruit; in reference to the shape of the mericarps, which are hollow in front). D. C. ex Meyer, verz. pflanz. p. 132.

Lin. syst. Pentándria, Digínia. Margin of calyx obsolete. Petals equal, obcordate; with an inflexed point. Stylopodium depressed; styles reflexed. Fruit nearly globose; mericarps solid, hemispherical: 5 primary, filiform ribs, which are often obliterated: the lateral ones of these merging into secondary ribs none. Vitæ wanting. Carphophore bipartite, free in the middle, but adnate at the base and apex. Seed excavated in front.—A small, annual fétid plant. Leaves decomposed, with short, linear segments. Umbels opposite the leaves. Leaves of involucera and involucels linear. Flowers white.

1 C. anethóides (D. C. ex Meyer, verz. pflanz. p. 132.) H. Native of Caucas, in stony places on the mountains of Talusch, near Swant, about 2000 feet above the level of the sea.

Fennel-like Cymbocarpum. Pl. 1 foot.

Cult. For culture and propagation see Bifora, p. 381.

N. B. The two species of Coriánderum cultivated in China and Cochín-china, are mentioned by Loreno in his fl. coch. p. 292. under the names of C. sativum and C. testúculatum: but the first differs from the true C. sativum in the involucers being of one leaf; and the second differs from the true C. testúculatum or Bifora, from the involucra and involucels being multifid, and in the fruit being sweet scented.

Tube of calyx adnate to the ovarium: with the limb entire or toothed. Petals 5-10, alternating with the calycine teeth, valvate in estivation, rarely wanting altogether. Stamens equal in number to the petals, rarely double that number, inserted beneath the margin of a large epigynous disk; anthers bilocular, petalate. Ovarium adnate to the calyx: with 2 or more cells, containing each only one ovulum. Styles many, simple, sometimes distinct and diverging, sometimes joined in one, rarely wanting; stigmas simple. Berry 2-15-celled, crowned by the entire or toothed limb of the calyx; having as many 1-seeded cells as there are styles. Seeds angular, erect, with a crustaceous testa, and a membranous endopelure. Embryo small, inverted, surrounded by copious fleshy albumen: having a superior radicle, which is twice the length of the cotyledons.—Trees or shrubs, rarely herbs. Stems frutescent, often scabdent, adhering by root-formed fibres to other substances, as in ivy. Leaves alternate, extispulate, petiolate, simple or compound. Petioles long, always dilated and thickened at the base. Flowers axillary or terminal, umbellate or capitiate; the umbels or heads often disposed in a racemose or paniculate manner: having involucres usually present.

The order Araliaceæ approximates Umbelliferaæ, but differs from it in the inflorescence being often imperfectly umbellate; in the styles being usually many; in the fruit being baccate, and usually plurilocular, always without vitta; and in the parts of the fruit not being separable; in the albumen being fleshy, and in the embryo being nearly the length of the albumen. It also comes near Ampelidææ, but differs in the stamens in Araliaceæ alternating with the petals, not as in Ampelidææ opposite them, in the leaves being extispulate, and in the inflorescence never being opposite the leaves, as well as in the calyx adhering to the ovary, not free from it. The genus Hedera has often been confused with Cuprifilialææ, but agrees best with the present order, in the free petals and structure of the fruit.

The flowers have no beauty, but the foliage of many is extremely fine. The medicinal properties are much the same as those of Umbelliferaæ, except the fruit, which differs in virtues, as it does in botanical structure. The bark of many of the species exudes an aromatic gum-resin, as in Arália umbellfera and others. The roots are tonic, with, in some cases, the flavour of parsnip. The famous Ginseng, which is produced by a species of Pánax, is reputed to have powerful tonic, restorative, and even aphrodisiac qualities; but it is probable that these have been greatly exaggerated. The plant has perhaps some really invigorating power when fresh, which after the statements made by Father Jartoux cannot reasonably be doubted.

Synopsis of the genera.

1 Adóxa. Calyx 2-3-cleft. Corolla rotate, 4 (f. 66. a.) -5-cleft. Stamens 8-10. Styles 4-5 (f. 66. b.). Berry 4-celled 4-seeded. Seed girded by a membranous border.

3 Cussonia. Margin of calyx entire, or with 5-7 acute teeth. Petals 5-7. Stamens equal in number to the petals. Ovarium crowned by a broad disk. Styles 2-3, short. Fruit 2-3-celled, roundish, nearly dry.

5 Gilsbe'ria. Margin of calyx entire, drawn out beyond the ovary. Petals 5-16. Stamens double the number of the petals, 2 in front of each petal. Styles 8-12, short, rather concreet at the base. Fruit 8-12-celled, 8-12-ribbed, nearly dry.

10 Scioda'phyllum. All as in Arália, but the petals are joined together in the form of a calyptra at the apex.

11 He'dera. Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex. Stamens 5-10. Styles 5-10, conniving, or joined in one. Berry 5-10-celled.

12 Paratro'pia. All as in Arália or Hedera, but differs in the stigmas being sessile, at first approximate, and immersed in the epigynous disk.

I. ADO'XA (from a priv. and doxa, doxa, glory; without any appearance. This plant covers the places where it grows, but the flowers are hardly to be seen, being of the same colour as the leaves). Lin. gen. no. 501. Guettm. fruct. 2. p. 141. t. 112. f. 9. Lam. ill. t. 320. D. C. prod. 4. p. 251.—Moschettrella, Tourn. inst. t. 68.

Lin. syst. Octándria, Tetrasygium. Tube of calyx adnate to the ovary, with 2-3 deep segments. Corolla of one petal, wheel-shaped, in 4-5 (f. 66. a.) deep ovate, acute, spreading segments, longer than the calyx. Stamens 8 or 10; anthers roundish. Ovarium half superior. Styles 4-5 (f. 66. b.), short, united at their base, which is permanent. Berry globose, its lower half invested with the permanent calyx, whose segments surround the middle part, of one cell, pulpy inside. Seeds 4, ranged round the
central pulp, compressed, surrounded by a vertical membranous border. The terminal flower is only 4-cleft, with 8 stamens: the rest 5-cleft; hence according to the rule assumed by Linneus, this genus is placed in Octandria.—A smooth herb of humble growth, with twice ternate leaves, and terminal capitulate green flowers. (f. 66. a.)

I. MOSCHATELLA (Lin. spec. p. 327.) 1. H. Native of Europe and Siberia, even to Dahuria, in groves, thickets, and under hedges; plentiful in Britain in the same situations; in North America in the woods between lat. 54° and 64°, and the Rocky Mountains between lat. 42° and 46°. Smith, engl. bot. t. 453. Curt. fl. lond. t. 26. Fl. dan. 94. Moschatella tetragona, Mœnch. meth. 478.—Lob. icon. 674. f. 2.—Cord. hist. 1732. f. 513. Gerard. emac. 1091. Root of several white imbricated concave scales, producing fibres and runners from their interstices. Stem angular. Radical leaves twice ternate, on long stalks; cauline ones ternate, on long stalks. Flowers with a musk scent, when moist, forming a round head. (f. 66. a.)

The plant will grow freely under the shade of trees; and will be easily increased by the offsets.

II. PANAX (from παν, pan, all, and ακος, akos, a remedy; that is to say, a remedy for all diseases; in allusion to the miraculous virtues which is attributed to P. quinquifolium, the ginseng of the shops). Lin. gen. no. 1106. Lam. ill. t. 860. D. C. prod. 4. p. 255.

Lin. syst. Polygânia, Dicœa. Flowers polygamous. Margin of calyx very short, obsolescent 5-toothed. Petals 5 (f. 67. a.). Stamens 5, inserted along with the petals under the margin of the disk, alternating with them. Styles 2-3, short. Fruit fleshy, compressed, orbicular, or didymous (f. 67. c.), 2-celled: cells coriaceous chartaceous, 1-seeded.—Herbs, shrubs, and trees, having the leaves and inflorescence variable. The habit of the species is heterogeneous, but the characters of those that are perfectly known agree.

§ 1. Herbaceous plants, with tuberous roots; and verticillate, petiolate, palmately-compound leaves.—Aureliiana, Cat. car. append. t. 16.—Araliâstrum, Vaill. sern. p. 43.

1 P. QUINQUIFOLIUM (Lin. spec. 1512.) root fusiform, a little branched; leaves with 5 leaflets, which are stalked from the top of the common petiole; peduncle of umbel shorter than the petiole; styles and seeds 2. 2. H. Native of North America, in shady mountain woods, from Canada to Carolina; and of the north of Asia, in Tauria; and the north of China. Sims, bot. mag. 1333. Bigel. med. bot. 2. t. 29. Woody med. bot. t. 99. Blackw. 513. —Lafit. gins. 51. t. 1. Catesb. car. 16.—Trew, ehet. t. 6. f. 1.

Jartoux, in phil. trans. 20. p. 237. Herb larger than the following species. Flowers yellowish. Berry globose, depressed, red. This plant is a native of Chinese Tartary, and also of North America. In the former country it has been gathered as an invaluable drug from time immemorial. In 1709 the Emperor of China gave orders to 10,000 Tartars to go in quest of the root, and to bring as much as they could find; every one was to give two pounds of the best to the emperor, and to sell the rest for the same weight of fine silver. The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese. Osbeck says that he never looked into the apothecaries' shops, but they were always selling ginseng, that both poor people and those of the highest rank made use of it, and that they boil half an ounce in their tea or soup every morning, as a remedy for consumption and other diseases. Jartoux relates that the most eminent physicians of China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves putrid humours and, renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hysteric, hypochondriacal, and all nervous affections, giving a vigorous tone of body, even in extreme old age. The French in Canada use the root for curing the asthma, and as a stomachic. After all, our physicians say that we have no proof of the efficacy of ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine. The Chinese name of yan-sam or yan-sam, and the American one garangtonges or garangtologing are both derived from the fancied resemblance in the root.

Three-leaved Ginseng. Fl. May, June. Clit. 1759. Fl. 3 fl. 3 P. pseudo-Ginseng (Wall. in act. soc. med. et phys. calc. 4. p. 117. fl. rar. asiat. 2. p. 130. t. 137.) tubers of roots in fascicles; leaves in threes or fours, quinate or ternate; leaflets lanceolate, ending in a long taper point, petiolate, much attenuated at both ends, doubly and cuspidately serrated, sometimes deeply serrated, beset with hoary bristles along the nerves and midrib; peduncles terminal, usually trifid, about equal in length to the pedicles; flowers hemiphrodite; berries 2-3-seeded. 2. H. Native of Nipan, on the top of Mount Sheopore. Flowers whitish. Styles 2-3. Berry 2-3-seelled, red. This species comes very near to P. quinquifolium or Ginseng, but is not known to possess any medicinal qualities.

False Ginseng. Fl. June. Fl. 1 to 2 feet.

4 P. triplinâta (Wall. cat. no. 4934.) herbaceous, unarméd; leaves triennate; leaflets ovate, acuminate, mucronately serrated, pale beneath, rather downy; panicle long, pubescent; umbellules many-flowered. 2. H. Native of Nipan, at Gosaingtham. P. decompositum, Wall. but not of D. C.

Triplinâta-leaved Panax. Fl. 2 to 3 feet.

§ 2. Prickly shrubs. Leaves terete, or palmately lobed.

5 P. aculeâ'tum (Ait. hort. kew. 3. p. 44.) stem shrubby;

**Prickly Panax.** Fl. Nov. Cht. 1773. Shrub 3 to 5 feet.

6 P. Loureihi a'num (D. C. prod. 4. p. 252.) stem shrubby; branches prickly; leaves of 3 broad, lanceolate leaflets; umbels terminal, dense; petals 4. \( \gamma \). G. Native of China, in the province of Canton. Electronia Chénisii, Lour. coch. p. 162. This is a true species of *Panax*, and probably nothing but *P. aculeatum*. Flowers white. Stamens 5. Berry 2-seeded.

**Loureiro’s Panax.** Shrub 5 feet.

7 P. ho'oribum (Smith, in Rees’ cyc. 26. no. 10.) shrub bushy and very prickly; leaves simple, palately lobed, deeply serrated, cordate; with prickly veins; umbels capitate, racemose; styles and seeds 2. \( \gamma \).

H. Native of the west coast of North America, at Nootka Sound. Abundant on the west side of the Rocky Mountains, from the head-springs of the Columbia to the coast; and of North California, ex Smith; and of the islands of Kadiak and Sitka, according to Steven. Styles 2, short. Fruit orbicular, pulpy. Racemes hispid. Flowers polygamous. Aralia occidentalis, Willd. herb. ex Stev. The entangled stems of this remarkable plant are described as a great impediment to travellers in the woods of North America.

**Hook. fl. bor. amer. I. p. 273. t. 98. (f. 68.)**

**Horrid Panax.** Shrub. Prickly.

8 P.? Hanila (D. C. prod. 4. p. 252.) stem arborescent, prickly; leaves cordate, 5-lobed, toothed, coriaceous, glabrous; umbels globose, tomentose, disposed in racemose panicles. \( \gamma \). F. Native of Nipaul, at Narrain-hetty. Hedera Hanila, Hamilt. in D. Don, prod. nep. 187.

**Hanila Panax.** Tree.

§ 3. **Shrubby, unarmed.** Leaves simple, undivided.

**Shell-leaved Panax.** Cht. 1820. Shrub 10 to 12 feet.

10 P. Heynianum (Wall. cat. no. 4927.) shrubby, unarmed; leaves broad, roundish-cordate, petiolar, quite entire, coriaceous, glabrous; branches of panicle in clusters; umbellules few-flowered. \( \gamma \). S. Native of the East Indies.

**Heyne’s Panax.** Tree.

11 P. simplex (Forst. prod. no. 399.) stem fruticose; leaves lanceolate, serrated; umbels compound. \( \gamma \). G. Native of New Zealand. Perhaps the same as *P. simplicifolium*, Dietr. garrn. lex. 6. p. 633.

**Simple-leaved Panax.** Shrub.

§ 4. **Unarmed shrubs, with digitate leaves.**

12 P. atenuatum (Swartz, prod. p. 54. fl. ind. occ. 1. p. 562.) stem shrubby, unarmed; leaves petiolar, digitate; stipulas intrapetiolar, membranous: leaflets 5, rarely 3, petiolate, ovate, narrowly acuminate, crenated, glabrous; umbels terminal; branches racemiflorous. \( \gamma \). S. Native of Guadaloupe and St. Christopher. Racemes shorter than the leaves. Fruit compressed, indehiscent, obtuse, hardish, 2-seeded, rarely 3-seeded. Flowers hermaphrodite, all fertile. Style bifid, rarely trifid.

**Attenuated-leafletted Panax.** Cht. 1823. Shrub 10 to 12 ft.

13 P. arboreum (Forst. prod. 398.) stem arboreous, unarmed; leaves digitate, petiolate; leaflets 5, obovate, serrate-toothed; umbels compound; rays of umbel elongated. \( \gamma \). G. Native of New Zealand. Lin. fil. suppl. 441.

**Arboreous Panax.** Tree.

14 P.? Gaudichaudii (D. C. prod. 4. p. 253.) shrub glabrous, unarmed; leaves digitate, petiolate; leaflets 3-5, oblate-lanceolate, cuneate at the base, acute, and quite entire at the apex, or bluntly somewhat toothed; umbels panicled, rising from the upper axes of the leaves, length of leaves. \( \gamma \). G. Native of the Sandwich Islands, in temperate places. Aralia trigyna, Gaud. voy. p. 474. t. 98. This species is very nearly allied to *P. Lessoni*. Petioles not dilated at the base. Peduncles having the branches umbellately disposed at the apex, the rest scattered. Leaves scattered along the branches. Styles 3, very short, almost concrete.

**Gaudichaud’s Panax.** Tree.

15 P.? Lessoni (D. C. prod. 4. p. 253.) shrub glabrous, unarmed; leaves digitate, petiolate; leaflets 3-5, oblate-lanceolate, cuneate at the base, acute, and quite entire at the apex, or bluntly somewhat toothed; umbels panicled, rising from the upper axes of the leaves, length of leaves. \( \gamma \). G. Native of the Sandwich Islands. Flowers and fruit unknown.

**Ovate-leaved Panax.** Tree.

17 P.? Platyphyllum (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arborescent, glabrous, unarmed; leaves petiolate: superior ones opposite; leaflets 3, on long petioles, oval-elliptic, obtuse, remotely and sharply serrated, coriaceous; peduncles terminal, bearing umbels which are disposed in panicles; pedicels very short; styles 3; fruit globose-trigonal, 3-seeded. \( \gamma \). G. Native of the Sandwich Islands. Flowers and fruit unknown.

**Ovate-leaved Panax.** Tree.

18 P. Glabra (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arborescent, glabrous, unarmed; leaves petiolate: upper ones opposite; leaflets 3, on long petioles, ovate, quite entire, coriaceous. \( \gamma \). F. Native of the Sandwich Islands. Flowers and fruit unknown.

**Broad-leaved Panax.** Tree.

19 P. Glabra (H. B. et Kunth, nov. gen. amer. 5. p. 10.) stem arborescent, unarmed; leaves petiolate, digitate; leaflets 5, petiolulate, elliptic-oblong, acute at the base, quite entire, glabrous; panicle terminal; umbellules few-flowered. \( \gamma \). S. Native of South America, near La Vente Grande de Caraccas.

**Smooth Panax.** Tree 20 feet.

19 P. Longipetiolatrum (Pohl, in litt. ex D. C. prod. 4. p. 253.) stem arborescent, unarmed; leaves on long petioles, digitate, glabrous; leaflets 5-9, oblong, acuminate, acute at the base, entire, or acutely toothed, membranous, on long petioles: adult ones glabrous, but when young clothed with rusty tomentum beneath. \( \gamma \). S. Native of Brazil.

**Long-petiolated Panax.** Tree.
20 P. splendens (H. B. et Kunth, l. c. p. 11.) stem arbores, unarmed; leaves digitate, on long petioles; leaflets 9, petiolulate, somewhat oblong, cuspitate acuminate, rounded at the base, or somewhat cordate, sharply and doubly toothed, rather hispid above and silky beneath.  h. S. Native of South America, in the temperate parts of Popayan. Aralia micans, Willd. in Schultes, syst. 6. p. 701. Flowers and fruit unknown.

Spleen-leaved Panax. Tree 20 feet?

21 P. serratum (Wall. in herb. Moricand. ex D. C. prod. 4. p. 253.) stem shrubby, unarmed; leaves on long petioles, digitate; leaflets 7, petiolulate, oblong-lanceolate, acuminate, rather bluntish at the base, somewhat serrated, pale beneath, glabrous on both surfaces in the adult state.  h. G. Native of Nipaul.

Umbs many, disposed in a racemose manner.

Serrate-leaved Panax. Shrub.

22 P. tomentosum (Wall. in herb. Moricand, ex D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves on long petioles, digitate; leaflets 5-7, petiolulate, oblong-lanceolate, quite entire, acuminate, somewhat attenuated at the base, glabrous above, and tomentose beneath.  h. G. Native of Nipaul. Flowers like those of P. serratum, and perhaps, with that species, ought to be excluded from P. tomentosum.

Tomentose Panax. Shrub.

23 P. speciosum (Willd. spec. 4. p. 1126.) stem arbores, unarmed; leaves petiolate, digitate; leaflets 7-10, petiolulate, ovate-oblong, rounded at the base, acute and quite entire at the apex, flat, clothed with silky tomentum beneath; panicles terminal, crowded; umbels of 12-15 flowers.  h. S. Native of Caracas and Porto-Rico, on sterile hills. P. spinosa, Poir. suppl. 2. p. 778. P. undulatum, H. B. et Kunth, nov. gen. amer. 5. p. 11. t. 417. f. 2. Panicle very showy, rather silky. Petioles 3 feet long; leaflets nearly a foot long.

Showy Panax. Tree large.

25 P. sericeum (Pohl, in litt. ex D. C. prod. 4. p. 254.) stem arbores, unarmed; leaves digitate; leaflets 6-7, nearly sessile, oblong, obtuse, cuneate, with a revolute entire margin, coriaceous, silky from very fine rusty down beneath; racemes umbelliferous, panicled, clothed with silky rusty down.  h. S. Native of Brazil. P. vinossus, Schlecht. ex Pohl.

Silky Panax. Tree.

5. Shubby or herbaceous plants. Leaves pinnate, bipinnate, and pinnately decomposed.

26 P. Anisatum (D. C. prod. 4. p. 254.) stem shrubby, unarmed; branches very hispid; leaves impari-pinnate: with 5-7 oval, quite entire leaflets, which are acute at both ends; umbels terminal, compound.  h. S. Native of the Moluccas, and other Indian islands. Anisatum Moluccænum, Rumph. amb. 2. p. 132. t. 42. Fruit rather digymous, with the scent of anise-seed.

Anise-scented-seeded Panax. Shrub 10 feet.

27 P. Leschenaultii (D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves pinnate: with 5 petiolulate, broadly ovate, narrowly acuminate, acutely serrated, glabrous leaflets; umbels compound, bracteate.  h. F. Native of the East Indies, on the Nellighery mountains, where it was gathered under the name of Solé maliquet. Calyx bluntly 5-toothed.

Leschenault’s Panax. Tree.

28 P. Desiccum (Wall. cat. 4937.) unarmed; leaves pinnate; leaflets 5, broad-ovate, acuminate, smooth, spinulose serrated, rather obtuse at the base; panicle umbellate, compound, spreading; umbellules of many flowers.  h. G. Native of Nipaul.

Two-paired-leafletted Panax. Tree.

29 P. pinnaatum (Lam. dict. 2. p. 715.) stem shrubby, prickly; rachis of leaves jointed, furnished with hooked prickles, particularly at the joints; leaflets ovate, acuminate, serrated, beset with bristly hairs on both surfaces, particularly on the nerves; panicle long, downy; umbellules many-flowered.  h. S. Native of the East Indies.

Armed Panax. Shrub.

30 P. Pragranum (Roxb. hort. beng. p. 21.) stem shrubby, unarmed; leaves decomposed, having the petiole many times oppositely branched: the ultimate branches of the petiole trifoliolate; leaflets ovate, acuminate, entire, petiolulate, the middle one the longest; panicles loose: ultimate branches short, bearing few-flowered umbellules.  h. G. Native of Nipaul. Hédera fragrans, D. Don, prod. fl. nepal. 187. but the leaves are not truly ternate, nor the margins serrately serrated, nor any ways glaucous beneath.

32 P. obtusum (Blum. bijdr. p. 880.) stem shrubby, unarmed; leaves supra-decomposed; leaflets obovate-roundish, entire, or deeply parted, repandly and cuspitate serrated; umbels compound, terminal.  h. S. Native of Java, where it is called Kodong-dong.

Obtuse-leafletted Panax. Shrub.

33 P. Samber firefight (Sieb. pl. exsic. nov. holl. 2. no. 256.) stem shrubby, unarmed; leaves pinnate; leaflets petiolate, oval-oblong, acuminate, coarsely and dentately serrated: ultimate ones deeply trifid; panicle corymbose: with the branches umbelliferous at the apex.  h. S. Native of New Holland. Styles 2, acute.

Elder-leafed Panax. Shrub.

34 P. Decompositum (Wall. in herb. Moricand. ex D. C. prod. 4. p. 255.) stem herbaceous? unarmed; leaves impari-pinnate, of 2-4 pairs of petiolulate, ovate, acuminate, sharply serrated, glabrous, or rather scabrous leaflets; umbels decomposed.—Native of Nipaul. Umbellules many-flowered; pedicels 4-5 lines long.
ARALIACEÆ. III. CUSSONIA.

IV. MARALIA. V. GILIBERTIA.

_Decompond-umbellated Panax._ Pl. 2 to 3 feet.

_Cult._ The hardy species of this genus grow best in peat, and are increased by dividing at the root. The other species grow well in a mixture of loam and sand: and are increased by cuttings which should be planted in sand, with a hand-glass placed over them.

**Linn. syst. Pet.-Heptandria, Di-Trigynia.** Margin of calyx entire, drawn out beyond the ovary. Petals 5-10. Stamens the same number as there are petals, and alternating with them. Ovary 5-10-celled, crowned by a broad disk above. Style short, thick, conical or pyramidal, composed of 3-10 joined ones, which are erectly conning at the apex at first, but at length diverging a little. Fruit fleshy.—Shrubs or small trees. Leaves variable. Flowers umbellate, disposed in racemose panicles.

This genus differs from Gastônia in the stamens being equal in number to the petals, not double that number as in that genus; and in the style being thick and pyramidal, hardly divided at the apex, not parted to the base, and stellate.

1 _G. umbella_ (Ruiz et Pav. fl. per. 3. p. 75. t. 312.) leaves simple; petioles unarmed; limb ovate-oblong, obsolescently denticulated, glabrous; umbels terminal, compound. _G._ G. Native of Peru, in the groves of Munna. Calyx 7-toothed. Petals 7. Style thick, conical; stigmas 7, at lengths spreading a little. Fruit 7-celled. Wangenheimia umbellata and Ginânía umbellata, Dietr. ex Steud. _Umbellate-flowed Gilbertia._ Tree.

3 _G. repanda_ (D. C. l. c.) leaves or leaflets broadly ovate, feather-nerved, coriaceous, glabrous on both surfaces, bluntly somewhat attenuated at the base, on short petioles, with repand-toothed margins; flowers umbellate. _G._ S. Native of the Mauritius. Margin of calyx short, entire. Ovary sulcate, conical in the superior part. Style hardly any; stigmas 5-7, very short, nearly stellate. The leaves or leaflets being detached from the specimen examined, it is doubtful whether the leaves are simple or compound; but from analogy we would rather consider them as compound. _Repand-toothed-leaved Gilbertia._ Shrub.

5 _G. panícula_ (D. C. l. c.) leaves or leaflets broadly ovate, obtuse, feather-nerved, quite entire, coriaceous, glabrous; flowers paniculate, disposed in racemes along the branches of the panicle. _F._ S. Native of the Mauritius and Bourbon. The leaves or the leaflets, whichever they may be, are about a foot long, and 6 inches broad. Panicle 6-8 inches long. Flowers on short pedicles. Margin of calyx entire; flower-bud conical, obtuse, 10-angled. Petals 10, valvate. Stamens 10, alternating with the petals. Style thick, conical, hardly 8-10-lobed at the apex. Ovary 8, rarely 9-10-celled. _Panicled Gilbertia._ Tree.

3 d 2
ARALIACEÆ. VI. GASTONIA. VII. POLYSCIAS. VIII. TORICELLIA. IX. ARALIA.

† A species not described.

6 G. saururoides (D. C. I. c.) ½. S. Native of the Moluccas. Gastrocné saururoides, Roxb. hort. Beng. p. 90. Saururus-like Gilbertia. Tree. Cult. Shrubs and trees, having handsome foliage. The soil best adapted to grow these is a mixture of sand, loam, and peat; and cuttings are readily rooted, if planted in sand under a handglass in heat.

VII. POLYSCIAS (from πολύς, poly, many, and σκεύος, skia, a shadow; in reference to the numerous umbels). Forst. gen. p. 63. t. 32. Lam. dict. 5. p. 559. ill. t. 329. with a figure. D. C. prod. 4. p. 257.

LIN. SYST. Pent-Octandria, Tri-Pentagynia. Margin of calyx short, denticulated. Petals 5-7, but usually 8, lanceolate, spreading. Stamens equal in number to the petals, and alternating with them. Style wanting; stigmas 3-5, short, erectly spreading. Berry globose, crowned by the margin of the calyx and stigmas, 4-celled, 4-seeded. Leaves pinnate. Umbels compound or verticillately proliferous; umbelles of many rays, flat. The rest unknown. A very doubtful genus, but probably only a species of Araúla.

1 P. pinna′ta (Forst. l. c.) ½. G. Native of the islands in the Southern ocean. P. umbellāta, Spreng. ex Steud. nom. 546. A plant has been sent by La Billardière from New Zealand, under the name of Polysciās, which rather disagrees with the description given by Forster of his plant, in the branches of the panicle being verticillate, and in the umbelles being 5-7-flowered. Margin of calyx nearly entire. Disk fleshy, covering the ovary. Styles 2-3, erect, approximate, acute. Leaflets oblong, obtuse at the base, and acuminated at the apex, with somewhat denticulate margins. Pinnate-leaved Polysciās. Tree or shrub. Cult. See Cussònia. p. 387. For culture and propagation.

VIII. TORICELLIA (in honour of Dr. Toricelli, who prepared a barometer for the measurement of mountains, and therefore has done something towards the geography of botany). D. C. prod. 4. p. 257.

LIN. SYST. Pentandria, Tetragynia. Margin of calyx acutely 5-toothed. Petals 5, oblong, attenuated at the base, and uncinately incurved at the apex. Stamens 5; filaments very short; anthers ovate. Styles 4, straight, short. Berry nearly dry, ovate, crowned by the calyx, 4-celled. Seed unknown. — A small mountain shrub: with terete white glabrous branches, ringed with ciliate. Leaves alternate, exstipulate, simple, cordate, roundish, membranous, palmately 5-nerved, coarsely and acutely toothed, somewhat 5-lobed, pubescent along the nerves and nerves; petals rather dilated at the base. Panicle terminal, many flowered. Flowers abortive or polygamous, or the number of the parts are rather variable. This genus is nearly allied to Polysciās.

1 T. tiliifolius (D. C. prod. 4. p. 257.) ½. H. Native of Nipaul, on the highest mountains. Sambucus? tiliifolia, Wall. mss. Leaves 5-6 inches in diameter, on petioles 3 inches long. Line-tree-leaved Toricecellia. Shrub 1 to 2 feet. Cult. This shrub will grow very well in the open ground, and it may be increased by cuttings or seeds.

IX. ARALIA (a name of unknown meaning, under which there is a species was sent to Fagon from Quebec, in 1764, by one Sarrazin, a French physician). D. Don, prod. fl. nep. 185. in a note. Kunth, nov. gen. amer. 5. p. 8. in a note. D. C. prod. 4. p. 257. — Arália species of Lin. and other authors. — Arália veræ, Blum. bijdr. 869.

LIN. SYST. Pentandria, Pentagynia. Margin of calyx very short, entire or toothed. Petals 5, free, and expanded at the apex. Stamens 5. Styles 5, expanded, spreading diveraciously. Berry 5-celled, usually torose. Pyrene chartaceous. — Herbs and shrubs, indigenous to North America, with compound leaves; and umbellate white flowers, which are usually disposed in panicles.

§ 1. Unarmed species.

1 A. nudicaulis (Lin. spec. 393.) plant stemless; radical leaf one, with a trifid petiole; impari-pinnate divisions, bearing each 5 ovate acute serrated leaflets; scape trifid at the apex, shorter than the leaf; each division bearing a many-flowered umbel, without any involucre. 2. H. Native of North America, from Canada to Carolinia, and from Lake Huron through the woody country to lat 46°, and the Rocky Mountains; and of Newfoundland. Lam. dict. 1. p. 224. Torr. fl. un. st. 1. p. 327. Big. fl. bost. ed. 2. p. 122. Rafin. med. bot. 1. t. 8.— Plak. al. t. 238. f. 5. Petals white, reflexed. Stamens exerted. Styles 3-5, short, erect, distinct. The Crees use the root of this plant as a remedy against the venereal disease, under the name of nampos-ootelephek, i.e. rabbit-root; and also apply the bruised bark of its root to recent wounds. — Richardson. The roots were formerly brought over and sold for sarsaparilla, and some of the inhabitants of Canada make use of it as such, but it is very different from the true sort. A. nudicáulis, Blum. bijdr. p. 870. introduced into Java from Japan, is distinct from our plant. Naked-stemmed Arália. Fl. June, July. Cist. 1731. Pl. ½ to 1 foot.

2 A. racemosâ (Lin. spec. 395.) stem herbaceous, smooth, diveraciously branched; petioles tripartite, the partitions bearing each 3-5, ovate or cordate, acuminate, serrated, smooth leaflets; peduncles axillary, and disposed in a terminal raceme, umbelliferous; involucrum small, of few leaves. 3. H. Native of North America, from Canada to Virginia, in rocky shady situations; throughout Canada, &c. from Lake Huron to the Saskatchewan. Schkuhr, handb. 1. t. 86. Hayn. term. bot. t. 38. f. 5.— Corn. can. t. 75.— Moris. hist. sect. 1. t. 2. f. 9. Petals greenish-white, spreading. Styles 5, short, erect, hardly recurved at the apex. Fruit 5-ribbed. Stamens equal in length to the petals. The plant is called spikenard in North America, and is highly esteemed as a medicine. Axillary branches leafy.
ARALIACEæ.

3 A. Hu'MILIS (Cav. Ícon. 4. p. 7. t. 318.) stem herbaceous, glabrous, a little branched; leaves impari-pinnate, pubescent: leaflets cordate, acute, serrated; umbels disposed in terminal racemes; involucra very short, of many leaves. H. G. Native of New Spain. The fruit, according to Cav. Ícon. is nearly globose. Styles 5, erect, rather distant. Stem variegated with brown tubercles. Petals green.

*Humble Aralia.* Pl. 1 1/2 foot.

4 A. PUBESCENS (D. C. cat. hort. monsp. 1813. p. 80.) stem woody, unarmed, glabrous, branched; leaves impari-pinnate, pubescent; leaflets ovate-lanceolate, serrated, attenuate at the base; and acuminate at the apex; umbels numerous, disposed in a terminal raceme; involucra very short, of few leaves. H. G. Native of New Spain. A. scabra, Presl, in herb. Henke. Petioles not dilated into auricles at the base. Styles 5, divaricately recurved. Fruit globose, dark purple.

5 A. hISPIDA (Michx. fl. bor. amer. 1. p. 185.) stem suffruticoso, very hispid at the base from bristles; leaves bipinnate; leaflets ovate, acute, deeply serrated, glabrous; petioles hispid; umbels on long peduncles; involucra of many short sessile leaves. H. H. Native of North America; in stony woods in New England, &c.; on high mountains in Pennsylvania and Virginia; Canada, from Lake Huron to the Saskatchewan; Hudson's Bay, and of Newfoundland. Vent. hort. cels. t. 41. Sims, bot. mag. t. 1085. Lodd. bot. cab. 1806. A. Muhlenbergiana, Schulz, syst. 6. p. 704. does not differ from this species. The shrub is called *Wild-elder.* Stem panicleately branched at top.

† Unarmed species, which are not sufficiently known.

*Cordate-leaved Aralia.* Pl. ?

7 A. Japonica (Thumb. fl. jap. 128.) stem shrubby, unarmed; leaves petiolate, 7-nerved, 7-lobed; lobes ovate, serrated at the apex; panicles terminal; peduncles umbelliferous. H. H. Native of Japan, near Nagasaki. Banks, icon. Kämpf. t. 10. Styles 5, diverging. Berry striated. Petals ovate, acute, reflexed (Thumb.). Leaves coriaceous, glabrous in the adult state, but when young woolly on both surfaces. (Blum. bijdr. p. 371.) Petals white.

*Japan Aralia.* Shrub 5 to 6 feet.

8 A. Scheffleræa (Spreng. ping. 1. p. 28.) stem shrubby, smooth; leaves on long petiolo, digitate; leaflets 5, petiolulate, lanceolate, attenuate at the base, serrated, glabrous on both surfaces. H. G. Native of New Zealand. Scheffleræa digitata, Forst. gen. t. 23. Lam. ill. t. 221. Petals 5, nearly spatulate, erect, not as in the genus Sciadophyllum, cohering into a calyx-trumpet at the apex. Styles 8-10, diverging, not erect, as in Hédera. Berry 8-10 angled.

*Scheffler's Aralia.* Shrub.

9 A. ÓCOPHYLLA (Lour. coeh. p. 187.) stem almost arborescent, unarmed; leaves petiolate, digitate: leaflets 8, oblong, obtuse, quite entire, glabrous; panicles umbellate. H. G. Native of Cochin-china. Flowers yellow, of 5 petals. Stigmas 5, sessile. Berry ovate, 5-seeded. Perhaps a species of *Polyscias.* Panicle large, ending in umbels, which are without involucra.

*Eight-leafletted Aralia.* Shrub 10 feet.

10 A. PALMATA (Lam. dict. 1. p. 224. but not of Lour.) stem shrubby, unarmed; leaves petiolate, pinnately 9-nerved, 9-cleft: lobes lanceolate, serrated; berry succulently angular, 6- to 8-celled. H. S. Native of the Moluccas.—Rumph. amb. 4. t. 43. Perhaps a species of *Polyscias* or *Hédera.* Umbels crowded, terminal.

*Palmate-leaved Aralia.* Shrub.

11 A. ? MCANS (Willd. herb. ex Spreng. syst. 1. p. 933.) leaves digitate; leaflets or lobes 10, subcordate, oblong, acuminate, mucronately toothed, hispid above, and silky beneath; heads disposed in racemes. H. S. Native country unknown. Perhaps a species of *Hédera.*

*Glittering Aralia.* Tree or shrub.

§ 2. Prickly species.

12 A. spinosa (Lin. spec. p. 392.) stem arborescent, and are, as well as the petioles, prickly; leaves doubly and triply pinnate; leaflets ovate, acuminate, deeply serrated; panicles much branched, beset with velvety stellate down; umbels numerous; involucra small, of few leaves. H. H. Native of North America, in fertile low woods; of Carolina and Virginia; likewise in the Illinois country. Wats. dendr. bit. t. 116. Comm. hort. amat. 1 t. 47. Pl. 102 and 103. A tree about 8-12 feet high, with a simple stem. Petals white, reflexed. Styles 5, divergent, arched. Fruit 5-ribbed. Known under the name of *anglica-tree.* The berries used in an infusion of wine or spirits are a remarkable medicine for relieving rheumatic pains.

Var. ß. înermis (Presl, fl. amer. sept. 1. p. 209.) stem spinose, glaucous; petioles unarmed. H. H. Native of South Carolina, near Charleston.

13 A. MONTANA (Blum. bijdr. p. 870.) stem arborescent, and are, as well as the petioles and base of the leaves, prickly; leaves compo咄nd; leaflets ovate, acuminate, obliquely subcordate at the base, doubly serrated, hairy on both surfaces; panicles branched; flowers umbellate. H. S. Native of Java, on the mountains of Seribu, where it is called *Kibokoyana.*

*Mountain Aralia.* Shrub 8 to 10 feet?

14 A. CHINEÆSIS (Lin. spec. 393.) Blum. bijdr. p. 870.) stem arborescent, and are, as well as the petioles, prickly; leaves bipinnate, compound; leaflets ovate-oblong, acuminate, unequally rounded at the base, sharply serrated, villous; panicle branched; flowers glomerate, H. S. Native of Java, on the mountains (Blum.), China (Lin.), Lour. coeh. 187. Styles diverging, revolute. Petioles villous, bearing a few straight prickles. The figure in Rumph. amb. 4. t. 44. cited by Linæus for this plant, is a species of *Leœa.* Loureiro describes the plant as very troublesome to travellers, with its numerous crooked prickles, as it climbs in the hedges. According to him the corolla is white. Styles scarcely any.

*China Aralia.* Tree 10 to 12 feet.

15 A. ERINAÆCA (Hook. in Brewst. edit. journ. sc. 1827. p. 64.) stem very spiny; leaves nearly palmate, very acute: lobes cut; petioles and nerves of leaves spiny; umbellules globose, disposed in racemes. H. H. Native of the west coast of North America, in Queen Charlotte's islands.

*Erinaæcaus Aralia.* Shrub.

16 A. ÓNTOMYLLA (Thumb. fl. jap. 128.) stem arborescent, prickly; leaves digitate: leaflets 5, ovate, acute, somewhat petiolate, serrated at the top; umbels simple, pedunculate. H. H. Native of Japan. *Panax spinosus,* Lin. fill. suppl. 441. ex Lam. dict. 2. p. 715.

*Five-leafletted Aralia.* Tree.

Cult. The hardly herbaceous species of *Aralia* grow best in peat or vegetable mould, and are increased by dividing at the
root, or by seed. The hardy shrubby kinds also grow best in peat-earth, and are very ornamental and curious; they are increased by seeds brought from the places of their natural growth, which do not vegetate until the second year; or by slips of the roots. The other species being either green-house or stove plants, require to be grown in pots, in a mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass.

Lin. syst. Pentándria, Pentagyния. All as in Aralia, but the petals cohere in the form of a calyptra at the apex, notwithstanding it ought perhaps still to be joined with Aralia.

§ 1. Leaves simple, undivided.

1 S. hu'ımile (Blum. bjjdr. p. 785.) shrub parasitical, diffuse; leaves simple, ovate-oblong, acuminated, distinctly serrated, coriaceous, glabrous; racemes terminal; flowers umbellate, tetrastichous. portlet S. Native of Java, in woods on Mount Salak.

Humble Sciodaphyllum. Shrub diffuse.

§ 2. Leaves simple, palmate-lobed.

2 S. pal'matóm (Blum. l. c. p. 785.) stem arborescent, prickly; leaves membranous, glabrous, palmately 5-parted: segments lanceolate, serrated from the middle to the apex; racemes axillary; flowers umbellate, with 8-12 stamens. portlet S. Native of Java, in humid parts of woods on the mountains, where it is called tkakura'niyu by the natives. Fruit hemispherical, 6 lines in diameter.

Palmate-leaved Sciodaphyllum. Tree.

§ 3. Leaves trifoliate.

3 S. sca'ndens (Blum. bjjdr. p. 787.) stem shrubby, scandent; leaves trifoliate; leaflets lanceolate, much acuminated, quite entire, coriaceous, glabrous; the middle one on a long petiole; racemes crowded, terminal, divaricate; flowers umbellate, pentandrous. portlet S. Native of Java, in woods on Mount Tjerantimaj.

Scendent Sciodaphyllum. Shrub cl.

4 S. parásiticum (Blum. bjjdr. p. 787.) stem shrubby, parasitical; leaves ternate: leaflets oblong, acuminated, obtuse at the base, remotely serrated, coriaceous, glabrous, nearly veinless; racemes axillary and terminal, solitary or twin; flowers umbellate, hexangular. portlet S. Native of Java, at the foot of Mount Salak, where it is called Ramo-giling hunte. Parasitic Sciodaphyllum. Shrub parasitical.

§ 4. Leaves digitate.

* East Indian species.

5 S. suba've'ne (Blum. bjjdr. p. 786.) stem fruticose; leaves digitate; leaflets 3-5, oblong, acuminated at both ends, coriaceous, nearly veinless; racemes crowded, terminal, diverging; flowers umbellate, pentandrous. portlet S. Native of Java, on Mount Salak, in woods, where it is called Ramo-hunte by the natives.

Nearly-veinless-leaved Sciodaphyllum. Shrub.

6 S. tomentósum (Blum. bjjdr. p. 877.) stem pubescent; leaves digitate; leaflets 5-7, oblong, acuminated, rounded at the base, shining above, but clothed with stellate tomentum beneath; racemes panicled, axillary, and terminal; flowers umbellate, pentandrous. portlet S. Native of Java, in woods on Mount Burangrang.

Var. β, farinósium (Blum. bjjdr. p. 785.) leaflets 7, ending in a long taper-point each. portlet S. Native of the west of Java, in mountain woods, where it is called Pangany tapok. Actinophyllum farinosum, Blum. cat. hort. butit. p. 43.

Tomentose Sciodaphyllum. Shrub.

7 S. elípticum (Blum. bjjdr. p. 787.) stem shrubby, scandent; leaves digitate; leaflets 5-7, rarely 3, elliptic, acutish at both ends, coriaceous, glabrous; panicle terminal, divaricate; flowers umbellate, pentandrous. portlet S. Native of Java, at the foot of Mount Salak, where it is called Ramo-gunti by the natives. Petals purplish.

Elliptical-leafletted Sciodaphyllum. Shrub el.

8 S. divarica'tum (Blum. bjjdr. p. 787.) stem arborescent, sometimes scandent; leaves digitate; leaflets 5-9, petiolulate, oblong, bluntish at both ends, glabrous, racemes panicled, terminal; flowers umbellate, pentandrous. portlet S. Native of Java, on the mountains in humid woods, in the province of Buitenzorg, where it is called Ramo-giling or Sanga-banaah. Actinophyllum divaricatum, Blum. cat. hort. butit. p. 42. and in flora 1825. p. 147.

Divaricate Sciodaphyllum. Shrub cl.

9 S. lu'cidentum (Blum. bjjdr. p. 877.) stem arborescent; leaves digitate; leaflets 11-12, oblong, acuminated, rounded at the base, coriaceous, glabrous; racemes crowded, terminal, divaricate, glabrous; flowers umbellate, pentandrous. portlet S. Native of Java, on the top of Mount Salak.

Shining Sciodaphyllum. Tree.

** American species.

10 S. Brónu'ii (Spreng. syst. 1. p. 953.) stem arborescent; leaves digitate; leaflets 7-11, nearly umbellate, petiolulate, oblong-lanceolate, glabrous, unequal; racemes compound, very long, nutant; flowers nearly capitate, pentandrous; corollas hemispherical. portlet S. Native of Jamaica, on the mountains in woods. Sciodaphyllum, Browne, lam. 195. t. 19. f. 1. Aralia Sciodaphyllum, Swartz, prod. 55. Hédera Sciodaphyllum, Swartz, fl. ind. occ. 1. p. 519. Schultes, syst. 5. p. 510. Vitis heptaphylla, Lin. mant. p. 212. Ex Smith, exclusive of the country. The central leaflets of the leaves are smallest. Anthers purple.

Browne's Sciodaphyllum. Clt. 1793. Tree 10 to 15 feet. 11 S. cónci'cum (Poir. dict. 6. p. 746.) stem shrubby; leaves digitate; leaflets 7-13, petiolulate, oblong, abruptly acuminated, coriaceous, glabrous, reticulately veined; racemes 2-3, rather velvety; flowers nearly capitate, pentandrous; corollas conical. portlet S. Native of Peru, in groves. Actinophyllum cóncicum, Ruiz et Pav. fl. per. 3. p. 74. t. 309. Heads of flowers about the size of a pea. Corollas of a whitish-red colour. Branches violaceous.

Conical-flowered Sciodaphyllum. Shrub 10 to 12 feet. 12 S. pénta'ndrum (Poir. dict. 6. p. 747.) stem shrubby, somewhat arborescent; leaves digitate; leaflets 7-11, petiolulate, oblong, acuminated at the apex, coriaceous, glabrous above, but beset with stellate pell beneath; racemes 1-3, woolly; flowers pentandrous, corollas conical. portlet S. Native of Peru. Actinophyllum pentándrum, Ruiz et Pav. fl. per. 3. p. 75. t. 311. Corollas of a whish purple colour; anthers yellow. Berry whitish, about the size of a cherry. Leaflets dark-brown beneath. Racemes pale-reddish.

Pentandrous Sciodaphyllum. Clt. 1820. Tree 18 to 20 ft. 13 S. angula'tum (Poir. dict. 6. p. 745. exclusive of Browne's synonyme,) stem arborescent; leaves digitate; leaflets 7-11, petiolulate, oblong, acuminated, concave at the base, shining above,
but clothed with powdery velvety rusty down beneath; racemes elongated, granular; flowers capitate, with 7-9 stamens; corollas obovate, angular, and truncate. \( g \). Native of Peru and New Granada, on shady hills. Actinophyllum angulatum, Ruiz et Pav. fl. p. 73. t. 307. H. B. et Kunth, nov. gen. amer. 5. p. 9. Heads of flowers about the size of a walnut, yellowish. Berry dark purple, cuneiform, angular. Styles 4-6.

**Angular Sciodaphyllum.** Tree 20 to 30 feet.

14 S. pedicella'tum (Poir. dict. 6. p. 746.) stem scandent; leaves digitate: leaflets 9-15, petiolulate, oblong, acuminate, somewhat sinuately undulated, and concave at the base, glabrous; racemes many; flowers pedicellate, articulate on the pedicels; corollas hemispherical. \( g \). Native of Peru, in groves at Manuna. Actinophyllum pedicellatum, Ruiz et Pav. fl. pers. 3. p. 73. t. 308. Stem rooting, filled with medullae; branches purplish. Racemes purplish, a foot long. Stamens 6-7. Berries angularly globose, greenish purple.

**Pedicellate-flowered Sciodaphyllum.** Shrub cl.

15 S. acuminat'us (Poir. dict. 6. p. 746.) stems scandent; leaves digitate: leaflets 7-11, petiolulate, oblong, obliquely acuminate, coriaceous, glabrous, reticulately veined; racemes 2-5, tomentose; flowers pentandrous and ovoid, capitate; corollas hemispherical, apiculate. \( g \). Native of Peru, in groves. Actinophyllum acuminatum, Ruiz et Pav. fl. pers. 3. p. 74. t. 310. Corollas yellow, disposed in heads, which are a little larger than a pea. Styles 5.

**Acuminated-leaved Sciodaphyllum.** Shrub cl.

16 S. anomala'tum (G. Don, in Loud. hort. brit. p. 112.) arboreus; leaves digitate: leaflets 5-7, oblong-lanceolate, acuminate at the apex, smooth and green on both surfaces: outer ones the smaller; umbels capitate, panicled; branches green and smooth. \( g \). S. Native of Trinidad, in woods. Carolinae insignis, Hortul. Flowers whitish yellow. Largest leaflets 1 foot long.

**Anomalous Sciodaphyllum.** Clt. 1817. Tree 20 feet.

17 S. quindiu'ense (D. C. prod. 4. p. 261.) stem shrubby, scandent; leaves digitate: leaflets 7, oblong, acuminate, quite entire, glabrous; umbels 4-flowered, racemose; flowers with 8-10 stamens. \( g \). Native of the Andes, about Quindiu, at the height of 3300 feet above the level of the sea. Aralîa Quindiuensis, H. B. et Kunth, nov. gen. amer. 5. p. 8. t. 417. f. 1. Styles 3-10, spreading. Petals cohering at the apex. Fruit 8-10-ribbed. Perhaps a species of Aralîa.

**Quindiu Sciodaphyllum.** Shrub cl.

Cult. All the species are worthy cultivating in gardens for the sake of their fine handsome large foliage. A mixture of loam, peat, and sand is a good soil for them; and they are easily increased by cuttings under a hand-glass in sand, placed in a moderate heat.

---

**XI. HE'DERA (a name for which many etymologies have been offered. The best explanation is, that it has been derived from hêdru, cord in Celtic, lierre in French. The English name of ivy is derived from the Celtic word im, green, from its being always green. The word ivi is given to Táxus by the French, hence also the English name of the genus Yew.)** Swartz, fl. ind. occ. p. 518. D. Don, prod. nep. p. 186. Gertrn. fruct. 1. t. 26. D. C. prod. 4. p. 261.—Araliâ sect. Gymnapetra, Blum. bijdr. p. 671.—Hédera and Aralîa species Lin. and all other authors.

**Lin. syst. Pent-Deccandria, Pent-Decagynia.** Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex in the form of a calyptra. Stamens 5-10. Styles 3-10, conniving, or joined in one. Berry 5-10-celled.—Climbing or erect shrubs. Leaves simple or compound. Flowers umbellate or capitate.

§ 1. Leaves simple, undivided, or lobed.

1 H. Herlix (Lin. spec. 292.) stems climbing, throwing out roots from the side by which it is placed to any substance; leaves coriaceous, glabrous, shining, with 5 angular lobes; those on the old upright branches, which form the tops of the plants, ovate, acute, quite entire; umbels simple, pubescent. \( g \). Native of Europe. Common ivy is a valuable ornamental evergreen climbing shrub. It is useful for covering walls and sides of houses, or training into fancy shapes, as of human figures, &c. on skeletons of wire-work, or trained up to a stake, so as to form a standard; but when ivy has reached to the top of any support, the branches shorten, and become woody, forming themselves into large bushy heads, and the leaves become entire and more of an oval shape, and not divided into lobes like the lower ones, and in this state they produce flowers at the end of every shoot. The berries are black at maturity. The flowers are yellowish, and appear late in the season, and in consequence is much resorted to by bees and flies, when little other food is to be had. The berries increase during the winter, are full formed in February, and ripen in April; furnishing food for wild pigeons, blackbirds, thrushes, &c. in the spring. Blackbirds, and several other birds, build their nests in the stumps of ivy twigs. Sheep are fond of the leaves, especially during severe weather. The ancients held ivy in great esteem, and Bacchus is represented crowned with it to prevent intoxication; and Homer describes his heroes as drinking out of a cup made of the wood. Haller says, that the leaves are given in Germany as a specific in atrophus in children. Common people apply them to issues and corns. The berries are aperient and emetic. The wood is soft and porous, so as to transmit liquids if turned of a sufficient degree of thinness. The roots are used by leather-cutters to whet their knives upon. The whole plant is rather aromatic; and a very fragrant resin exudes from the old stems when bruised. The specific name Hélix is derived from vixea, vixil, to encompass or turn round; in reference to the twining stems.

**Var. β, Canariénisis (D. C. prod. 4. p. 261.) pedicels clothed with stellate down; floral leaves ovate; fruit black; leaves of the rooting branches 5-lobed, with white veins. \( g \). Native of Europe, in woods, hedges, and on old buildings. Hédera Hélix, Lin. spec. 292. Smith, engl. bot. t. 1267. Curt. lond. fasc. 1. t. 16. Fl. dan. t. 1027. Bull. fr. t. 135. Drev. and Hayne, pl. europ. t. 66. There is a variegated-leaved variety of this in the gardens.

**Var. γ, chryscocarpa (D. C. prod. 4. p. 261.) pedicels beset with lepidopted pubescence; floral leaves subcordate; those of the creeping branches 5-lobed, larger than those of the common ivy; fruit red. \( g \). Native of the Canary Islands. Hédera Canariensis, Willd. in berl. mag. 2. p. 170. t. 5. f. 1. Schultes, syst. 5. p. 508. In the gardens this is called Irish Ivy.

2 H. corima'osa (Choisy, mss. in herb. D. C. ex prod. 4. p. 262.) stem arboresous, bushy; leaves cordate, acute, bluntly 5-angled, when young velvety on the nerves beneath, but in the adult state glabrous on both surfaces; flowers corym-
ARALIACEÆ. XI. Hedera.

9. H. racemosa L. Native of the Canary Islands, where it has been probably introduced, and is called Pipto de St. Augustin. This is probably nothing but the Irish ivy of the gardens.

11. H. multiflora (D. C. prod. 4. p. 262.) stem arborescent, unarmed; leaves long petiolar, oblong-elliptic, acuminate, somewhat cuneate at the base, quite entire, membranous, glabrous, with pinnate nerves: the 2 lower nerves remote from the rest, parallel with the margin, and rising from an acute angle; racemes panicked, diverging; heads globose. H. Native of Brazil, where it was collected by Schott. Aralia multiflora, Pohl, in litt.

Many-flowered I. Tree 10 to 12 feet.

Many-flowered I. Tree 10 to 12 feet.

13. H. ovata (Wall. cat. no. 4911.) stem unarmed; leaves ovate, elliptic, quite entire, coriaceous, ending in a short blunt point, rusty beneath; peduncles axillary, solitary, and terminal, umbellate; umbels many-flowered. H. Native of Madras.

Ovate-leaved I. Shrub.

Ovate-leaved I. Tree or shrub.

15. H. avicennifoá (D. C. prod. 4. p. 263.) arborescent; leaves oblong-lanceolate, acute at the apex, and acutish at the base, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; coriaceous; flowers capitate. H. Native of South America, in the province of Quito, between Tambo de Burgay and Delay, at the altitude of 4000 to 5000 feet. Aralia avicenniifolia, H. B. et Kunth, nov. gen. amer. 5. p. 2. t. 2. Aralia tarchanathiifolia, Willd. in Schultes, syst. 6. p. 698. Styles 5-9, short, connivent. Avicennia-leaved I. Tree.

16. H. cupánènès (D. C. l. c.) stem arborescent, unarmed; leaves ovate, acuminate, cuneate at the base, quite entire, somewhat 3-nerved, membranous, glabrous, shining. H. Native of Cumaná, in shady places at Mount Cocolar, at the elevation of 1200 feet. Aralia Cumananensis, H. B. et Kunth, nov. gen. amer. 5. p. 3. Flowers and fruit unknown.

Cumanan I. Tree.

Catalepa-leaved I. Tree or shrub.

18. H. septemérivia (D. C. l. c.) stem arborescent? unarmed; leaves ovate, acuminate, rounded at the base, 7-nerved, rather coriaceous, glabrous; racemes panicked; heads globose. H. Native of New Granada, at the altitude of 4000 feet. Aralia septemérivia, H. B. et Kunth, nov. gen. amer. 5. p. 3. Said to be hardly distinct from H. capitata. Style 1.

Pendulous-umbellate I. Cht. 1824. Tree 12 to 15 feet.

6. H. Umbellata (D. C. prod. 4. p. 262.) stem frutescent, unarmed; leaves ovate, lanceolate, acuminate, rarely serrate; peduncles umbellate, trifid; umbels capitate, nearly globose. H. Native of Jamaica, on the mountains. Poéodo-santumum Aboimense, Rumph. amb. 2. p. 54. t. 12. Aralia umbellata, Lam. dich. 1. p. 226. Schultes, syst. 6. p. 697. There is a yellow gum issues from this tree, which becomes blackish on drying, and is sweet scented, which is called Saruru in Aboimana. Flowers whitish.

Umbelliferous I. Tree.

7. H. cuneata (D. C. prod. 4. p. 262.) stem arborescent, unarmed; leaves petiolate, broadly oblong, acute, quite entire, cuneate at the base, membranous, glabrous, with pinnate nerves: the 2 lower nerves parallel with the margins, rising from an acute angle; umbels terminal, of many rays; heads half globose. H. Native of Brazil, where it was collected by Schott. Aralia umbellata, Pohl, in litt. but not of Lam.

Cuneate-leaved I. Tree small.

8. H. Nutans (Swartz, fl. ind. occ. 1. p. 514.) stem arborescent, unarmed; leaves elliptic, acutish, coriaceous, entire; umbels nodding, hemispherical; peduncles erectish. H. Native of the south of Jamaica, on the tops of the Blue Mountains. Very like H. pendula, but the peduncles are shorter, the peduncles shorter, the petioles reflexed, and the petals reflexed. Style short, 5-angled.

Drooping-umbellate I. Tree 4 to 15 feet.

9. H. ramiflora (D. C. prod. 4. p. 262.) stem arborescent, unarmed; leaves petiolate, acute, quite entire, membranous, glabrous, hardly cuneate at the base, with pinnate nerves: the 2 lower nerves parallel to the margin, and rising from an acute angle; racemes few, rising from the old branches; umbels semiglobose. H. Native of Brazil, where it was collected by Schott. Aralia ramiflora, Pohl, in litt. Flowers 15-16 in each umbel, pedicellate.

Branch-flowered I. Tree 10 to 15 feet.

Many-spined I. Tree.

Tree Iy. Tree 10 to 15 feet.

Seven-nerved-leaved Ivy. Tree or shrub.

19 H. Turbacinis (D. C. l. c.) stem arboreous; leaves on long petioles, acute at the base, membranous, glabrous, of one colour; some of them are undivided, and others are trifid at the apex: with the lobes or segments entire and acuminate: having the recesses between the lobes rounded. \( H. \) S. Native of New Granada, in hot places near Turbaco, where it is called Arbol de Guaco. Aralia Turbacensis, H. B. et Kunth, nov. gen. amer. 5. p. 3. Flower and fruit unknown.

Turbaco Ivy. Tree 40 to 50 feet.

20 H. discolor (D. C. l. c.) stem arboreous; leaves petiolate, rather coriaceous, glabrous, rounded at the base, shining above, and of a rusty-purplish colour beneath: some of them undivided and 1-nerved, and others are 2-nerved and trifid at the apex: having the lobes or segments somewhat acuminate, the intermediate one the longest; racemes panicked; heads globose. \( H. \) S. Native of New Granada. Aralia discolor, H. B. et Kunth, nov. gen. Amer. 5. p. 4. Flowers and fruit not sufficiently known.

Discoloured-leaved Ivy. Tree or shrub.

21 H. argentina (D. C. l. c.) stem arboreous, unarmed; leaves petiolate, coriaceous, glabrous and shining above: but marked by silvery dots beneath: some of which are undivided and 1-nerved, and others are 2-nerved and trifid at the apex: having the lobes or segments somewhat acuminate: the intermediate lobe remotely serrated; racemes panicked; heads of flowers globose. \( H. \) S. Native of South America, along with H. argentina. Aralia argentina, H. B. et Kunth, nov. gen. Amer. 5. p. 5. Styles 3, convining. Petals white.

Silvery-dotted Ivy. Tree 15 to 20 feet.

22 H. crassineria (D. C. l. c.) stem arboreous; leaves petiolate, acute at the base, coriaceous, glabrous above and shining, densely beset with rusty dots beneath: some entire, ovate-oblong, and others 3-lobed and somewhat acuminate; racemes panicked; heads globose. \( H. \) S. Native of South America, with H. argentina. Aralia crassinervia, H. B. et Kunth, nov. gen. Amer. 5. p. 5. Styles 3-6, convining.

Thick-nerved-leaved Ivy. Tree.

23 H. obtusifolia (D. C. l. c.) stem arboreous; leaves petiolate, truncate roundly at the base, 5-nerved, coriaceous, glabrous and shining above, but beset with fuscose dots beneath: some entire, ovate-oblong, and others 3-lobed and somewhat acuminate; racemes panicked; heads of flowers elliptic-globose. \( H. \) S. Native of temperate places towards Loja, at the altitude of 3300 feet. Aralia obtusifolia, H. B. et Kunth, nov. gen. Amer. 5. p. 5. Willd. in Schultes, syst. 6. p. 699. Petals white, glabrous. Styles 4, convining.

Blunt-nerved-leaved Ivy. Tree or shrub.

24 H. angulatis (D. C. prod. 4. p. 263.) stem arboreous; leaves 5-angled, obtuse, tomentose beneath; flowers capitata. \( H. \) S. Native of South America, Humb. et Bonpl. Aralia angulatiss, Willd. in Schultes, syst. 6. p. 698.

Angular-leaved Ivy. Tree.

25 A. plataniifolia (D. C. l. c.) stem arboreous; leaves petiolate, coriaceous, glabrous above and shining, but clothed with rusty tomentum beneath, truncate at the base, 7-nerved, 7-cleft at the apex: lobes or segments glabrous, acuminate, quite entire; racemes panicked; heads of flowers globose. \( H. \) G. Native of Peru, on the western declivity of the Andes. Aralia plataniifolia, H. B. et Kunth, nov. gen. Amer. 5. p. 6. t. 415. Willd. in Schultes, syst. 6. p. 699. Tree 15-20 feet. Styles 4-5. Petals white, tomentose on the outside.

Platanaus-leaved Ivy. Tree 15 to 20 feet.

26 H. acerifolia (D. C. prod. 4. p. 264.) stem arboreous; leaves 5-lobed, acuminate, quite entire, glabrous, shining lepidodendron and of a different colour beneath. \( H. \) S. Native of South America, Humb. and Bonpl. Aralia acerifolia, Willd. in Schultes, syst. 6. p. 699. The rest unknown. This is the same as H. argentina, according to Sprengel.

Maple-leaved Ivy. Tree.

27 H. jatrophiaphylla (D. C. l. c.) stem arboreous; leaves petiolate, coriaceous, glabrous above, but clothed with fuscous tonmentum beneath, corolate at the base, 7-nerved, deeply 7-cleft: segments or lobes lanceolate-oblong, acuminate, narrowed at the base and quite entire. \( H. \) S. Native of New Granada. Aralia jatrophiaphylla, H. B. et Kunth, nov. gen. Amer. 5. p. 6. Leaves almost like those of Manihot. This species approaches very near H. plataniifolia.

Jatropha-leaved Ivy. Tree.

Reticulated-leaved Ivy. Tree.

29 H. cheirophylla (D. C. l. c.) stem unknown; leaves palmately 5-cleft, cream-coloured beneath: lobes or segments acuminate, toothed; heads of flowers disposed in racemes, clothed with villous tomentum. \( H. \) S. Native of South America. Aralia cheirophylla, Spreng. syst. 1. p. 955.

Hand-leaved Ivy. Tree or shrub.

30 H. floribunda (D. C. l. c.) stem arboreous; leaves petiolate, glabrous above, but clothed with canescent tomentum beneath, 7-9-parted: segments or lobes acuminate, remotely and sharply toothed; racemes panicked; heads elliptically globose. \( H. \) S. Native of New Granada, in temperate parts, at the altitude of 3600 feet. Aralia floribunda, H. B. et Kunth, nov. gen. Amer. 5. p. 6. t. 416. Aralia Umboldti pii, and A. incisa, Willd. in Schultes, syst. 6. p. 699. ex Kunth. Styles short, convining, somewhat diverging after flowering. Leaves so deeply parted as nearly to be compound.

Bundle-flowered Ivy. Tree 15 to 20 feet.

Climbing Ivy. Shrub cl.

§2 Leaves compound; leaflets divided to the top of the petiole, digitately or palmately disposed.

32 H. ferruginea (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 7, petiolate, oblong, acuminate and cuspidate, rounded at the base, quite entire, coriaceous, glabrous above, but clothed with fine tomentum beneath; when young clothed with rusty wool; racemes panicked; heads somewhat elliptically globose. \( H. \) S. Native of South America, in the province of Quito, between Paramo de Saraguru and Ota, at the altitude of 3600 feet. Aralia ferruginea, H. B. et Kunth, nov. gen. Amer. 5. p. 7. Willd. in Schultes, syst. 6. p. 701.

33 H. Xalapensis (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 5-7, glabrous, shining above, but dotted beneath, lanceolate-oblong, acute, narrowed at the base, and quite entire, rather coriaceous; racemes panicked; heads of flowers nearly globose. \( H. \) G. Native of Mexico, on the mountains near Xalapa, at the altitude of 2000 feet. Aralia Xalapensis, H. B. et Kunth, nov. gen. Amer. 5. p. 8. Aralia digitata, Willd. in Schultes, syst. 6. p. 701. ex Kunth. Petals glabrous. Styles joined in one.
ARALIACEÆ.

34. **Xalaxa Ivy. Tree.**
35. **H. Echinophyllum (Cham. et Schleg. in Linnaea. 5. p. 174.)** leaves membranous, smoothish above, except on the middle nerve, but clothed with lax stellateomentum beneath; floral leaves entire and lobed: lower leaves compound, of 5 nearly cuneate-ovate, acuminate leaflets; heads of flowers globose. ɣ S. Native of Mexico in woods near Hacienda de la Laguna. Middle leaflet a foot long and 7½ inches broad.

**Globe-thistle-like Ivy.** Shrubs.

36. **H. undulatum** (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arborescent, unarmèd; leaves digitate; leaflets 7, radiate, petiolate, elliptic-oblong, acuminate, coriaceous, quite entire, glabrous, glaucous beneath, round at the base; umbels glabrous, racemously panicled. ɣ G. Native of Nipal, at Narain-Hetty, where it is called Cailushi by the natives.

**Tall Ivy.** Tree.

37. **H. subcordatum** (Wall. cat. no. 4916.) stem shrubby; leaves on long petioles, digitate; leaflets 5-6, petiolate, smooth, oblong-lanceolate, acuminate, undulated; paniculate; umbellules few-flowered: lateral ones opposite: terminal ones umbellate. ɣ G. Native of Silhet. Fruit oblong. Reticulated.

**Undulate-leaved Ivy.** Shrubs or trees.

38. **H. esculifolia** (Wall. cat. no. 4913.) stem shrubby; leaves digitate; leaflets 7, obvolute-ovate, acuminate, clothed with rusty pubescence beneath: outer ones the smallest, all serrated; racemes lateral; umbellules pedunculate, many-flowered. ɣ H. Native of Nipal.

**Horsetail-leafed Ivy.** Shrubs or trees.

38. **H. tomentosa** (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arborescent, unarmèd; leaves digitate; leaflets 7-9, petiolate, oblong-lanceolate, acuminate, coriaceous, quite entire, acute at the base, densely clothed with tomentum beneath, as well as the peduncles, petioles, and younger stems; umbellules rising in clusters, pedunculate. ɣ F. Native of Nipal.

**Tomentose Ivy.** Tree.

39. **H. subcordatum** (Wall. cat. no. 4917.) stem shrubby; leaves on long petioles, trifoliolate; leaflets petiolate, membranaceous, ovate, somewhat cordate at the base and acuminate at the apex; panicles numerous; flowers disposed in long slender racemes. ɣ G. Native of Silhet. Flowers small, spreading.

**Subcordate-leaved Ivy.** Shrubs or trees.

40. **H. floribunda** (Wall. cat. no. 4912.) stem beset with short, conical prickles; leaves digitate; leaflets 7, on long petioles, elliptic, acuminate, clothed with rusty tomentum beneath while young; racemes long; umbellules on long peduncles, rusty as well as the rachis. ɣ G. Native of Silhet.

**Bulbed-flowered Ivy.** Shrubs or tree.

41. **H. aculeata** (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arborescent, prickly; leaves digitate; leaflets 7, radiate, elliptic-oblong, acuminate, serrated, puberulous beneath, acute at the base; umbellules tomentose, racemose. ɣ G. Native of Nipal, at Narain-Hetty. Tree tall and thick. Flowers white.

**Prickly Ivy.** Cl. 1820. Tree.

42. **H. teretistalcatra** (Vahl. symb. 3. p. 42.) stem arborescent; leaves petiolate, digitate; leaflets 5-7, radiate, petiolate, elliptic, quite entire; panicule diffuse, terminal; umbellules disposed in racemes. ɣ S. Native of Ceylon, Penang, Silhet, and Nipal, in groves and woods. Arâlia digitata, Roxb. Pepl. 6. Style 1. Fruit angular. Allied to Unìjala of Rheed. Hort. maj. 7. t. 28.

**Torpentine Ivy.** Tree.

43. **H. rugosa** (D. C. prod. 4. p. 267.) stem shrubby, parasitical; leaves digitate; leaflets 5-7, ovate, or oval-oblong, acuminate, obliquely attenuated at the base, quite entire, rugose, clothed with brown stellate tomentum beneath; petiole terminal, very long; flowers racemose. ɣ S. Native of Java, in woods on Mount Gede. Arâlia rugosa, Blum. bijdr. p. 871.

**Wrinkled-leaved Ivy.** Shrubs.

44. **H. simillima** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-6, elliptic-oblong, acuminate, rounded at the base, remotely serrated, reticulate, wrinkled and rather downy from stellate pili beneath; petiole terminal, divaricate; flowers racemose. ɣ S. Native of Java, in woods on the mountains. Allied to H. rugosa. Arâlia simillima, Blum. bijdr. p. 171.

**Very similar Ivy.** Shrubs.

45. **H. aromatica** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-7, elliptic-oblong, acuminate, for the most part obliquely rounded at the base, glabrous; petals corymbose, lateral; flowers umbellate. ɣ S. Native of Java, on Mount Salak and Gede, &c. where it is called Pangang-pag. Arâlia aromatica, Blum. l. c. p. 871.

**Var. ß: leafless, longer, serrated. ɣ ß. Native of Java, on Mount Salak, where it is called Kirengdong. Blum. l. c.

**Aromatic Ivy.** Shrubs.

46. **H. leptocarpa** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 7-9, oblong-lanceolate, long-acuminated, nearly veinless, shining above; racemes crowded, terminal; flowers umbellate. ɣ S. Native of Java, in the higher woods, on the mountains of Barangrang and Tjerimai. Arâlia dispersa, Blum. l. c. p. 872.

**Yellowish Ivy.** Shrubs.

47. **H. dseirolema** (D. C. prod. 4. p. 256.) stem shrubby, climbing; leaves digitate; leaflets 5-7, oblong, acuminate, rounded at the base, sharply serrated, glabrous; raceme terminal, scurvy; flowers umbellate; fruit 2-seeded. ɣ S. Native of Java, on Mount Gede, where it is called Pangang-divaricus. Arâlia lepidola, Blum. bijdr. p. 872. Perhaps a species of Panax.

**Two-seeded Ivy.** Shrubs.

48. **H. glemorula** (D. C. l. c.) stem arborescent, spinescent; leaves digitate; leaflets 5-7, rarely 3, oblong, acuminate, acute at the base, serrulately towards the apex, smoothish; petiole terminal, very long; flowers glomerulate; ovaries 2-seeded. ɣ S. Native of Java, on Mount Gede, where it is called Pangang. Arâlia glemorula, Blum. bijdr. p. 872. Perhaps a species of Panax.

**Glomerulate-flowered Ivy.** Tree.

49. **H. heterophylla** (Wall. cat. no. 4919.) stem shrubby; leaves digitately compound, with the divisions quinate or terminal; leaflets oval-oblong, acuminate, glabrous; umbellules disposed in racemes, many-flowered, with a woolly bractea at the base of each peduncle; rachis woolly. ɣ S. Native of Penang. Fruit angular.

**Variable-leaved Ivy.** Tree or shrubs.

§ 3. **Leaves compound, pinnate.**

50. **H. paraëtica** (D. Don, prod. fl. nep. p. 188.) stems rooting, parasitical; leaves pinnate; with 5, elliptic, acute, quite entire, nearly sessile, coriaceous, glabrous leaflets, which are glaucous beneath; umbels glabrous, racemose. ɣ G. Native of Nipal, at Narain-Hetty. Arâlia parasitica, Hamilt. miss.

**Parasitical Ivy.** Shrub climbing and rooting.

51. **H. glaucà** (Wall. cat. no. 4921.) stem shrubby, much branched; leaves pinnate; leaflets 5, elliptic-lanceolate, acuminate, glaucous beneath, glabrous; umbellules terminal, solitary or twin, many-flowered. ɣ G. Native of Nipal, at Kamaon. Style simply.

**Glaucescent-leaved Ivy.** Shrubs.

52. **H. jackià**; leaves pinnate; with many pairs of opposite, oblong-lanceolate, petiolate, quite entire, smooth leaflets, which are oblique at the base; rachis jointed; umbels composed...

Cult. All the species of Ivy are of easy culture. The common ivy and its varieties only require to have slips of them planted where they are intended to remain; or to be grown in pots until they are the size required, and then finally planted out: the other hardy species should be treated in a similar manner. The greenhouse and stove kinds will grow in almost any kind of soil, but the lighter the better; and cuttings of them are easily rooted under a hand-glass.

XII. PARATROPIA (σαράπερνεν, paratropo, a bending or crooking; the petioles are knobbed and bent). D. C. prod. 4. p. 265.—Arália, sect. 3. Paratropia, Blum. bijdr. p. 875.

Lin. syst. Pentándria, Monogynía. All as in Arália or Hedera, but differs in the stigmas being sessile, at first approximate, and immersed in an epigynous disk. Shrubs or trees. Leaves compound. Flowers panicked or racemose.

1 P. nodosa (D. C. prod. 4. p. 265.) stem arborescent; leaves impari-pinnate; with many pairs of leaflets; leaflets on short petioles, crenated, glabrous: lower ones roundish-ovate, the rest oblong; panicle terminal, very long. \(\phi\). S. Native of Java, in woods on the mountains in the western provinces, where it is called Kilanget. Arália nodosa, Blum. l. c. Common petioles 5-6 feet long, bent, articulated when dried. Panicle 4-5 feet long. Flowers pendentuous. Nodose-petioled Paratropia. Tree.

2 P. pergamæca (D. C. prod. 4. p. 266.) stem shrubby, parasitical; leaves digitate; leaflets 6-12, oval, acute, rounded at the base, in substance like parchment, glabrous; racemes crowded, terminal, scurfy; flowers subfasciculate. \(\phi\). S. Native of Java, on the higher declivities of Mount Gede. Arália pergamæca, Blum. bijdr. 875. Parchment-leaved Paratropia. Shrub.

3 P. kónda (D. C. l. c.) stem arborescent; leaves digitate; leaflets 6-12, oblong, acute, bluish at the base, and acutish at the apex, in substance like parchment, glabrous; racemes crowded, terminal, divaricate, rather scurfy; flowers umbellate, ovoid-capsulate. \(\phi\). S. Native of the western parts of Java, in woods on the mountains, where it is called Songa-Poana. Arália rigida, Blum. l. c. Var. \(\beta\); racemes incurved, densely clothed with scurf. \(\phi\). S. Native of Java, in the province of Bantam, where it is called Tulak-Tangol. Blum. l. c. Stiff Paratropia. Tree.

4 P. longifóliá (D. C. l. c.) stem arborescent, scandent; leaves digitate: leaflets 9-11, rather large, oblong, acute, rounded at the base, glabrous; racemes crowded, densely clothed with tomentum, terminal, straight; flowers umbellate, with 7-9 stamens. \(\phi\). S. Native of Java, in mountain woods, where it is called, along with many other Araliaceous plants, Ramo-gil ing. Sciodendrimum longifólium, Blum. bijdr. p. 876. Long-leaved Paratropia. Shrub cl.

5 P. Canto nénsis (Hook. et Arn. in Beech. voy. pt. bot. 189.) stem arborescent; leaves on long petioles, digitate: leaflets 5-9, elliptic, acutish at the base, acuminate at the apex, rather coriaceous, glabrous; racemes terminal, furfuraceous; flowers in fascicles, decandrous; stigma sessile, 10-cleft. \(\phi\). G. Native of China, about Canton. Arália octophylla var. Canto nénsis, Lour. coch. p. 187. This species comes very near P. pergamæca. Canton Paratropia. Tree 10 feet.

Cult. Any light soil will suit the species of Paratropia; and cuttings of them will be easily rooted under a hand-glass in heat.

XIII. ARTHROPHYLLUM (from ἀρθρός, arthon, a joint, and φύλον, phyllon, a leaf; in reference to the jointed petals). Blum. bijdr. p. 878. D. C. prod. 4. p. 266.

2 A. diversi-fólium (Blum. l. c.) leaves impari-pinnate, terminate or bipinnate; leaflets oblong, somewhat acuminate, oblique at the base, membranous. \(\phi\). S. Native of Java, in woods, on Mount Salak. Diverse-leaved Arthrophyllum. Tree.

3 A. ellipti-foleum (Blum. l. c.) leaves bipinnate: leaflets elliptico-oblong, acute, oblique at the base, coriaceous. \(\phi\). S. Native of Java, in mountain woods. Elliptico-leafletted Arthrophyllum. Shrub or tree.

Cult. See Paratropia above for culture and propagation.

Order CXXV. HAMAMELIDÆ (plants agreeing with Hamamelis in important characters). R. Br. desc. pl. chin. 1818. p. 3. Adr. Juss. dict. class 8. p. 28. Sweet. hort. brit. 371. D. C. prod. 4. p. 267.—Pet. Th. veg. austr. ed. 2. p. 31. Tube of calyx adhering to the ovarium more or less, 4-lobed (f. 69. a. g.) or repandly toothed. Petals 4 (f. 69. c. i.), linear, elongated, inserted in the calyx, alternating with the calyceine lobes, involutely valvate in restoration: rarely wanting, but probably sometimes changed into stamina. Stamens inserted with the petals, and double their number (f. 69. b.); those alternating with the petals are fertile, and those opposite the petals are sterile and destitute of anthers (f. 69. g.); filaments all short. Fertile anthers inserted by the base, 2-celled, dehiscing in various ways. Ovarium adnate at the base, 2-celled: cells 1-seeded; ovula pendulous. Styles 2 (f. 69. c), very rarely 3. Capsule adnate at the base to the permanent tube of the calyx, 2-celled, 2-valved; valves bifid at the apex. Seed pendulous, with a superior hyalum. Albumen corneous. Embryo straight, slender, with a superior radicle; and foliaceous flat cotyledons, or having their margins rather involute.—Shrubs. Leaves alternate, bipinulate, petiolate, feather-nerved, entire or sinually toothed. Flowers axillary, nearly sessile, in fascicles, usually bracteate, sometimes dioecious or polygamous.

Many of the genera of this order were formerly placed among the Berberidæ and Amentiæceae, but were constituted a distinct order by R. Brown in 1818; but the place which it should hold in the natural system is still doubtful. According to R. Brown, it is intermediate between Bruniæceae and Mâlæae*, (a genus which should have been placed in Alangiæceae, vol. ii. p. 806. But according to Pet. Thouars, it comes nearest to Rhénæceae, and according to Juss. to Haloragiæae. But afterwards it was
placed by R. Brown and Pet. Thouars near Araliaceae and Cornaceae. The order differs from Alangiaceae in the fruit being capsular, not baccate; and from Bruniaceae in the parts of the flowers being quaternary, in the stamens being double the number of the petals, in the insertion and dehiscence of the anthers, and in the cells of the ovary being 1-seeded, &c.; it differs from Araliaceae and Cornaceae in the fruit being capsular, in the number of the parts of the flower, and in the structure of the anthers; and from Amentaceae in the flowers of most of the genera being complete; but the genus Fothergilla agrees with Amentaceae in habit, and in the want of petals; but perhaps in this genus the outer series of the stamens represent the petals.

Lin. syst. Octandria, Monogynia. Tube of calyx adnate to the ovary: limb short, bluntly 6-8-toothed. Petals 6-8, linear, alternating with the teeth of the calyx. Stamens 8, adnate to the epigynous disk, and inserted at the top of the calyx; anthers long, linear. Ovarium 2-celled, biovulate. Style short; stigma 4-toothed. Drupe oval, rather fleshy, umbilicate from the teeth of the calyx: containing a 2-celled nucleus. Seed compressed. Albumen fleshy. Embryo with a superior radicle and flat cotyledons.—A small Asiatic tree. Leaves alternate, exstipulate, petiolate, unequally cordate, acuminate, entire, glabrous, except the nerves on the under side. Flowers on axillary peduncles, somewhat corymbose, whitish or yellowish.

1. *Begonia-leaved Marlea.* Fl. June, July. Cht. 1824. Shrub 5 to 6 feet. Cult. This shrub is easily increased by cuttings in sand under a hand-glass. The soil best adapted for it is a mixture of sandy loam, and peat.

**Synopsis of the genera.**

**Tribe I.**

**Hamamelidæ.** Petals 4 (f. 69. c.), Stamens 8, 4 fertile (f. 69. b.), and 4 sterile (f. 69. g.). Anthers dehiscing by a valve.

1. **Hamamelis.** Calyx 4-lobed, furnished with 3-4 scales on the outside. Ovarium ending in 2-3 styles at the apex (f. 69. l.). Capsule coriaceous, 2-celled (f. 69. c.).

2. **Dicoryphæ.** Calyx 4-lobed. Styles 2. Fruit inclosed in the circumcised calyx, umbilicate at the apex, 2-horned, 2-seeded.

**Tribe II.**

**Fothergillæ.** Petals wanting. Stamens 24, all fertile. Anthers opening by a semicircular chink at the margin.

**Hamamelidæ.** (shrubs agreeing with the genus Hamamelis in important characters). D. C. prod. 4. p. 268. Petals 4. Stamens 8, 4 of which are sterile. Anthers dehiscing by a valve.

1. **Hamamelis (ομοφυλακ, homonelis, a name under which Atheneæus speaks of a fruit resembling an apple; it comes from ομος, omos, like, and μυκης, meleas, an apple-tree; but the present genus is not in any way analogous to the apple).** Lin. gen. no. 169. Juss. gen. p. 288. Lam. ill. t. 88. f. 1. D. C. prod. 4. p. 268.—Triilopus, Milh. act. acad. nat. cur. 8. appendix.

Lin. syst. Tetradria, Digynia. Calyx 4-lobed, adhering to the ovary at the base, furnished with 2-3 scales on the outside. Petals 4 (f. 69. a), long, tongue-shaped, alternating with the teeth of the calyx (f. 69. c). The 4 stamens alternating with the petals, fertile (f. 69. b), with very short filaments: adnate 2-celled anthers; the cells opening by a vertical valve. The 4 sterile stamens (f. 69. g) with very thick filaments and round anthers, one in front of each petal. Ovarium free at the apex, ending in 2 (f. 69. l), rarely in 3 short styles. Capsule coriaceous, half free, 2-celled, 2-valved at the apex; valves biform. Arils 2 in each capsule, coriaceous, 1-seeded, opening by 2 elastic valves above. Seed oblong, shining, with a superior hyalum; albumen fleshy. Embryo with a superior radicle and flat cotyledons.—Small American or Asiatic trees. Leaves alternate, on short petioles, bistipulate, ovate or cuneate, feather-nerved, nearly entire. Flowers nearly sessile, disposed in clusters in the axils of the leaves, girded by a 3-leaved involucrem. Petals yellow.

1. **Hamamelis Virginica** (Lin. syst. nat. p. 535.) leaves obovate, acutely toothed, with a small coriaceous receptacle at the base. 2. **H.** Native of North America, from Canada to Florida, in stony and dry situations, but frequently near water. Mill. ill. t. 10. Duham, arb. 1. t. 114. Schkuhr, handb. t. 27. Lod. bot. cab. 598. Guipp. abb. holzart. t. 75. Rafn. med. bot. 1. t. 45.—Catesb. car. 3. t. 2. This singular shrub, which grows about 10 or 12 feet high, begins to show its yellow flowers in autumn, when all others have dropped their leaves, continues to flower all winter, and forms its fruit the spring following. The flowers are either polygamous, varying to dioecious, monococious, and androgynous; hence the names of Hamamelis dioica, monoica, and androgyna; Wilt. car. 255. The Indians consider this tree as a valuable article in their Materia Medica. They apply the bark, which is sedative and discutient, to painful tumours and external inflammations. A cataplasm of the inner rind is found to be very efficacious in removing painful inflammations of the eyes.

Var. 3. **parisfolia** (Nutt. gen. amer. p. 107.) leaves smaller, oblong-obovate, upper part undulate and grossly crenated: the under side pubescent, rather hairy; segments of the calyx oblong; stamens and perigynous filaments often nearly equal. 3. **H.** From the mountains of Pennsylvania.

2. **H. macrophylla** (Pursh. fl. sept. amer. p. 116.) leaves nearly orbicular, cordate, coarsely and bluntly toothed, sebaceous from dots beneath. 3. **H.** Native of North America, in the
western part of Georgia; and of North Carolina, on the Catawba Mountains. The large leaves punctuated on their under side, with rough tuberules and other marks, give sufficient reason for considering it a distinct species.

**Large-leaved Witch-hazel.** Fl. May, Nov. Ct. 1812. Shrub 10 to 12 feet.

3 **H. Pea'sca** (D. C. prod. 4. p. 268.) leaves oval, acuminate, reeledly toothed above, cuneated at the base, equal. H. Native of Persia, in the province of Lenkeran, where it was collected by Hansen. Adult leaves rather scabrous on the nerves and petioles; the rest glabrous. Flowers unknown. Fruit a little smaller than that of *H. Virginica*, but similar.

**Persian Witch-hazel.** Shrub 10 to 12 feet.

4 **H. Carposus** (R. Br. descrip. pl. clin. 1818. p. 4. with a figure.) leaves ovate, quite entire, unequal at the base, grey on both surfaces from stellate hairs. H. Native of China, near Nankin, and in the island of Cheusan.—Pluk. amalith. 32. t. 368. f. 2. Petals linear, 3-nerved, very much elongated. Anthers with decisional valves; hence it is proposed by R. Br. to form it into a distinct section under the name of *Loropetalum*.

**China Witch-hazel.** Shrub 6 to 10 feet.

**Cult.** The species of Witch-hazel are well adapted for shrubbery; they will grow in any common soil, and are increased by layers or suckers.

**Lin. syst. Tetrandria, Dicygnia.** Tube of calyx oblong, hairy, adhering to the ovary: limb 4-lobed, circumscribed after flowering. Petals 4, inserted in the upper part of the tube of the calyx, joined to the filaments at the base. Stamens 4, fertile, alternating with the petals: filaments broad at the base: anthers oblong, adnate, erect, dehiscing at the sides; and 4 sterile smaller stamens alternating with the first named ones. Styles 2. Pericarp inclosed in the circumscribed calyx, umbilicate at the apex, and 2-horned, inclosing 2 1-seeded coriaceous coccule, which open at the apex. Seed ovate, hanging from the top. Albumen fleshy. Embryo with a superior radicle: and flat cotyledons, having revolute edges.—A small shrub, with twiggly weak branches. Leaves alternate, on short petioles, oblong, feather-nerved, entire, furnished with 2 unequal broad foliaceous stipules at the base. Corymbs terminal, somewhat fasciculate, 7-8-flowered.

**Stipulate-leaved Dictoryphe.** Shrub.

**Cult.** A mixture of sand, loam, and peat will be a good soil for this plant; and young cuttings will strike root in sand under a hand-glass, in heat.

III. **TRICHOCLADUS** (from θρίς, thrizhos, a hair, and κλάδος, klados, a branch; the branches are clothed with stellate hairs.) Pers. ench. 2. p. 597. D. C. prod. 4. p. 269.—Dählia, Thunb. diss. (1792) and in edit. Gcott. 1. p. 108. act. soc. hist. nat. hafn. 2. vol. 1. p. 133. t. 4. but not of Cav. 1791.

Style 1. Capsule ovate, 4-valved, 4-celled. Staminodes, (seed, heads) ovate, glabrous, villous from stellate dots. Leaves opposite, petiolate, ovate, acuminated, entire. Flowers in terminal heads, crowded on a common receptacle. The character is taken from the description of the tree by Thunberg.

1 **T. crassus** (Pers. l. c.) H. Native of the Cape of Good Hope; in the woods of Hout*ui*zak. Dahlia crinata, Thunb. il. cc. et fl. exp. 1. The shrub has the resemblance of a species of *Crotone*.

**Hairy Trichocladus.** Ct. 1823. Shrub 4 to 8 feet.

**Cult.** A mixture of loam and sand is a good soil for this shrub; and young cuttings will root readily in sand under a hand-glass.

**Tribe II.**

**FOTHERGILLA** (this tribe only contains the genus *Fothergilla*.) D. C. prod. 4. p. 269. Petals wanting. Stamens 24, all fertile; anthers dehiscing by a chink. This tribe is intermediate between *Hamamelidae* and *Amenitàceae* from habit.

**IV. FOTHERGILLA** (in memory of John Fothergill, M.D. an eminent physician, and patron of botany; who cultivated a variety of most curious plants in his garden near London.) Lin. fil. suppl. p. 42. Lam. ill. t. 480. Juss. gen. 408. but not of Aublet. D. C. prod. 4. p. 269.

**Lin. syst. Icosandria, Digynia.** Calyx campanulate, adhering to the ovary at the base, somewhat truncate, with 5-7 callose subruptile teeth. Petals wanting. Stamens about 25, inserted in the calyx, club-shaped, exserted; anthers terminal, of the form of a horse shoe, opening by a semi-circular chink at the margin. Ovary 2-celled, 2-ovulate. Styles 2, filiform. Capsule adnate to the base of the calyx, 2-lobed, 2-celled; cells 2-valved at the apex, 1-seeded. Seed bony, pendulous, with a superior hydnum.—A shrub, with alternate, ovobate, feather-nerved, bis-tipulate leaves, clothed with soft starchy down; and terminal ovate spikes of flowers, having a solitary bractea under each flower; those bracteas at the base of the spike are trifid, and those at its apex are nearly entire. Flowers white, sweet-scented, sessile. Anthers yellow.

**Var. a, obtusa** (Sims, bot. mag. 1841. Mill. fig. t. 1.) leaves obovate, crenate at the top, when young clothed with fascicles of down beneath. F. mayor, Lodd. bot. cab. t. 1580. (f. 70.)

**Var. c, acuta** (Sims, l. c.) leaves ovate-oblong, somewhat cordate at the base, very blunt and serrated at the apex, sometimes with an acumen; when young tomentose beneath.

**Var. c, serótina** (Sims, l. c.) leaves oblong, acute, crenately toothed at the top, green beneath.

**Alder-leaved Fothergilla.** Fl. April, May. Ct. 1765. Shrub 3 to 6 feet.
CORNEÆ.

Cult. All the varieties of this shrub are very handsome while in flower and leaf, and are therefore proper for shrubberies. A peat or vegetable soil answers them best; and they may either be increased by layers put down in spring or autumn, or by seed, which is annually received from America.

ORDER CXXVI. CORNEÆ (this order contains plants agreeing with Cornus in important characters). D. C. prod. 4. p. 271.
—Caprifoliaceæ Cornææ, Kunth, nov. gen. amer. 3. p. 430.—
Genera of Caprifoliaceæ, Juss.
Calyx having the tube adnate to the ovary; and the limb superior and 4-lobed (f. 71. c). Petals 4, oblong, broad at the base, inserted in the upper part of the tube of the calyx, regular, valvate in aestivation. Stamens 4, inserted with the petals, and alternating with them; anthers ovate-oblong, 2-celled. Style filiform; stigma simple. Drupe baccate, crowned by the vestiges of the calyx, containing a 2-celled nucleus. Seed pendulous, solitary in the cells. Albumen fleshy. Embryo with a superior radicle, which is shorter than the two oblong cotyledons.—Trees and shrubs, rarely herbs. Leaves of all opposite, except in one species of the genus Cornus, entire or toothed, feather-nerved. Flowers capitate, umbellate or corymbose, naked or involucrated, rarely dioecious from abortion. Flesh or pulp of fruit edible.

This order agrees with Hamamelidaceæ, and Caprifoliaceæ, tribe Sambúaceæ; but differs from the first in the aestivation of the petals being truly valvate; in the stamens not being double the number of the petals; in the style being simple, not double; in the fruit being drupaceous, not capsular; and in the albumen being fleshy, not horny, &c. From Sambúaceæ it differs in the corolla being polypetalous, not gamopetalous; in the parts of the flower being quaternary, not quinary; in the style being exserted, not wanting; in the stigmas being 2, not 3, and in the fruit being drupaceous, not baccate, &c. Cornus differs from Loranthidaceæ in the stamens alternating with the petals, not opposite them.

All the genera of this order have more or less astringent bark; that of Cornus flórida is used in North America in intermittent fevers, as is also that of Cornus sericææ, which, according to Bar-ton, is scarcely inferior to quinina.

Synopsis of the genera.

1 Cornus. Limb of calyx 4-toothed (f. 71. c). Drupe baccate, marked by the vestiges of the calyx, containing a 2-celled, rarely 3-celled nucleus.

2 Votomi'ta. Tube of calyx turbinate; limb 4-toothed. Anthers approximating into a tube, and terminated by a thin membrane. Stigmas 4, oblong. Drupe crowned by the calyx, 1-celled.

3 Mastixia. Limb of calyx 4-5-toothed. Stamens 4-5; anthers didymous. Style short, girded by a disk; stigma obtuse. Drupe umbilicate, containing a 1-seeded nucleus.

I. Corneus. (from cornu, a horn; the wood being thought to be as hard and as durable as horn. Its value as a material for warlike instruments has been celebrated by Virgil.—Bona bello corneus). Tourn. inst. 641. t. 410. Lin. gen. no. 149. Gartn. fruct. t. 20. D. C. prod. 4. p. 271.

§ 1. Nudiflóreæ (from nudus, naked, and flos, a flower; in allusion to the flowers being exinvolutae). D. C. prod. 4. p. 271. Flowers corymbose or panicked, exinvolucrate.

* Leaves alternate.

1 C. alternifolium (Lin. fil. suppl. p. 125.) leaves alternate, ovate, acute, hoary beneath; corynbs depressed, spreading; branches wanting. ß. H. Native of North America, from Canada to Carolina, in shady woods on river banks. Lher. corn. no. 11. Guimp. abb. holz. t. 43. Schmidt. arb. 2. t. 70. C. alternæ, Marsh. Berries purple, globose, about the size of a grain of pepper. Leaves on long petioles. Branches green or reddish-brown.

Alternate-leaved Dogwood. Fl. May, July. Cl. 1760. Tree 15 to 20 feet.

* * Leaves opposite.

2 C. paniculata (Lher. corn. no. 10. t. 5.) branches erect; leaves ovate, acuminate, glabrous, hoary beneath; corynbs thyrsoid; ovarian silky. ß. H. Native of North America, from Canada to Carolina, rare, in swamps and near rivulets among other bushes. Schmidt. arb. 2. t. 08. C. racemosa, Lam. dict. 2. p. 116. C. flémissa, Mill. dict. no. 4. C. citrifólia, Hort. par. Branches pale-purplish. Berries roundish, depressed, watery, white, 3 lines in diameter. The dots on the under side of the leaves, which are only seen through a lens, bear bicuspidate short adpressed hairs. Tube of calyx pubescent.

V. ß. rúbidæ (Ehrh. beitr. 4. p. 16.) leaves elliptic-lanceolate.

V. γ. rúdidiæ (Pursh. fl. amer. sept. 1. p. 109.) racemes sterile, foliiferous.

3 C. tolúca (H. B. et Kunth, nov. gen. amer. 3. p. 430.) branches dichotomous, spreading; leaves ovate-oblong, narrowly acuminate, puberulous on both surfaces, paler beneath; cymes lateral, naked. ß. H. Native of Mexico, on the higher plains about the city of Tolucca. Very like C. paniculata. Compare Cham. ct Schlecht. in Linneæ. 5. p. 171. in which place is a species described which was found about Jalapa, and which is probably referrible to the present plant.

Tolucca Dogwood. Tree or shrub.

4 C. obéngæ (Wall. in Roxb. fl. ind. 1. p. 432.) leaves oblong, acuminate, acute at the base, glaucous and rather scabrous beneath, with many excised glandular on the axils of the ribs and nerves; corynbs spreading, panicked. ß. H. Native of Nipaul, about Narainhetty, Kaimandu, and the valley of Dhooon. C. paniculata, Hamilt. ex D. Don, prod. fl. nep. p. 140. Young shoots clothed with short adpressed hair. Leaves 4-6 inches
long, and 1 to 1 1/2 inch broad; petioles about an inch long. Flowers white or pale-purplish, fragrant. Calyx clothed with adpressed silvery hairs, as well as the pedicels and petals. Drupes ovate-oblong. Ovarium 3-celled.

Oblong-leaved Dogwood. Clt. 1818. Tree 10 to 15 feet.

5 C. stric'ta (Lam. dict. 3. p. 116.) branches straight, fastigate; leaves ovate, acuminated, glabrous, green on both surfaces, when young hardly pubescent beneath; corymbs convex, somewhat panicled. H. H. Native of North America, from Carolina to Canada, on the banks of rivers, frequent; also of Mexico, between Tampico and Real del Monte. Lher. corn. no. 9. t. 4. Schmidt, arb. 2. t. 67. C. fastigiata, Michx. fl. bor. amer. 1. p. 92. C. sanguinea, Walt. but not of Lin. C. cyanocarpus, Genel. syst. veg. 1. p. 257. C. Canadensis, Hort. par. C. caerulea, Meeth. icon. 3. but not of Lam. Branches reddish-brown. Anthers blue. Berries globose, soft, blue on the outside, but white inside.

Var. β, variegata; leaves variegated with white or yellow.

6 C. sanguinea (Lin. spec. p. 171.) branches straight; leaves ovate, acute, smooth and green on both surfaces; corymb flat. H. H. Native of Europe and the north of Africa, in hedges and thickets, especially on a chalk and limestone soil, common; plentiful in Britain in like situations. It is also said to grow in North America near the Lakes of Canada and New York, but has probably been introduced there. Smith, engl. bot. t. 249. Fl. dan. 481.—Dubham. arb. 1. t. 78. C. femina, Rai, syn. 460. Ger. emac. 1467. with a figure. Virga sanguinea, Matth. valgr. 1. p. 236. with a figure. Cam. epist. 159. with a figure. Branches of a dark-red when fully grown. Leaves 2-3 inches long. Flowers greenish-white, unpleasantly scented; petals brown at the sides. Fruit dark-purple, very bitter. Matthioli records that the fruit was obtained from the berries by pressure, after they have first been boiled, which is used for lamps in the country near Trent. The shrub, after a smothered combustion, affords a charcoal, esteemed the best for entering into the composition of gunpowder. It has a variety of names in different parts of the kingdom, as female cornel, dogberry-tree, hound's-tree, prickwood, from its use in making skewers, gater or gaten-tree, gater or gater-tree. The wood was formerly made use of for cart timber and rustic instruments, &c. Mr. Miller informs us, that in his time the fruit was often brought to the markets, and sold for those of lucktchors.

Bloody-branched Dogwood or Wild Cornelian. Fl. June, Britain. Shrub 4 to 5 feet.

7 C. P'urshii; branches straight; leaves ovate, green on both surfaces, and pubescent; corymb spreading. H. H. Native of North America, near the lakes of Canada and New York. C. sanguinea, Pursh, fl. amer. sept. 1. p. 109. Schmidt, arb. 2. t. 66. Flowers with yellow anthers. Berries dark-brown. This differs from the C. sanguinea of Europe in the leaves being pubescent, and in stature.

Pursh's Dogwood or Cornelian. Fl. June, July. Sh. 8 to 12 ft.

8 C. xece'lla (H. B. et Kunth, nov. gen. amer. 3. p. 430.) branches spreading; branchlets pubescent; leaves ovate, acuminated, pubescent and pale beneath, and with minute scattered pili above; cymes naked, spreading. H. H. Native about the city of Mexico. Allied to C. sanguinea.

Tall Dogwood. Tree.

9 C. Al'ba (Linn. mant. p. 40.) branches recurved; branchlets glabrous; leaves ovate, acute, pubescent, hoary beneath; corymbs depressed. H. H. Native of Siberia, at the rivers Obly and Iristsch, among bushes, &c.; North America, from Virginia to Canada, on the banks of rivers and lakes; and of North California. Pall. fl. ross. 1. t. 94. C. stolonifera, Michx.

fl. bor. amer. 1. p. 109. C. sibırica, Lodd. C. Tatárica, Mill. fig. 104.—Amm. r. t. 32. Branches of a fine red colour. Berries white or bluish-white.

Var. β, circinátta; leaves larger, more hairy beneath. H. H. Native throughout Canada, and from Lake Huron to north lat. 69°, Newfoundland, and the north-west coast of America. C. circinátta, Cham. et Schlecht. in Linneáa. 3. p. 159. The berries are lead-coloured according to Dr. Richardson, who further says, they are named by the Creees musquameena, because the bears fatten upon them, and meethkun-peemeneatik and mecanin (red stick berry), and that penguins are fond of them.

Var. β, oblongifólia (D. C. prod. 4. p. 272.) leaves oblong, glabrous above. H. H. C. oblongifólia, Rafin. in litt.

Silky Dogwood. Fl. June, July. Clt. 1683. Shrub to 5 or 8 feet.

11 C. cirrin'áta (L'Her. corn. p. 7. no. 8. t. 3.) branches warty; leaves broadly oval, acuminated, clothed with hoary tomentum beneath; corymbs depressed, spreading. H. H. Native of North America, from Canada to Virginia, on the banks of rivers, and probably of California, ex Cham. and Schlecht. in Linneáa. 3. p. 139. Schmidt, arb. 2. t. 69. C. tomentósa, Michx. fl. bor. amer. 1. p. 91. C. rugósa, Lam. dict. 2. p. 115. C. Virginíkana, Hort. par. Branches slightly tinged with red. Leaves broad, waved on their edges. Flowers white as in most of the species. Berries globose, at first blue, but at length becoming white.

12 C. macróphy'lla (Wall. in Roxb. fl. ind. 1. p. 433.) branches smooth; leaves broad-ovate, acuminated, rounded at the base, smooth, glaucous and soft beneath, with the axils slightly glandular; corymb umbellate; flowers racemose along the branches of the corymb, and secund. H. H. Native of Nipaul, near Saharumpore and Siringat, and at Kamaon. Leaves with adpressed bristles, 6 inches long, and 4 inches broad, pale beneath; the bristles fixed by the centre, and therefore bicuspitate, but are only to be seen through a lens. Ovarium hairy. Berries round, smooth, about the size of a grain of black pepper.

Long-leaved Dogwood. Shrub.

§ 2. Involúcrites (from involucra, an involucre; the heads of flowers are surrounded by an involucre). D. C. prod. 4. p. 273. Flowers disposed in heads (f. 71. b.) or umbels, surrounded by coloured involucre, which are usually composed of 4 leaves (f. 71. a.).

* Trees, with white capitate flowers.

13 C. capita'ta (Wall. in Roxb. fl. ind. 1. p. 434.) branches
spreading, smooth; leaves lanceolate, acuminate at both ends, on short petioles, rather rough from small adpressed down; flowers sessile, densely aggregate, forming a round head, girded by a 4-leaved scabrous involucrum. \( \text{C.} \). Native of Nipaul, in Gosaingsthan, where the tree is called *chungra*; and about Serampore, where it is called *Bhumoro*; and between Sutley and Jumna. D. Don, prod. fl. nep. 141. Leaves coriaceous, 2 inches long, glaucous and pale beneath: with sometimes pink-coloured nerves, having each a minute gland in their axis. Heads of flowers about the size of a moderate-sized cherry, supported by a club-shaped peduncle, which widens at the upper end into a convex ligneous receptacle for the reception of the flowers. Involucrum yellow, of 4 obovate leaves. 

**Capitate-flowered Dogwood.** Tree 10 to 15 feet. 

14 **C. disciflora** (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 4. p. 273.) branches smooth; leaves lanceolate, acuminate at both ends, on short petioles; flowers nearly sessile, disposed in capitate umbels; leaves of involucrum joined together into a roundish 4-lobed disk. \( \text{C.} \). Native of Mexico, near Jalapa, where it was collected by Berlandier, Deppe, and Schiede. C. grándis, Cham. et Schlecht. in Linnaea. 5. p. 171. Flowers white, many sterile. Fruit ovate. Perhaps C. polygama, Rafin. fl. Ind. p. 78.?

**Disk-flowered Dogwood.** Tree. 

**Japan Dogwood.** Shrub 5 to 6 feet. 

**Trees, with yellow umbellate flowers.** 

16 **C. ma's** (Lin. spec. 172.) branches smoothish; leaves oval, acuminate, rather pubescent on both surfaces; flowers arising before the leaves; umbels about equal in length to the 4-leaved involucre; fruit elliptic. \( \text{C.} \). Native throughout Europe, Britain excepted, and in the north of Asia, in hedges, and among bushes; as in France, Russia, Germany, Switzerland, Austria, Carniola, Piedmont, &c. Blackw. t. 121. Plench. icon. t. 64. C. maseula, L'Her. corn. no. 4. Guimp. abb. t. 2. Hayne, term. bot. t. 35. Fl. gruec. t. 151. Schmidt, arb. 2. t. 63. Lam. ill. t. 74. f. 1. Knip, cent. t. 18. Flowers yellow. Fruit elliptic, of a high shining scarlet color, the size and form of a small olive or acorn, very styptic in its immature state. The Cornelian cherry is very common in plantations of shrubs. If the season be mild, the flowers will come out in the beginning of February; and though there be no great beauty in them, yet they are produced in plenty at a season when few other flowers appear. Formerly it was cultivated for the fruit, which was used to make tarts, and a rob de cornis was kept in the shops. The fruit is gratefully acid, and is called sorbet by the Turks. Cornel, says Evelyn, grows with us of a good bulk and stature, and is exceedingly commended for its durability in wheelwork, pins, and wedges, in which it lasts like the hardest iron. 

**Var. \( \beta \):** fruit yellow or yellowish. Duham. arb. 1. p. 182. This variety is to be found but very rare in the gardens.

**Var. \( \gamma \):** coriáta; leaves edged with white or yellow.

**Male Cornel or Cornelín-cherry.** Fl. Feb. April. Cilt. 1596. Shrubs 10 to 15 feet.

17 **C. florída** (Lin. spec. 1661.) branches shining; leaves ovate, acuminate, pale beneath, beset with adpressed pili on both surfaces; flowers umbellate, rising after the leaves; leaves of involucrum large, roundish, retuse or nearly obcordate; drupes ovate. \( \text{C.} \). Native of North America, from Carolina to Canada, in woods, common; and on the banks of the Columbia near its confluence with the sea. L'Her. corn. no. 3. Curt. bot. mag. t. 520. Catesb. car. t. 27. Bigel. med. bot. 2. t. 28. Guimp. abb. holz. t. 39. Rafin. med. bot. t. 28. Schmidt, arb. 2. t. 52. Wang. beytr. 1. t. 17. f. 41. This is a beautiful small tree. Leaves of involucrum white. Flowers greenish-yellow. Berries scarlet, about half the size of those of *C. máscula*, ripe in August. The wood is extremely hard, and of a very fine texture. The bark is extremely bitter, and is used in North America for the cure of remittent and intermittent fevers; and is considered not inferior to Peruvian bark. The young branches stripped of their bark, and rubbed with their ends against the teeth, render them extremely white. (Baron, l. p. 51.) From the bark of the more fibrous roots the Indians obtain a good scarlet colour. 

**Flowering Dogwood.** Fl. April, May. Cilt. 1731. Tree 20 to 30 feet.

***Herbaceous plants, with subterranean creeping roots.*** 

**Stems simple, herbaceous.** Flowers white, in umbels.

18 **C. Canadensis** (Lin. spec. 172.) stems simple, herbaceous; upper leaves in whorles, ovate, acuminate, veiny, on short petioles; flowers umbellate, much shorter than the leaves of the involucrum, which are ovate, and acuminate; drupes globose. \( \text{C.} \). Native of North America, on the high mountains, in boggy ground, from New England to Carolina; also of Newfoundland, and the island of Unalaska; throughout Canada nearly to the Arctic coast, every where as far as pine woods extend, &c. L'Her. corn. no. 2. t. 1. Curt. bot. mag. 880. Begel. fl. bost. ed. 1. p. 37. Cham. and Schlecht. in Linnaea. 3. p. 129. Kerner, t. 636. ex Reem. et Schultes, syst. 3. p. 319. Flowers purplish-white; involucre white. Berries red, ripe in July. 

**Habit of *Pàris quadrifflia*.

**Canadian Dogwood.** Fl. May, June. Cilt. 1774. Pl. \( \frac{1}{2} \) ft. 

19 **C. Suecica** (Lin. spec. 172.) stem herbaceous; umbel between two branches, stalked, surrounded by 4 unequal white involucral leaves, tinged with red; leaves opposite, sessile, ovate, almost nerved from the base; drupe globose. \( \text{C.} \). Native of Europe and the north of Asia, Kamtschatka, Aleutian Islands, Greenland, Lapland, Canada, Newfoundland, and Labrador, in moist alpine pastures. In Britain in like situations; on the Chevit hills of Northumberland, abundantly. In the highlands of Scotland, frequent in boggy spots about rivulets. In the Hole of Horcum, near Scarborough. Lin. fl. lapp. ed. 2. p. 38. t. 5. f. 3. Svensk. bot. t. 261. Penn. tour. scot. p. 39. Smith, engl. bot. t. 310.—Öder, fl. dan. t. 5. Sturm, deutschl. fl. with a figure. C. herbacea, Huds. angl. 71.—Dill. edth. 108. t. 91.—Rall, syn. 261. Park. theat. 1461. f. 1. The involucral leaves finally turn green. Flowers dark purple. The berries are red and sweetish, containing a 2-celled nucleus, having the dissepiment between the cells furnished with a large hole; they are supposed by the Highlanders to create an appetite, and hence the Gaelic name, *Lus-a-chraida*, plant of gluttony. 

**Var. \( \beta \):** nearly twice the size of the species. \( \text{C.} \). Native of North America, at Fort Vancouver, on the Columbia.

† Species not sufficiently known.

20 C. ferulacea (Jacq. ex Steud. nom. 227.) or C. ferula-folia, Neeva, syn. pl. p. 38, but is undescribed. Compare Rœm. et Schultes, syst. 3. p. 323.

Fennel-like Dogwood. Shrub.

21 C. latifolia (Bray, in Steud. nom. phan. 227.) this species is undescribed as far as we know.

Broad-leaved Dogwood. Shrub.

Polygamous Dogwood. Shrub 15 feet.

 Cult. All the woody species are desirable for shrubbiers; and many of the kinds will grow under the drip of trees, which renders them valuable for thickening strips of plantations which have become naked below. They are easily increased by cuttings, layering, or by suckers. The C. Suzukiou and C. Canaden-sis should be grown in a border of peat, in a rather shady situation; they are to be increased by dividing when the plants have run considerably at the roots; or they may be planted in pots filled with peat earth, and treated as alpines.

II. VOTOMITA (Votomita is the name of the tree in Guiana). Aubl. guian. 1. p. 90. t. 35. D. C. prod. 4. p. 275.—Glßssoma, Schreib. gen. no. 1728.—Guillenlima, Neck. elem. no. 813. but not of Kuntth.

Lin. syst. Pentandria, Monogynia. Tube of calyx turbinate, adnate to the ovary; limb 4-toothed. Petals 4, oblong, acuminate, spreadingly reflexed. Stamens 4, with very short filaments; anthers oblong, approximate into a tube, terminated by a thin membrane. Style filiform, perforating the tube of the anthers; stigmas 4, oblong. Drupe crowned by the calyx, 1-celled. Seed one striated. — A glabrous shrub, having the branches somewhat quadrangular at the apex. Leaves opposite, sessile, ovate, acuminate, stiff, quite entire, furnished within the base of the petals with 2 deciduous stipulas. Flowers corymbose; corymb terminal, few-flowered. Corolla white. This genus is not sufficiently known, but is allied to Corus from the description.

Guiana Votomita. Shrub 5 to 6 feet.

 Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root readily in sand under a glass-house in heat.

Lin. syst. Tetra-Pentandra, Monogynia. Tube of calyx adnate to the ovary; limb superior, 4-5-toothed. Petals 4-5, ovate, broadest at the base. Stamens 4-5, opposite the calycine teeth. Anthers indolous, bursting inwards. Ovarium containing a pendulous ovulum. Style short, girded by a disk; stigma obtuse. Drupe baccate, umbilicate, containing a 1-seeded nut. Embryo inverted in the albumen.—Tall trees, natives of Java, with oblong acuminate leaves, and corymbose flowers.

1 M. Pentandra (Blum. l. c.) leaves alternate, oblong, quite glabrous; corymb terminal; flowers pentandrous, ʻ. S. Native of Java, on the more elevated woods on Mounts Salak and Burangrang, where it is called by the natives Huru-Lilia.

401

Pentandra Mastixia. Fl. July, Dec. Tree 30 to 50 feet. 2 M. trichotomia (Blum. l. c.) leaves opposite, oblong, puberulous on the under side, as well as the petioles, and the corymbs which are terminal and trichotomous; flowers with a 4-toothed calyx, 4 petals, and 4 stamens. ʻ. S. Native of Java, in woods on the mountains along with the preceding species, where it is called Palaglar burice or Tenpod. Trichotomous-corymbed Mastixia. Tree 50 to 60 feet.

 Cult. For culture and propagation see Votomita above.

Lin. syst. Tetrandria, Monogynia. Tube of calyx adnate to the ovary; limb superior, 4-toothed, permanent. Petals 4, sometimes joined at the base. Stamens 4, free, alternating with the petals; filaments linear, rather membranous; anthers bursting lengthwise inwardly, adnate, 2-celled. Ovarium incompletely 2-celled, many-seeded. Style filiform; stigma truncate, simple. Drupe somewhat baccate, containing a 1-seeded nucleus. Albumen rather horny. Embryo inverted. — Trees and shrubs, native of Java, with opposite exstipulate leaves; and axillary terminal racemes of whitish, very sweet-scented flowers, furnished with 5 bracteoles under each.

1 P. flabellifolium (Blum. l. c.) stem arborescent; leaves oblong, coarsely and deeply serrated at the top. ʻ. S. Native of Java, on the tops of the higher mountains.

Holly-leaved Polyosma. Tree 20 to 30 feet.

2 P. serrulatum (Blum. l. c.) stem shrubby; leaves oblong, slightly serrated. ʻ. S. Native of Java, in woods on Mounts Gede and Pangurango.

Serrulate-leaved Polyosma. Shrub 5 to 6 feet.

3 P. integrifolium (Blum. l. c.) stem arborescent; leaves oblong, quite entire. ʻ. S. Native of Java, in the higher woods on Mount Burangrang.

Entire-leaved Polyosma. Tree 60 feet.

 Cult. See Votomita above for culture and propagation.

Flowers hermaphrodite, or of different sexes (f. 73. a. d.).

Tube of calyx girded at the base by a calyculous, which is adnate to the ovary; limb short, entire, or lobed. Petals 4-5 (f. 73. c), sometimes distinct from each other, sometimes cohering more or less together, valvate in aestivation. Stamens equal in number to the petals, and opposite them; filaments adnate to the corolla, more or less, or wanting; anthers oscillatory, or erect on the tops of the filaments; or when the filaments are deficient or wanting, they are adnate to the lobes of the corolla. Ovarium ovate or turbinate, adnate to the calyx. Style filiform or wanting; stigma capitate. Berry 1-celled (f. 73. a. f.), 1-seeded (f. 73. c), crowned or umbilicate by the calyx (f. 73. b). Tegument membranous, involving the seed. Albumen fleshy. Embryo with a superior radicle, which is thickened or truncate at the apex.—The shrubs contained in this order are almost all parasitical, that is, growing on and deriving their nourishment from other trees; very few of them grow in earth. Leaves opposite, rarely alternate or wanting, coriaceous or more or less fleshy, and always entire. The disposition of the flowers and
the habit of the plants are very variable.—Very few of the plants belonging to this order are cultivatable; they being nearly all genuine parasites, fixed in the bark and wood of trees, on which they grow, and deriving from their juices the whole of their nutriment. The Viscums have little or no beauty, but the other parasitical genera are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the trunks and branches of trees in the tropics, which they often clothe with a beauty not their own. The Mistletoe of the Druids is supposed to have been the Loranthus Europæus, the common Viscum never having been seen upon the oak, while the Loranthus Europæus inhabits no other tree. If this be correct, the latter must have once existed in this country, although now extinct. It has been suggested, that all vestiges of their religion were extirpated with the Druids, which will perhaps account for the Loranthus having disappeared wherever that religion formerly held its sway.

This order is very nearly allied to Caprifoliaceæ, from which it is easily distinguished by the anthers being opposite the lobes of the corolla. A connection is established between this order and Araliaceæ by means of Ascleia. Mr. Brown suggests their relation to Proteaceæ. The germination of Viscum is exceedingly remarkable; it has afforded a subject of some curious experiments upon the vital energies of vegetables. See Du Trochet sur la Motilité, p. 114.

Synopsis of the genera.

TRIBE I. Parasitical shrubs.

1 Viscum. Flowers dioecious (f. 73. b. c.), or monocious. Margin of calyx entire. Petals usually 4 (f. 73. c.), connected at the base in the male flowers, but free in the female. Stamens 4. Stigma obtuse, sessile.

2 Arceuthobium. Flowers dioecious. Male flowers sessile, without a calyx, but with a monopetalous 2-3-4-parted corolla, and the same number of sessile 1-celled anthers, and a gland in place of an ovary. Female flowers pedicellate, with an ovate, fleshy, bidentate calyx, adnate to the ovary, without any corolla, stamens, or style, but with a small obscurely-lobed stigma. Berry ovate-baccate.

4 Loranthus. Flowers dioecious or hermaphrodite. Margin of calyx entire. Petals 5-6, linear, reflexed. Stamens inserted into the middle of the petals; filaments very short. Berry globose, umbilicate by the calyx, immersed in the rachis.

5 Struthanthus. Flowers hermaphrodite, nearly all hexamerous. Margin of calyx truncate. Petals linear, at length revolute. Anthers ovate, fixed near the base or beneath the middle of the petals; filaments very short. Berry ovate-elliptic.

6 Psittacanthus. Flowers hermaphrodite, for the most part hexamerous. Margin of calyx entire, obsolescently 5-6-toothed or repand. Petals linear-spatulate, erect, spreading, for the most part free to the middle. Filaments filiform from the middle of the petals; anthers fixed by the base or back. Berry ovate.

7 Tri'sterix. Flowers hermaphrodite; each furnished with 3 bracteas. Margin of calyx entire. Petals linear-spatulate, or linear, bearing the stamens in the middle; anthers fixed by the back, incumbent. Berry ovate or elliptic.

8 Dendropterygium. Flowers hermaphrodite; each furnished with 1 bractea. Margin of calyx entire or toothed. Petals linear-spatulate, bearing the stamens in the middle; anthers fixed by the base. Berry ovate or elliptic.

9 Pintheria. Flowers hermaphrodite, perhaps always 4-parted; each furnished with 3 or more bracteas. Anthers fixed by the back, ovate. Berry ovate.

10 Sco'runula. Flowers hermaphrodite, tubular, divided into 4-5 short lobes, usually gibbous at the base, and bursting by a longitudinal fissure as in Lobelia. Filaments 4-5, adhering a long way to the corolla; anthers fixed by the base, erect. Style filiform; stigma capitate.

11 Eltryanthus. Flowers hermaphrodite; petals 4-6-8, joined to the middle, forming a regular 4-6-8-eleft limb. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the base, erect. Style filiform. Stigma capitate.

12 Notanthéra. Flowers hermaphrodite. Petals 5-6-8, but usually 6, sometimes almost free, and sometimes joined at the base. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the back, versatile or incumbent. Bracteas concave, 1 under each ovarium, but often wanting.

13 Loxanthéra. Flowers hermaphrodite. Tube of corolla elongated, knedd at the base, but somewhat clavate and oblique at the apex, and 6-lobed; the lobes somewhat spirally twisted. Filaments stiff and curved at the apex, not attenuated but rather dilated, and the anthers are fixed by the back. Style filiform. Stigma clavate.

TRIBE II. Terrestrial shrubs.

14 Schoepfia. Flowers hermaphrodite. Margin of calyx entire. Limb of corolla 5-cleft, rarely 4-6-cleft. Filaments adnate to the tube; anthers ovate-roundish. Drupe containing a 3-celled, 3-seeded nucleus.

TRIBE I. Parasitical shrubs.

1. Viscum (viscus, birdlime, on account of the sticky nature of the berries; called gui, in French; misel in German; visco in Italian; and mistelo in English). Tourn. inst. p. 609. t. fruct. 1. p. 131. t. 27. Lam. ill. t. 807. D. C. prod. 4. p. 277. 380. Lin. gen. no. 1105. D. C. coll. mem. 6. no. 1. Gernt. Lin. syst. Monococcia or Diococcia, Tetrándria. Flowers monoecious or dioecious. Calyx a slight border in the male flowers, but rather a more evident border in the female flowers. Corolla in the male flowers gamopetalous, in 4 deep, ovate, acute equal divisions; in the female flower of 4 ovate, equal, deciduous petals, which are dilated at the base. Anthers in the female flowers none, but in the male flower there are 4 compressed, sessile ones, one on the base of each corolla segment, all over pitted or cellular. Ovary in the female flower inferior, ovate, adnate to the calyx, and crowned by its border. Stigma sessile, obtuse, undivided. Berry globose, smooth, juicy, viscid, of
line-formed on the upper surface. The branches are more likely dichotomous or trichotomous than verticillate.

*Starry Mistletoe.* Shrub parasitical.

3 V. orientale (Wild. spec. 4. p. 737.) branches terete; leaves oblong, obtuse, attenuated at the base, 3-nerved; peduncles axillary, usually 3-flowered. *P.* S. Native of the East Indies (ex Wall.), and of Java, on the mountains (ex Blum. bidr. 606.), and of Palestine upon olive trees, ex Sieb. pl. exciscipal. Leaves 15-18 lines long, but in the Palestine specimens 20-23 lines long. Berries purple, ex Wall. Perhaps the Indian plant is the same as the Palestine one.

*Eastern Mistletoe.* Shrub parasitical.

4 V. Heyneanum (D. C. prod. 4. p. 278.) branches terete; branchlets rather compressed; leaves ovate, acute at both ends, quintuple-nerved; peduncles axillary, aggregate, 3-flowered. *P.* S. Native of the East Indies, where it was collected by Heyne. V. orientale, Heyne, herb. ex Wall, and probably of Wild. The form of the leaves is truly different from the Palestinian form of *V.* orientale, but more of the figure of those of *V.* monoicum.

*Heyne's Mistletoe.* Shrub parasitical.

5 V. monoicum (Roxb. hort. beng. p. 105.) branches terete; leaves elliptic-oblong, acuminated at both ends, 5-nerved; peduncles of flowers axillary, aggregate, sessile, usually with only 3 flowers in each cluster. *P.* S. Native of the East Indies, at Sunderbund.

*Monococcus Mistletoe.* Shrub parasitical.

6 V. falcatum (Wall. cat. no. 492.) branches terete; leaves elliptic-oblong, acuminated, rather falcate, acute at the base, 5-nerved; peduncles of flowers axillary, aggregate, sessile, usually with only 3 flowers in each cluster. *P.* S. Native of the East Indies, on the Punduah mountains. Leaves 24-27 lines long, and 9-10 broad. Flowers very small.

*Falcate-leaved Mistletoe.* Shrub parasitical.

7 V. ovalifolium (Wall. cat. no. 489.) branches terete; leaves oval, obtuse, 5-nerved, narrowed into the short petioles at the base; flowers some of them in axillary sessile fascicles, and others are opposite, and somewhat verticillate, along an axillary rachis, disposed in an interrupted spike. *P.* S. Native of the East Indies, in the island of Penang. Leaves 3 inches long, and 1½ broad. Rachis not articulated. Berry ovate.

*Oval-leaved Mistletoe.* Shrub parasitical.

8 V. obtusatum (Wall. cat. no. 494.) branches terete; leaves oval, obtuse, somewhat cuneated, 5-nerved; flowers axillary, 1-5-together, almost sessile. *P.* S. Native of the East Indies, in the kingdom of Ava, on Mount Taung-Dong. Leaves 30 lines long, and 15 lines broad. Flowers small. Berries ovate. Lateral nerves of leaves slender.

*Bluntish-leaved Mistletoe.* Shrub parasitical.

9 V. heteranthum (Wall. cat. no. 488.) branches angular, at length terete; leaves elliptic, obtuse, cuneated at the base, 5-nerved beneath; peduncles axillary, 2-5-together, equal in length to the petioles, capitate at the apex, 5-6-flowered, bearing 3-5 involucrate bracteas. *P.* S. Native of Nipaul. Berries ovate-globose, solitary in each head, surrounded by the small permanent bracteas. Flowers 5-cleft, one central, the rest disposed in a whorl around the central one, all sessile on the top of the common peduncle.

*Variable-flowered Mistletoe.* Shrub parasitical.

10 V. platyphyllum (Spreng. curs. post. 47.) branches alternate, angular; leaves alternate, ovate or obovate, petiolate, attenuated at the base, narrowed beneath; umbellules usually of 4 flowers, dispersed, pedunculate, solitary or aggregate; involucres 5-cleft, permanent. *P.* G. Native of Nipaul, at Bimpedi. V. latifolium, Hamilt. in D. Don, prod. fl. nep. p. 142, but not of others.

3 f 2
Broad-leaved Mistletoe. Shrub parasitical.

11 V. umbellatum (Blum. bijdr. p. 666.) branches alternate, angular while young; leaves obovate, 3-nerved; lateral nerves bifid; umbrellas pedunculate, axillary, crowded; male flowers pentandrous. \( \gamma \). P. S. Native of Java, on trees on Mount Salak.

* Umbellate-flowed Mistletoe. Shrub parasitical.

12 V. capitellatum (Smith, in Rees' cyc. 37. no. 18.) stem branched, rough to the touch; leaves concave, obtuse; peduncles axillary; berries capitulate, oval. \( \gamma \). P. S. Native of Ceylon. Stems 3 inches high. Leaves an inch long, smooth, thick, fleshy. Heads 4-5-flowered, and under each head there are two thick bractees.

* Capitellate-flowed Mistletoe. Shrub parasitical.

13 V. triflorum (D. C. prod. 4. p. 279.) branches angular from numerous stripes; leaves oval, bluntish, somewhat undulated, and rather attenuated at the base, 3-nerved beneath; peduncles axillary, 3 times shorter than the leaves, about the length of the berries, 3-flowered, and furnished with 3 bractees at the apex; flowers 4-clft, sessile among the bractees; berries globose. \( \gamma \). P. S. Native of the Mauritius. Leaves 6-7 lines long, and 5 lines broad. Peduncles hardly 2 lines long. Flowers 1-2-together, sometimes sessile in the axils of the upper leaves. This species is designated V. rotundifolium in Bory, voy. 1. p. 390.

* Three-flowered Mistletoe. Shrub parasitical.

14 V. venosum (D. C. l. c.) branches angularly striated; leaves ovate or oval, obtuse, attenuated at the base, on short petioles, 5-veined; veins branched; peduncles axillary, very short, 2-5-flowered; berries globose. \( \gamma \). P. S. Native of the Mauritius. V. Capenese, Bory, voy. 1. p. 320. ? Plant becoming blackish on drying.

Var. \( \beta \). lanceolatum (D. C. l. c.) leaves ovate-lanceolate, somewhat acuminate. \( \gamma \). P. S. Native along with the species.

* Vicin-leaved Mistletoe. Shrub parasitical.

15 V. rotundifolium (Lin. fl. suppl. p. 426.) stem and branches hexagonal, articulated; leaves sessile, roundish, acute; peduncles 3-flowered, short; bracteas minute, opposite. \( \gamma \). P. G. Native of the Cape of Good Hope, on trees. Thum. fl. cap. 154.

Round-leaved Mistletoe. Shrub parasitical.

§ 2. Plants with true leaves. Flowers disposed in articulated spikes; the joints sheathed.—American species.

* Branches terete.

16 V. torulorum (D. C. prod. 4. p. 279.) much branched; branches terete; leaves roundish-ovate or elliptic, oblique, rounded at the apex; spikes axillary, of 2-3 joints; flowers immersed, in 4 rows. \( \gamma \). P. S. Native of Quito, on trees near Guayaquil. V. buxifolium, from South America, Spreng. syst. 1. p. 488. Loranthus torulorum, H. B. et Kunth, nov. gen. amer. 3. p. 443. Schultes, syst. 7. p. 156. Leaves 30-33 lines long, and 16-20 broad, on petioles, which are 2-3 lines long. Fruticose spikes ½ inch long. Flowers unknown.

* Torulose-spiked Mistletoe. Shrub parasitical.

17 V. trieavum (Lam. dict. 3. p. 57.) branches terete, articulated, trichotomous; leaves obovate, obtuse, narrowed at the base, 3-nerved; spikes dense, short, lateral; berries round. \( \gamma \). P. S. Native of St. Domingo and Martinico. Plum. ed. Burm. t. 258. f. 2. V. verticillatum, Lin. exclusive of the syn. Browne, and Sloane. Berry copper-coloured, size of a grain of pepper.

Three-nerved-leaved Mistletoe. Shrub parasitical.

18 V. buxifolium (Lam. dict. 3. p. 56.) branches terete, articulated: joints short, thickish; leaves obovate, obtuse, 1-nerved, sessile; spikes axillary, solitary or twin, length of the leaves. \( \gamma \). P. S. Native of St. Domingo, in the district of Leogane.

Wild. spec. 4. p. 738.—Plum. ed. Burm. t. 258. f. 3. There are varieties with both white and purple berries.

* Buxifoliate Mistletoe. Shrub parasitical.

19 V. sauruboides (D. C. prod. 4. p. 36.) branches terete; leaves ovate, acute or acuminate, on very short petioles, beset with dot-like tubercules beneath, having the middle nerve rather prominent, and the lateral veins hardly perspicuous; spikes axillary, twin, shorter than the leaves, very slender. \( \gamma \). P. S. Native of Cayenne. V. latifolium, Lam. dict. 3. p. 57. but not of Swartz, Don or Plum. V. racemosum, Aubl. guian. 2. p. 895. ? Leaves 4 inches long, and 2½ broad, on petioles which are a line long. Spikes an inch long, with bifid sheaths. Flowers in 4, 3-flowered whorls between the sheaths.

Saururus-like Mistletoe. Shrub parasitical.

20 V. tereticaule (D. C. l. c.) branches terete, smooth; leaves ovate, acute, nerveless, veinless, on very short petioles; spikes axillary, twin or solitary, shorter than the leaves; female flowers trifid. \( \gamma \). P. S. Native of Jamaica, on trees. V. latifolium, Swartz, fl. ind. occ. 1798. but not of Lam. nor Don. Var. \( \beta \), Cubences (D. C. l. c.) leaves having the middle nerve rather prominent, but with few veins in the dried state; the margins rather undulated. \( \gamma \). P. S. Native of Cuba. Lower spikes 2-3. Perhaps the same as the Jamaica plant.

* Terete-stemmed Mistletoe. Shrub parasitical.

21 V. Martiniceae (D. C. l. c.) plant glabrous; branches terete; leaves ovate-lanceolate, acuminate, 3-nerved, on very short petioles, thick; spikes axillary, solitary, 3 times shorter than the leaves; flowers 4 in a whorl, between the sheaths in each joint of the rachis of the spike. \( \gamma \). P. S. Native of Martinico. Sieb. fl. mart. no. 227. Leaves 3 inches long, and an inch broad, having the middle nerve rather prominent.

Martinico Mistletoe. Shrub parasitical.

22 V. flavescens (Pursh, fl. amer. sept. 1. p. 114.) branches terete, opposite, and verticillate; leaves cuneate-obovate or lanceolate, obtuse, 3-nerved; spikes axillary, solitary, a little shorter than the leaves, interrupted. \( \gamma \). P. H. Native of North America, from Pennsylvania to Carolina, and probably of Louisiana, on oak trees. V. album, Waltz. car. 241. Muhl. cat. no. 91. V. verticillatum, Nutt. gen. amer. 2. p. 255. Ell. sketch. 2. p. 677. V. leucocarpum, Rafn. fl. lud. 79. Berries white, diaphanous. Male flowers mostly trifid.

* Yellowish Mistletoe. Shrub parasitical.

23 V. crassifolium (Pohl. in litt. ex D. C. prod. 4. p. 280.) branches terete; leaves broad-oval, attenuated at both ends, nerveless, on short petioles; spikes axillary, twin or tern, 4-6 in a whorl, 7 times shorter than the leaves, articulated: with truncate sheaths, and short joints; flowers disposed in 4 rows; berry ovate-globose. \( \gamma \). P. S. Native of Brazil, where it was collected by Pohl. Leaves 4 inches long, and 2½ broad. Spikes 6-8 lines long.

* Thick-leaved Mistletoe. Shrub parasitical.

24 V. leptoverticillatum (D. C. prod. 4. p. 280.) branches terete; leaves oblong-lanceolate, acute at both ends, 3-nerved; spikes trichotomous, elongated, somewhat panicked, slender, jointed: with cushion-shaped sheaths; berries ovate-roundish, not immersed. \( \gamma \). P. S. Native of St. Domingo, where it was collected by Bertero. V. macrostachyum, ex Hispaniola, Spreng. syst. 1. p. 487. V.iphyllum bicacae aureus, Plum. ed. Burm. t. 258. f. 1 and therefore V. opuntioides var. \( \beta \), Lam. dict. 3. p. 56.

* Slender-spiked Mistletoe. Shrub parasitical.

25 V. Perrotteae (D. C. prod. 4. p. 280.) branches terete; leaves lanceolate, obliquely falcate, bluntish at the apex, cuneated at the base, 5-7-nerved: nerves branched a little; spikes axillary, solitary, opposite, one-half shorter than the leaves, jointed: with bifid sheaths. \( \gamma \). P. S. Native of French Guiana. Leaves
5-6 inches long and 1½ broad. Spikes 2 inches long, erect, constantly of 5 joints. Flowers in 6 rows, many of which are abortive. Immature berries nearly globose, half immersed.

*Perrottet's Mistletoe.* Shrub parasitical.

26 *V. brachystachyum* (D. C. I. c.) branches terete; leaves oblong, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary, opposite, sessile, ovate, few-flowered; berries ovate-globose. h. P. S. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlandier. Leaves 12-15 lines long, and 3-4 broad. Spikes 3-4 lines long.

*Short-spiked Mistletoe.* Shrub parasitical.

27 *V. pru'rum* (Lin. spec. 1451.) stems terete, simple; leaves oblong, obtuse, tapering into the petiole at the base; spikes axillary, one-half shorter than the leaves, somewhat interrupted; flowers triplicate; berries globose. h. P. S. Native of the Bahama Islands, parasitical upon mahogany and other trees. Berries red. Leaves opposite, of a shining green colour.

*Red-berried Mistletoe.* Shrub parasitical.

28 *V. Berteri'num* (D. C. prod. 4. p. 281.) branches terete, dichotomous; leaves oblong-lanceolate, attenuated at both ends, acute at the base, very short petioles, having the middle nerve rather distinct, and with 2 rather oblique veins rising from the middle; spikes axillary, solitary, opposite, one-half shorter than the leaves, jointed, with biform sheaths. h. P. S. Native of St. Domingo. *V. dichotomum,* Spreng. syst. 1. p. 448. exclusive of the synonyms, but not of D. Don. Leaves 3 inches long, and an inch broad. Spikes 1-2 inches long. Berries globose. Flowers disposed in 4 rows on the spikes.

*Bertero's Mistletoe.* Shrub parasitical.

29 *V. Schott'ra* (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves oblong-lanceolate, attenuated at both ends, and somewhat acuminate, tapering into the petiole at the base; spikes axillary, solitary, opposite, one-half shorter than the leaves, articulated: with trifid sheaths; berries ovate; flowers trifid. h. P. S. Native of Brazil, where it was collected by Schott. Leaves 2-5 inches long, and 8-9 lines broad. Spikes 9-12 lines long. Allied to *V. Berteri'num*.

*Schott's Mistletoe.* Shrub parasitical.

30 *V. Macrostachyum* (Jacq. coll. 2. p. 109. t. 5. f. 3.) branches terete; leaves linear-lanceolate, nearly sessile, oblong, veinless; spikes axillary, solitary, filiform, much longer than the leaves, articulated: with bowl-shaped sheaths; corolla tripartite. h. P. S. Native of Martinico and Trinidad, on trees. Sieb. fl. trim. no. 357. Spikes 3-6 inches long; ultimate ones subpanicled. Flowers small. Leaves an inch long, and 3 lines broad.

*Long-spiked Mistletoe.* Shrub parasitical.

31 *V. fasci'rons* (Hook. et Arn. in bot. misc. 3. p. 356.) branches terete, but when young compressed; leaves narrow-lanceolate, bluntish, recurvedly falcate, tapering into the petiole at the base, obscurely 3-5 veined; spikes axillary, solitary, opposite, almost one-half shorter than the leaves; sheaths of spikes truncate. h. P. S. Native of Brazil, upon laurels by the river Uruguay. The sheaths of the spikes are here formed of 2 opposite and equal portions, which are truncate at the apex. In *V. Ligea* they are keeled on the back, and acute at the extremity.

*Sickle-leaved Mistletoe.* Shrub parasitical.

*Pepper-like Mistletoe.* Shrub parasitical.

33 *V. Augusi'rolium* (D. C. prod. 4. p. 281.) much branched; branches terete, in whorles; leaves petiolate, linear-lanceolate, somewhat ensiform, narrowed at the apex and obtuse; spikes 1-3-together, axillary, articulated; flowers in 4 series, immersed in the rachis. h. P. S. Native of Peru, in the temperate regions of the Andes, between Ollera and Mount Aipate. Leaves 4-5 inches long, and half an inch broad; petioles 3-4 lines long; Spikes 12-18 inches long. Flowers unknown. *V. stemophyl'um,* Spreng. syst. 1. p. 487. *Loranthus piperoides,* H. B. et Kunth, nov. gen. amer. 3. p. 442. Schultes, syst. 7. p. 155.

*Narrow-leaved Mistletoe.* Shrub parasitical.

34 *V. Affine* (Pohl, in litt. ex D. C. prod. 4. p. 281.) branchlets rather tetragonal; branches terete; leaves linear-lanceolate, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary or twin, twice or thrice longer than the leaves, articulated: with small sheaths; berries ovate, exserted. h. P. G. Native of Chili, on trees near Los Cerillos de San Juan, where it is called *Ligea* by the natives. This species seems very nearly allied to *V. affine,* Pohl.

*Ligea Mistletoe.* Shrub parasitical.

35 *V. Ligea* (Gill. mas. ex Hook. bot. misc. 3. p. 355.) branches terete, while young compressed; leaves straight, linear-oblong, obtuse, hardly apiculated, attenuated at the base, 3-nerved, somewhat feather-veined in the middle; spikes solitary, axillary, opposite, 2 or 3 times shorter than the leaves; sheaths of spikes keeled, acute; berries ovate, exserted. h. P. G. Native of Chili, on trees near Los Cerillos de San Juan, where it is called *Ligea* by the natives. This species seems very nearly allied to *V. affine,* Pohl.

*Ligea Mistletoe.* Shrub parasitical.

36 *V. ensi'folum* (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves linear-oblong, acuminate at both ends, petiolate, finely 5-nerved at the base; spikes axillary or terminal, many, verticillate, articulated, length of the petals; with the sheaths biform; flowers in 6 rows; berries globose. h. P. S. Native of Brazil, where it was collected by Pohl. Leaves coriaceous, 6-7 inches long, and 8-9 lines broad; petioles 8 lines long.

*Sword-leaved Mistletoe.* Shrub parasitical.

37 *V. vel'litimum* (D. C. prod. 4. p. 281.) branches terete, velvety from short down; leaves linear-oblong, attenuated at both ends and acute, 3-5-nerved at the base, rather velvety when young, but glabrous in the adult state; spikes axillary, solitary or twin, 3 times shorter than the leaves, articulated: with biform ciliated sheaths; berries 4½ rows. h. P. G. Native of Mexico, in the valley of Tolucua, where it was collected by Berlandier. Leaves 4 inches long, and 6 lines broad. Spikes 9-15 lines long. The plate in Catesb. car. t. 81. lower figure, agrees pretty well with the present species.

*Velvet Mistletoe.* Shrub parasitical.

38 *V. tomen'tosum* (D. C. prod. 4. p. 670.) branches terete, while young rather compressed; leaves obovate, obtuse, a little attenuated at the base, clothed with velvety, somewhat deciduousomentum on both surfaces, as well as the branchlets; spikes axillary, interruptedly articulated, solitary or twin, rather shorter than the leaves: with small nearly entire sheaths. h. P. S. Native of Mexico, in the plains at Real de Ratone, beyond the range of Mimosas, where it was collected by Berlandier.

*Tomentose Mistletoe.* Shrub parasitical.
** Branchlets 2-edged or compressed, but at length becoming terete.

39 V. interrup'tum (D. C. prod. 4. p. 282.) branches compressed while young, but at length becoming terete; leaves oblong-lanceolate, obtuse, attenuated at the base, petiolate, almost nerveless, with 3-5 fine veins; spikes axillary, 1-2, with the sheaths rather truncate at the apex; joints naked at the base, and fructiferous at the apex. H. P. S. Native of Brazil, where it was collected by Pohl. V. lanceolato-ellipticum, Pohl, in litt. Leaves 4 inches long, and 8-10 lines broad. Petioles 4 lines long. Spikes 1½ inch long, interrupted, constantly of 3-4 joints. Perhaps sufficiently distinct from V. rubrum.

** Interrupted-spiked Mistletoe. Shrub parasitical.

40 V. ances (Spreng. syst. 1. p. 487.) branches 2-edged, but in the adult state they are nearly terete; leaves oblong-lanceolate, obtuse, attenuated at the base, having 3 veins rising from the base; spikes axillary, opposite, one-half or more shorter than the leaves. H. P. S. Native of Porto-Rico and Hispaniola, where it was collected by Bertero. Leaves 3-4 inches long, and 9 lines broad; petioles 4 lines long. Spikes an inch long or a little more.

** Two-edged-branched Mistletoe. Shrub parasitical.

41 V. hexastichum (D. C. prod. 4. p. 282.) branches 2-edged, but at length becoming nearly terete; leaves elliptic, tapering at both ends, bluntish at the apex, and acute at the base, petiolate, feather-nerve地区的; spikes axillary, solitary, opposite, articulated: with the sheaths truncate; berries globose depressed, disposed in 6 rows. H. P. S. Native of the island of Cuba, near Havana. Leaves coriaceous, 3 inches long, and about 15-16 lines broad; petioles 4 lines long. This species is very like V. Perrottetii.

** Six-ranked Mistletoe. Shrub parasitical.

42 V. undulatum (Pohl, in litt. ex D. C. prod. 4. p. 282.) branches 2-edged; branches terete, leaves oval or oblong, tapering at the base, and bluntish at the apex, undulated, thickish, having the middle nerve rather tumid, and the rest of the leaf veinless; spikes axillary, twin, articulated, 3 times shorter than the leaves: having the sheaths rather truncate, and the joints short. H. P. S. Native of Brazil, where it was collected by Pohl.

** Undulated-leaved Mistletoe. Shrub parasitical.

43 V. macrophyllum (Spreng. syst. 1. p. 488.) branches nearly terete; branches compressed at the apex; leaves broadly ovate or oval, petiolate, with the middle nerve rather thick, and the lateral veins perspicuous; spikes 2-4 from each axil, one-half shorter than the leaves, somewhat tetragonal; berries ovate, half immersed. H. P. S. Native of the West India Islands, as of St. Domingo (Plum. ed. Burm. t. 258. f. 4.), and Porto-Rico (Bertero). Leaves 6 inches long, and 3½ broad; petioles 6-8 lines long. Spikes 2½ inches long, interrupted. Fruit disposed in 4 rows on the spike, and each row composed of 4 berries. Sheaths of spike truncate.

** Long-leaved Mistletoe. Shrub parasitical.

44 V. Schiedeanum (D. C. prod. 4. p. 670.) trunk terete; branches 2-edged, dilated under the forks; leaves fleshy, 3-5-nerved, falcate, obtuse: female spikes 1-3-together, axillary; flowers 6 in a whorl. H. P. G. Native of Mexico, on trees near Jalapa. Fruit a little smaller than hemp seed. V. falcatum, Cham. et Schlcht. in Linnaea. 5, p. 172. but not of Wall.

** Schiede's Mistletoe. Shrub parasitical.

45 V. flavens (Swartz, fl. ind. occ. p. 266.) branches 2-edged, at length terete; leaves ovate, somewhat attenuated at the apex, obtuse, 5-nerved at the base, on very short petioles; spikes axillary, twin or tern, 3 times shorter than the leaves, articulated; berries ovate. H. P. S. Native of Jamaica (Swartz), and Porto-Rico (Bertero), on the branches of trees. The figure of Plumier, cited for this plant by several authors, has here been omitted in consequence of the leaves in the figure being feather-nerve地区的, and not 5-nerved at the base, as in this species.

** Yellowish Mistletoe. Shrub parasitical.

46 V. tetragonium (D. C. prod. 4. p. 282.) branches opposite, and are, as well as the branchlets, tetragonal; leaves elliptic-lanceolate, attenuated at the base, and obtuse at the apex, 3-nerved or 5-nerved, the 2 lateral nerves being hardly evident; spikes axillary, solitary, 3 or 4 times shorter than the leaves. H. P. S. Native of Porto-Rico and Guadaloupe, on trees by the sea side. V. angustifolium, Spreng. syst. 1. p. 487. V. myrtilloides and Loranthus sessilis, Spreng. in herb. Balb. Leaves 12-16 inches long, and 5-8 lines broad; petioles a line long. Spikes 2-3 lines long. Perhaps the same as V. myrtilloides, Willd. spec. 4. p. 759. V. myrtilloides, Willd. spec. 4. p. 759.2

** Tetragonal-branched Mistletoe. Shrub parasitical.

47 V. mucronatum (D. C. c. l.) branches tetragonal, 2-edged while young, but nearly terete in the adult state; leaves oblong-lanceolate, attenuated at the base, obtuse, and mucronate at the apex, having the middle nerve and one on each side of it distinct; spikes axillary, solitary, 4 times shorter than the leaves. H. P. S. Native of St. Domingo. V. myrtilloides, Spreng. in herb. Balb., and hence it is the V. myrtilloides from Hispaniola of Spreng. syst. 1. p. 488. Leaves nearly an inch long, and 4 lines broad; petioles 1-2 lines long. Spikes 2-3 lines long. Mucronate-leaved Mistletoe. Shrub parasitical.

48 V. penniveneum (D. C. l. c.) branches tetragonal, nearly terete; leaves somewhat alternate, oval on short petioles, obtuse: having the middle nerve rather prominent beneath, and with the lateral veins pinnate and branched, hardly perspicuous above; spikes axillary, solitary, one-half shorter than the leaves; berries oblong. H. P. S. Native of French Guiana.

** Feather-veined Mistletoe. Shrub parasitical.

49 V. kunthianum (D. C. prod. 4. p. 283.) plant much branched; branches tetragonal, articulated; leaves nearly sessile, obliquely oblong, 3-5-nerved, rounded at the apex and cuneate at the base; spikes axillary, 2-3 together, articulated; berries globose, immersed in the rachis. H. P. S. Native of Quito, near Guayaquil, on trees. Leaves 18-24 lines long, and 7-9 lines broad. Spikes nearly an inch long. V. trinervium, Spreng. syst. 1. p. 488. exclusive of the syn. of Lam. Loranthus visci folius, H. B. et Kunth, nov. gen. amer. 8. p. 443. Schultes, syst. 7. p. 156.

** Kunth's Mistletoe. Shrub parasitical.

Leaves 24-27 lines long, and 6-7 broad; petioles a line long. Fruit bearing spikes an inch and a half long.

** Quadrangular-stemmed Mistletoe. Shrub parasitical.

51 V. oblongifolium (D. C. prod. 4. p. 283.) branches tetragonal; leaves oblong, obtuse, attenuated at the base, nearly nerveless, or somewhat 1-nerved at the base; spikes axillary, solitary, 2 or 3 times shorter than the leaves. H. P. S. Native of Guadaloupe, on the mountains. Allied to V. tetragonium and V. mucronatum, but differs in the leaves being longer and nerveless. Leaves 12-14 lines long and 3-4 broad. Fruit bearing spikes an inch and a half long.
Oblong-leaved Mistletoe. Shrub par.
52 V. microphyllum (Pohl, in litt. ex D. C. prod. 4. p. 283.) branches tetragonal, when young rather compressed, but in the adult state nearly terete; leave: linear-oblong, obtuse, attenuated at the base, nerveless; spikes axillary, solitary, much shorter than the leaves, articulated: with small sheaths, and short, usually 4-flowered joints. {P. S. Native of Brazil, where it was collected by Schwott. Leaves an inch long and 2 lines broad. Spikes 2 lines long, constantly of 3-4 joints.

Small-leaved Mistletoe. Shrub parasitical.

§ 3. Plants without leaves. Branches articulated.
53 V. Cape'ense (Linn. fil. suppl. p. 426.) plant leafless; stems bluntly tetragonal, much branched, articulated; branches decussate; flowers usually 6 in a whorl, sessile: female ones 4-parted; berry globose. {P. G. Native of the Cape of Good Hope, parasitical on some species of Rhúis. Male flowers 2-4-cleft. Thunb. prod. p. 31. fl. cap. p. 154. Razomówskis Capénis, hort. mosc. In the racemes of a plant under this name, collected by Mr. Burchell, the branches are terete, it is therefore perhaps a distinct species.

Cape Mistletoe. Shrub parasitical.

54 V. angulá'tum (Heyne, herb. ex Wall. cat. no. 497. D. C. prod. 4. p. 283.) plant leafless; branches angular, tetragonal, articulated; flowers unknown. {P. S. Native of the East Indies, where it was collected by Heyne. From the imperfect specimens examined, it appears to be very distinct from the other species of this genus, but it is hardly known.

Angular-branched Mistletoe. Shrub parasitical.

55 V. ambi'guum (Hook. et Arn. in bot. misc. 3. p. 356.) plant leafless; branches terete, without joints and without sheaths; spikes alternate towards the tops of the branches, oblong-linear, without sheaths; flowers sessile, a little longer than the concave obtuse scales. {P. G. Native of Brazil, upon myrtles by the river Uruguay. The two lateral petals are carinate, and the dorsal one nearly plain. In Víscum the margin of the calyx in the female flowers is usually conspicuous, but in this species it is so entirely wanting, as almost to induce a belief that the 5 petals, which are apparently the same texture as the texture of the calyx, form its limb; and if this really were so, it ought to form a genus next to Tupéin, Cham. et Schlecht, in Linnaea. 3. p. 203., which seems in that specific resemblance.

Ambiguous Mistletoe. Shrub parasitical.

56 V. tenco'dèdès (Comm. ex Pet. Th. mel. obs. p. 43.) plant leafless, much branched; stem and branches compressed, articulated, linear-oblong; sheaths truncate; flowers sessile, 2 opposite or 4 in a whorl, situated in the axis of the sheaths. {P. S. Native of the Mauritius and Bourbon. Joints 3 lines long, and a line broad, but not striated. Flowers small. Plant becoming wholly black in drying. Habit almost of Saticótría. Wreath Mistletoe. Shrub parasitical.

58 V. dichótónum (Hamilt. D. Don, prod. fl. nep. 147. but not of Spreng.) plant leafless; branches compressed, articulated; joints oval-oblong, striated lengthwise, 5 times longer than its breadth; flowers by threes, sessile at the tops of the joints or branches. {P. G. Native of Nepal, about Narin-hetty. V. nepáleñse, Spreng. cur. post. Bracteae membranous, cipular, under the fruit, which is oval. Branches usually opposite, hence dichotomous.

Dichotomous Mistletoe. Shrub parasitical.

59 V. elongá'tum (Wall. cat. no. 495. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, somewhat attenuated at the base, 7 times longer than their breadth; fascicles of flowers somewhat verticillate, sessile, containing 1-3 flowers each, placed at the tops of the joints. {P. S. Native of the East Indies, on the Pandava mountains, in Silhet. Joints 20-22 lines long, and 3 lines broad. Branchlets usually opposite.

Elongated Mistletoe. Shrub parasitical.

60 V. fragíle (Wall. cat. no. 498. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, striated a little, thickish in the middle, six times longer than their breadth; fascicles of flowers opposite, sessile, containing 1-3 flowers, placed at the tops of the branches. {P. S. Native of the East Indies, at Martaban and Tavoy. Branchlets usually opposite. Perhaps sufficiently distinct from V. dichótomum.

Brittle Mistletoe. Shrub parasitical.

61 V. attenuá'tum (D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints gradually attenuated both at the base and apex, linear-cuneated, somewhat striated, sometimes longer than their breadth; fascicles of flowers at the tops of the joints opposite, sessile, containing each 3-5 flowers. {P. S. Native of Java, parasitical upon some species of Anóna. Joints of branches an inch long, and a line or a little more in breadth. Stems nearly terete at the base.

Var. ß, Timóriénses (D. C. prod. 4. p. 381.) branches nearly herbaceous; ultimate joints of branches acute at the apex. {P. S. Native of Timor. Perhaps the same as V. compréssum, Poir. suppl. 2. p. 861., which was collected in Ambonya. The berry, according to Poir, is small and yellow.

Jointed Mistletoe. Shrub parasitical.

62 V. monislióide (Blum. bijdr. p. 667.) plant leafless; stems terete at the base; branches 2-edged, articulated; joints naked; flowers in whorles, sessile. {P. S. Native of Java, on trees about Buitenzorg, very common, and is called by the natives Mengando along with other species.

Necklace-formed Mistletoe. Shrub parasitical.

64 V. tunéfórmis (D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated, trichotomous, elongated; joints of branches 4 times longer than broad, striated lengthwise; flowers nearly sessile, by threes at the tops of the joints. {P. S. Native of Brazil, where it was collected by Pohl. P. articulátum, Pohl, in litt. but not of Borrm. Allied to V. dichótomum, but differs in the joints being longer, branches much less branched, branchlets elongated, and the flowers not in whorles.

Tuna-formed Mistletoe. Shrub parasitical.

65 V. opuntioides (Linn. spec. 1452.) plant leafless; branches compressed, articulated; joints broadly ovate; spikes jointed, at the tops of the branches or articulations, bearing 2 rows of opposite flowers, and margined by a membrane. {P. S. Native of Jamaica. Sloane, hist. jum. 2. p. 93. t. 201. f. 1. V. monstrósum, Bertero, inéd. V. opuntioides, Willd. spec. 4. p. 740. exclusive of the synonyme of Plumer. Spreng. syst. 1. p. 487. exclusive of the Japan plant. Berries like those of the common mistletoe.

Var. ß. angástitus (D. C. prod. 4. p. 284.) joints oblong, somewhat attenuated at the base. {P. S. Native of Jamaica.
Berries oval-oblong; flowers 3-cleft. Perhaps the present variety is the female plant, and this called the species the male.

Indian-fig-like Mistletoe. Shrub parasitical.

66 V. vagina'tum (Humb. et Bonpl. in Willd. spec. 4. p. 740.) plant leafless; stem tetragonal; branches terete; joints bearing sheaths, which are bidentate at the apex; flowers 2, opposite, sessile in the recess of the sheath. P. S. Native of Mexico, in pine woods, on the high mountain called Cofre de Perote. H. B. et Kunt., nov. gen. amer. 3. p. 445.

Sheathed Mistletoe. Shrub parasitical.

67 V. cupula'tum (D. C. prod. 4. p. 285.) plant leafless; stem tetragonal; branches compressed; sterile joints elongated: fertile ones very short, usually bearing 2 fruit each; sheaths very short; flowers spicate, sessile, opposite; bractea cupulate, membranous, orbicular under each berry; berries ovate. P. S. Native of St. Domingo, where it was collected by Bertero. V. vagina'tum ex Hispaniola, Spreng. Syst. 1. p. 447.

Cupulate-bracteate Mistletoe. Shrub parasitical.

68 V. Domi'nie'ssis (Spreng. syst. 1. p. 487.) plant leafless; stem and branches terete; sheaths large, bowl-shaped, bifid, with white rather scarious margins. P. S. Native of St. Domingo. Spikes opposite, flavous.

St. Domingo Mistletoe. Shrub parasitical.

69 V. graci'le (D. C. prod. 4. p. 285.) stem terete; branches rather compressed, articulated; joints linear, elongated, 12 times longer than broad; spikes terminal, compressed, articulated, with the flowers disposed along the margins on both sides in distant rows. P. S. Native of the West Indies, but in what island is unknown.

Slender Mistletoe. Shrub parasitical.

70 V. Chile'ense (Hook. et Arn. in Beech. bot. p. 25.) stem terete, branched; branches and branchlets opposite, articulated, leafless; flowers 2-3-together, sessile at the knees of the branches. P. G. Native of Chili, at Concepcion.

Chili Mistletoe. Shrub parasitical.

† Species not sufficiently known.

71 V. purpure'um (Lin. spec. 1451.) branches terete; leaves obovate, obtuse, petiolate; racemes axillary, a little longer than the leaves; flowers opposite, distant, 3-6 pairs; berries ovate, on short pedicels, terminated by the long style. P. S. Native of the Bahamas Islands, parasitical upon Hippomane Mancenilla. Catesb. Carol. 2. p. 95. t. 95. lower figure. Perhaps a species of Loranthus.

Purple Mistletoe. Shrub par.

72 V. verticillat'um (Lam. dict. 3. p. 57.) stem terete, striated; branches verticillate, terete. P. S. Native of Jamaica, parasitical on the branches of trees. Sloane, jum. hist. 2. p. 93. t. 201. f. 2. Perhaps a species of Rhipsalis.

Whorled-branched Mistletoe. Shrub par.

73 V. pauciflorum (Lin. fil. suppl. 246.) stem striated; branches alternate; leaves alternate, sessile, oblong; flowers scattered, solitary, on short peduncles. P. G. Native of the Cape of Good Hope. From the leaves being alternate, this is perhaps a true species of Viscum.

Few-flowered Mistletoe. Shrub.

74 V. obscurn'um (Thumb. prod. p. 31. fl. cap. p. 154.) stem erect, wrinkled; branches alternate; leaves opposite, elliptic, veinless, unequal. P. G. Native of the Cape of Good Hope. Flowers and fruit unknown.

Obscure Mistletoe. Shrub.

75 V. antar'cticum (Forst. prod. no. 370.) branches unknown; leaves oblong or ovate, narrowed at both ends, obtuse, nervellous; racemes terminal, articulated, usually containing 5 flowers. P. G. Native of New Zealand, parasitical on trees. Willd. spec. 4. p. 39.

Autarctic Mistletoe. Shrub par.

76 V. Kemple'eri (D. C. prod. 4. p. 285.) P. G. Native of Japan, at Mikawaseki, Kemptf. am. ex 785. where it is called Gami Maatz. V. album, Thunb. jap. p. 64. but it differs from V. album in the spikes being axillary, in the berries being reddish, and in the leaves being 1-nerved.

Kempfer's Mistletoe. Shrub par.

N. B. V. rubrum, Burm. fl. Ind. 311. is certainly not a species of Viscum, but perhaps one of Hédcra. V. capillare and V. ligulatum, Blum. bijdr. 667 are species of Psilütis. V. terrest're, Lin. spec. 1452 is Lysimichia stricta. V. fla'vescens, Comm. is Misodendron punctulatum.

Cult. None of the species of Mistletoe are cultivable in gardens, except the common Mistletoe, whose culture and propagation are treated of under that species.

Lin. syst. Diócia, Di-Tetrándoseria. Flowers dioecious. Male ones sessile; calyx none; corolla monopetalous, 2-3, rarely 4-parted, tough, and fleshy; segments ovate, concave, spreading; stamens 2-3-4; anthers sessile, fixed in the middle of the segments, free, nearly globose, 1-celled, membranous, dehiscing transversely; ovarium none, but in its stead there is a small 2-3-4-lobed gland. Female flowers on short pedicels; calyx oval, compressed, fleshy, bidentate, almost covering the ovary, which is one ovulate, and adnate to it; corolla, style, and stamens none; stigma small, obscurely lobed. Berries narrow, obviate, terete, 1-seeded, on short pedicels. Seed immersed in viscid pellicul pulp, fixed to the upper part of the cell, pendant, obovately cylindrical, acuminated at the base; integument thin; albumen fleshy. Embryo immersed, slender, cylindrical, placed towards the base of the seed; radical turned to the hilum of the seed.—A small, leafless, rather fleshy, proliferous branched shrub, parasitical on resiniferous trees, in Middle Europe and North America; branches opposite, blantly tetragonal, articulated in the manner of Saticorium; joints sheathing above, and somewhat pelviform. Flowers terminal and lateral, usually by threes, small, and conspicuous.

1 A. Oxycéd'rei (Bieb. fil. taur. suppl. p. 629. Hook. fl. bor. amer. 1. p. 278. t. 99.) P. H. Native from Spain, near Lescorial, to Iberia, near Tiflis and Gandscha, on Juniperus Oxycéd'rus; and of North America, on the west side of the Rocky Mountains, on Pinus ponderosâ; and from the Spoken River to the west side of the Rocky Mountains, on Pinus Banksiâ, in lat. 47°, to the Rocky Mountains and thence to Hudson's Bay on the east, in lat. 57°. In America the female plants grow on Pinus Banksiâ, and the male ones on Pinus ponderosâ. Razumov'ska Cauca'ska, Hoffm. Hort. mosq. 1805. intr. no. 1. f. 1. Viscum Oxycéd'ri, D. C. fil. fr. ed. 3. no. 3400. Stev. soc. mosq. 4. p. 71. Bieb. fil. taur. 2. p. 406.—Viscum in Oxycéd'ro, Clus. hist. 1. p. 39. Lob. icon. 2. p. 213. f. 2. This is a very singular parasitical plant. The American plants become yellowish when dried, and the European ones become blackish-green.

Red-cedar Arceuthobium. Shrub par.

Cult. This curious plant is not cultivable, unless the trees or shrubs on which it grows could be imported with the plant growing upon them.

LIN. SYST. Diocèa, Tetrándria? Flowers dioecious; male ones unknown; female ones having the tube of the calyx adnate to the ovary, and furnished with 3 long plumose bristles on the outside, alternating with 3 bracteas, which are adnate to the calyx; limb of calyx minute, truncate. Fruit an oblong triquetrous indelisent urticulus, crowned by the permanent limb of the calyx. Seed one; albumen fleshy.—Small smooth parasitical shrubs, with the habit of Viscum.

§ 1. Plant leafless.

1 M. punctulatum (Banks, mss. ex. D. C. prod. 4. p. 286.) plant leafless; branches terete, rugged from dots; bracteas alternate along the branches, half stem-clasping, ovate, obtuse; flowers 1-2, sessile in the axils of the bracteas. γ. P. S. Native of America, on trees. D. C. coll. mem. vi. t. 11.

Var. a, Magellànium. γ. P. H. Native of the Straits of Magellan. Viscum flavescens, Comm. herb.

Var. b, subumbellatum. γ. P. G. Native of the north-west coast of America, in Statenland. It differs from var. a in the branches being thicker and somewhat umbellate.

Dotted-branched Misodendron. Shrub par.

§ 2. Plants furnished with leaves. Branches alternate, bearing each one articulated leaf at the apex.

2 M. Brachystachyum (D. C. coll. mem. vi. t. 12. f. 1.) branches alternate, bearing each an obovate or oval obtuse leaf at the apex; spikelets few-flowered, bracteas, rising from the branches beneath the leaves; fruit ovate. γ. P. H. Native of the north-west coast of America, in Statenland. Leaves 3-5 lines long, and 2-5 broad, flat, nerveless. Flowers and fruit not sufficiently known, and therefore the genus is doubtful.

Short-spiked Misodendron. Shrub par.

3 M. ? Quadrifidum (D. C. coll. mem. iv. t. 12. f. 2.) branches alternate, each bearing an oblong-obovate suberelinated leaf at the apex, and 4 sessile unilateral flowers on the upper side. γ. P. H. Native of North America, in Statenland. This is very like the preceding species in habit, but differs in the flowers and fruit being unilateral. Calyx triquetrous, dehiscing at the sides.

Four-flowered Misodendron. Shrub par.

§ 3. Plants furnished with leaves. Leaves alternate. Branches floriferous at the apex.

4 M. oblongifolium (D. C. prod. 4. p. 671.) branches clothed with fine velvety down; leaves oblong-lanceolate, cuneated at the base, 3-nerved, glabrous; spikes bearing each one leaf at the base, conforming to the others. γ. P. G. Native of Chili (Bertero), and of Chiloë (Cuming). Genus novum, n. 1. Poepp. pl. exsic. no. 813. Flowers bracteas, with 8-10 distant ones in each spike.

Oblong-leaved Misodendron. Shrub par.

5 M. linearefolium (D. C. prod. 4. p. 671.) plant glabrous; leaves linear, acute; flowers sessile, solitary at the axils of the leaves in the flowering branches. γ. P. G. Native of Chili, where it was collected by Poeppig. Genus novum, n. 2. Poepp. pl. exsic. no. 800.

Linear-leaved Misodendron. Shrub par.

6 M. microphyllum (Hook. et Arnh. in bot. misc. 3. p. 357.) leaves minute, linear; flowers sessile, solitary at the axils of the leaves; branches pubescent. γ. P. G. Native of Chili, in the province of Maule. Closely allied, but apparently quite distinct from the preceding species.

Small-leaved Misodendron. Shrub par.

Cult. These are singular shrubs, similar to the Mistletoe, but not cultivable in gardens.

IV. LORANTHUS (from lorum, a lash made of leather, and aνθος, anthos, a flower; alluding to the long linear shape and leathery substance of the petals). Mart. in D. C. prod. 4. p. 671.—Loranthus species of Lin. and others.

LIN. SYST. Penta-Hexàndria, Monogónía. Flowers dioecious or hermaphrodite. Calyx cup-shaped, adnate, with an entire border. Petals 5-6 (f. 74. a. d.), linear, reflexed. Stamens inserted into the middle of the petals; filaments short; anthers globose, dinsuous, having the cells dehiscing in front towards the connecting part. Style thickish; stigma simple. Berry globose (f. 74. e.), umbilicate by the calyx, 1-celled, 1-seeded as in the rest of the genera, broken off from the present.—Parasitical shrubs. Spikes axillary and terminal, simple. Flowers immersed in the fleshy rachis, each propped by a somewhat orbicular bractea at the base.

1 L. Europaeus (Lin. spec. 1672.) plant glabrous, much branched; branches terete; leaves opposite, petiolate, oval-oblong, obtuse, somewhat attenuated at the base; racemes terminal, simple; flowers dioecious, of 6 petals; anthers adnate in the male flowers. γ. P. H. Native of Austria, Hungary, Italy, and Upper Siberia, parasitical on oak and sweet-chestnut trees. Jacq. fl. austr. t. 30. Schkuhr, handb. t. 94. Sturm, fl. germ. with a figure. Plenck. icon. t. 248. Habit of Viscum album. Flowers greenish. Berries oval, white or yellowish. This is the Viscum or Mistletoe of the ancients.

European Loranthus. Shrub par.

2 L. odoratus (Wall. in Roxb. fl. ind. 2. p. 215.) glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, fleshy; spikes axillary, subfascicled, with a foveolate fleshy rachis, and jointed sessile subimmersed spreading 6-petalled hexandrous flowers; anthers ovate, inserted by the base; style shorter than the petals. γ. P. G. Native of Nipaul, on the mountains of Chandigiri and Sheeppore, parasitical on trees. D. Don, prod. fl. nep. p. 143. Schultes, syst. 7. p. 101. D. C. prod. 4. p. 294. Leaves pale green, at length becoming yellowish, from 4 to 6 inches long. Spikes shorter than the leaves, many flowered, almost sessile. Flowers small, nearly white, very sweet-scented, at first claveate, but at length spreading; petals cuneate, slightly concave at the apex. Óvarium supported by no other bractea than the acute margin of the foveola of the rachis.

Sweet-scented-flowered Loranthus. Shrub par.

3 L. lamberthianus (Schultes, syst. 7. p. 118.) glabrous, dichotomously branched; leaves opposite, on very short petioles, ovate-lanceolate, narrowed at both ends, acute, nerved; spikes terminal, solitary; flowers half immersed in the foveolate rachis, 5-petalled; anthers fixed by the base. γ. P. G. Native of Nipaul. Habit of L. Europaeus.

Lambert’s Loranthus. Shrub par.

Cult. The species have the habit of common mistletoe, but are not cultivable in gardens on account of their being parasitical.

V. STRUTHA’NTHUS (from στρούθος, strouthos, a sparrow, and ανθος, anthos, a flower; some of the species are called Erva de Passerinho and Herba dos Passeros, i.e. Sparrow-plant, in South America). Mart. in D. C. prod. 4. p. 671.—Loranthus species of authors.

LIN. SYST. Hexàndria, Monogónía. Flowers hermaphrodite, almost always 6-parted (except in one species, which is 4-parted).
and dicteous, and in another 5-parted). Calyx angular, small, hemispherical, with an extended truncate margin. Petals linear, distinct from each other a long way at the base, and at length revolute at the apex; anthers ovate, fixed by the back near the base or beneath the middle; filaments short, inserted beneath the middle of the petals. Ovary ovate-globose. Style subulate. Berry ovate-elliptic.—Parasitical shrubs. Racemes terminal or lateral, solitary or aggregate in the axils, having the rachis for the most part angular or 2-edged. To this genus belongs the greater part of the sections Stachyaphyton and Protostelides of Loranthus, D. C. prod. 4. p. 287 and 289. particularly the Brazilian species.

 Sect. I. Stachyaphyton (from σταχύς, stachys, a spike, and ἀνθος, anthos, a flower; flowers sessile, disposed in spikes). Flowers sessile along the rachis, and sometimes immersed in spots on it, spicate, solitary or by threes, usually furnished with 3 bracteas each.

1 S. Alveolatus; plant glabrous, much branched; branches terete; leaves petiolate, roundish-ovate, rather oblique, obtuse, somewhat coriaceous; spikes axillary, 1-3-together, without joints, somewhat tetragonal; flowers disposed in 4 rows on the spikes, immersed in spots in the rachis; petals linear-lanceolate. ʃ. P. S. Native of South America, near Popayan and Carthage, parasitical on Crescentia Cofete. Loranthus alveolatus, H. B. et Kunth, nov. gen. amer. 3. p. 444. Loranthus rotundolobus, Bonpl. herb. Schultes, syst. 7. p. 154. Leaves 2 inches long, and ½ broad, on petioles 2 lines long. Spikes an inch or an inch and a half long. Corolla greenish white. Perhaps a true species of Loranthus.

Alveolate-spiked Struthanthus. Shrubs par.

2 S. Pertrygopus; plant glabrous; branches compressed at the apex; leaves opposite, on short petioles, ovate, acuminate, coriaceous; spikes axillary, solitary, longer than the leaves; peduncles compressed, winged; flowers by threes, sessile; petals 6, linear-lanceolate. ʃ. P. S. Native of Brazil, in the provinces of Minas Geraes and Bahia, on trees in the woods. Loranthus pterygopus, Mart. in Schultes, syst. 7. p. 153. Flowers semi-linear. Anthers roundish-ovate.

Wing-stalked Struthanthus. Shrubs par.

3 S. Uruguayensis; plant glabrous, erect; branches terete; leaves alternate, oblong-lanceolate, cuspitate by a point at the apex, attenuated into the petiole at the base; peduncles 1-2, axillary, equal in length to the leaves, forked above the middle; pedicels furnished with 3 bracteas and 3 flowers at the apex; flowers sessile; petals 5, linear, nearly free; filaments shorter than the petals; anthers ovate, crept; stigma capitatte; berries egg-shaped. ʃ. P. G. Native of South America, upon laurels and myrtles, on the banks of the Uruguay. Loranthus Uruguayensis, Hook. et Arn. in bot. misc. 3. p. 358. In many points it resembles Loranthus flaggallaris, Cham. et Schlecht.

 Uruguay Struthanthus. Shrubs par.

4 S. Podopterus; plant glabrous, erect; branches terete; leaves alternate, when young angularly compressed; leaves elliptic, attenuated at both ends, feather-nerved, reticulated above; spikes axillary and terminal, flexuous, pedunculate; flowers by threes, immersed in the rachis, which is winged; corolla 6-parted, with linear lobes; anthers inserted by the base; stigma capitata. ʃ. P. S. Native of Brazil. Loranthus podopterus, Cham. et Schlecht. in Linnean. 3. p. 218. Loranthus acutus, Pohl, in litt. Leaves 3½ inches long, and ½ broad, on petioles 2 lines long. Corolla a line long.

Winged-peduncled Struthanthus. Shrubs par.

5 S. Obolongus; plant glabrous; branches terete; branchlets compressed; leaves oblong, nearly elliptic, obtuse, cuneated at the base, and 5-5-nerved; nerves slender, reticulately branched; spikes axillary, very short, few-flowered. ʃ. P. S. Native of Brazil. Loranthus oblongus, Schott. and Pohl, in litt. ex D. C. prod. 4. p. 287. Leaves 2 inches long, and 8 lines broad; petioles and spikes about 2-3 lines long. The nervation of the leaves is very distinct from the other species, but the young flowers are not described. It is probably a species of Viscum.

Oblong-leaved Struthanthus. Shrubs par.

6 S. Occidentalis; branches terete, scabrous; leaves ovate-roundish or elliptic, margined, glabrous, feather-nerved at the base, on very short petioles; spikes axillary, simple, shorter than the leaves, nearly terete; flowers almost sessile, furnished with a small very blunt bracta each; petals 6, rather connate at the base; stamens 6, 3 fertile and 3 sterile. ʃ. P. S. Native of Jamaica, on trees, and of many other of the West Indian Islands. Loranthus occidentalis, Lin. amen. 5. p. 396. Swartz, obs. 138. Schultes, syst. 7. p. 146. Sloan. jam. 2. t. 100. f. 2. Scúrrula 2. Brown, jam. 197. Leaves 15-16 lines long, and 8-9 broad. Spikes an inch long. Flowers 2 lines long. Berries roundish.

Western Struthanthus. Shrubs par.

7 S. Polystachyus; plant glabrous; branches terete, but compressed at the articulations; leaves petiolate, ovate-lanceolate, acute, thick, veiny; spikes axillary, by threes, one-half shorter than the leaves, diverging; flowers by threes, sessile, opposite; petals 6. ʃ. P. G. Native of Peru, in groves on the Andes upon trees and shrubs. Loranthus polystachyus, Ruiz et Pav. fl. per. 3. p. 50. Schultes, syst. 7. p. 155. Leaves as in many other species about 2 inches long. Flowers small, purple. Bracteas semijamilar, hardly conspicuous. Berries oval, brownish-yellow.

Many-spiked Struthanthus. Shrubs par.

8 S. Patrisii; plant glabrous; branches terete, but when young compressed; leaves opposite, petiolate, oval-oblong, obtuse at the base, acuminate at the apex, of the consistence of parchment, feather-nerved; spikes axillary, simple, shorter than the leaves; ultimate ones disposed in a terminal panicle; flowers distant along the rachis, sessile, bractless; fruit oblong, spreading, truncate at the apex. ʃ. P. S. Native of French Guiana, where it was collected by Patris. Loranthus Patrisii, D. C. prod. 4. p. 288. Leaves 4½ inches long, and 1-2 broad, rather glaucous above, and rufescent beneath, on petioles 2 lines long. Berries tetragonally compressed while young, 3 lines long. Flowers unknown, therefore it is doubtful whether it belongs to this genus or not.

Patrius's Struthanthus. Shrubs par.

Stem-clasping-leaved Struthanthus. Shrubs par.

10 S. Marginatus; plant glabrous, somewhat scandent; branches terete, when young compressed; leaves ovate-cuneate, emarginate, on very short petioles, without any lateral nerves; spikes axillary and terminal, tetragonal, rather shorter than the leaves; flowers opposite, bractless, nearly sessile; petals 6, lanceolate, distinct; anthers 6, 3 of which are acuminate and sterile, and the 3 fertile ones roundish. ʃ. P. S. Native of Hispaniola, Porto-Rico, and Guadaloupe, on the mountains, parasitical on trees. Loranthus marginatus, Swartz, prod. p. 58. fl. ind. occ. p. 625. Schultes, syst. 7. p. 152. Berries black, elongated.

Emarginate-leaved Struthanthus. Shrubs par.

11 S. Spathicus; plant glabrous; branches terete; leaves ob-
V. Struthanthus.

Native of South America, amongst the bushes and woods of Carthagen.  

Loranthus spicatus, Jacq. amer. p. 97. t. 68.  

Flowers small, red. Berries green, red at the apex.  

Schultes, syst. 7. p. 151.

Var. β. athroanths (E. Meyer, nov. act. bonn. 12. p. 788.)  

lower spikes axillary, superior ones crowded in racemes, leafless.  

P. S.

Spiked-flowered Struthanthus.  

Schultes par.

12 S. leptostachys; plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminate, rounded at the base, rather coriaceous; spikes axillary, thin or torn, 2 or 3 times shorter than the leaves; flowers sessile, scattered, distant; rachis compressed, rather quadrangular; petals 6, lanceolate-linear, spreading.  

P. S. Native of the Andes of Quindiu, between Carthagen and Buga.  

Loranthus leptostachys, H. B. et Kunth, nov. gen. amer. 3. p. 440.  

Schultes, syst. 7. p. 154.  

Leaves 5 inches long, and 2½ broad.  

Spikes 1½ to 2½ inches long.  

Flowrs hardly 2 lines long.

Slowd-spiked Struthanthus.  

Schultes par.

13 S. ovatifolius; plant glabrous, herbaceous; stem terete, quite simple, erect; leaves oval, thick, nearly veinless, on short petioles, obtuse or emarginate; spikes axillary, 1-2, twice the length of the petioles; flowers sessile, bracteolate; petals 6, linear, retroflexed at the apex.  

P. S. Native of Peru, on the Andes in groves, upon trees and shrubs.  

Loranthus ovatifolius, Ruiz et Pav. fl. per. 3. p. 50. t. 277.  

Schultes, syst. 7. p. 151.  

Herb a foot high. Flowers much crowded, small, purple.  

Berry oval, of an obscure purple colour.

Oval-leaved Struthanthus.  

Schultes par.

14 S. marginatus (Lam. dict. 3. p. 596.) plant glabrous; branches terete; leaves ovate-lanceolate, acuminate, petiolate, with scarious margins, having the middle nerve rather prominent, and the lateral ones wanting; spikes axillary, solitary, opposite, shorter than the leaves; flowers by threes in a fascicle along the rachis, bracteolate; corolla 6-parted, with linear segments; anthers very caducous; stigma capitulate.  

P. S. Native of Brazil.  

Loranthus marginatus, Lam. dict. 3. p. 596.  

Schultes, syst. 7. p. 157.  

L. avium, Pohl, in litt. Leaves 2 inches long, and 9-10 lines broad; petioles 2-3 lines long.  

Corolla 2-5 lines long.

Marginate-leaved Struthanthus.  

Schultes par.

15 S. concinnus; plant glabrous; branches slender, terete; leaves opposite, lanceolate, acuminate, membranous, shining above; spikes axillary and terminal, solitary, interrupted, shorter than the leaves; flowers by threes, opposite, sessile, somewhat verticillate, bracteate; petals 6, linear, reflexed.  

P. S. Native of Brazil.  

Loranthus concinnus, Mart. in Schultes, syst. 7. p. 150.  

Flowers a line and a half long, clavate in the unexpanded state. Anthers ovate.

Neat Struthanthus.  

Schultes par.

16 S. nitens; plant glabrous; branches terete, rooting on one side; leaves alternate, ovate-lanceolate, acuminate, shining, membranous; spikes racemose, interrupted, lower ones axillary, solitary; superior ones panicled; flowers by threes, sessile, bracteate; petals 6, linear-lanceolate.  

P. S. Native of Brazil, in the province of Rio Negro, in woods at Ega.  

Loranthus nitens, Mart. in Schultes, syst. 7. p. 150.  

Flowers a line and a half long, clavate in the unexpanded state. Anthers ovate, excavated at the side of the filaments.

Shining Struthanthus.  

Schultes par.

17 S. subcamptostachys; branches terete, beset with rusty dots at the apex, compressed; leaves opposite, ovate-elliptic, obtuse, coriaceous, nervled, glabrous; spikes 1-2, axillary, interrupted, one-half shorter than the leaves; flowers nearly opposite, by threes, sessile, bracteate, small; petals 6, linear-lanceolate.  

P. S. Native of Brazil, in the province of Minas Geraes.  

Flowers half a line long. Anthers ovate.  

Loranthus subcampestris, Mart. in Schultes, syst. 7. p. 151.

Field Struthanthus.  

Schultes par.

18 S. affinis; branches terete, compressed at the apex, and beset with rusty dots; leaves nearly opposite, ovate-elliptic, acuminate, coriaceous, nervecl, glabrous; spikes axillary, solitary, interrupted, not half so long as the leaves; flowers by threes, sessile, retroflexed, bracteate, small.  

P. S. Native of Brazil, in the woods of Japura, in the province of Rio Negro.  

Loranthus affinis, Mart. in Schultes, syst. 7. p. 151.  

Very like the preceding species.

Allied Struthanthus.  

Schultes par.

19 S. anceps; branches compressed, 2-edged, green; leaves on short petioles, elongated, ovate-obtuse; spikes on short peduncles, solitary, axillary, much shorter than the leaves; flowers small, somewhat imbricate.  

P. S. Native of Guiana.  

Loranthus anceps, Desv. in Hamilt. prod. p. 33.  

The rest unknown.

Two-edged-branched Struthanthus.  

Schultes par.

Sect. II. Protostelides (meaning unknown to us).  

Flowers of 6 petals, racemose or panicled; the branches of the panicles or racemes usually bearing 3 flowers and 3 bracteas at the apex.  

—Species all natives of South America.

20 S. ruifexus; branches terete; leaves nearly opposite, on short petioles, ovate-oblong, long-acuminate, coriaceous; spikes terminal, panicled; rachis beset with rusty dots; pedicels very short, bearing 3 flowers and 3 bracteas each; petals 6, linear, anthers roundish-ovate.  

P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura.  

Loranthus ruifexus, Mart. in Schultes, syst. 7. p. 130.  

Flowers a line and a half long, white.

Ruifexus-branched Struthanthus.  

Schultes par.

21 S. aviculiius; plant glabrous; young branches tetragonal; leaves nearly opposite, ovate, rather acuminate, coriaceous; panicles axillary and terminal, solitary, diffuse, longer than the leaves; peduncles opposite, bracteate at the base; flowers by threes, sessile, 3 bracteate; petals 6, linear-lanceolate.  

P. S. Native of Brazil, frequent, where it is called Erva de Passerinho.  

Loranthus aviculiius, Mart. in Schultes, syst. 7. p. 132.  

Flowers a line and a half long. Filaments of stamens excavated on the side at the apex.

Knot-grass-like Struthanthus.  

Schultes par.

22 S. Theobromae; branches tetragonal, but at length becoming terete, rather radican; leaves ovate, acuminate, on short petioles; panicles axillary and terminal, longer than the leaves; pedicels very short, 3-flowered at the apex.  

P. S. Native of Brazil, at Para, upon trees of Theobroma Cacao, where it is called Herba dos Passeros.  

Loranthus Theobromae, Willd.  

ex Schultes, syst. 7. p. 132.  

According to Schultes, this is probably the same as the preceding species.

Cacao Struthanthus.  

Schultes par.

23 S. virgatus; plant glabrous; branches radican, tetragonal at the apex; leaves opposite, ovate, acuminate, complicate, rather coriaceous; panicles axillary, solitary, twiggy, 3 times longer than the leaves; having the branches tetragonal, and bracteate at the base, and the brachotears short and bearing 3 flowers at the apex, and 3 bracteas; petals 6, linear-lanceolate.  

P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura.  

Loranthus virgatus, Mart. in Schultes,
syst. 7. p. 132. Flowers half a line long. Filaments of stamens excavated at the side at the apex.

*Twigg* Struthanthus. Shrub par.

24 S. *Deppeanus*; glabrous; branches rather radican; leaves almost opposite, petiolate, ovate-lanceolate, acuminate, somewhat 3-nerved; racemes 1-2, axillary; peduncles 3-flowered, bractless; flowers pedicellate; anthers linear, fixed by the base. ♂ P. S. Native of Mexico, near Jalapa. *Loranthus* Deppeanus, Cham. et Schlecht. in Linnaea. 5. p. 172. Style twisted in a circinate manner at the apex.

*Deppe’s* Struthanthus. Shrub par.

25 S. *Erythrocarpus*; plant glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, acuminate, attenuated at the base, coriaceous, vein, racemes 1-3 together, rather spicate, interrupted, axillary, and terminal: having very short branchlets, which bear 3 flowers and 3 bracteas at the apex; petals 6, linear. ♂ P. S. Native of Brazil, in the province of Rio Negro, on trees. *Loranthus* erythrocarpus, Mart. in Schultes, syst. 7. p. 138. Anthers ovate. Berries orange-coloured.

*Red-fruit* Struthanthus. Shrub par.

26 S. *Citricula*; plant glabrous; branches terete; leaves rather alternate, ovate, somewhat acuminate, and obtuse, sub-erect, vein, racemes axillary and terminal, shorter than the leaves: superior ones solitary, but the lower ones are somewhat verticillate; branches of racemes short, opposite, bearing each 3 flowers at the apex and 3 bracteas. ♂ P. S. Native of Brazil, near Rio Janeiro, on trees of the orange tribe, where it is called *Hecera de Passerinho*. *Loranthus* citricula, Mart. in Schultes, syst. 7. p. 137. Perhaps the same as *S. marginatus*.

*Orange* Struthanthus. Shrub par.

27 S. *Flexicaulis*; plant glabrous; branches sarmentose, radican; leaves almost alternate, oblong, obtuse, with a mucron, tapering at the base, flat, reflexed; racemes 1-2 together, axillary, erect, shorter than the leaves: having short, opposite, 3-flowered, tribracteate branchlets; petals 6 linear, spreading above the middle. ♂ P. S. Native of Brazil, in the fields of Taboleira, in the province of Minas Geraes. *Loranthus* flexicaulis, Mart. in Schultes, syst. 7. p. 139. Flowers yellowish, a line long, clavate in the unexpanded state.

*Bent-stemmed* Struthanthus. Shrub par.

28 S. *Polyrhizos*; plant glabrous; branches scendent, rooting; leaves subalternate, ovate, emarginate, flat, vein, racemes axillary, solitary, compound, erect, one-half shorter than the leaves: having the branchlets tetragonal, and bearing 3 flowers at the apex and 3 bracteas; petals 6, reflexed from the middle. ♂ P. S. Native of Brazil, in the province of Bahia, in the woods. *Loranthus* polyrhizos, Mart. in Schultes, syst. 7. p. 139. Flowers 2 lines long, green. Anthers ovate.

*Many-rooted* Struthanthus. Shrub par.

29 S. *Tetragueter*; plant glabrous; branches comparatively tetragonal, scendent, rooting; leaves nearly opposite, ovate, obtuse, reflexed, rather coriaceous; racemes 2-3, axillary: having very short, nearly opposite 3-flowered tribracteate branchlets; petals 6, linear, hardly reflexed, spreading. ♂ P. S. Native of Brazil, in the province of Minas Geraes, on trees. *Loranthus* tetragueter, Mart. in Schultes, syst. 7. p. 140. Flowers hardly a line long, roundish in the unexpanded state.

*Four-sided* Struthanthus. Shrub par.

30 S. *Staphyleus*; plant glabrous; branches compressed at the apex; leaves nearly opposite, ovate or emarginate, attenuated at the base, flat, coriaceous, nerved; racemes axillary, solitary, longer than the leaves: having short bent branchlets, each bearing 3 flowers and 3 bracteas at the apex; petals 6, linear, reflexedly spreading. ♂ P. S. Native of Brazil, in the province of Rio Negro. *Loranthus* staphylinus, Mart. in Schultes, syst. 7. p. 290. Flowers a line long. Anthers roundish-ovate. *Staphylea-like* Struthanthus. Shrub par.

31 S. *Cuspidatus*; plant glabrous; branches rooting, terete; leaves nearly opposite, obvoate, attenuated at the base, cuspidate at the apex, coriaceous, glaucous; racemes axillary, solitary, about equal in length to the leaves, few-flowered; having the branchlets 3-flowered at the apex, and tribracteate; petals 6, linear, reflexed from the middle. ♂ P. S. Native of Brazil, in the woods about Pianhi. *Loranthus* cuspidatus, Mart. in Schultes, syst. 7. p. 140. Flowers 2 lines long, clavate in the unexpanded state. Anthers ovate.

*Cuspidate* Struthanthus. Shrub par.

32 S. *Longipesdeculatus*; plant glabrous; branches terete; leaves opposite, oblong-ovate, acuminate, attenuated at the base, rather coriaceous, nerved; racemes axillary, solitary, longer than the leaves: with few branchlets, bearing each 3 flowers at the apex and 3 bracteas; petals 6, linear, spreading above the middle. ♂ P. S. Native of Brazil, in the province of Bahia. Flowers 4 lines long, of a pale greenish colour. Anthers ovate. *Loranthus* longipesdeculatus, Mart. in Schultes, syst. 7. p. 141. Long-peduncled Struthanthus. Shrub par.

33 S. *Syringaefolius*; plant glabrous; branches unknown; leaves opposite, petiolate, ovate, rather coriaceous, ending in a long taper point; racemes axillary, solitary, panicled, shorter than the leaves; peduncles compressed tetragonal: with the branchlets short, thick, and bearing 3 flowers at the apex and 3 bracteas; petals 6, linear. ♂ P. S. Native of Brazil, in the province of Rio Negro, in the woods. *Loranthus* syringaefolius, Mart. in Schultes, syst. 7. p. 141. Racemes 1½ to 2 inches long. The unexpanded flowers dilated into a somewhat hexagonal club. Anthers erect, hastate at the base.

*Syringa-leaved* Struthanthus. Shrub par.

34 S. *Patens*; plant glabrous; branches terete; leaves opposite, lanceolate, thin, ending in a long taper point; racemes axillary, solitary, spreading, exceeding the leaves a little; pedicels 3-flowered; flowers pedicellate; bracteas very minute, orbicular; petals 6, nearly linear, reflexed above the middle. ♂ P. S. Native of Brazil, in the province of Minas Geraes. *Loranthus* patens, Mart. in Schultes, syst. 7. p. 142. Flowers 4½ lines long, tubularly club-shaped in the unexpanded state. Anthers ovate.

*Spreading* Struthanthus. Shrub par.

35 S. *Elegans*; plant glabrous; branches terete at the base, but compressed at the apex; leaves nearly opposite, somewhat ovate, rather coriaceous, terminating in a short reflexed acumen; racemes axillary, solitary, twice the length of the leaves: having the branchlets opposite, and bearing 3 flowers at the apex, without any bracteas; petals 6, linear-lanceolate. ♂ P. S. Native of Brazil. *Loranthus* elegans, Mart. in Schultes, syst. 7. p. 144. Flowers white, a line and a half long, of a roundish club-shaped form at the apex in the unexpanded state. Anthers ovate.

*Elegant* Struthanthus. Shrub par.

36 S. *Rubens*; plant glabrous; branches terete, radican; leaves opposite, somewhat reflexed, lanceolate, attenuated at both ends, nerved, somewhat undulate; racemes shorter than the leaves: and the peduncles are trifid: branchlets short, nearly opposite, bearing 3 flowers at the apex, and 3 bracteas. ♂ P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. *Loranthus* rubens, Mart. in Schultes, syst. 7. p. 144. Flowers unknown. Berries ovate-oblung, umbilicate, 3-4 lines long.

*Reddish* Struthanthus. Shrub par.

37 S. *Polyanthos*; plant glabrous; branches terete; leaves opposite, lanceolate, mucronately acuminate, flat, coriaceous;
races axillary, many-flowered, about equal in length to the leaves: branches 3-flowered at the apex, and tribracteate; bracteas ovate, acute; petals linear, reflexed from the middle.  

**P. P. S.** Native of Brazil, in the province of Bahia, in the woods called Catingas. Loranthus polyanthos, Mart. in Schultes, syst. 7. p. 145. Flowers yellowish, 2 lines long. Anthers ovate.

**Many-flowered Struthanthus.** Shrub par.

38 **S. PANICULATUS;** plant glabrous; branches terete; floreforous branches tetragonal; leaves petiolate, ovate-elliptic, acute at both ends, rather coriaceous; panicles terminal, branched, dentate: branches very short, bearing 3 flowers and 3 bracteas at the apex.  

**P. P. S.** Native of South America, on trees near Cumana, where it is called *Paxariro.* Loranthus paniculatus, H. B. et Kunth, nov. gen. amer. 3. p. 442. Flowers unknown. Berries oblong. Loranthus tetragnos, Wildl. rel. in Schultes, syst. 7. p. 131. Perhaps the same as *S. Orinocensis.*

**Panied Struthanthus.** Shrub par.

39 **S. ORINOCENSIS;** plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminate, rounded at the base, and somewhat complicate, rather coriaceous; racemes axillary and terminal, exceeding the leaves, panically disposed, diffuse: branches short, bearing 3 bracteas and 3 flowers; flowers sessile; petals 6, linear-lanceolate, 3 of which are coherent; filaments broad; anthers adnate.  

**Orinoco Struthanthus.** Shrub par.

40 **S. PHILLIREOIDEIS;** plant glabrous; branches elongated, filiform; leaves oblong, acute, rather coriaceous, running into the short petiole at the base, veinless, with the middle nerve rather prominent beneath; peduncules axillary, rather dichotomous, 2-5 times shorter than the leaves; flowers sessile, usually by threes; tribracteate; petals 6, linear, spreading; anthers adnate, mucronate.  

**P. P. S.** Native of South America, parasitical on trees, near Cumana, where it is called by the natives *Guate-Paxariro.* Loranthus phillireoides, H. B. et Kunth, nov. gen. amer. 3. p. 439. Schultes, syst. 7. p. 122. Leaves 9-10 lines long, and 2-3 broad. Flowers small.

**Phyllirea-like Struthanthus.** Shrub par.

41 **S. MICROPHYLLUS;** plant clothed with hairy pubescence; branches terete; branches very short, bearing leaves and flowers at the apex: leaves oblong, obtuse, rather mucronate, sessile, thickish, canescent; flowers sessile, crowded, axillary, and terminal; petals 6-7, lanceolate-linear, rather concretes at the base; filaments adnate to the petals, nearly to the apex; anthers adnate, mucronate.  

**P. P. S.** Native of Mexico, near Guanacava, on the mountains. Loranthus microphyllus, H. B. Kunth, nov. gen. amer. 4. p. 291. Leaves 4 lines long and 1½ broad. Flowers hardly 2 lines long, pubescent on the outside.

**Small-leaved Struthanthus.** Shrub par.

42 **S. RARIUSCULUM;** plant glabrous; branches terete, while young angularly compressed; leaves attenuated at the base, on short petioles, obuse at the apex, nervless; peduncules axillary, opposite, trifid, 3-flowered, 3 times shorter than the leaves; petals 6, lanceolate, acute; stamina shorter than the petals.  

**P. P. S.** Native of the higher mountains of Jamaica, upon the branches of trees. Loranthus parvifolius, Swartz, prod. p. 58. fl. ind. occ. p. 628. Schultes, syst. 7. p. 120. Leaves 6 lines long, and 3 broad. Corolla 2 lines long. Berry oblong, black.

**Small-leaved Struthanthus.** Shrub par.

43 **S. rotundifolius;** stems diffuse; leaves roundish, glabrous; flowers axillary, crowded, tribracteate, hexadrous; peduncles short, many-flowered.  

**Round-leaved Struthanthus.** Shrub par.

44 **S. SYRIIFOLIUS;** glabrous, pendulous; branches terete, compressed at the nodes; leaves petiolate, oblong, obtuse, acute at the base, rather membranous, compacted; racemes axillary and terminal: branches very short, nearly opposite, tribracteate, 3-flowered; flowers sessile; petals 6, lanceolate.  

**Pear-leaved Struthanthus.** Shrub par.

45 **S. SUBROSTANUS;** plant glabrous, twining; branches terete; leaves alternate or opposite, petiolate, ovate-orbicular, ending in a short mucronate acumen, feather-nerved, shining above, coriaceous; racemes axillary, solitary, about equal in length to the leaves, or twin one shorter than the other: branches opposite, bearing 3 sessile flowers and 3 bracteas at the apex; petals 6, linear, somewhat conereate at the base; filaments a little shorter than the petals, anthers ovate, erect.  

**P. P. S.** Native of Brazil, where it was collected by Schott. Loranthus subrostanus, Pohl, in litt. ex D. C. prod. 4. p. 292. Leaves 15-18 lines long, and 10-12 broad; petioles 5-6 lines long. Corolla 3 lines long. Style filiform; stigma simple, not capitate.

**Roundish-leaved Struthanthus.** Shrub par.

46 **S. GLOMERATUS;** plant glabrous; branches terete, radiant; leaves opposite, on short petioles, ovate, ending in a short acuminate acumen, glaucous, coriaceous; peduncles very short, axillary, glomerate, bifid; flowers by threes, sessile, tribracteate; petals 6, linear, reflexed from the middle; anthers ovate; style equal in length to the petals.  

**P. P. S.** Native of Brazil, in the provinces of the Mines. Loranthus glomeratus, Mart. in Schultes, syst. 7. p. 121. Flowers yellowish green, 2 lines long.

**Gloeromate-flowered Struthanthus.** Shrub par.

47 **S. CONFERTUS;** plant glabrous; branches radiant, terete; leaves opposite, ovate or roundish, obtuse, with a short acuminate, coriaceous, nerved; peduncles axillary, crowded, dichotomous, simple; flowers by threes, sessile, tribracteate; petals 6, spreadingly reflexed, linear; anthers ovate; style one half shorter than the petals.  

**P. P. S.** Native of Brazil, on trees of the orange tribe. Loranthus confertus, Mart. in Schultes, syst. 7. p. 121.

**Crowded-peduncled Struthanthus.** Shrub par.

48 **S. Perrottetii;** plant glabrous; branches terete, but rather compressed in the young state; leaves petiolate, ovate, or oval, obtuse, coriaceous, feather-nerved; racemes twin, unequal, simple, axillary; with the branches bearing each 3 small concrete bracteas, and 3 sessile flowers; flower-buds ovate, small; berry oval.  

**Perrottet's Struthanthus.** Shrub par.

49 **S. Intermedius;** glabrous, pendulous; branches terete; leaves oblong, acute, running into the petiole at the base, rather coriaceous; racemes axillary and terminal: with short, nearly opposite, distant branches, bearing each 3 sessile flowers at the apex, without bracteas.  

**P. P. S.** Native of Mexico, near

Interrupted-spiked Struthanthus. Shrub par.

50 S. ADUNCUS: plant glabrous; branches terete, knotted, scandent; branchlets angular; leaves opposite, oblong-roundish, apiculated by a hooked point, veiny, petiolate; racemes axillary, trichotomous, or simple; flowers sessile, 3-6 together, propped by a subtriangular bract; petals 6, linear; anthers oblong. 5. P. S. Native of Guiana, on trees. Loranthus aduncus, Meyer. prim. essq. p. 149. Schultes, syst. 7. p. 147. Perhaps the racemes ought to be called spikes; or perhaps the flowers are sessile on the tops of the branchlets, not on a rachis.

Hooked-leaved Struthanthus. Shrub par.

51 S. Magdalenae: plant glabrous; branches terete, rather serpentine; leaves petiolate, ovate, acute, complicate, feather-nerved, rather coriaceous; panicles axillary, longer than the leaves, spreadingly branched; peduncles distant, bearing 3 flowers and 3 bractes at the apex; petals 6, linear; anthers erect, inserted by the base, 3 of which are drawn out in a horn? 5. P. S. Native of South America, on the banks of the river Magdalena, where it was collected by Bertero. Loranthus Magdalenae, Cham. et Schlecht. in Linnaea 3. p. 219. Wénhe Magdalenæ, Spreng. in herb. Balb. not of his syst. Leaves 20-22 lines long and 12-15 lines broad; petioles 4-5 lines long. Corolla 2 lines long.

Magdalenæa Struthanthus. Shrub par.

52 S. SESSILIS: glabrous; leaves ovate; spikes simple, solitary; flowers sessile, by three; pedicels thick, 3-flowered at the top. 5. P. S. Native of South America, in the woods of Carthagea. Loranthus sessilis, Jacq. amer. 99. Berries of reddish dirty green colour. Perhaps Loranthus sessilis, Meyer. prim. essq. p. 149 is the same as that of Jacques.

Sessile-flowered Struthanthus. Shrub par.

Mistletoe Struthanthus. Shrub par.

54 S. Pedunculatus: glabrous; branches shining; leaves cordate-ovate, ending each in a short taper point, coriaceous, shining, petiolate, feather-veined; racemes axillary, solitary, shorter than the leaves: having the rachis compressed and the branchlets 3-flowered, and the flowers pedicellate; petals 6, obtuse; stamens some of them sterile. 5. P. S. Native of the interior of Jamaica, and of Cayenne, parasitical on trees. Loranthus pedunculatus, Schwart, prod. p. 58. fl. ind. occ. 677. Schultes, syst. 7. p. 147. Loranthus occidentalis, Aubl. guian. p. 510. ex Swartz. Allied to S. occidentalis, but differs in the raceme or spike being tripartite, not simple.

Fern-flowered Struthanthus. Shrub par.

55 S. guadalupensis: glabrous; branches terete; leaves ovate, rather cordate at the base, acuminate at the apex, on very short petioles, veinless except the middle nerve; peduncles terminal, trichotomous and corymbose at the apex, about the length of the leaves; bracteae small; calyx denticulate; berry oval. 5. P. S. Native of Guadaloupe, where it was collected by Bertero. Loranthus Guadalupensis, D. C. prod. 4. p. 291. Loranthus pedunculatus, Spreng. in herb. Balb. Guadaloupe Struthanthus. Shrub par.

56 S. quercicola: glabrous; branches terete; leaves almost opposite, petiolate, ovate, acuminate, papery, reticulately veined; racemes 1-2, axillary; flowers almost sessile, by threes, opposite: anthers orbicular, fixed by the base. 5. P. S. Native of Mexico, near Jalapa, parasitical on oak and other trees. Flowers minutely bracteolate. Corolla a line and a half long. Loranthus quercicola, Cham. et Schlecht. in Linnaea. 5. p. 173.

Oak Struthanthus. Shrub par.
LORANTHACEÆ. V. STRUTHANTHUS. VI. PSITTACANTHUS. 415

leaves glabrous; branches having ovate, acute, deflexed, rather coriaceous, on short petioles, panicles axillary and terminal; with an angular rachis: and reflexed branchlets, bearing ovate, concave, deciduous bracteas, and 2-4 flowers, which stand on short pedicels; petals 6, linear, reflexed at the apex. P. S. Native of Peru, in groves on the Andes, upon trees. Loranthus retroflexus, Ruiz, et Pav. fl. per. 3. p. 49. t. 279. f. a. Schultes, syst. 7. p. 138. Leaves usually an inch and a half long and 2 inches broad; on petioles 2-3 lines long. Flowers small, purple. Berries oval, of a yellowish globose colour.

Loranthus section Oscillatiae Callanthae. D. C. prod. 4. p. 308.—Loranthus species of authors.

lin. syst. Hezändria, Monogynia. Flowers hermaphrodite, for the most part hemispherical. Calyx cup-shaped, hemispherically cyathiform, with a contracted mouth; having the border sometimes entire, and sometimes obliquely 5-6-toothed or re- pand. Petals 6, linear-spatulate, in most of the species distinct to the middle, erect, spreading, often furnished with a linear scale in the middle. Filaments filiform, rising from the base of the petals; anthers linear or oblong, fixed by the base, therefore erect: or by the back, then they are incumbent. Ovarium ovate. Style filiform; stigma capitate. Berry ovate. Pani- cles dichotomous or trichotomous, expanded or coriaceous; peduncles articulately inserted, bracteate; pedicels extended into a cup-shaped bracteole each. Flowers large, thick, deeply coloured.

P. ramificulosus; glabrous; branches terete; branchlets angular; leaves ovate, bluntish, attempted at the base; peduncles opposite, trifid, 6-flowered, spreadingly deflexed, rising beneath the leaf-bearing branches; alabastra conical; petals lanceolate-linear, acuminate; anthers versatile. P. G. Native of Mexico, parasitical on trees, on the mountains of Mahuitta. Loranthus ramificulosus, Moc. et Sesse, fl. mex. icon. inde. ex D. C. prod. 4. p. 308. Leaves 1½ inch long, and 6-7 lines broad; on very short petioles. Corolla 10 lines long, conical.

Branch-flowered Psittacanthus. Shrub par.

2 P. calyculus; glabrous; branches nearly terete; leaves opposite, ovate, or lanceolate, hardly petiolate, coriaceous, vein- less; coryms terminals, trichotomous, shorter than the leaves: having a cup-shaped bractea under each flower, as in all the rest of the species; petals 6, linear, acute; anthers versatile. P. S. Native of Mexico, about Cuacarava, where it was collected by Berlandier. Loranthus calyculus, D. C. coll. mem. vi. t. 101. Larger leaves 2 inches long and ½ broad, the rest rather smaller. Flowers of a yellowish scarlet colour, almost 2 inches long. There are 2 oblong floral leaves under each lateral branch of the coryms. Limb of calyx truncate. Allied to P. ceus. Perhaps the same as Loranthus Quaqu-chiti of Moc. et Sesse, fl. mex.

Calyculus Psittacanthus. Shrub par.

3 P. Jacquinii; glabrous; branches terete; leaves ovobovate or ovate, coriaceous, shining, on short petioles, veinless; pedun- cles axillary and terminal, cymose, shorter than the leaves: ul- timate ones trifid: having an urceolate, small bractea under each flower; petals 6, contiguous at the base, linear, revolute at the apex; alabastra curved a little; anthers oblong, versatile. P. S. Native of Jamaica, Martinique, and Brazil, parasitical on trees. Loranthus Jacquinii, D. C. prod. 4. p. 308. L. ameri- canus, Jacq. amer. p. 97. t. 67. exclusive of the synonyms. Lin. spec. 331. exclusive of the synonym of Cham. and Schlecht. in Linneae. 3. p. 210. but not of Lin. amoen. nor Swartz.

Jacquinii Psittacanthus. Shrub par.

4 P. Brasiliensis; glabrous; branches terete, compressed while young; leaves petiolate, lanceolate-ovate, obliquely nervet, thickish, shining above; peduncles trichotomous, terminal, and in the upper axis: branchlets 5-flowered; alabastra club-shaped; petals 6, linear, anthers versatile. P. S. Native of Brazil. Loranthus Brasiliensis, Desr. in Lam. dict. 3. p. 596. Schultes, syst. 7. p. 137. Habit of Avicennia tomentosa, but is perfectly glabrous. Leaves 3 or 3½ inches long, and 12-15 lines broad, on petioles 3-4 lines long. Corolla an inch and a half long.

Brazilian Psittacanthus. Shrub par.

5 P. cinctus; branches terete; leaves opposite and alternate, on very short petioles, oblong-ovate, obtuse, thick, margi- nated; racemes axillary and terminal, compound; peduncles nearly opposite, 2-flowered; bracteas cup-shaped; flowers tomentose on the outside, clavate at the apex in the unexpanded state; petals 6, nearly linear, glabrous at the base. P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loranthus cinctus, Mart. in Schultes, syst. 7. p. 134. Corolla 1 or 1½ inch long, densely clothed with coloured tomentum. Anthers oblong. Style equal in length to the petals. Stigma capitate.

Girded Psittacanthus. Shrub par.

6 P. speciosus; glabrous; leaves oblong-elliptic, or lanceo- late, bluntish, cuneated at the base, coriaceous; having the middle nerve hardly conspicuous, and the lateral veins wanting; racemes unknown; alabastra cylindrical; petals 6, linear, hardly concrete at the base; anthers versatile; stigma not capitate. P. S. Native of Brazil. Loranthus speciosus, Pohl, in litt. but not Dietr. nor Wall. Leaves 3 inches long and an inch broad; pedioles hardly any. Corolla 3 inches long. It differs from P. Brasiliensis, Lam. in the alabastra not being clavate.

Showy Psittacanthus. Shrub par.

7 P. Dicksonii; glabrous; branches terete; leaves opposite, obovate, emarginate, coriaceous, hardly veined; peduncles soli- tary, axillary, dichotomous: the branches 2-3-flowered; bractea cup-shaped, shorter than the ovarium, 1-toothed; petals 6, linear, spreadingly reflexed from the middle; anthers linear-oblong. P. S. Native of Brazil, in the province of Rio Janeiro. Loranthus Dickciss, Mart. in Schultes, syst. 7. p. 122. Flowers 18-20 lines long, scarlet, but green at the apex.

Two-coloured-flowered Psittacanthus. Shrub par.

8 P. grandiflorus; branches terete; leaves opposite, on short petioles, ovate-lanceolate, acuminate, thick; peduncles dichotomous: terminal ones 3-4: axillary ones solitary; flowers pedicellate by threes, tomentose; bractea cup-shaped, undinate; petals 6, linear, bearing each a scale on the inside at the base. P. S. Native of Brazil, in the province of Rio Negro, in the woods about Japura. Loranthus grandiflorus, Mart. in Schultes, syst. 7. p. 124. Corolla 1½ to 2 inches long, purplish? Stigma capitate-glabose.

Great-flowered Psittacanthus. Shrub par.

9 P. biternum; branches terete, rather velvety; leaves nearly opposite, petiolate, elliptic, obtuse, thick, glabrous; pe- duncles axillary and terminal; lower ones solitary, dichotomous: superior ones sub-pedicellate; flowers pedicellate, pubescent;
brectae ovate; petals 6, linear, bearing each a scale on the inside at the base; anthers oblong, versatile. Ψ. P. S. Native of Brazil. Loranthus bicornatus, Hoffmannseg, in Schultes, syst. 7. p. 124. Corolla 12-18 lines long. Three of the stamens are shorter than the rest. Style bent, with 2 knees; stigma capitate.

**Bilateralis** Psittacanthus. Shrub par.

10 P. robustus; glabrous; branches tetragonal; leaves opposite, decussate, on short petioles, oblong-obovate, obtuse, thick; peduncles terminal, and corymbose crowded in the axils of the upper leaves, 3-flowered; flowers erect, angular; bracteas nearly orbicular, short. Ψ. P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loranthus robustus, Mart. in Schultes, syst. 7. p. 125. Corolla yellow, 2-8 inches long, glabrous on the outside. Style filiform; stigma capitate. Anthers linear.

**Robust** Psittacanthus. Shrub par.

11 P. fuscatus; glabrous; branches tetragonal at the apex; leaves opposite, obovate, emarginate or obtuse, coriaceous, almost nerveless; peduncles axillary, and terminal, 1-3 together, those in the forks bearing 2-6 flowers; bracteas ovate, acutish; petals 6, cohering at the base, but spreadingly reflexed at the apex. Ψ. P. S. Native of Brazil, in woods, at the river St. Francisco. Loranthus fuscatus, Mart. in Schultes, syst. 7. p. 126. Corolla 1 or 1½ inch long, scarlet at the base, but paler towards the apex, and yellow inside. Anthers oblong, probably versatile.

**Forkeled**-peduncled Psittacanthus. Shrub par.

12 P. bicalyculatus; branches terete; leaves opposite, ovate-cordate, obtuse, somewhat stem-clasping, thick, glaucous; panicule terminal, dichotomous, bracteate; pedicels 2-3-flowered, tomentose; bracteas cup-shaped, girdling the ovarium; calyx 6-toothed; petals linear. Ψ. P. S. Native of Brazil, in the province of Bahia, in woods. Loranthus bicalyculatus, Mart. in Schultes, syst. 7. p. 128. Corolla 14 lines long, tomentose on the outside, scarlet. Style longer than the stamens; stigma capitate.

**Bicalyculate**-flowered Psittacanthus. Shrub par.

13 P. cordatus; glabrous; branches terete; leaves opposite, cordinate at the base, stem-clasping, coriaceous, ending in a long acumen, triple or quintuple-nerved; flowers racemose, panicled on the tops of the branches, and in the axils of the upper leaves; peduncles 2-flowered; rather tomentose; bracteas cup-shaped; petals 6, linear, spreading above the middle. Ψ. P. S. Native of Brazil. Loranthus cordatus, Hoffmannseg in Schultes, syst. 7. p. 128. Corolla 12-16 lines long. Anthers oblong. Stigma capitate.

**Cordate**-leaved Psittacanthus. Shrub par.

14 P. falcifrons; glabrous; branches terete; leaves opposite, sessile, oblong-lanceolate, rather falcate, triple or quintuple-nerved, coriaceous; panicle terminal and axillary, somewhat dichotomous; flowers by threes, glabrous; pedicels equal in length to the bracteas, which are drawn out into a cup, around the ovary, and much longer than them; petals 6, linear. Ψ. P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loranthus falcifrons, Mart. in Schultes, syst. 7. p. 129. Corolla golden-yellow, 14-18 lines long. Anthers oblong, yellow._There is a variety of this species having shorter, ovate-oblong, hardly falcate leaves.

**Sickle-leaved** Psittacanthus. Shrub par.

15 P. acinarus; glabrous; leaves lanceolate, acuminate, oblique, rather falcate, thick, hardly veined; cymes 5-parted, with the branchlets 3-flowered; flowers pedicellate; bracteas cup-shaped, large, truncate, nearly entire; calyx 6-toothed; petals 6, linear. Ψ. P. S. Native of Brazil, in woods in the province of Piauiba. Loranthus acinarus, Mart. in Schultes, syst. 7. p. 130. Corolla 1½ inch long, club-shaped at the apex in the unexpanded state. Anthers oblong. Stigma rather oblique.

**Acranius** Psittacanthus. Shrub par.

16 P. cucullaris; glabrous; branches terete, nodose at the joints; leaves broad-lanceolate, falcate, 5-nerved, opposite, on short petioles; peduncles axillary and terminal, bident or sub-papilate, nearly one-half shorter than the leaves: with 1-3-flowered branches; bracteas large, concave, cordate, acuminate; flowers sessile; petals 6, linear; anthers versatile. Ψ. P. S. Native of French Guiana. Loranthus cucullarius, Lam. journ. hist. nat. 1. p. 144, t. 23. Schultes, syst. 7. p. 130.

**Cucullar**-bracted Psittacanthus. Shrub par.

17 P. mexicanus; glabrous; leaves ovate-lanceolate, rather falcate, running down the short petiole in a cuneate manner at the base, 5-7-nerved, rather coriaceous; panicles axillary and terminal: with thick branchlets, bearing 3 flowers at the apex; pedicels shorter than the bracteas, which are drawn out into ovate cupula, much exceeding the ovary; petals 6, linear, acute, velvety on the outside; anthers oblong. Ψ. P. S. Native of Mexico, where it was collected by Hennke. Loranthus Mexicanus, Presl, in herb. Hennke, and in Schultes, syst. 7. p. 129. Leaves 5 inches long and ½ broad. Flowers 18-20 lines long, golden yellow in the dried state. The leaves are very similar to those of P. cucullaris, but differs in the bracteas being much smaller.

**Mexican** Psittacanthus. Shrub par.

18 P. destructur; glabrous; branches tetragonal, warted; leaves petiolate, oblong, acute, coriaceous, having the midrib nerve rather prominent beneath, the rest of the leaf veinless; racemes terminal, having the branchlets 3-flowered, approximate, secund, and bracteal; flowers pedicellate; petals 6, linear; anthers incumbent. Ψ. P. S. Native of Quito, on trees near Villa de Ibarra, where it is called Matapalo. Loranthus destructus, H.B. et Kunth, nov. gen. amer. 3. p. 485. Schultes, syst. 7. p. 135. Leaves 2 inches long and 8-9 lines broad; petioles 3 lines long. Flowers about an inch long, orange-coloured. Berries globose, black. It is very doubtful whether this is a species of the present genus from the want of bracteas.

**Destructive** Psittacanthus. Shrub par.

19 P. torquosus; quite glabrous; branches compressedly angular at the nodi; leaves elliptic-lanceolate, obtuse, on short petioles, coriaceous, feather-veined; umbels 3, 1 terminal, and 2 axillary, pedunculate; bracteas irregular; calyx re pandly truncate; corolla 6-parted, with linear lobes; anthers versatile. Ψ. P. S. Native of Brazil. Loranthus formosus, Cham. et Schlecht. in Linnaea. 3. p. 211. An intermediate species between P. Jacquinii and P. Multisii. Leaves almost alternate or opposite, 3-4 inches long, and 1-2 broad. Corolla 4 inches long, showy.

**Beautiful** Psittacanthus. Shrub.

20 P. cuneiformis; glabrous; branches terete; leaves nearly sessile, cuneiform, small, ending in a short acumen, fissile, shining; peduncles 1-3 together, axillary, 1-flowered, 3 times shorter than the leaves; bracteas cup-shaped, one under each flower; petals 6, linear, spatulate, concrete at the base; anthers versatile. Ψ. P. S. Native of Brazil and Peru, on trees and shrubs; of Chili, in valleys in the Andes of Mendoza, Cordillera of Chili, on Areñia Cauenia at Llaylay, and upon willows at Banda Oriental. Loranthus cuneiformis, Ruiz et Pav. fl. par. 3. p. 46. t. 276. f. b. Cham. et Schlecht. in Linnaea. 3. p. 212. Schultes, syst. 7. p. 118. Loranthus Montevideensis, Spreng. syst. 2. p. 128. Leaves hardly an inch long, some of them emarginately retuse at the apex. Corolla scarlet, an inch and a half long. Berries roundish, black, crowned by the urceolate calyx.

**Cuneiform-leaved** Psittacanthus. Shrub par.
21 P. cupulifer; glabrous; branches terete; leaves nearly sessile, obliquely ovate-oblong, narrowed at the apex and obtuse, reticulately somewhat veined, somewhat membranous; peduncles axillary, 2-3-flowered, unibracteate; pedicels furnished with a large cup-shaped bractea under the flower; petals 6, linear, spreading, revolute at the apex; anthers incumbent.  \* P. S. Native of Peru, near Loxa. Loránths cupulifer, H. B. et Kunth, nov. gen. amer. 3. p. 438. Schultes, syst. 7. p. 120. Leaves 5 inches long and 2 inches broad, on very short pedioles. Flowers 1 or 1 1/2 inch long, on very short pedicels. Berry elliptic, about the length of the cup-shaped bractea.

Cup-bearing Psittacanthus. Shrub par.

22 P. Plumier; glabrous; branches terete; leaves ovate (3-nerved ex Lam.) 3-7-nerved at the base, coriaceous; peduncles axillary, trichotomously corymbose, shorter than the leaves; petals 5, linear, contiguous at the base; alabaster a little curved; anthers versatile.  \* P. S. Native of the West India Islands, parasitical on trees. Loránths Plumieri, Cham. et Schlcht., in Linnae. 3. p. 311. Linocera, Plum. nov. gen. 17. t. 27. pl. amer. ed. Burm. t. 166. f. 1. Loránths, Vaill. act. acad. par. 1722. p. 201. Plumier says the flowers of his plant are composed of 6 petals, but the number of the parts of the flower is unknown.

Plumier's Psittacanthus. Shrub par.

23 P. euclalpytfoius; glabrous; branches terete; leaves petiolar, ovate, rounded at the apex, coriaceous, almost veinless; peduncles axillary, 3-flowered, shorter than the leaves; pedicels furnished with a cup-shaped bractea each under the flower; petals 6, linear, a little dilated at the apex, hardly cohering at the base; anthers incumbent.  \* P. S. Native of South America, in the province of Caracass, at Villa de Cura. Loránths euclalsipulfoius, H. B. et Kunth, nov. gen. amer. 3. p. 439. Leaves 3 inches long, and nearly 2 broad. Flowers yellow, glabrous, about 1 1/2 inch long. Schultes, syst. 7. p. 120.

Euclalpytfoius-leaved Psittacanthus. Shrub par.

24 P. crassifolius; branches terete, dotted with brown at the apex; leaves opposite, broad-ovate, obtuse, with subrevolute margins, coriaceous; peduncles axillary, 1-3-together, dichotomous; flowers twin or tern, pedicellate, tubular, the tube ventricose above the middle, and spreading at the apex, and having the throat constricted; bracteas cup-shaped, one under each flower.  \* P. S. Native of Brazil, in the province of Rio Grande, in woods about Jupara. Loránths crassifolius, Mart. in Schultes, syst. 7. p. 123. Corolla purplish, 2 and 2 1/2 inches long. Anthers linear.

Thick-leaved Psittacanthus. Shrub par.

25 P. dichotomus; glabrous; branches terete, dichotomous, 3 or 4 in a whorl; leaves usually in whorles, ovate-elliptic, rounded at the apex, coriaceous; peduncles axillary, twin, bifurcate, pendulous in the flower-bearing state, but erect in the fruit-bearing state; limb of calyx truncate; bracteas cup-shaped, one under each flower; petals 6, linear, concretes at the base, revolute spreading at the apex; anthers incumbent.  \* P. S. Native of Peru, on the Andes, in groves about Muna. Loránths dichotomus, Ruiz et Pav. fil. per. 3. p. 45. t. 274. f. a. Schultes, syst. 7. p. 123. Loránths clusiaflouis, Wildl. rel. ex Schultes, syst. l. c. Leaves 2 hands long, and a hand and a half broad. Corolla about a hand and a half long, scarlet at the base, and yellow at the top. Petioles very short.

Var. \beta. Balthasarens (D. C. prod. 4. p. 311.) petals 8-9 lines long; margins of leaves somewhat revolute, shining above, and rather glaucous; flowers red, 3 inches long; petals a little dilated at the apex.  \* P. S. Native of South America, on the banks of the Orinoco, near Balthazar. Loránths dichotomus, H. B. et Kunth, nov. gen. amer. 3. p. 433. Perhaps sufficiently distinct from the species.

Vol. III.

Dichotomous-pedunculated Psittacanthus. Shrub par.

26 P. nodosus; glabrous; branches terete, dichotomous, articulated at the nodi; leaves opposite, petiolar, ovate-roundish, coriaceous, somewhat 7-nerved at the base; peduncles axillary, and in the forks of the branches, in fascicles, 1-2-flowered, nearly the length of the petals; bracteas semi-ovate; alabaster terete, acute; petals 6, linear-lanceolate; filaments adnate a long way to the petals.  \* P. S. Native of Peru. Loránths nodosus, Desr. in Lam. dict. 2. p. 601. Schultes, syst. 7. p. 119. Leaves 2 1/2 to 4 inches long, and 2 1/2 to 3 inches broad. Corolla 3 or 3 1/2 inches long.

Knotted-branched Psittacanthus. Shrub par.

27 P. Muriisi; glabrous; branches terete; leaves 3 in a whorl, sessile, somewhat obliquely elliptic-oblong; or obovate, rounded at the apex, coriaceous; peduncles axillary, few-flowered, bractless; petals 6, linear, glabrous, concretes at the base?  \* P. S. Native of South America, near Santa Fe de Bogota. Loránths Muriisi, H. B. et Kunth, nov. gen. amer. 3. p. 439. Schultes, syst. 7. p. 124. Loránths longifolius, Mutis, ined. ex Bonpl. Leaves 2 1/4 to 3 inches long, and 1 1/2 broad. Flowers half a foot long.

Muriisi's Psittacanthus. Shrub par.

28 P. divaricatus; glabrous; branches terete, divaricate; leaves petiolar, oblong or elliptic, rounded at the apex, coriaceous, glaucous; peduncles panicled on the tops of the branches, 3-flowered, bractless; pedicels expanded into an entire cupula under each flower; petals 6, linear, glabrous; anthers incumbent.  \* P. S. Native of South America, on the banks of the Orinoco. Loránths divaricatus, H. B. et Kunth, nov. gen. amer. 3. p. 433. Schultes, syst. 7. p. 127. Flowers more than an inch long. Leaves 10-15 lines long, and 5-9 broad. Peduncles axillary and terminal.

Divaricate Psittacanthus. Shrub par.

29 P. acutifolius; glabrous; branches terete; leaves petiolate, lanceolate, very acute; racemes axillary, one-half shorter than the leaves, having the branchlets 1-3-flowered; flowers pedicellate, furnished with a common acute bractea each; petals 6, linear, somewhat spatulate, erect to the middle, and coning.  \* P. S. Native of Peru, parasitical on trees, and in hedges at Huanaaco. Loránths acutifolius, Ruiz et Pav. fil. per. 3. p. 48. t. 274. f. b. Schultes, syst. 7. p. 142. Leaves 2-3 inches long, and nearly an inch broad; petioles 2-3 lines long. Corolla white, 4-5 lines long. Berry oval, blackish.

Var. \beta. Chileanus (D. C. prod. 4. p. 314.) racemes denseflowered, almost bractless; petals erect beneath the middle, and coning, linear and acute at the apex.  \* P. G. Native of Chili, where it was collected by Haeke. Loránths acutifolius, Presl, in herb. Haeke. Perhaps a distinct species.

Acute-leaved Psittacanthus. Shrub par.

30 P. ? Eschscholziaanus; branches terete, or a little angular, rough; leaves subalternate, on very short petioles, rough, ovate or roundish, obtuse, glabrous, coriaceous; peduncles corymbose racemose, terminal and axillary, erect, for the most part 3-flowered; the middle flower sessile; bracteas ovate, fringed at the apex, equal in length to the ovaria; corolla 5-cleft, clavate; anthers fixed by the back.  \* P. G. Native of Chili. Loránths Eschscholziaanus, Mart. in Schultes, syst. 7. p. 117. Ovarium oblong. Corolla 3 lines long.

Eschscholz's Psittacanthus. Shrub par.

31 P. thyrsiflorus; glabrous; branches dichotomous or trichotomous; leaves broad-lanceolate, acutish or acuminate, with pellucid cartilaginous margins; racemes terminal and axillary; flowers 2-3, sessile at the tops of the branches; bracteas ovate, acute, one under each flower; corolla 6-parted, with linear lobes; anthers versatile.  \* P. S. Native of Brazil. Loránthus thyrsiflorus, Cham. et Schlcht. in Linnae. 3. p. 214. 3 H
LORANTHACEÆ. VI. PSITTACANTHUS.

Leaves 2 inches long, and 8-9 lines broad; pedioles 6-9 lines long. Flowers 5 lines long. Limb of calyx very narrow, truncate.

Thyreoe-flowered Psittacanthus. Shrub par.

92 P. ? Flagella'riis; glabrous, sermentose; branches terete; leaves sessile, linear, acute, coriaceous, with the middle nerve hardly conspicuous; racemes terminal, naked, erect; lower pedicels 3-flowered, superior ones 1-flowered; bracteas deciduous, one under each flower; calyx lacerated, truncate; corolla 5-6-parted, having the lobes linear and dilated at the apex; anthers versatile. P. S. Native of Brazil; of Chili, near La Punta de San Luis, at El Aquadita, and on the banks of El Rio Chorillo. Loranthus flagellaris, Cham. et Schlecht. in Linnaea. 3. p. 213. Like Loranthus cuneifolium and sermentosus, Ruiz et Pav. in fl. per. Corolla fine red, 6 lines long. Style attenuated at the apex. Leaves 20 lines long and 1½ broad.

Whip Psittacanthus. Shrub par.

93 P. Bertero; glabrous; branches terete; leaves alternate, broad, elliptic, obtuse, tapering into the short pedioles at the base, coriaceous, with somewhat revolute margins; peduncles terminal, in dense corymbose racemes; the partial peduncles 2-5-flowered; flowers tubular, with 6 linear-spatulate, nearly free segments; filaments equal in length to the petals; anthers linear-oblong, oscillatory; style filiform, angular; stigma hardly capitate; ovary roundish, exceeding the unilateral bracteas, which is roundish and denticulate at the apex. P. G. Native at Juan Fernandez, growing on Myrtus Fernandezianus. Hook. et Arn. Loranthus Berteroi, Hook. et Arn. in bot. misc. 3. p. 558. Loranthus venetus, Bertero, but not of Kunth. The partial peduncles are simple, and bear 2 flowers, or are forked, and then bear 3 or 5 flowers. The flowers are about an inch long. It is probably a species of Struthanthus.

Bertero's Psittacanthus. Shrub par.

94 P. Schiedeanaus; plant glabrous; branches subalate tetragonal, dilated at the nodi; leaves nearly opposite, on short pedioles, ovate-lanceolate, obliquely falcate, feather-veined, and somewhat triple-nerved; coriolls terminal; bracteas cup-shaped, one under each flower; limb of calyx truncate. P. S. Native of Mexico, near Jalapa. Loranthus Schiedeanaus, Cham. et Schlecht. in Linnaea. 5. p. 172. Allied to P. Jacquinii, but differs in the flowers being more slender, and about 2 inches long.

Schiede's Psittacanthus. Shrub par.

Cult. The flowers of all the species of this genus are very showy, and comparatively large. The habit is that of honey-suckle. Being all parasitical shrubs, they are not cultivable.

VII. TRISTERIX (from τριστερός, treis, three, and τέρας, pteris, a wing; in reference to the 3 bracteas to the flowers). Mart. in D. C. prod. 4. p. 671.—Loranthus species of authors.

Lin. syst. Tetra-Hexandria, Monogynia. Flowers hermaphrodite, each furnished with one bractea; bracteas sometimes lateral, and sometimes cupular and oblique. Calyx cup-shaped or campanulate, with an entire or toothed border. Petals linear-spatulate, bearing the stamens in the middle. Anthers fixed by the base, erect, linear. Style filiform; stigma capitate. Berry ovate or elliptic.—Racemes for the most part lateral, subcorymbose.

§ 1. Flowers of 4-5 petals, having a cucullate bractea under each flower.

1 D. lignustrorum; branches terete, when young, as well as the new leaves, peduncles, bracteas, and leaves pubescent; leaves petiolate, lanceolate, acuminate, coriaceous, at length glabrous; peduncles many, axillary, cymosely corymbose; bracteal laciniate, cucullate under each flower; limb of calyx almost entire; corolla tetragonal; petals 4, linear, at length spreading, flowers petaloid. P. G. Native of Nipaul, in woods in the great valley. Loranthus lignustrinus, Wall. in Roxb. fl. ind. 2. p. 219. Corolla green, 3-4 lines long. Authors nudate, ex Wall.

Green-flowered Tristerix. Shrub par.

2 T. tetraandrus; branches terete, and are, as well as the pedioles and nerves of leaves, pubescent; leaves ovate, bluish, rather coricate, coriaceous, glabrous in the adult state; coriolls nearly sessile, dense, many flowered; pedicels very short, pubescent, having 3 bracteas under each flower; corolla glabrous, 4-parted; lobes shell-formed at the apex and acute; stamens 4; anthers versatile. P. G. Native of Chili, about Tala- quano, Conception, El Valle del Rio Tingirica, and Valparaiso, parasitical on Guevina and other trees, along with Loranthus buxifolium, Cham. et Schlecht. in Linnaea. 3. p. 206. Schultes, syst. 7. p. 103. Loranthus tetrandrus, Ruiz et Pav. fl. per. 3. p. 48. t. 275. The vernacular name of this species is Quinratal ex Bertero.

Tetrandrous Tristerix. Shrub par.

5 T. aphylus; much branched; branches nearly terete, glabrous, short, leafless; flowers pedicellate, somewhat corymbose; bracteas 3 under each flower, somewhat acute; corolla glabrous, 4-parted; lobes linearly coelate at the apex; stamens 4; anthers versatile. P. G. Native of Chili, parasitical upon Cercus Peruvianus at Rancagua, Coquimbo, Guardia del Maypo, Villavicenzo in the Andes of Mendoza, Cordill. of Chili, &c. Loranthus aphylus, ex Bert. in litt. 829. Loranthus cactorum, Hook. et Arn. in Beech. voy. part. bot. 1. p. 285. Flowers like those of the preceding species. The vernacular name of this plant is Quinstral de Quisco.

Leafless Tristerix. Shrub par.

4 T. Reinwardtianus; leaves opposite, oblong, attenuated at both ends, coriaceous, veinless beneath; peduncles crowded, axillary, 1-flowered; flowers pentadactyl or tetradactyl; tube of corolla very long, curved; lobes linear, secund, at length circinnately revolute at the top. P. S. Native of Java, in woods on the mountains. Loranthus Reinwardtianus, Schultes, syst. 7. p. 105. Loranthus coccineus, Reinw. in Blum. biijdr. p. 604. but not of Jack.

Reinwardt's Tristerix. Shrub par.

Cult. The species of this genus, like the rest of the genera of this order, are not cultivable in gardens. Their habit is that of Lonicera.
11. **Pricet-like Dendrophthoe.** Shrub par.

2 D. **WALLICHIANA;** glabrous; branches terete; leaves rather alternate, ovate, obtuse, acute at the base; racemes axillary, 1-3-together, one-half shorter than the leaves, simple, in fascicles round the base of the branches; flowers small, pedicellate; bracteae lateral cucullate, one under each flower; petals 4, linear-cuneate: alabastra nearly terete; berry subglobose, reflexed; flowers tetrads. h. P. S. Native of the East Indies, where it was detected by Heyne. Loranthus Wallichianus, Schultes, syst. 7. p. 100. Loranthus polystachyus, Wall. in Roxb. fl. ind. 2. p. 217. but not of Ruiz et Pav. Corolla deep purple, 4 lines long.

**Wallich's Dendrophthoe.** Shrub par.

3 D. **ru'cher;** glabrous; branches terete; leaves nearly opposite, on short petioles, ovate-elliptic, acuminate, coriaceous, glaucous; racemes axillary, simple, many flowered, length of the leaves; bracteae cucullate, lateral, one under each flower; alabastra cylinrodially pentagonal; petals 5, free to the base, linear; flowers pentandrous. h. P. S. Native of Penang. Loranthus pulcher, D. C. prod. 4. p. 295. Loranthus speciosus, Wall. mas. but not of Pohl, nor Perr. nor Dietr. Leaves 4 inches long, and 2 broad. Corolla 2 lines long. Style filiform; stigma simple: Calyx truncate.

**Fair Dendrophthoe.** Shrub par.

4 D. **fendulis;** glabrous; branches terete; leaves opposite, petiolate, long-linear, acute, coriaceus, with 5 subparallel veins, which are hardly conspicuous; corymbus axillary, 1-2-together, pedunculate, trifid; flowers 3-flowered; bracteae ovate-roundish, lateral, one at the outer side of each flower; limb of calyx truncate; alabastra terete, cucullate; petals 5, linear, somewhat dilated at the apex; flowers pentandrous; anthers oblong, erect. h. P. G. Native of New Holland. Loranthus pendulus, Sieb. fl. nov. holl. no. 241. Schultes, syst. 7. p. 157. D. C. coll. mem. vi. t. 1. Leaves 6-8 inches long, and 5 lines broad; petioles 10 lines long. Corolla 15 lines long. Berry ovate. Style filiform.

**Pendulous Dendrophthoe.** Shrub par.

5 D. **conger;** glabrous; branches terete; leaves oblong, obuse, attenuated at the base, on short petioles, coriaceous, veinless; racemes axillary, shorter than the leaves, subcorymbose; peduncles 3-flowered; flowers pedicellate; bracteae ovate, acute, lateral, one under each flower; limb of calyx truncate; alabastra terete, somewhat club-shaped; petals 5, linear, acute; flowers pentandrous; anthers linear, inserted by the base. h. P. G. Native of New Holland. Loranthus conger, Sieb. nov. holl. no. 243. Schultes, syst. 7. p. 114. D. C. coll. mem. vi. t. 2. Leaves 2 inches long, and 4-5 lines broad. Corolla nearly an inch long. Style filiform.

**Congener Dendrophthoe.** Shrub par.

6 D. **FORSTERIANUS;** glabrous; branches terete; leaves opposite, petiolate, ovate, obtuse, veneus, thin; cymes axillary, solitary, shorter than the leaves; peduncles 3-flowered; bracteae ovate, obtuse, lateral, one under each flower; calyx truncate; alabastra terete, somewhat club-shaped; petals 5, linear, acute; flowers pentandrous; anthers linear, inserted by the base. h. P. G. Native of the Society Islands. Loranthus Forsterianus, Schultes, syst. 7. p. 114. Loranthus stelis, Forst. prod. ex specimen in lieber. Scribe. from Schultes obs. Perhaps this species does not belong to the present genus.

**Forster's Dendrophthoe.** Shrub par.

7 D. **GAUDICHAUDII;** glabrous; branches terete; leaves opposite, linear, obtuse, thickish, attenuated at the base; peduncles axillary, much shorter than the leaves, divaricate bifid at the apex, 2-4-flowered; parts of flowers equal; flowers tetrads; petals spathulate; anthers ovate, inserted by the base. h. P. G. Native of New Holland, where it was collected by Gaudichaud. Loranthus Gaudichaudii, D. C. prod. 4. p. 295.

**VIII. Dendrophthoe.**

Leaves 10-12 lines long, and 2 lines broad. Flowers 5-6 lines long. Style filiform.

**Gaudichaud's Dendrophthoe.** Shrub par.

8 D. **tetrapetalus;** leaves opposite, nearly sessile, oblong, or elliptic, coriaceous; flowers tetrandrous, one on each side of each leaf, and therefore there are 4 at each joint, disposed in a whorl; petals 4, linear. h. P. G. Native of New Zealand. Loranthus tetrapetalus, Lin. fil. suppl. 211. Forst. prod. no. 156. Schultes, syst. 7. p. 96. Calyx nearly entire. Style a little longer than the petals, filiform; stigma capitata. Bracteae wanting.

**Four-petalled Dendrophthoe.** Shrub par.

9 D. **luzonensis;** glabrous; branches terete, dichotomous or whorled, knotted at the joints; leaves opposite or verticillate, oval-oblong, coriaceous, sessile, almost veinless; peduncles terminal, cinamon-corymbose at the apex, pubescent; bracteae ovate, acute, lateral, rather concave, one under each flower; limb of calyx truncate; corolla of 4 linear acute petals, which are somewhat conicrete at the base (sometimes joined by pairs); style filiform. h. P. S. Native of Luzon, one of the Philippines. Loranthus Luzonensis, Presl. in herb. Haene, and in Schultes, syst. 7. p. 104. Leaves 11-15 lines long, and 6-7 broad. Corolla 15 lines long, hardly pubescent on the outside.

**Luzon Dendrophthoe.** Shrub par.

10 D. **pentapetalus;** glabrous, much branched; leaves opposite, petiolate, lanceolate-ovate or oval-cordate, obliquely attenuated, smooth; racemes 1-2, axillary, simple, stiff, length of the leaves; flowers very numerous, on short pedicels; bracteae oblique, oval, adpressed to the ovarium; limb of calyx nearly entire; petals 5, swelled out at the base into a fleshy triquetrous body, recurved at the apex; stamens 5; anthers obovate; style angular; berry oblong. h. P. S. Native of the East Indies. Parasitical on trees, in Silhet. Loranthus pentaphyllus, Roxb. fl. ind. 2. p. 211. Schultes, syst. 7. p. 109. Wall. pl. rar. asiat. t. 3. p. 225. Flowers regular, small, red. Berry greenish yellow. Leaves 3-4 inches long; petioles 6 lines long. Racemes 6-8 inches long, red. Anthers inserted by the base.

**Five-petalled Dendrophthoe.** Shrub par.

11 D. **? racemiferus;** branches terete, glabrous, clothed with rufous villi in the young state, as well as the peduncules; leaves opposite or alternate, on short pedioles, oblong-lanceolate, bluntness at the base, and acutish at the apex; racemes axillary, spicate, simple, length of leaves; bracteae cucullate, lateral, one under each flower; petals 4, triquetrous at the base. h. P. S. Native of the East Indies, in the Burman empire, at Amherst and Tavoy. Loranthus racemiferus. Wall. mss. Very like D. pentapetalus, but differs in the flowers being tetrandrous.

**Raceme-bearing Dendrophthoe.** Shrub par.

12 D. **coccineus;** glabrous; branches elongated; leaves alternate, on short petioles, oblong-ovate, obtuse, somewhat coriaceous at the base; spikes axillary, 1-2-together, erect, longer than the leaves; flowers sessile, with one bracteae under each; limb of calyx nearly entire; corolla tubular; petals 4, linear, dilated at the base; anthers adnate; flowers tetrandrous. h. P. S. Native of the East Indies, in Singapore. Loranthus coccineus, Jack, mal. misc. t. 1. p. 8. and in Roxb. fl. ind. 2. p. 215. Schultes, syst. 7. p. 192. Corolla scarlet. Berry ovate. Said to be allied to D. pentapetalus.

**Scarlet-flowered Dendrophthoe.** Shrub par.

§ 2. Flowers tubular, slender, 4-cleft, disposed in racemes, with one bractea under each flower. Many of the plants in this section are probably species of Scurrula.

13 D. **obrectus;** branches terete; branchlets compressed, velvety, as well as the young leaves; leaves opposite, on short
petioles, elliptic-lanceolate, at length glabrous; flowers in fascicles from the axils of the leaves, velvety from dense rufous pubescence, as well as the racemes and peduncles; bractlets lateral, ovate, one under each flower; limb of calyx hardly any; corolla tubular, arched: lobes 4, oblong; anthers erect. H. P. S. Native of the Burmese Empire, on Mount Taung-Dong, near Ava. Loranthus obtectus, Wall. mss. Leaves 2 inches long and an inch broad; petioles 1½ inch long. Corolla 4-cleft, 10-11 lines long. Stigma hardly capitate.

Covered Dendrophthoe. Shrub par.

14 D. recoursus: branches terete, adult ones glabrous; leaves alternate, petiolate, elliptic, obtuse, acute at the base, smoothish; peduncles axillary and lateral, branched, 2-3-flowered, and are, as well as the flowers, velvety; flowers recurved; bracttes broad, obliquely cupulate, one under each flower; limb of calyx cup-shaped, toothed; alabastra terete; lobes 5, oblong; flowers tetrandrous. H. P. G. Native of the East Indies, on the Nelligeherry mountains, where it was collected by Noton. Loranthus recurvens, Wall. mss. Leaves 2 inches long and 1½ lines broad; petioles 3-4 lines long. Alabastra 6 lines long. Anthers oblong, inserted by the base. Style filiform. Stigma slightly capitate.

Reduced-flowered Dendrophthoe. Shrub par.

15 D. lepideus: branches terete, while young as well as the leaves white from velvety down; leaves opposite, or rather alternate, petiolate, oval, obtuse at both ends, at length glabrous; racemes short, axillary, and arc, as well as the flowers, velvety from white tomentum; tube of corolla long, terete, somewhat incurved: lobes 4, nearly equal, spreading; flowers tetrandrous. H. P. S. Native of the Burmese empire, at the river Irrawaddy, near Yenangon. Loranthus leptanthus, Wall. mss. var. rotundifolia, D. C. coll. mem. vi. t. 5. Corolla 4-cleft, 15-17 lines long. Anthers linear, erect. The species is allied to D. pulverulentus.

Dlicate-flowered Dendrophthoe. Shrub par.

16 D. ferrugineus: branches long, pendulous, densely clothed with ferruginous down when young, as well as the under side of leaves, pedicels, calyces, and corollas; leaves opposite, on short petioles, elliptic, obtuse, coriaceous, glabrous above; peduncles 1-4 together in the axils of the leaves, 2-6-flowered; bracteas small, adpressed to the ovary, one to each; corolla tubular, deeply 4-parted; berry ovate; flowers tetrandrous. H. P. S. Native of the East Indies, in Pulo-Penang, Singapore and Sumatra. Loranthus ferruginosus, Roxb. fl. ind. 2. p. 297, Jacq. mal. misc. 1. p. 9. Schultz, syst. 7. p. 98. Corolla densely clothed with rusty hairs, 7 lines long.

Rusty Dendrophthoe. Shrub par.

17 D. graciliflorus: branches compressed, at length terete, glabrous; leaves opposite, on short petioles, elliptic-oblong, acute at both ends, at length glabrous; racemes axillary, 5-7-flowered, somewhat umbellate; bracteas lateral, small, acute, one under each flower; corolla white from velvety down, slender, 4-lobe: lobes linear. H. P. S. Native of the East Indies, in Silhet. Loranthus graciliflorus, Wall. mss. Loranthus gracilis, Schultz, syst. 7. p. 99. Leaves an inch and a half long, and 6-9 lines broad. Corolla 5 lines long, 4-cleft, with the tube tetragonal at the base. Anthers inserted by the base. Allied to D. lignustrinus.

Slender-flowered Dendrophthoe. Shrub par.

18 D. Heynei: branches terete, glabrous in the adult state; leaves opposite, on short petioles, oval, bluntish, rather velvety beneath from rufescence down; peduncles axillary, in fascicles, or branched, much shorter than the leaves, and are, as well as the flowers, clothed with rufous velvety down; bracteas lateral, small, one under each flower; corolla very slender, tubular, terete, 4-lobe: lobes oblong, short. H. P. S. Native of the East Indies. Loranthus Heynei, Wall. mss.

Heyne's Dendrophthoe. Shrub par.

19 D. atropurpureus: branches nearly terete, somewhat canescent; leaves nearly opposite, oval, obtuse at both ends, rather oblique at the base, and undulate below; white from scurf beneath; racemes crowded, axillary; limb of calyx quite entire, very short; flowers 4-parted; fruit subcuneatus.

Dark-purple Dendrophthoe. Shrub par.

20 D. repandus: branches somewhat compressed, clothed with rusty lepidotened down; leaves nearly opposite, oval or obtuse, obtuse equal at the base, repand, clothed with leprous fuscous down beneath; racemes crowded, axillary; corolla slender, 4-toothed, covered with brown scurf on the outside: lobes or teeth short, equal. H. P. S. Native of Java, in temperate places. Loranthus lepidotus, Schultz, syst. 7. p. 100. but not of Blume. Loranthus melanostemon, Reinw. ined. ex Schultz, syst. 7. p. 100. Loranthus Schultesii, Blume, in litt. 1829. fl. jav. 2. t. 2. Flowers brownish. Anthers black.

Schultes's Dendrophthoe. Shrub par.

21 D. schulzii: branches terete, clothed with lepidotened rusty down on the top; leaves nearly opposite, obtuse at both ends, or rather coriaceae at the base, pale, and ochraceously lepidotened beneath; racemes crowded, axillary; flowers 4-parted, rusty on the outside. H. P. S. Native of the interior of Java, in temperate places. Loranthus lepidotus, Schultz, syst. 7. p. 100. but not of Blume. Loranthus melanostemon, Reinw. ined. ex Schultz, syst. 7. p. 100. Loranthus Schultesii, Blume, in litt. 1829. fl. jav. 2. t. 2. Flowers brownish. Anthers black.

Sphenoid-flowered Dendrophthoe. Shrub par.

22 D. sphenoides: branches terete, glabrous; leaves nearly opposite, cuneiform, roundly obtuse, when young covered with rusty scurf, at length glabrous on both surfaces; peduncles crowded, axillary, bearing 3-5 flowers, in fascicles; alabastra terete, globose at the apex, hardly 4-toothed. H. P. S. Native of Java, in the province of Bantam, on trees. Loranthus sphenoides, Blum. in litt. 1829. fl. jav. 2. t. 4. Loranthus atropurpureus var. cuneatus, Blum. ibid. p. 600. Very nearly allied to D. atropurpureus, but differs in the figure of the leaves, and in the shorter more crowded peduncles.

Sphenoid-flowered Dendrophthoe. Shrub par.

23 D. cinnamomeus: branches terete, young velvety from rufous down, as well as the peduncles and flowers; leaves opposite, on short petioles, lanceolate, acute, glabrous; flowers 5-5 in a fascicle in the axils of the leaves, on short pedicels; corolla elavate, truncate at the apex; style elongate. H. P. S. Native of the East Indies, in Silhet. Loranthus cinnamomeus, Wall. mss. D. C. coll. mem. vi. t. 6. Leaves 27 lines long and 10-11 broad. Corolla 6-7 lines long.

Cinnamome-coloured Dendrophthoe. Shrub par.

24 D. chrysanthus: branches terete, glabrous, compressed when young; leaves oval, on short petioles, blunt at both ends, or rather coriaceae at the base, covered with fuscous scurf; but when young clothed with dense ferruginous tomentum, as well as the branches and flowers; peduncles solitary or crowded, axillary, bearing 3-5 flowers; corolla cymular, truncate at the apex; style elongate. Anthers 4. H. P. S. Native of Java, on the mountains in the province of Bantam. Loranthus chrysanthus, Blum. in litt. 1829. cx D. C. prod. 4. p. 300. Allied to D. cinnamomeus, but the flowers are shorter.

Golden-flowered Dendrophthoe. Shrub par.

25 D. cuneatus: branches terete, velvety from rufous down while young, as well as the leaves and flowers; leaves opposite or alternate, obovate-cuneated, very blunt, at length glabrous;
peduncles axillary, 3-5-flowered; bracteas lateral, cuneate, one to each flower; corolla cylindrical, truncate at the apex; style clavate. Ḥ. P. S. Native of the East Indies, at Martaban, on the banks of the Irrawaddy. Loranthus cuneatus, Wall. mss. Heyne, ex Roth, nov. spec. p. 193. Anthers probably 5, but in the younger flowers they are glued together, and with the stigma. Corolla 6 lines long, velvety on the outside. This, with the preceding species, may hereafter form a distinct genus, or at least a separate section.

Cuneated-leaved Dendrophthoe. Shrub par.

Cult. Like the rest of the genera of this order, the species are not cultivated in gardens. They are showy plants, with the habit of honesuckle.

IX. PTHIRIUSA (from φθίριος, φθείρειον, to destroy; the species destroy the trees on which they grow). Mart. in D. C. prod. 4. p. 672. Loranthus, sect. Clandestini, D. C. prod. 4. p. 287.

Lin. syst. Tetrándria, Monogynia. Flowers hermaphroditic, 4-parted, furnished with 3 jagged bracteas each, some of them crowded in the axils of the leaves. Anthers fixed by the back, ovate. Styles short; stigma capitate. Berry ovate. Flowers small, axillary, sessile, or in axillary racemes.

1 P. Clandestina; glabrous; branches compressedly tetragonal while young; leaves opposite, obovate, coriaceous; flowers axillary, solitary, sessile, small; petals 4, concave; anthers ovate; berries oblong. Ḥ. P. S. Native of Brazil, in the province of Para, in woods. Loranthus clandestinus, Mart. in Schultes, syst. 7. p. 96. Flowers hardly half a line long; bracteas suborbicular, jagged, one under each flower. Stamens shorter than the petals, but equal in length to the style. The anthers are said to be almost sessile.

Clandestine-flowered Pthirusa. Shrub par.

2 P. Salicifolia; branches compressedly tetragonal above; leaves opposite, lanceolate, acuminate, glaucous, coriaceous; racemes solitary, axillary, 3 times shorter than the leaves; pedicels 3-flowered, short, bearing 3 bracteas at the apex; petals 4, linear-lanceolate; anthers roundish-ovate. Ḥ. P. S. Native of Brazil, in the province of Minas Geraes. Loranthus salicifolius, Mart. in Schultes, syst. 7. p. 102. Flowers small, probably dioecious.

Willow-leaved Pthirusa. Shrub par.

3 P. Lucarquensis; plant glabrous, much branched; branches terete; leaves petiolate, roundish-elliptic, acute, rounded at the base, somewhat membranous, veiny, with the middle nerve rather prominent; racemes axillary and terminal, few-flowered; flowers almost sessile, scattered, bracteal; petals 4, oblong, rather concave; anthers unknown. Ḥ. P. S. Native of Peru, in temperate parts near Lucarque. Loranthis Lucarqueensis, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 102. Leaves an inch long, and 9-10 lines broad; petioles 4-5 lines long. Racemes 3 lines long. Flowers minute, of a whitish yellow colour.

Lucarque Pthirusa. Shrub par.

Cult. The species of this genus do not possess any beauty, and are not cultivable in the gardens.

X. SCCURRULA (a diminutive of Squarria, a parasite; plants parasitical on trees). Loranthus, sect. iii. Sc hourlla, D. C. prod. 4. p. 501.

Lin. syst. Tetra-Pentándria, Monogynia. Flowers hermaphrodite. Petals 4-5, joined together into a long tube, which is divided at the apex into 4 or 5 short unilateral lobes, usually gibbous at the base, opening by a longitudinal fissure as in Lobélia. Stamens 4-5; filaments adhering a long way to the corolla, but free at the apex; anthers fixed by the base, seldom by the back, to the top of the filaments, oblong, erect. Style filiform or clavate; stigma capitate. Peduncles axillary, few-flowered, or racemose, having a solitary bractea under each flower, which is usually pressed to the ovary.

§ 1. Flowers tetraedrous. Corolla 4-parted.

1 S. Roxburghii; branches terete, glabrous; leaves opposite, ovate, subcordate, white from soft down beneath; peduncles crowded in the axils of the leaves, very short, simple or branched, 1 or few-flowered; bractea adpressed to the ovary, which is turbinate; alabastra cylindrical, 4-lobed at the apex, and having the tube cleft longitudinally. Ḥ. P. S. Native of Malabar, and probably of China, if the synonyme of Linnæus does not appertain to S. Chinensis. Loranthus Scourrula, Lin. spec. 472. Roxb. cor. 2. t. 140. Corolla of a rusty grey colour and mealy on the outside, but dark purple inside.

Roxburgh's Scourrula. Shrub par.

2 S. Chinensis; branchlets and young leaves clothed with rusty villi: the rest glabrous; leaves opposite, ovate, on short petioles, coriaceous, obtuse, cuneated at the base; peduncles axillary, very short, bearing 2-5 umbellate pedicellate flowers; bractea ovate, small, under the ovary; limb of calyx truncate; corolla clavate, and curved in the bud, cleft longitudinally on one side; lobes of corolla 4, linear, short, reflexed. Ḥ. P. G. Native of China, where it was collected by Sir George Staunton. Loranthus Chinensis, D. C. coll. mem. vi. t. 7.

Chinese Scourrula. Shrub par.

3 S. Pulverulentum; the younger parts of the plant are clothed with mealy stellate tomentum; branches terete; leaves opposite, petiolate, broad-ovate, acute, at length glabrous; racemes lateral, tomentose, in fascicles; flowers pedicellate; tube of corolla long, terete, curved, cleft at the apex into 4 short unilateral reflexed lobes. Ḥ. P. G. Native of Nipaul, on trees at Hetaouana, and along the banks of the river Rapti. Loranthus pulverulentus, Wall. in Roxb. fl. ind. 2. p. 321. Schultes, syst. 7. p. 99. Petioles an inch long. Leaves 5-7 inches long. Corolla more than an inch long, mealy outside. Berry large, club-shaped, mealy.

Powdered Scourrula. Shrub par.

4 S. Fasciculata; glabrous; branches terete; leaves opposite, or somewhat verticillate, obovate, veiny above, but veinless beneath, coriaceous; fascicles lateral, few-flowered; lobes of corolla 4, reflexed, secedum; style longer than the exserted stamens. Ḥ. P. S. Native of Java, near Linga Jattie, in the province of Cheribon, on trees. Loranthus fasciculatus, Blum. bijdr. p. 661. Loranthus odoratus, Blum. bijdr. p. 663. does not differ from this species according to the author.

Fascicled-flowered Scourrula. Shrub par.

5 S. Fuscus; glabrous; branches terete, rather angular in the young state; leaves opposite, on short petioles, obovate, and oval, acute at the base, coriaceous, beset with rusty dots beneath while young; peduncles axillary, 1-2-flowered; corolla cleft on one side, having 4 erect lobes. Ḥ. P. S. Native of Java, on Mount Salak and Gede, on trees. Loranthus fuscus, Blum. bijdr. p. 600. Genitals dark purple. Stigma capitate. See Blum. bat. verhandl. 1823. p. 190.

Fuscus Scourrula. Shrub par.

6 S. Umbellifer; glabrous; branches terete; leaves opposite, oblong-lanceolate, on short petioles, acute at the base; peduncles in fascicles, axillary, and lateral, pubescent, 3-flowered, subumbellate; corolla very long, slender, cleft into 4 linear reflexed segments at the apex; stigma cleft. Ḥ. P. S. Native of Nipaul, on Mount Shecopore. Loranthus umbellifer, Schultes, syst. 7. p. 97. Loranthus umbellatus, Wall. in Roxb. fl. ind. 2. p. 222. but not of Roth. Corolla of a bright red colour, curved, pubescent. Peduncles clothed with ferruginous tomentum.

Umbel-bearing Scourrula. Shrub par.

7 S. Cordifolia; branches terete, villous, mealy while young;
leaves opposite, ovate-cordate, obtuse, villous on both surfaces, petiolate; racemes fascicled, villous, axillary; corolla tubular, clavate, villous, cleft at the apex into 4 short lanceolate lobes.

8. S. buxifolia; branches terete, rusty, of short peduncles, glabrous above, and clothed with fine velvety down beneath; fascicles of flowers axillary, on short peduncles, hardly longer than the pedi
cles; bracteas ovate, small, one under each flower; tube of corolla arch
ed, clothed with rusty velvety down, cleft into 4 linear-cu
nated unequal lobes. \( \text{S. buxifolia, Desr. in Lam. & Wall. \text{d. t. 3. p. 600.}} \) Schultes, syst. 7. p. 97.

**Budelia-like Scurrula.** Shrub par.

9. S. biflora; glabrous; branches terete; leaves petiolate, ovate-roundish, thickish; peduncles axillary, 1-2, biform, a little shorter than the petioles; bracteae ovate, girding the base of the o
varium; bud of corolla slender, somewhat clavate at the apex, arch
ed, clothed with rufous velvety down. \( \text{S. biflora, Desr. in Lam. & Wall. \text{d. t. 3. p. 600.}} \) Schultes, syst. 7. p. 110. Corolla 4-lobed.

**Two-flowered Scurrula.** Shrub par.

10. S. philippensis; branches terete, velvety from short down when young, as well as the peduncles, bracteas, calyxes, and corollas; leaves on short peduncle, oval, rather pubescent, obtuse at both ends; flowers few, in fascicles, axillary, on short pedi
cels; bracteae ovate, concave, small, under the o
varium; limb of calyx truncate; corolla cylindric, cleft into 4 linear nearly equal lobes at the apex; style filiform. \( \text{S. philippensis, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Leaves 3 inches long and an inch broad. Corolla 7-8 lines long. Stigma small, capitate. Anthers linear, erect.

**Philippine Scurrula.** Shrub par.

11. S. vestita; branches terete; peduncles, under side of leaves, peduncles, bracteas, and flowers, clothed with rusty, mealy, velvety, stellate tomentum; leaves oblong-lan
ceolate, acute, shining above, and glabrous; fascicles of flowers numerous, on short peduncles in the axils of the fallen leaves; bracteae ovate, concave, small under the o
varium; limb of calyx somewhat 4-toothed; corolla cylindric, 4-lobed; lobes of corolla 4, linear, unilateral, reflexed. \( \text{S. vestita, Desr. in Lam. \text{d. t. 143.}} \) Wall. \text{p. l. rar. asiatic 3. t. 220.} Plant stout. Fascicles numerous, few-flowered, in the axils of the fallen leaves. Cor
olla cylindrical, with a subglobular apex before expansion, afterwards its limb bursts into 4 linear reflexed segments. On the outside the flower is rust or cinnamon coloured, and within purple and smooth. Berry oblong, tomentose.

**Clothed Scurrula.** Shrub par.

12. S. levis; branches terete, glabrous, when young compressed; leaves petiolate, opposite, elliptic-oblong, obtuse, villous, smooth; peduncles axillary, branched, 7-8-flowered, 4 times shorter than the leaves, and are, as well as the flowers, rather velvety from rusty down; bracteae lateral, small; tube of corolla terete, cleft on one side: lobes 4, oblong. \( \text{S. levis, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla 4-lobed.

**Smooth Scurrula.** Shrub par.

13. S. rufula; branches terete, glabrous in the adult state, but when young angularly subcompressed; leaves opposite, peti
olate, elliptic-oblong, acutish, glabrous, or clothed with rufous velvety down on the nerves beneath; bracteae lateral, small, con
vex; corolla with a terete tube, and 4 oblong lobes. \( \text{S. rufula, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla 4-lobed.

14. S. lepidota; branches terete, compressed while young, beset with velvety dots at first, but at length glabrous; leaves nearly opposite, oval, beset with rusty dots beneath; corolla 4-lobed, curved, elongated, covered with rusty dots; lobes reflexed, unilateral. \( \text{S. lepidota, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla nearly an inch and a half long.

**Wrinkled-leaved Scurrula.** Shrub par.

15. S. rugulosa; glabrous; branches rather compressed, but at length terete; leaves opposite or alternate, on very short pedi
cles, obovate-lanceolate, obtuse, glaucous, rufescens, with smooth rather pubescent margins; racemes axillary, oppo
site, simple, shorter than the leaves; bracteae concave, one at the side of each o
varium; corolla tubular, arch
ed: limb of 4 lanceolate lobes. \( \text{S. rugulosa, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla nearly an inch and a half long.

**Club-flowered Scurrula.** Shrub par.

16. S. corynitis; leaves opposite, broad-lanceolate; flowers axillary, few, aggregative, tetradas; corolla irregular, 4-1
obed; berry clavate. \( \text{S. corynitis, Desr. in Lam. \text{d. t. 218.}} \) Wall. \text{p. l. rar. asiatic 3. t. 220.}

**Obovate-leaved Scurrula.** Shrub par.

\( \text{§ 2. Flowers pentandrous. Corolla 5-lobed.} \)

* Species natives of Africa.

18. S. thomningii; branches terete, compressed at the apex; leaves petiolate, ovate, somewhat acuminate, coriaceous, glabrous and dark green above, somewhat canescent beneath from almost imperceptible down, as well as the branches; peduncles 1-3, axillary, short, bearing each 3-4 umbellate flowers on short pedal
cels; bracteae small, ovate, lateral, one under each pedicel; fru
it ovate. \( \text{S. thomningii, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla 4-lobed.

**Thomning's Scurrula.** Shrub par.

19. S. rufulus; branches terete, rather compressed at the apex; young leaves, peduncles, and flowers clothed with rusty down; leaves petiolate, ovate, obtuse at both ends, coriaceous; peduncles 1-3 together, shorter than the petals, bearing 2-3 1-flowered pedicels; bracteae lateral, oblong, 1 under each pedicel; flow
er-bud pentagonal at the apex; fruit ovate. \( \text{S. rufulus, Desr. in Lam. \text{d. t. 3. p. 204.}} \) Schultes, syst. 7. p. 110. Corolla 4-lobed.

**Rufulus Scurrula.** Shrub par.

20. S. sessilifolia; glabrous; branches terete, simple; leaves sessile, opposite, ovate-roundish, cordate at the base; flowers
many in the axils, fascicled, sessile, deflexed; corolla tumid at the base, narrowed above, cleft longitudinally, hence it is expanded into a 5-lobed ligula on one side. \( \gamma \). P. S. Native of Africa, at Koto or Keta. *Loranthus sessilifolius*, Beauv. fl. d'ov. p. 8. t. 23. Schultes, syst. 7. p. 108. The anthers are delineated in the figure versatile.

**Sessile-leaved Scurreda.** Shrub par.

21 S. *Belvisi*; glabrous; branches simple, terete; leaves on short petioles, nearly opposite and alternate, broad ovate-lanceolate, acute; peduncles very short, axillary, numerous, fascicled, 1-flowered, deflexed; corolla tumid at the base, narrowed above, cleft laterally, expanded into a 5-lobed ligula at the apex; anthers somewhat versatile. \( \gamma \). P. S. Native of America, in the kingdom of Waree, at Chama or Sama. *Loranthus Belvisi*, D. C. prod. 4. p. 303. *Loranthus lanceolatus*, Beauv. fl. d'ov. 2. p. 8. t. 64. Schultes, syst. 7. p. 108. but not of Ruiz et Pav.

*Belvisi's Scurreda.** Shrub par.

22 S. *Pentagonia*; glabrous; branches terete; leaves on short petioles, ovate or lanceolate, coriaceous, almost veinless, glaucous; flowers 4-5, in the axils of the leaves, sessile, crowded; bracteas calyceiform under the ovary; corolla tumid at the base, and contracted under the middle, clavate, and pentagonal at the apex before expansion, but at length expanded into a 5-lobed ligula; filaments flexed; style tymid and pentagonal under the apex; stigma capitale. \( \gamma \). P. S. Native of Senegal, on trees. *Loranthus pentagonia*, D. C. coll. mem. vi. t. 8. This species is easily distinguished from the rest in the form of the style and flower-bud. *It is very like S. Belvisi.*

**Pentagonal-leaved Scurreda.** Shrub par.

23 S. *Dodoneaeformia*; glabrous; branches terete; leaves on short petioles, elongated, oblong-linear, obtuse, attenuated at the base, thick and coriaceous, glaucous, almost nerveless; flowers 2-3 together, sessile, crowded; bracteas cup-shaped, one under each ovary; alabastra cylindrical; corolla tumid at the base, but somewhat constricted above, expanded into a 5-lobed ligula at the apex; filaments flexed; style tymid at the apex and pentagonal; stigma capitata. \( \gamma \). P. S. Native of Senegal, on the trunks of tamarind trees. *Loranthus dodoneaeformia*, D. C. coll. mem. vii. t. 9. Allied to S. *Pentagonia*.

**Dodonea-leaved Scurreda.** Shrub par.

24 S. *Olyca*; glabrous; branches terete; leaves alternate, opposite, and in 3 in a whorl, oblong or ovate-oblong, obtuse, covered with a glaucous bloom; peduncles axillary, erect, bearing each 3 flowers at the apex, on short pedicels; corolla rather tumid at the base, constricted in the middle, and divided at the apex into 5 linear revolute lobes; anthers linear, erect. \( \gamma \). P. G. Native of the Cape of Good Hope. *Loranthus glaucus*, Thumb. fl. cap. p. 285. but not Ruiz et Pav. Schultes, syst. 7. p. 104. Moquiniâ rupra, Spreng. ex Zeyh. in herb. Moricand. Habit almost of *S. oleofolia*, but differs in the anthers being long and linear, not oval, and in the stamens being free, not concretes.

*Var. \( \beta \)*, Burchellii (D. C. prod. 4. p. 303.) leaves more remote and narrower, and less glaucous in the dried state. \( \gamma \). P. G. Native of the Cape of Good Hope. *Burchellia* cat. pl. afr. austr. no. 2887.

**Glaucus Scurreda.** Shrub par.

25 S. *Oleofolia*; branches terete; leaves opposite, oblong, silky, bluntish, feather-nerved; peduncles axillary, very short, bearing each 3 almost sessile flowers at the apex; corolla tumid at the base, and narrowed above, tubular, 5-lobed: lobes short, deflexed; stamens monadelphous; anthers oblong, fixed by the base. \( \gamma \). P. G. Native of the Cape of Good Hope. *Loranthus oleofolia*, Cham. et Schlecht. in Linnaea. 3. p. 209. Lichtensteinia oleofolia, Wendl. coll. 2. p. 4. t. 39. *Loranthus speciosus*, Dietr. Corolla red. Ovarium 1-celled; cell pentagonal, 1-seeded, ex Cham. et Schlecht. not 5-seeded.

**Olive-leaved Scurreda.** Shrub par.

26 S. *Cane'scens*; every plant of the part is cane-scent; leaves oval, obtuse, small. \( \gamma \). P. S. Native of the Cape of Good Hope, in arid places on the branches of Lycium. *Loranthus cane'scens*, Burch. cat. geogr. 1119. trav. afr. 2. p. 90.

**Canescent Scurreda.** Shrub par.

27 S. *Clava*; glabrous; branches terete; leaves opposite, on short petioles, oval, obtuse, coriaceous, almost veinless, rusty beneath; peduncles many, crowded, very short, in the axils of the leaves, dilated under the apex into a somewhat discoid bractea; limb of calyx 5-toothed; alabastra cylindrical, clavate; corolla at length cleft laterally, 5-lobed; style strictly angular. \( \gamma \). P. S. Native of Madagascar. *Loranthus clavata*, Lam. dict. 3. p. 598. but not of Roxb. Schultes, syst. 7. p. 106. Filaments of stamens adunate a long way to the corolla; anthers oblong, erect, terminal.

**Clavate-leaved Scurreda.** Shrub par.

* * Species natives of Asia.*

28 S. *Henkeana*; glabrous; branches terete; leaves petiolate, lanceolate-oblong, obtuse or acuminate, coriaceous, obliquely veined; peduncles from the forks of the branches erect, bearing 3-flowered pedicles; bracteas ovate, concave, one under each ovary; calyx pubescent, entire; corolla tubular, cleft laterally on one side: lobes 5, linear, reflexed. \( \gamma \). P. S. Native of the island of Luzon. *Loranthus Henkeana*, Presl, in herb. Henke, ex D. C. prod. 4. p. 304. Schultes, syst. 7. p. 113. Leaves 3-6 inches long, and 1½ to 2 inches broad, on petioles 8-10 lines long. Corolla 3-4 lines long, glabrous. Calyx reddish.

* Henke's Scurreda. Shrub par.*

29 S. *Malifolia*; glabrous; branches terete; leaves ovate, acute, petiolate, coriaceous, oblanceolate, oblong, obtuse or acuminate, crenate, obliquely veined; peduncles from the branches erect, bearing 3-flowered pedicles; bracteas ovate, concave, one under each ovary; calyx pubescent, entire; corolla tubular, cleft nearly at the middle, and somewhat laterally cleft; lobes linear, reflexed. \( \gamma \). P. S. Native of the island of Luzon. *Loranthus malifolius*, Presl, in herb. Henke, ex D. C. prod. 4. p. 304. Schultes, syst. 7. p. 113. Perhaps sufficiently distinct from *S. Henkeana*.

**Apple-leaved Scurreda.** Shrub par.

30 S. *Longiflora*; glabrous; leaves ovate-oblong, obtuse, veiny, coriaceous; upper ones rather cordinate at the base; racemes axillary, simple, short, suberosembrose; bracteas concave, one under each ovary; limb of calyx 5-toothed: corolla pale, cleft, and contracted beneath the limb; lobes unequal, cuneate. \( \gamma \). P. S. Native of Malabar and Pondicherry. *Loranthus longiflorus*, Desr. in Lam. dict. 3. p. 408. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 112. Wall.-Iti-canni, Rheed. mal. 10. p. 5. t. 4. Flowers purple, curved, 20 lines long. Anthers linear, inserted by the base.

**Long-flowered Scurreda.** Shrub par.

31 S. *incarnata*; plant while young beset with deciduous stellate down; leaves alternate, on short petioles, broad-ovate, acute, nervèd; racemes rising beneath the leaves, hoary from wool; flowers nearly sessile, each furnished with 1 bractea; limb of calyx 5-toothed; tube of corolla gibbous at the base, but contracted a little above the base; limb 5-parted: lobes reflexed; stigma clavate. \( \gamma \). P. S. Native of the East Indies, in the island of Pulo Nias. *Loranthus incarnatus*, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 111. Leaves 9 inches long. Corolla above 2 inches long, slightly tomentose without, pale rosy, with a greenish limb; tube gibbous below, contracted a little above the base, then widening upwards till it suffers a
second contraction before expansion into the limb, which is about a fourth the length of the tube, 5-parted, with reflexed segments. Berry mealy, ovate, 1-seeded. This is a beautiful species. 

**Loranthaceæ. X. Scurrula.**

32 S. elegans: glabrous; branches terete; leaves opposite, or nearly alternate, oblong, obtuse, somewhat euneated at the base, with undulated margins, almost veinless, coriaceous; racemes axillary, short, or nearly terminal, linear, 5-7-flowered; corolla terete, somewhat incurved, 5-lobed; lobes linear, spreadingly reflexed, nearly equal; style exerted beyond the anthers. *P. S.* Native of the East Indies, near Yenangenn. Loranthus elegans, Wall. cat. no. 530. Leaves 2 inches long, and 9 lines broad. Corolla glabrous, an inch and a half long, red. Antlers linear, erect. Calyx truncate. Bracteas lateral, small, one under each ovary. 

**Elegant Scurrula.** Shrub par. 

33 S. cylindrica; glabrous; leaves alternate, petiolate, lanceolate, acute at both ends, smooth, nervied; racemes axillary, stiff, length of the leaves; flowers pedicellate, rather distant from each other, each girdled at the base by a bractea on the outer side; limb of calyx almost entire; limb of corolla much longer than the tube, which is cylindrical, with reflexed segments. *P. S.* Native of Sumatra. Loranthus cylindricus, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4-5 inches long; petals about an inch long. Corolla red, perfectly cylindrical, before expansion, 5-petalled: limb reflexed, 3 times as long as the tube; petals linear, separating almost to the base. Ovarium cylindrical, 1-seeded. Flowers sometimes tetrandrous.

**Cylindrical-flowered Scurrula.** Shrub par. 

34 S. indic a; glabrous; branches terete; leaves nearly opposite, oblong, obtuse, on short pedicles, bluntish, feather-nerved; racemes axillary, or nearly terminal, solitary, simple, shorter than the leaves; flowers on short peduncles, each peduncle bearing 1-3 sessile flowers at the top, each flower propped by an ovate bractea; petals 5, linear, acute, hardly concretes at the base: the border reflexed; anthers linear, erect. *P. S.* Native of the island of Timor, and probably elsewhere in India. Loranthus Indicus, Desr. in Lam. dict. 3. p. 601. Schultes, syst. 7. p. 149. D. C. prod. 4. p. 305. Lonicera Zeylanica, Gaertn.fruct. 1. p. 137. t. 27. *Corolla purple, glabrous, 7-8 lines long. Leaves 3 inches long, 1 or 1½ broad, on petioles, which are 2-3 lines long. Berry ovate.* 

**Indian Scurrula.** Shrub par. 

35 S. tubinata; glabrous; branches terete; leaves sub- alternate, on short pedioles, oval or oblong, obtuse or acutish, thick; peduncles axillary, 2-3-cleft, much shorter than the leaves; bracteas ovate, one under each ovary, which is turbinate; limb of calyx unequally and bluntly 5-toothed. *P. S.* Native of the East Indies, on the Nelligerry mountains, where it is called Mandjil, along with other species, by the natives. Loranthus tubinatus, D. C. prod. 4. p. 305. Leaves 3 inches long, and 12-15 lines broad; petals 5-6 lines long. Corolla unknown, and is only judged to belong to the present section of the genus in the calyx being said to be 5-parted. 

**Turbinate-fruiting Scurrula.** Shrub par. 

36 S. dicolor; glabrous; leaves nearly opposite, on short pedioles, from oval to lanceolate, thick, undulated, hardly veined; racemes axillary, simple, solitary, many flowered; bracteas concave, cordate, small, one adpressed to each ovary on the outer side; calyx cup-shaped, with an entire border; corolla long, tubular, a little curved, swelling from the bottom to within a third of the mouth, then contracting a little, with a 5-parted border; upper fissure much the deepest; lobes linear, reflexed towards one side; stigma clavate; berry oblong, smooth, 1-celled, 1-seeded. *P. S.* Native of the East Indies, frequent on trees. Loranthus bicolor, Roxb. cor. 2. p. 19. t. 139. fl. ind. 2. p. 205. Schultes, syst. 7. p. 109. D. C. prod. 4. p. 305. Flowers the size and appearance, and much like those of a honeysuckle, red at the base, and green at the apex, nearly 1½ inch long. Anthers exerted, linear, fixed by the base. Leaves from 5-6 inches long; and from ½ to 1 inch in breadth. 

**Two-coloured-flowered Scurrula.** Shrub par. 

37 S. falcat a; glabrous; branches terete; leaves opposite, on short petioles, linear, glaucous, coriaceous, obtuse, laterally falcate; racemes axillary, few-flowered; bracteas short, one under each ovary on one side; alabastra falcate, cylindrical, pentagonal at the apex; lobes of corolla 5; anthers linear-oblong, inserted by the base. *P. S.* Native of Madras. Loranthus falcatu s, Lin. fil. suppl. 211. Schultes, syst. 7. p. 150. The flowers are fusilous according to Linnaeus. 

**Falcat-e-flowered Scurrula.** Shrub par. 

38 S. venosa; glabrous; branches terete; leaves subalternate or opposite, oval, attenuated at both ends, coriaceous, having the veins blood coloured beneath; racemes axillary, much shorter than the leaves, rather conics; limb of calyx somewhat 5-toothed; tube of corolla more or less cleft on one side; lobes 5, reflexed, unilateral; berries oblong-conical. *P. S.* Native of Java, at Buitenzorg, upon trees. Loranthus venosus, Blum. bijdr. p. 668. bat. verh. 1823. p. 188. Corolla 4-5 lines long. Leaves variable in form. Style a little longer than the stamens; stigma ciliate. Antlers linear, adnate. Blum. l. c. 

**Venous Scurrula.** Shrub par. 

39 S. pentandra (Lin. mant. p. 63.) glabrous; branches terete; leaves alternate, on short petioles, oblong, bluntish, thickish; racemes axillary, solitary, few-flowered, and are, as well as the flowers, covered with velvety mealy down; bracteas ovate, one under each ovary; limb of calyx bluntly 5-toothed; bud of corolla cylindrical; petals 5, linear. *P. S.* Native of Java, on trees. Loranthus pentandrus, Lin. mant. p. 63. Blum. bijdr. p. 661. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4 inches long, and an inch broad. Corolla 7 lines long, purplish inside. Anters erect. 

**Var. β, flavus (Blum. bijdr. p. 661. under Loranthus) racemes crowded; tube of corolla inflated. *P. S.* Native of Java, on trees, about Buitenzorg. 

**Pentandra Scurrula.** Shrub par. 

40 S. amplexifolia; glabrous; branches terete; leaves sessile, opposite, cordate at the base, orbicular, coriaceous, marginate; flowers racemos; bracteas rather concave, orbicular, one under each ovary on one side; corolla cylindrical, contracted under the apex; lobes oblong. *P. S.* Native of the East Indies, on the Nelligerry mountains, where it was collected by Noton. Loranthus amplexifolius, D. C. prod. 4. p. 305. Loranthus amplexicaulis, Wall. mss. but not of Kunth. Corolla 15 lines long, of a brownish purple colour. Anters linear, erect. Calyx truncate. Upper leaves 2 inches in diameter. 

**Clositating-leaved Scurrula.** Shrub par. 

41 S. heteranth a; glabrous; branches terete, angular while young; leaves alternate, on short petioles, elliptic or lanceolate, somewhat attenuated at both ends, thick, and coriaceous; racemes axillary, length of the leaves; pedicles twice the length of the calyx; bracteas convex, short, one under each ovary on the outside; bud of corolla nearly straight, somewhat pentagonal: with 5 linear lobes; anthers erect, linear, twice the length of the filaments. *P. S.* Native of the East Indies, at Martaban. Loranthus heteranthus, Wall. cat. no. 537. Leaves 4 inches long, and 15-18 lines broad. Flowers 8-10 lines long. Calyx truncate.
Variable-flowered Scurrula. Shrub par.
42 S. FLELO'SGA; leaves alternate, oval, obtuse, tapering a little at the base, glabrous, of the consistence of parchment; racemes axillary; flowers secund; tube of corolla very long, clavate, angular.  P. S. Native of Java, near Tjiradjas. Loranthus prelongus, Blum. bijdr. p. 664. Schultes, syst. 7. p. 112. Allied to S. clavata and S. longiflora. Tube of corolla yellow, nearly 3 inches long; lobes linear, channelled inside, greenish.

Longest-flowered Scurrula. Shrub par.
43 S. CURVATA; leaves opposite or alternate, oblong, bluntish, acute at the base, coriaceous, rather veiny, glabrous; racemes axillary, solitary; tube of corolla elongated, curved; lobes reflexed.  P. S. Native of Java, on Mount Salak, parasitical on trees. Loranthus curvatus, Blum. bijdr. p. 665. Schultes, syst. 7. p. 110. Tube of corolla nearly 1½ inch long, yellow, but having the limb of a pale orange colour. Anthers adnate, elongated.

Curved-flowered Scurrula. Shrub par.
44 S. BRACTEATA; every part of the plant clothed with grey starry tomentum; branches terete; leaves small, alternate, ovate, obtuse, tapering to the base, on rather long petioles; umbels axillary, 5-flowered; bracteas oblong, tongue-shaped, one under each ovarium; corolla long, slender, cylindrical at the base, but widening at the apex, with the throat contracted: lobes linear, unilateral, much shorter than the tube.  P. S. Native of the East Indies. Loranthus bracteatus, Heyne, in Roxb. fl. ind. 2. p. 220. Loranthus Heyneanum and L. tomentosus, Schultes, syst. 7. p. 105 and 106. Loranthus tomentosus, Roth, nov. spec. p. 191. Umbels densely villous; pedicels one-third of an inch long.

Bracteate Scurrula. Shrub par.
45 S. GOODENIEFOLIA; branches terete, glabrous; leaves alternate, obovate-cuneated, obtuse, somewhat emarginate, tapering into the petioles at the base, rather veiny, glabrous in the adult state, but canescent in the young state from stellate deciduous down; peduncles axillary, 2-5-flowered; bracteas ovate, acute, one under each ovarium; tube of calyx pubescent, with 5 rather ciliated teeth; corolla cylindrical, cleft on one side: lobes 5, linear, reflexed, unilateral; style filiform.  P. S. Native of the East Indies, on the Nellibehery mountains, where it is called Mandjil, and where it was collected by Leschenault. Loranthus goodenii-folius, D. C. prod. 4. p. 306. Very nearly allied to S. lobelii-florea.

Goodenia-flowered Scurrula. Shrub par.
46 S. LOBELIEFLOREA; glabrous; branches terete; leaves obovate-cuneated, obtuse, tapering into the petioles, sparingly veined; pedicels 1-2, axillary, 1-flowered, very short, spreading; bracteas ovate, acute, one under each ovarium; tube of calyx cylindrical, cleft on the inner side: lobes 5, linear, reflexed, unilateral; style filiform.  P. S. Native of the south of India, where it is called Vira-marum and pile-riey by the natives, and where it was collected by Leschenault. Loranthus lobelieflorus, D. C. prod. 4. p. 306. Leaves an inch long, and 4 lines broad. Corolla an inch long, red in the dry state. Loranthus cuneatus, Roth, nov. spec. p. 193.

Lobelia-flowered Scurrula. Shrub par.
47 S. ELASTICA; glabrous; branches strong, columnar: internodes short; leaves sessile, thick, ovate, acutish, obscurely 5-nerved; flowers almost sessile, in fascicles about the joints; tube of corolla cylindrical: having the limb beaked before expansion; segments linear, short, separating from the base upwards, revolute.  P. S. Native of Malabar. Loranthus elasticus, Desr. in Lam. dict. 3. p. 599. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 107. Belutta-Itti-canli, Rheed. mal. 10. p. 7. t. 3. The leaves are remarkably thick, and appear both trinerved and triple-nerved.

Elastic-flowered Scurrula. Shrub par.
48 S. REINWARDTIANA; leaves opposite, oblong, attenuated at both ends, coriaceous, veinless beneath; peduncles crowded, axillary, 1-flowered; tube of corolla very long, curved: lobes linear, unilateral, at length cincinnately revolute.  P. S. Native of Java, on the mountains. Loranthus Reinwardtianus, Schultes, syst. 7. p. 105. Loranthus coccineus, Reinw. in Blum. bijdr. p. 664. but not of Jack.

Reinwardt's Scurrula. Shrub par.
49 S. KENIGIANUS; glabrous; leaves nearly opposite, on short petioles, elliptic, veiny; racemes axillary; pedicels decollated, calyx rather truncate; corolla 5-clawed, clavate.  P. S. Native of the East Indies. Loranthus Kenigianus, Agardh, in Schultes, syst. 7. p. 108.

Kenig’s Scurrula. Shrub par.

Cult. The species of this genus are easily distinguished from the rest that are broken off from the old genus Loranthus in the tube of the corolla being curved, and bulged at the base on one side, as in Lobelia, cleft longitudinally on the upper side, and the segments all leaning to the lower side, and reflexed. The plants have the habit of honeysuckle, but are not cultivable.

XI. ELYTRANTHE (from elypor, elytron, a case or sheath, and anther, anthers, a flower; in reference to the joined bracteas forming a sheath under the flower). Lepoestegères and Elytranthe species of Blum. in litt. 1829. Loranthus species of authors. Loranthus, sect. iii. Symphýanthus, § 1-2-3 and s. C. prod. 4. p. 296-299.

LIN. SYST. Penta-Hexandria, Monogynia. Flowers hermaphrodite, pentameros or hexameros. Petals 5-6, joined together into a tube to the middle, and therefore divided to the middle into a 5-6 cleft regular limb. Stamens 3-6: filaments adnate to the petals at the base, and free at the apex; anthers fixed by the base, erect. Style filiform; stigma obtuse. Racemes axillary: flowers bracteate. — This genus differs from Struthanthus in the corolla being gamopetalous, and from Denrophëbe, to which it comes nearest, in the flowers being race-mose, not corymbose, and in each flower being usually furnished with more bracteas than one, which are not cup-shaped nor oblique, as in that genus; it also differs from Scarrule in the limb of the corolla being regular, not as in that genus unilateral; and from Loxanthora in the antlers not being oscillatory.

§ 1. Anguliflora (from angulus, an angle, and flos, a flower; the flowers are more or less hexagonal from crests at the base). Flowers tubular, usually twined at the base, and more or less hexagonal from crests, dividing into 6 lobes to the middle; anters erect. Bracteoles 3, joined together under each flower.

1 E. Retusa; glabrous; leaves opposite, on short petioles, obovate-oblong, coriaceous, retuse, or emarginate, with the lateral nerves indistinct; racemes short, usually solitary, rising from the axis of the fallen leaves; flowers pedicellate, each furnished with 1-2 bracteas at the base; limb of calyx entire; tube of corolla clavate, gibbous, and angular, contracted at the limb: lobes 3-6, lanceolate, reflexed.  P. S. Native of the Island of Singapore. Loranthus retusus, Jack, in Roxb. fl. ind. 2. p. 212. Schultes, syst. 7. p. 112. The plant fastens itself by long runners to trees. Leaves smooth, about 3 inches long. Margin of calyx entire. Tube of corolla clavate, gibbous, and angled above, rosy, suddenly contracted at the limb, which is yellowish green, having the lobes or segments shorter than the tube.

Retuse-leaved Elytranthe. Shrub par.
2 E. Ampullacea; glabrous; leaves opposite, on short petioles, oblong, polished; racemes axillary, solitary or in pairs, much shorter than the leaves; flowers opposite, on short pedi-
LORANTHACEÆ. XI. ELYTRANTHE.

cels; bracteas ovate, one at the base of each pedicel, and 2 others pressing the base of the germ, like an inferior bilabiate calyx; limb of calyx entire, rotate; corolla with a gibbous tube, and a 6-cleft regular border, the divisions revolute, and rather spatulate; anthers ovate, longer than the corolla; stigma large; berry long, oval. P. S. Native of the New Indies, in the forests of Silhet, but seems to prefer the Mango trees to all others. Loranthus ampullaceus, Roxb. fl. ind. p. 209. Leaves 3-4 inches long, and rather less than 2 inches broad. Flowers pretty large, greenish yellow. Berry yellow, size of a currant.

_Ampullaceae_ Elytranthe. Shrub par.

3 _E. carinata;_ glabrous; leaves opposite, petiolate, elliptic, somewhat acuminate; racemes spiked, 7-flowered, 3 times longer than the pedicels; bracteas 3, subconcrete under each flower; limb of calyx clearly shorter than the pedicel. P. S. Native of the New Indies, Martaban, and at Cheppedon. Loranthus carinatus, Wall. Orc. ind. 2. p. 3. Very like _E. ampullaceus._

4 _Little-leaved Elytranthe._ Shrub par.

5 _E. subglobose;_ glabrous; primary branches somewhat verticillate, rather compressed while young; leaves opposite, on short petioles, lanceolate, tapering at both ends; racemes axillary, and from the caticries of the fallen leaves, 2-3-angled, sessile, one-third shorter than the leaves; pedicels 1-flowered, remote; bracteas 3, rather concret under each ovarium; tube of corolla slightly ventricose, bluntly 6-angled: having the limb divided regularly into 6, rarely into 5 linear-clavate reflexed segments, which are nearly as long as the tube, their inside rugose, their extremity broad, concave, acute. P. S. Native on trees in the forest of Konkurrum, in the valley of Nipaul. Loranthus viridisflorus, Wall. in Roxb. fl. ind. 2. p. 219. Leaves smooth, about 3 inches long, rather conspicuously reticulated, less coriaceous than in most other species. Flowers green, rather remote, with the tube an inch and a half long. Filaments attached to the segments of the corolla, running down to their base. Style filiform; stigma rugose. Berry small, ovate.

Green-flowered Elytranthe. Shrub par.

5 _E. subglobose;_ glabrous; branches terete; leaves opposite, linear-oblong, on very short petioles, attenuated at both ends; peduncles axillary, simple, 3 times shorter than the leaves; bracteas trifiid, or 3 concretc ones under each flower; tube of corolla inflated, ovate, hexagonal; the limb divided into 6 linear-oblong erect segments. P. S. Native of the New Indies, on the banks of the Irawaddy, parasitical on trees. Loranthus subglobose, D. C. prod. 4. p. 297. Leaves 3 inches long, and 8 lines broad. Corolla 5 lines long, and the tube 3 lines in diameter. Anthers erect. Stigma small, capitulate.

Subglobose-flowered Elytranthe. Shrub par.

5 _E. fallax;_ glabrous; branches terete, compressed while young; leaves opposite, on short petioles, ovate, ending in a short blunt acumen, coriaceous, rather glaucescent; racemes axillary, short, few-flowered; bracteas lateral, ovate, small, one under each ovarium; flower-bud hexagonal at the base, having the tube at length broadly obconical: lobes 6, reflexed from the middle. P. S. Native of the island of Pulo-Penang. Loranthus fallax, Wall. cat. no. 523. Leaves 3 inches long, and usually about 2 inches broad.

_Pale Elytranthe._ Shrub par.

7 _E. viridiflora;_ glabrous; branches terete, when young rather compressed; leaves oblong, attenuated at both ends, opposite, on short petioles, stiff, rather glaucescent; peduncles axillary, short, few-flowered; flowers unknown; bracteas lateral, rounded, one under each ovarium; berries ovate. P. S. Native of the island of Pulo-Penang. Loranthus oleoides, D. C. prod. 4. p. 297. Loranthus oleifolius, Wall. miss. but not of Cham. et Schlecht. Allied to _E. fallax._ ex Wall.

_Olive-like Elytranthe._ Shrub par.

8 _E. globose;_ plant glabrous, branched; leaves opposite, though sometimes alternate, and 3 in a whorl, oblong, coriaceous, smooth, almost veinless; racemes or spikes axillary, or between the leaves, or from the axils of the fallen leaves, generally solitary, but sometimes 2-3 together, much shorter than the leaves; flowers sessile, opposite, from 3-6 pairs on each spike; bracteas no other than the perianth of the fruit, but according to D. C. the corollas are rather limb of calyx truncate; tube of corolla gibbos, 6-sided: limb 6-parted: segments regular, reflexed; berry round-oval, size of a pea. P. S. Native of the New Indies, throughout Bengal on trees. Loranthus globosus, Roxb. fl. ind. 2. p. 206. Leaves 3-2 inches long. Flowers small, of a greenish orange colour. Perianth of the flower inferior, 2-leaved, the under and exterior corolla, the inner bidentate: that of the flower no other than the circular margin of the pit, which receives the flower. Filaments inserted at the base of the segments of the corolla. Berry smooth, size of a pea, when ripe the pulp is yellow, clamy, and elastic.

_Globose-flowered Elytranthe._ Shrub par.

_Showy Elytranthe._ Shrub par.

10 _E. spilerocharpa;_ glabrous; branches terete; leaves on short petioles, opposite, ovate-oblong, coriaceous, veinless beneath; racemes axillary, solitary or twin; flowers angular. P. S. Native of Java, about Buitenzorg, Batavia, &c. on trees, where it is called _Mengando,_ as well as many other species, by the natives. Loranthus spilerocharpa, Blum. bijdr. p. 661. and bat. verhandl. 1823. p. 139. Schultes, syst. 7. p. 149. Tube of corolla angular: flower-bud 5 lines long.

_Round-fruited Elytranthe._ Shrub par.

11 _E. tata;_ glabrous; leaves opposite, petiolate, elliptic-ovate, coriaceous, smooth, acutish; panicles axillary, or rising beneath the leaves, shorter than the leaves; bracteas 2 or 3, embracing the ovarium; limb of calyx entire; tube of corolla acutely 6-angled, equal in length to the segments of the limb, which are 6, narrow, and revolute. P. S. Native of the interior of Bencoolen, on trees. Loranthus tatus, Jack, in Roxb. fl. ind. 2. p. 214. Schultes, syst. 7. p. 135. Leaves about 3 inches long. Corolla green, tipped with light red, and with a purplish tinge towards the base: having the tube clavate and dilated upwards. Stigma capitate. Berry subglobose.

_Spreading-panicled Elytranthe._ Shrub par.

12 _E. Cochinchinensis;_ glabrous, much branched; leaves opposite, ovate-lanceolate, acute; peduncles axillary, many-flowered, crowded, furnished with 3 concretc bracteas under each flower; tube of corolla hexagonal, with 6 linear-lanceolate lobes, which burst elastically, and become revolute; stigma capitate; berries ovate. P. G. Native of Cochinchina, on trees in gardens. Loranthus Cochinchinensis, Lour. coo. p. 195. Flowers greenish yellow. Berry yellowish red.

_Cochin-china Elytranthe._ Shrub par.

13 _E. avensis;_ glabrous; branches terete; leaves opposite, narrow-lanceolate, coriaceous, glabrous, veinless; peduncles crowded, axillary, usually 2-flowered; flowers angular, hexan-

14 E. tetragona; glabrous; branches tetragonal; leaves opposite, sessile, oval, acute or obtuse, of the consistence of parchment, glabrous; racemes crowded, axillary; flowers angular, hexandrous. † P. S. Native of Java, on trees about Tjiradjas, in the province of Kwang. Loranthus tetragonus. Blum. bijdr. p. 663. Schultes, syst. p. 7. p. 149. Corolla 3 lines long. Tetragonal-branched Elytranthe. Shrub par.

15 E. subumbellata; leaves opposite, oblong-lanceolate, long-acuminated, coriaceous, glabrous; racemes axillary, ultimate pedicels subumbellate; flowers hexandrous. † P. S. Native of Java, on trees near Tjiradjas, in the province of Kwang. Loranthus subumbellatus, Blum. bijdr. p. 662. Schultes, syst. p. 7. p. 148. Allied to E. sphaerocarpa, and is, as well as it, called Mengando by the natives of Java. Subumbellate-flowered Elytranthe. Shrub par.

§ 2. Rigidiflora (from rigidus, stiff, and flo, a flower; flowers stiff). Flowers pentandrous, tubular, eleft into 5 parts beyond the middle, having the lobes reflected from the middle; tube obconical, hardly pentagonal. Anthers erect. Bracteas one under each flower.

16 E. rigida; glabrous; branches terete, rather compressed when young; leaves opposite, petiolate; elliptic-lanceolate, acuminate; racemes axillary, simple, 7-flowered; flowers on short pedicels; bracteas ovate, lateral, one under each ovarium; calyx expanded, somewhat denticulated; tube of corolla ovate at the base; lobes linear-oblong, reflected from the middle. † P. S. Native of the East Indies, at Amberst. Loranthus rigidus, Wall. cat. no. 531. Leaves 2-3 inches long, and 18-18 lines broad. Corolla 9 lines long, finely velvety, as well as ovarium. Anthers linear. Flower-bud pentagonal at the apex. Stiff Elytranthe. Shrub par.

17 E. farinosa; glabrous; branches terete; leaves alternate, smooth, coriaceous, ovate, obtuse, on thick short petioles; racemes in axillary fascicles, clothed with much mealy stalkless whitish tomentum; tube of corolla ventricose, divided two-thirds of its length into 5 linear semi-recurred segments; berry large, ovate, slightly famstone. † P. S. Native of the East Indies, at Singapore. Loranthus farinosus, Desr. in Lam. dict. 3. p. 597. Wall. in Roxb. fl. ind. 2. p. 221. Schultes, syst. p. 111. D. C. coll. mem. vii. t. 4. Leaves nearly as large as a hand, with unequal margins, having the nerves remote and a little elevated. Flowers of a bright red colour, densely clothed with stalkless tomentum, which is easily rubbed off; they are about an inch long, having the tube wide. Mealy Elytranthe. Shrub par.

§ 3. Cupulata (from cupula, an acorn cup; in reference to the shape of the bractea, which surrounds the ovarium). Flowers small; bud of corolla equal at the base, terete, but globose and pentagonal at the apex; limb of 5 equal regular lobes. Anthers ovate, truncate, inserted by the base, dehiscing laterally. Stigma capitate. Bracteas cup-shaped, one girding or surrounding each ovary.

18 E. cupulata; branches terete, somewhat compressed at the apex; young petioles, leaves, peduncles, and flowers clothed with rusty down; leaves petiolate, ovate or oblong, acutish, coriaceous, more or less coriaceous at the base; peduncles very short, branched, umbrellately many-flowered; bracteas cup-shaped, one girding each ovary. † P. S. Native of Casamania, on the trunks of trees. Loranthus cupulatus, D. C. prod. 4. p. 298. Flowers 2-3 lines long. Branches clothed with rusty villi. Leaves variable in size and form. Berry obovate-globose. Lower part of the tube of the corolla cylindrical.

Cupular-bracted Elytranthe. Shrub par.

§ 4. Involutarâî (the flowers are involucrated with bracteas). Flowers tubular, 5-6-cleft. Anthers erect. Bracteas many, crowded, constituting an involucrum around the flowers, which are subcapitate.

19 E. involutarâî; glabrous; branches shining; leaves opposite, on short petioles, ovate-cordate, smooth; umbels axillary, nearly sessile, much shorter than the leaves, 4-flowered, involucrated by 4 bracteas; bracteas ovate-lanceolate, smooth, entire; calyx villous, with a 5-toothed border; tube of corolla villous, widening towards the mouth; limb regular, 5-parted, with linear-revolute segments; anthers oval; stigma 2-lobed. † P. S. Native of the East Indies, on the eastern border of Bengal; parasitical on trees. Loranthus involutarus, Roxb. fl. ind. 2. p. 209. Schultes, syst. p. 7. p. 106. Leaves 3-4 inches long. Flowers pentandrous. Stems equaling the segments of the corolla, and inserted on them below the middle. Ovarium silky. Style rather longer than the corolla. Var. $\beta$, hebeclada (D. C. prod. 4. p. 298. under Loranthus) branchlets angular, velvety from pale rusty down. † P. S. Native of Silhet. Wall. in fl. ind. p. 209. Corolla 6 lines long, villous on the outside, not gibbous at the base; lobes 5 equal. Anthers oval, inserted by the base. Involucrate-flowered Elytranthe. Shrub par.

20 E. gemmiflora; glabrous; branches tetragonal; leaves opposite, broad-ovate, or oval, obtuse, coriaceous; buds (imbricated involucra) axillary, solitary, sessile, many-flowered. † P. S. Native of Java, in woods on the mountains. Loranthus gemmiflorus, Blum. bijdr. p. 665. Schultes, syst. p. 159. Lepeostegæ gemmiflorus, Blum. in litt. This species is called Mengando by the Javanese. Flowers in capitulate heads, sessile, densely crowded upon the dilated tops of the peduncles. Anthers subulate, ex Blum. and the berries are pedicellate.

Bud-flowered Elytranthe. Shrub par.

21 E. loniceroides; glabrous; leaves almost sessile, ovate to lanceolate, attenuated, obtuse, rounded at the base; peduncles opposite, longer than the petioles, bearing each a head of a few sessile, hexandrous flowers, and each head supported by 4 broad-ovate, acute, concave bracteas; corollas long, tubular, slender, having the limb irregularly eleft into 5 cuneate spreading segments. † P. S. Native of the East Indies. Loranthus loniceroides, Lin. spec. 473. exclusive of the synonyme of Pluknet. Wall. in Roxb. fl. ind. 2. p. 216. Loranthus coriaceus and lonicerolodes, Schultes, syst. 7. pp. 107 and 108. Loranthus coriaceus, Desr. in Lam. dict. 5. p. 597. The flowers, according to Wallich, are hexandrous, but according to Lamarex pendentous. It is perhaps a species of Scirrula, on account of the irregular flowers. Honey-suckle-like Elytranthe. Shrub par.

22 E. ? umbellatus; leaves opposite, ovate-lanceolate; umbels axillary, opposite, on short peduncles, few-flowered; bracteas opposite, orbicular under each flower; limb of calyx truncate; corolla tubular; with 6 linear obtuse segments; anthers linear. † P. S. Native of the East Indies. Loranthus umbellatus, Roth. nov. spec. p. 192. but not of Wall. Schultes, syst. 7. p. 155. Flowers deep purple, glabrous, coriaceous.

§ 5. Elytranthes (from elytron, a sheath or case, and anthos, a flower; in reference to the large bracteas)

211
forming a sheath to the flowers). *Flowers tubular, 6-cleft, hexandrous; lobes of limb linear, acute. Flower-buds nearly terete. Anthers erect. Flowers sessile, and decussate along the rachis of the spikes, furnished each with 3 bracteas, one under the flower and two opposite lateral combined ones; all large, concave, and deciduous."

23 E. \( L. \) (Blum, in litt. 1329.) glabrous; branches compressed; leaves opposite, oval-oblong, acute, coriaceous; spikes axillary, on short peduncles, sub-capitate, each bearing 4 decussate, tribracteate flowers. \( \frac{2}{3} \). P. S. Native of Java, in woods on the mountains. \( L. \) albidos, Blum. bijdr. p. 665.

\section*{Whitish Elytranthe. Shrub par.}

24 E. \( L. \) omninutus; branches terete, straight; leaves spathulately linear, thickened at the apex; peduncles nutate, somewhat secund. \( \frac{2}{3} \). P. S. Native of Brazil, on the banks of the Rio Grande. \( L. \) omninutus, Spreng, cur. port. 139. Each ovary is supplied by a cup-shaped bractea, or by 3 concrete ones.

\section*{Clothed Elytranthe. Shrub par.}

\section*{Culture. Like the rest of the genera of the present order, the species are not cultivable. The plants have much the habit of \( \textit{Lonicera}. \)

\section*{XI. \( L. \) NOTANThA-REA (from \( vescer \), \( notos \), the back, and \( \alpha \) \( \nu \) \( \psi \) \( \gamma \), \( anthera \), an anther; the anthers are fixed by the back to the filaments; hence they are oscillator). \( L. \) Notanthera, sect. iv. Notanthera, exclusive of \( \textsection \) IV. \( L. \) Tetramerium and \( \textsection \) III. \( L. \) Calanthe, D. \( \& \) pro. p. 307. - \( L. \) Notanthera species of authors.}

\section*{Lin. syst. \( Penta-Hexadria \), Monogynia. Flowers hermaphrodite. Petals 5-6-7-8, but usually 6, sometimes almost distinct to the base, and sometimes equally joined together at the base, linear or lanceolate. Stamens equal in number to the petals; filaments adnate to the corolla at the base, but free at the apex; anthers fixed by the back, oscillator or incumbent. Style filiform. Stigma clavate. Berries ovate.—Parasitical shrubs, natives of South America, except one from Asia. Peduncles coriaceous or racemose; branchlets usually bearing 3 flowers and 3 bracteas; sometimes the pedicels are 1-flowered, and with a bractea under each flower.}

\begin{center}
\textsection 1. \textit{Pentameria} (from \( \pi \) \( \nu \) \( \tau \) \( \tau \), \( pente \), five, and \( \mu \) \( \pi \) \( \nu \) \( \rho \), \( nera \), a part; the flowers are pentamous or divided into 5 parts.). \( L. \) pentameri and pentandrous, large, from 1-8 inches long.
\end{center}

1 N. \( \textit{grandilobus} \); shrub glabrous, dependent; stems terete; leaves on short petioles, oval, thick; racemes terminal, subcorymbose, few-flowered; pedicels bearing each 1 flower and 1 bract; bracteas ovate, concave, length of fruit; petals 5, linear, joined to the middle; anthers versatile. \( \frac{2}{3} \). P. G. Native of \( \textit{Parasitha} \), parasitical on trees, where it is called \( \textit{Hatun Mecuad} \). \( L. \) grandilobus, Ruiz, \( \& \) Pav. fl. per. 3. p. 45. t. 275. f. a. Schultes, syst. 7. p. 115. Corolla very long. Berry blue, size of an olive.

Great-flowered Notanthera. Shrub par.

2 N. \( \textit{lignobracteatus} \); glabrous; branches terete; leaves scattered, lanceolate, or ovate-lanceolate, acute, sessile, coriaceous, veiny; spikes terminal; bracteas foliaceous, linear-lanceolate; flowers adhering to the bracteas at the base; flower-bud clavate; petals 5, linear; anthers versatile. \( \frac{2}{3} \). P. G. Native of \( \textit{Parasitha} \). \( L. \) longobracteatus, Desr. in Lam. dict. 3. p. 590. Schultes, syst. 7. p. 117. Leaves 18-24 lines long, and 8-9 lines broad. Corolla 1 inch long.

\begin{center}
Long-bracteate Notanthera. Shrub par.
\end{center}

3 N. \( \textit{verticillatus} \); branches terete, 3 in a whorl; leaves also usually 3 in a whorl, lanceolate, nerveless, glaucous, usually secund; flowers terminal, secund, crowded into heads; bracteas ovate, concave, 1 under each flower; petals 5, joined at the base, spathulately-lanceolate and revolute at the apex; anthers oblong.

4 N. \( \textit{ceusius} \); glabrous; branches terete; leaves on short petioles, ovate-lanceolate, or lanceolate, thickish, veiny; peduncles 1-flowered, disposed in terminal racemes, bearing under each flower an oblong bractea, which is 3 times longer than the ovary; petals 5, joined to the middle, and spreading at the apex, linear; anthers incumbent. \( \frac{2}{3} \). P. G. Native of the Andes of Peru, upon trees. \( L. \) ceusius, Spreng syst. 1. p. 123. \( L. \) glaucus, Ruiz, \( \& \) Pav. fl. per. 3. p. 45. t. 275. f. b. H. B. \& Kuntz. nov. gen. amer. 3. p. 458. but not of \( \textit{Thunberg} \). \( L. \) glaucus, Ruiz, \( \& \) Pav. fl. per. 3. p. 458. but not of \( \textit{Fleischner} \). \( L. \) coriaceus, Dietr. gart. lex. 4. p. 468. Schultes, syst. 7. p. 117. Leaves an inch or more long, and half an inch broad; petioles 2 lines long. Flowers an inch long, red at base and apex, but yellow in the middle. Berry oval, dark purple. This species is nearly allied to \( L. \) glaucus, Ruiz.

\begin{center}
Grey Notanthera. Shrub par.
\end{center}

5 N. \( \textit{peloponnis} \); glabrous; branches terete, rather glaucous; leaves opposite, on short petioles, lanceolate, thickish, veiny; peduncles 1-flowered, disposed in a terminal raceme, bearing an ovate, acute bractea under each flower, which is one-half shorter than the ovary; limb of calyx truncate; petals 5, joined together a little beyond the middle; anthers fixed by the back to the filaments. \( \frac{2}{3} \). P. G. Native of \( \textit{Parasitha} \), where it was collected by Poeppig. Leaves an inch long. Flowers 2 inches long.

\begin{center}
Poeppig's Notanthera. Shrub par.
\end{center}

6 N. \( \textit{Sternebergianus} \); glabrous; branches terete; leaves ovate or oval, obtuse, coriaceous, veinless above; peduncles many, short, 1-flowered; crowded, coriaceous, rising from the axils of the upper leaves and the tops of the branches; bracteas ovate, one under each ovary, and shorter than it; petals 5, linear, hardly concrete at the base; anthers versatile. \( \frac{2}{3} \). P. G. Native of \( \textit{Parasitha} \), near \( \textit{La Guardia} \), and \( \textit{Aconcagua} \), and on the Cordillera of \( \textit{Chili} \). \( L. \) Sternebergianus, Schultes, fil. in herb. Henke, and syst. 7. p. 116. \( L. \) glaucus, Gill. but not of \( \textit{Ruiz} \) and \( \textit{Pav} \). nor \( \textit{Thunberg} \). Leaves 12-15 lines long, and 8-10 broad; petioles \( \frac{1}{2} \) inch line long. Allied to \( L. \) \( \textit{ceusius} \), but differs in the bracteas being one half shorter than the ovaries, not 3 times longer.

\begin{center}
Sterneberg's Notanthera. Shrub par.
\end{center}

7 N. \( \textit{Pohlii} \); glabrous; branches terete; leaves oval, obtuse at both ends, on short petioles, thick, coriaceous, glaucous; the middle nerve hardly distinct at the base, the rest of it obsolete; peduncles axillary, solitary, shorter than the leaves, opposite, dichotomously coriaceous, few-flowered; petals 5, linear, thick, almost distinct, bearing each a ligula beneath the stamens; anthers versatile. \( \frac{2}{3} \). P. S. Native of \( \textit{Parasitha} \), where it was detected by Pohl. \( L. \) glaucus, Pohl. in litt. but not of others. \( L. \) Pohlil, D. \( \& \) pro. 4. p. 308. Leaves 12-15 inches long, and 8-9 broad. Corolla an inch long. Bracteas small, very blunt, one under each flower. Perhaps a species of \( \textit{Eisittia-céntikisk} \).

\begin{center}
Pohl's Notanthera. Shrub par.
\end{center}

8 N. \( \textit{Mierráncéa} \) (from \( \mu \) \( \nu \) \( \sigma \) \( \nu \) \( \zeta \), \( mieros \), small, and \( \alpha \) \( \nu \) \( \theta \) \( \upsilon \), \( antheros \), a flower; flowers of the species small). Flowers small, usually hexameros or divided into 6 parts, but in a very few they are divided into 4-5-6 parts, disposed in racemes; the branches of the raceme usually bearing 3 flowers and 3 bracteas each.—Species all natives of \( \textit{America} \).
**Racemes axillary.**

8 N. *sarmentosus*; glabrous, rather scendent, hence the branches throw out roots on one side; branches angular; leaves petiolate, oblong-lanceolate, acute, somewhat complicate and keeled; having the middle nerve rather prominent; racemes axillary, about equal in length to the leaves; having their branches short and angular, and bearing 3 bracteas and 3 sessile flowers each at the apex; petals 6, linear-spatulate; anthers ovate, incumbent. P. P. G. Native of Peru, at Munna: parasitical on trees. Loranthus *sarmentosus*, Ruiz et Pav. f. fl. per. 3. p. 49. t. 278. f. a. Schultes, syst. 7. p. 145. Corolla yellowish, 3–4 lines long. Berry oblong, greyish. Leaves 1½ inch long, and an inch broad; petiolo 2 lines long.

*Sarmentose* Notanthera. Shrub par.

9 N. *acuminatus*; glabrous; branches angular, somewhat sarmentose; leaves petiolate, remote, ovate, long-acuminate; racemes axillary, one half shorter than the leaves; having their branches bracthate, and bearing each 3 ovate, concave, acute bracteas, and 3 sessile flowers; petals 6, linear; anthers ovate. P. G. Native of the Andes of Peru, in groves. Loranthus *acuminatus*, Ruiz et Pav. f. fl. per. 3. p. 49. Schultes, syst. 7. p. 144. Very nearly allied to N. *sarmentosus*, but differs in the leaves being flat, in the stigma being peltate, and the berries being brownish yellow.

*Acuminated-leaved* Notanthera. Shrub par.

**Racemes terminal and axillary.**

10 N. *sellowii*; glabrous; branches tetragonally terete, radicant; leaves obovate, retuse, or emarginate, ending in a recurved mucrone, cartilagineous, feather-nerved, tapering into the short petioles; racemes axillary and terminal, naked, shorter than the leaves; having the branches bearing 3 flowers and 3 bracteas; limb of calyx lax; corolla 6-parted; with linear lobes; anthers versatile. P. P. S. Native of Brazil. Loranthus *Sellowii*, D. C. prod. 4. p. 312. Loranthus rethusa, Cham. et Schlecht. in Linneä. 3. p. 215. but not of Jack. Leaves 20 lines long, and 13–16 lines broad; petiolo 4 lines long. Corolla 3 lines long. Stigma thickish.

*Sellii's* Notanthera. Shrub par.

11 N. *radicans*; glabrous; branches terete, elongated, radicant; leaves ovate, oblong, or lanceolate, acuminate, ending in a subulate point, feather-veined, with carilagineous margins, running down the petioles at the base; spikes axillary and terminal; flowers and bracteas by threes; corolla 6-parted, with linear lobes; anthers versatile. P. P. S. Native of Brazil. Loranthus *radicans*, Cham. et Schlecht. in Linneä. 3. p. 207. Leaves 5 inches long and 1¼ broad; petiolo hardly 5 lines long. Corolla 3 lines long. Flowers disposed in something like whorls of fives.

*Rooting* Notanthera. Shrub par.

12 N. *buxifolius*; branches rather angular, and rather hispid from stiff short hairs; branches terete, and are as well as the petiolo and leaves glabrous; leaves oval, coriaceous; racemes terminal and axillary, erect; pedicels bearing each 3 flowers and 3 bracteas; corolla tubular, 4–5–6-parted; having the lobes dilated and concave at the apex; anthers versatile. P. G. Native of Chili, near Talcahuano: parasitical on various trees. Loranthus *buxifolius*, Cham. et Schlecht. in Linneä. 3. p. 207. Loranthus Eschscholziánus, Mart. in Schultes, syst. 7. p. 117. Leaves 9 inches long in the young state. Bracteas fringed at the apex. The root, according to Chamisso, creeps under the bark of the trees on which the plant grows. Style acutus at the apex. Corolla 3–4 lines long. This comes very near to N. *heterophyllus*; and appears only to differ in the branches being covered with short rigid hairs.

**Box-leaved** Notanthera. Shrub par.

13 N. *heterophyllus*; branches terete, slender, scabrous, rusty; leaves scattered, on short petiolo, cordate or oval, mucronate, coriaceous, glabrous; racemes terminal and axillary, angular; pedicels short, bearing each 3 bracteas and 3 flowers; the 2 lateral flowers stalked: and the middle one sessile; bracteas small; petals 6, linear-spatulate; anthers incumbent. P. G. Native of Chili: parasitical upon trees, especially myracaceous trees. Loranthus *heterophyllus*, Ruiz et Pav. fl. per. 3. p. 48. t. 273. f. b. Schultes, syst. 7. p. 153. The old branches are smooth; the younger ones are angled, glabrous, or sometimes roughish from minute rust-coloured tubercules. Pedals 4–5, concave, and dilated at the apex. Leaves 6–12 lines long, and 4–9 lines broad; petiolo 2 lines long. Corolla purplish white, 4–5 lines long.

*Variable-leaved* Notanthera. Shrub par.

14 N. *elipticus*; glabrous; branches terete, slender, angular; leaves petioloate, elliptic, somewhat acuminate, thick-coriaceous, veinless, shining above; peduncules axillary and terminal, racemose; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, somewhat dilated and concave at the apex; anthers ovate, versatile. P. S. Native of Peru, in groves, in high frigid places on the Andes near Pozuzo. Loranthus *elipticus*, Ruiz et Pav. fl. per. 3. p. 47. t. 276. f. a. Schultes, syst. 7. p. 159. Leaves an inch long, and half an inch broad; petiolo 2 lines long. Corolla yellow, 4 lines long. Perhaps a species of Giaidendron.

*Elliptic-leaved* Notanthera. Shrub par.

15 N. *ligustrióideus*; glabrous; branches terete; leaves oblong-lanceolate, acuminate, coriaceous; corollas axillary and terminal, one half shorter than the leaves, solitary; pedicels crowded, bracteas, bearing 2–3 flowers; petals 6, linear, somewhat dilated and concave at the apex; anthers ovate, versatile. P. G. Native of Peru, or Chili, where it was collected by Henke. Loranthus *ligustrióideus*, Schultes, fil. in herb. Henke, and in syst. 7. p. 155. Loranthus *ligustrius*, Willd. herb. ex Schultes, but not of Wall. Leaves 2 inches long, and 9–10 lines broad; petiolo 2 lines long. Corolla 4–5 lines long, black in the dried state.

*Privet-leaved* Notanthera. Shrub par.

16 N. *vexetus*; glabrous; branches scendent, terete; leaves elliptic-oblong, ovate, rounded at the apex, thick-coriaceous, glaucoscent, on short petiolo, racemes axillary, solitary; pedicels short, bracteate, bearing each 3 sessile flowers at the apex, drooping in the fructiferous state. P. G. Native of Mexico, near Cuernavaca. Loranthus *véxetus*, D. C. prod. 4. p. 313. H. B. et Kunth, nov. gen. amer. 3. p. 434. Leaves 2 inches long, and 10–12 lines broad. Flowers unknown. Berries ovate-oblong.

*Lilly-leaved* Notanthera. Shrub par.

17 N. *orbicularius*; glabrous; branches tetragonal; leaves petioloate, orbicular, acutish, thick-coriaceous, obsolescent veined; racemes axillary, solitary; pedicels short, bearing each 3 sessile flowers at the apex; petals 6, glabrous, anthers ovate. P. S. Native of Quito, near Guayaquil, on trees. Loranthus *orbicularius*, H. B. et Kunth, nov. gen. amer. 3. p. 434. Schultes, syst. 7. p. 149. Leaves 18 inches long and 16–17 broad; petiolo 4–5 lines long. Flowers 4 lines long, green on the outside, and white on the inside.

*Oribacular-leaved* Notanthera. Shrub par.

18 N. *salicícola*; plant glabrous, pruinose? branches terete, compressed at the nod; leaves oblong-lanceolate, acuminate, margined petiolo; racemes axillary, solitary or twin, erect, sessile; pedicels very short, bearing each 3 flowers and 3 bracteas; corolla 4-parted, with linear lobes, which are shell-formed at the apex; anthers versatile; stigma capitate. P. S.
Native of Brazil. Loranthus salicifolius, Cham. et Schlecht. in Linnaea. 3. p. 216. Leaves 4½ inches long and ½ inch broad; petioles 6 lines long. Flowers a line long.

Willow-leaved Notanthera. Shrub par.

19. N. lanceolatus; glabrous; branches terete, slender, rather angular; leaves on short petioles, lanceolate-oblong; peduncles racemose, axillary, and terminal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 7-9, linear, spathulate, joined at the base; anthers incumbent. ½. P. S. Native of Peru, on the Andes at Pillao. Loranthus lanceolatus, Ruiz et Pav. fl. per. 3. p. 47. t. 278. f. b. but not of Beauv. Loranthus lanceolatus, Poir. ex Schultes, syst. 7. p. 142. Leaves 2 inches long and an inch broad; petioles 2-3 lines long. Corolla yellow, half an inch long. Berries oblong.

Lanceolate-leaved Notanthera. Shrub par.

20. N. oxyphyllus; glabrous; branches terete, but somewhat compressed at the apex; leaves lanceolate-oblong, tapering into the petioles at the base, and much acuminated at the apex, feather-nerved; having the middle nerve rather prominent; racemes axillary or solitary, shorter than the leaves; pedicels opposite, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, acute, hardly joined together at the base, longer than the filaments; anthers ovate, erect, incumbent. ½. P. S. Native of Brazil, where it was collected by Pohl. Loranthus oxyphyllus, Pohl. ex D. C. prod. 4. p. 514. Loranthus acuminatus, Pohl. in litt. Leaves 2 inches long. Flower-bud sub-clavate. Style thickish; stigma truncate.

Sharp-leaved Notanthera. Shrub par.

21. N. suaveolens; glabrous; branches terete; leaves petiolate, ovate-oblong, acuminated, rounded at the base, coriaceous; racemes 2-4 together; pedicels short, approximate, bracteas bearing 3 stalked flowers at the apex; petals 6, linear, spreading; anthers incumbent. ½. P. S. Native of Peru, in groves near Gonzanama. Loranthus suaveolens, H. B. et Kunth, nov. gener. 3. p. 435. Schultes, syst. 7. p. 145. Leaves 26-27 lines long and an inch broad; petioles 2-3 lines long. Flowers 3 lines long, white, glabrous.

Sweet-scented Notanthera. Shrub par.

22. N. conduplicatus; glabrous; branches tetragonal; leaves petiolate, ovate, acuminated, acute at the base, rather coriaceous, conduplicate recurved; panicle terminal, much branched, leafy; having the branches twin, and as are as thick as the rachis of the racem; pedicels very short, bearing 3 flowers and 3 bracteas at the apex; petals 6, linear. ½. P. S. Native of Cuman and Cumanoca, on trees. Loranthus conduplicatus, H. B. et Kunth, nov. gener. 3. p. 441. Loranthus anceps, Will. vel. in Schultes, syst. 7. p. 131. Leaves 24-27 lines long, and 14-17 lines broad; petioles 4-5 lines long. Flowers hardly 2 lines long.

Conduplicate-leaved Notanthera. Shrub par.

23. N. attenuatus; plant glabrous, twining; branches terete; leaves rather alternate, obturate-oblong, cuneated at the base, and tapering into the petioles, and mucronate at the apex; mucron deciduous; racemes axillary, twin or tern, shorter than the leaves; pedicels short, bearing each 2-3 bracteas and 2-3 sessile flowers at the apex; petals 6, linear, hardly connected at the base, longer than the filaments; anthers ovate-ellipsoid, fixed by the base. ½. P. S. Native of Brazil. Loranthus attenuatus, Pohl. in litt. ex D. C. prod. 4. p. 515. Leaves 12-15 lines long and 6-7 broad. Corolla ½ line long. Stigma not capitae.

Attenuated-leaved Notanthera. Shrub par.

24. N. anceps; glabrous; branches terete; branchlets and peduncles compressed and 2-edged; leaves alternate or opposite, oblong-elliptic, petiolate, ending in very short mucrones, feather-nerved; racemes axillary, solitary, or twin, and terminal, subcorysbose, unequal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; anthers ovate, erect. ½. P. S. Native of Brazil, where it was detected by Pohl. Loranthus anceps, D. C. prod. 4. p. 315. Loranthus oblongo-ellipticus, Pohl. in litt. Leaves an inch long and 5-6 lines broad; petioles 3 lines long. Corolla 2 lines long. Allied to Loranthus paucifolius.

Two-edged-branched Notanthera. Shrub par.

25. N. ovatus; glabrous; branches unknown; leaves ovate, acute, somewhat acuminated, petiolate, coriaceous: having the middle nerve rather prominent, and the lateral ones hardly conspicuous; racemes a little shorter than the leaves; pedicels short, bearing 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, distinct, acutish, a little longer than the filaments; anthers erect, fixed by the base. ½. P. S. Native of Brazil. Loranthus ovatus, Pohl. ex D. C. prod. 4. p. 515. Leaves 2½ inches long and 1½ broad; petioles 2-3 lines long. Branchlets racemose, 2 lines long. Ovarium glaucous. Petals 2 lines long. Style thickish, equal at the apex. Perhaps this and the preceding belong to Struthanthus.

Ovate-leaved Notanthera. Shrub par.

Cult. The species are not cultivable, and have the habit of those of the other parasitical genera of the order.

XIII. LOXANTHE'RA (from loxos, loxos, oblique, and anthera, an anther; in reference to the filaments being curved at the apex). Blum. in litt. Loranthus, sect. ii. Loxanthera, D. C. prod. 4. p. 316. Linn. syst. Hexandra, Monogynia. Flowers hermaphrodite. Tube of corolla geniculated at the base, but clavate, and rather oblique at the apex, with a 6-lobed limb; lobes oblong, attenuated at the base, and somewhat spirally twisted. Filaments stiffly curved at the apex, not attenuated, but somewhat dilated; anthers inserted by the back. Style longer than the stamens. Stigma clavate.—Parasitical shrubs.

1. L. speciosa (Blum. in litt. 1829.) glabrous; leaves oblong, obtuse or bluntly acuminated, coriaceous, 1-nerved, veinless; peduncles axillary, few-flowered; tube of corolla elongated. ½. P. S. Native of Java, in woods. Loranthus loxanthérea, D. C. prod. 4. p. 316. Bud of corolla 4 inches long, scarlet, but yellowish inside. Stigma blood-coloured.

Shorey Loxanthera. Shrub par.

2. L. spirostylis; glabrous; branches terete, tetragonally compressed at the apex; leaves somewhat alternate, petiolate, oblong-lanceolate, coriaceous, having the middle nerve rather prominent, the rest veinless; racemes solitary or twin, axillary, shorter than the leaves; rachis angular; petals 6, linear; anthers fixed by the back to the filaments; style spirally twisted. ½. P. S. Native of Mexico, at Acapulco. Loranthus spirostylis, D. C. prod. 4. p. 315. Spirostylis Hæneæana, Presl, ex Schultes, syst. 7. p. 164. Flowers 2 lines long. This is perhaps a distinct genus, as it differs from all the others in the twisted style; and from the present in the filaments not being curved at the apex, and in the petals not being spirally twisted.

Scren-styled Loxanthera. Shrub par.

Cult. The species of this genus have the habit of the other parasitical genera of the order, and are not cultivable like them.

† Plants referred to the old genus Loranthus by authors, but the number of the parts of the flowers and their structure being unknown, it is impossible to refer them to any of the genera broken off from that genus; therefore they must stand under the names originally given.

1. L. florul'entus (Rich. act. soc. hist. nat. par. p. 107.) branches opposite, spreading, quadrangular; leaves oblong-ovate, very blunt; peduncles solitary and sessile in all the axils.
Native petals corolla anthers P. P. 

Spotted-leaved Lauranthus. Shrub par. 16 L. eucalyptoides (D. C. prod. 4, p. 318.) glabrous; branches terete, dichotomous; leaves opposite, petiolate, lanceolate-linear, acutish, thick-coriaceous, almost veinless. P. G. Native of New Holland. L. eucalyptoides, Sieb. fl. nov. holl. no. 242, but not of Kunth. Leaves 3-4 inches long, and 6-7 lines broad. Petiolo 6 lines long. Flowers and fruit unknown. Schultes, syst. 7, p. 163.

Eucalyptus-like Lauranthus. Shrub par. 17 L. Hoffmannseggii (Wildl, in Schultes, syst. 7, p. 113.) leaves ovate-oblong, acute; racemes axillary, usually twin; flowers verticillate. P. S. Native of Brazil, at Para. Lor. verticillatus, Hoffmansegg in herb. Wildl. Flowers pentandrous.

Hoffmannsegg's Lauranthus. Shrub par. 

† † Species only known by name.

1 L. accice-Nilolice, Oudh. in Brown, append. 2. 2 L. calycinus, R. Brown, in Salt, abyss. 3 L. congestus, R. Br. l. c. 4 L. leucus, R. Br. l. c. 5 L. serrulatus, Roxb. ex Steud.

N. B. Asclepias lactifera, Burm. fl. ind. p. 61. is a species of Loranthus not known.

Tribe II.—Terrestrial shrubs.

XIII. a GAIADE'NDRON (from γαα, gaia, the earth, and ἔδον, deodon, a tree; these trees grow in earth and not parasitical, like other genera broken off from Loranthus). Loranthus species of authors.

Lin. syst. Hexa-Octandria, Monogynia. Calyx 6-8-toothed. Petals 6-8, narrow, sometimes free and sometimes joined at the base. Stamens 6-8, inserted in the petals. Style filiform; stigma simple. Ovarium oblong-cylindric. — Terrestrial trees, with obovate leaves and racemes of yellow flowers. 1 G. eugenioides; arboreous; branches terete; leaves ovate-oblong, acuminate, running down the petioles at the base, rather coriaceous; racemes axillary and terminal, solitary or racemes short, approximate, 3-flowered, bracteose; flowers pedicellate; corolla 5-6-parted; lobes linear-acute; anthers incumbent. P. G. Native of Peru, and in the Andes, near Guanacabamba, and of Brazil. Loranthus eugenioides, H. B. e. Kunth, nov. gen. amer. 3, p. 435. Schultes, syst. 7, p. 135. Cham. et Schlecht. in Linnaea, 3, p. 214. Loranthus attenuatus, Wildl. herb. but not of Pohl. Flowers about half an inch long, white, sweet-scented. Racemes 1½ to 3 inches long.

Eugenia-like Gaiadendron. Tree 15 to 20 feet. 2 G. Ta'aua; arboreous; branches terete; leaves oblong, acute, running down the petioles at the base, coriaceous, shining above and dotted beneath; racemes axillary, solitary; pedicels short, usually 3 together, approximate, bearing each 3 bracteas and 3 flowers; flowers on short pedicels; petals 7, spreading, linear, acute. P. G. Native about Santa Fe de Bogota. Loranthus Tagua, H. B. et Kunth, nov. gen. amer. 3, p. 436. Schultes, syst. 7, p. 159. Loranthus arboreus, Mutis mss. Leaves 3½ inches long, and 14-18 lines broad; petiolo 6 lines long. Flowers 9 lines long. Berry ovate-oblong. Very like N. punctatus.

Tagua Gaiadendron. Tree 15 to 20 feet. 3 G. Laurifolium; arboreous; glabrous; branchlets angular; leaves elliptic-oblong, bluntish, running into the petioles at the base, coriaceous, shining above; racemes axillary and solitary, terminal, and panicled; pedicels short, usually by threes, approximate, bearing each 3 bracteas and 3 sessile flowers;
petals 7-8, linear, rather dilated at the apex; anthers incumbent.

**Laurel-leaved Gaiadendron.** Tree 15 to 20 feet.

4. G. nitidum; arboreous, glabrous; branches terete; leaves petiolar, oblong, obtuse at both ends, coriaceous, shining above, veinless, having the middle nerve obsolete; corymbs terminal; peduncles bearing each 2-3 flowers and 3 bracteas; flowers sessile; petals 8, linear; anthers incumbent. G. Native of the Andes of Quito, in Paramo de Saraguri, in temperate parts. Loranthus nitidus, H. B. et Kunth, nov. gen. amer. 3. p. 437. Schultes, syst. 7. p. 160. Leaves 2 inches long, and 10 lines broad; petals 4 lines long. Flowers sweet-scented, about an inch long, yellow, glabrous. Berries ovate.

**Shining-leaved Gaiadendron.** Tree 15 to 20 feet.

5. G. Peracense; arboreous, glabrous; branches terete; leaves lanceolate-oblong, acutish, running into the petioles at the base, coriaceous, shining above, and beset with black spots beneath; racemes terminal; peduncles short, 3-5-together, approximately, each bearing 3 bracteas; from 1-3 flowers; petals 6-8, linear. G. Native on the Andes, about Popayan, in Paramo de Purace. Loranthus Puraceensis, H. B. et Kunth, nov. gen. amer. 3. p. 437. Schultes, syst. 7. p. 160. Leaves 22-27 lines long, and 9-10 lines broad; petals 4 lines long. Racemes 4-6 inches long. Corolla yellow. Perhaps sufficiently distinct from N. Tagua.

**Purace Gaiadendron.** Tree 10 to 15 feet.

6. G. Puccatius; arboreous, glabrous; branches terete; leaves obovate or oval, somewhat attenuated at the base into the short petiolar, coriaceous, beset with black dots beneath, having the middle nerve rather prominent; racemes long, terminal, and from the axils of the superior leaves; peduncles somewhat verticillate, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear-spatulate; anthers incumbent, fixed by the back near the base to the filaments. G. Native of the Andes of Peru, in cold places in groves. Loranthus punctatus, Ruiz et Pav. fl. par. 3. p. 47. t. 177. f. a. Presl, in herb. Huenke, Schultes, syst. 7. p. 194. Leaves 2 inches long, and 1 broad; petals 2-5 lines long. Corolla yellow, almost an inch long before expansion. Berry ovo-ovate, crowded, crowned by the limb of the calyx, which is truncate.

**Dotted-leaved Notanthera.** Tree par.

**Cult.** For culture and propagation see **Nytsia**.

---

**Bundles-flowered Nytsia.** Cult. 1831. Tree 15 to 25 feet. Cult. A mixture of sand, loam, and peat will be a good soil for this singular tree. Cuttings will probably root if planted in sand under a hand-glass.

**XIV. SCHEEPFFIA.**

**Bundles-flowered Nytsia.** Cult. 1831. Tree 15 to 25 feet. Cult. A mixture of sand, loam, and peat will be a good soil for this singular tree. Cuttings will probably root if planted in sand under a hand-glass.

---

**LIN. SYST. Pentandria, Monogynia.** Flowers hermaphrodite. Margin of calyx entire; tube adnate to the ovarium, very narrow, calculeate at the base. Corolla gamopetalous, tubular, with a 5-cleft limb, rarely with a 4-6 cleft limb; lobes valvate in aestivation. Stamens equal in number to the lobes of the corolla, and situated in front of them, and having the filaments adnate to the tube; anthers ovate or roundish, dehiscing laterally by a double chink. Style erect, truncate; stigma capitate or 5-lobed. Ovarium 3-celled, with a solitary ovulum in each cell. Drupes containing a 3-celled-seeded nucleus, or only 1-seeded from abortion. Embryo minute, placed in the vertex of the albumen, which is amygdaline: with a turbinate radicle. Small smooth terrestrial trees. Leaves alternate, petiolar, entire, feather-nerved. Peduncles axillary, usually many flowered.

—This genus comes near to *Caprifoliaceae* from the gamopetalous corolla and 3-celled fruit; but differs from it, and agrees with Loranthaceae, in the stamens being in front of the lobes of the corolla, and in the flowers being calculeate. It also agrees with the order *Symphoricarpos* in the 3-celled fruit.

*Tube of corolla ovate, with a naked throat.—American species.*

1. S. Arbore'scens (Roxb. et Schultes, syst. 5. p. 160.) leaves ovate; peduncles axillary, usually twin, 1-3-flowered. G. Native of the islands of Santa Cruz, Montserrat, ex Rohr; and of Guadaloupe, ex Bertero; but in Rohr's specimen the leaves are obtuse, while in that of Vahl's they are acuminate; they are therefore probably distinct species. Codonium arbore'scens, Vahl. act. soc. hist. hafn. 2. pt. 1. p. 206. t. 6. symb. bot. 3. p. 36. Schreb. Lam. ill. 2. p. 51. S. Americana, Willd. spec. 1. p. 996. Flowers yellow. Arborescent Scheepffia. Tree 8 to 10 feet.

2. S. Flexuosa (Roxb. et Schultes, syst. 5. p. 160.) leaves ovo-lanceolate, acute; racemes axillary, solitary, 4-5-flowered; tube of corolla ovate; lobes acute; throat naked. G. Native of Peru, on the Andes, on the mountains at Pillao and St. Antonio de Playa Grande. Huenkea flexuosa, Ruiz et Pav. fl. per. 3. p. 8. t. 251. Leaves 3-4 inches long. Branches flexuous, diffuse, Corolla yellow.

Flexuous-branched Scheepffia. Tree 10 to 12 feet.

* * * Tube of corolla terete, having the throat furnished with fascicles of hairs at the origin of the stamens.—Species natives of Asia.*

---

**XIII. b NYTSIA.** (named after Peter Nytsia, a celebrated Dutch navigator, and discoverer of that part of New Holland called Nytsland). R. Br. in geogr. soc. trans. vol. 1.

**LIN. SYST. Hexandria, Monogynia.** Teeth of calyx 3-5, unequal. Petals 6-7, linear, distinct. Stamens 6-7, inserted towards the middle of the petals; anthers versatile, sub-hastate, 2-celled. Ovarium turbinate, rather trigonal. Style subulate; stigma acute. Fruit 1-seeded, covered by pulp or glutin, and of a different texture from the rest of the Loranthaceae genera.

—A terrestrial tree, native of New Holland.

1. N. floribunda; arboreous, glabrous; branches terete; leaves alternate, linear, obtuse, thick; racemes elongated, simple; peduncles longer than the flowers, bearing each 3 bracteas and 3 flowers at the apex. G. Native of New Holland, in Van Lewin's Land. Loranthus floribundus, Labill. nov. holl. 1. p. 87. t. 113. Schultes, syst. 7. p. 193. Loranthus celastrodes, Sieb. fl. nov. holl. essic. no. 244. Leaves 2-3 inches long, and 4-5 lines broad. Racemes 6-8 inches long, crowded at the tops of the branches. Corolla 9-10 lines long, sulphur-coloured.
exquisitely fragrant, even after being dried, disposed in racemes, which are about half the length of the leaves. Ovarium supported by a calyciform bractea like the rest of the species, which is divided into 2 or 3 unequal acute segments. Corolla rather flabby; tube nearly an inch long. Drupe pale yellow, almost white, about the size of an olive, 1-seeded from abortion. The perfume of the flowers is of a most delightful kind, and may be perceived on steeping them in warm water even long after they have been dried.

_Fragrant Schöepfia._ Tree 10 to 15 feet.

4. _S. Acuminata_ (Wall. cat. no. 486.) leaves ovate, acuminate, obtuse at the base; racemes axillary, many flowered; tube of corolla terete: lobes bluish. η: G. Native of Nippon, on the Pundua mountains. Flowers yellow.

_Acuminate-leaved Schöepfia._ Tree 10 to 12 feet.

_Cult._ A mixture of loam, peat, and sand will suit these trees; and young cuttings of them will be easily rooted if planted in sand, and placed under a hand-glass.

**XV. AU'CUBA (the Japanese name of the shrub).** Thunb. fl. jap. p. 4. Lam. ill. t. 759. D. C. prod. p. 274.—Aūkuba, Koempf. amen. 5. p. 775.—Eubáasis, Salisbury. prod. p. 68.

_LIN. SYST. DIOTÉCIA, TETRÁDRIA._ Flowers dioecious. Calyx closely adhering, with the margin a little elevated and 4-toothed: teeth obtuse, very short. Petals 4, deciduous, alternating with the calycine teeth, inserted in the margin of the elevated fleshy, 4-angled disk ovate, acuminate, fleshy, with the margin truncate on one side, and minutely papillose on both surfaces, valvate in comparison, induplicate at the apex. Stamens 4, opposite the petals? Ovarium cylinhrical, adhering closely to the tube of the calyx, 1-celled, containing one ovulum. Style very short, thick, terete: stigma capitata, thick, fleshy, viscid, oblong 2-lobed. Berry fleshy, 1-seeded, crowned by the permanent style. The rest unknown.—A small evergreen tree, native of Japan; branches dichotomous or verticillate in the manner of _Loranthus_ and _Viscum_. Leaves opposite, petiolate, broad, ovate-lanceolate, acuminate, toothed, coriaceous, glabrous, shining, pale green, beautifully spotted with yellow, having the midrib rather prominent, the rest of the leaf reticulately veined. Petioles cylindrical. Flowers small, panicled. Panicles many, spike-formed, pedunculate; peduncles rather villous. Bracteas lanceolate, membranous, pale, caducous. Calyx beset with adpressed villi. Petals dark blood-coloured. The buds are large, angular, imbricated from conduplicate stipules; the leaves are large, toothed, and veiny, and the petioles are articulated with the branches and dilated at the base; hence there is some analogy in the genus to _Fráxinus_. This genus was included by Jussieu in the order _Rhâmi_; but from its having no affinity whatever to either of the families into which that order has been since divided, its place in the natural system has remained undetermined; and perhaps also from its want of novelty, the plant has been despised by botanists, and its characters and affinities consequently overlooked. Like the _Sâlicia Babylónica_, or weeping-willow, too, we possess only one sex of the tree in Europe, and that the female, which circumstance has likewise prevented its being accurately examined. The structure of the female flower agrees so exactly with that of _Viscum_, that, notwithstanding the different mode of growth of the two genera, and the absence of more accurate details respecting the male blossoms, and the ripe fruit, its arrangement among the _Loranthaceae_ appears fully justified. It will ultimately be found the connecting link between the _Araliaceae_ and the present family.

1 _A. Japónica_ (Thunb. fl. jap. p. 64.) η: H. Native of Japan. Banks, Icon. Koempf. t. 6. Thunb. icon. fl. jap. t. 12 and 13. Sims, bot. mag. 1197. Eubáasis dichótomus, Salisbury. prod. p. 68. The _Auceba_ is a well-known laurel-like evergreen shrub, having the leaves mottled with yellow; but in Japan the leaves are said to be sometimes green by Thunberg. According to Koempfer, the fruit is a red oblong drupe, like a laurel-berry, with a white sweetish pulp, and a kernel with a bitter taste. The shrub is called in the gardens _aucuba_ or spotted-leaved laurel.

**Japan Aucuba.** Fl. May, July. Cit. 1783. Shrub 6 to 10 feet.

_Cult._ This is a showy evergreen shrub, well adapted for shrubberies and small gardens. It is easily increased by cuttings from the young wood planted in autumn under a hand-glass or by layers. The shrub will grow in any soil.

**ORDER CXXVIII. CHLORANTHEÆ (plants agreeing with _Chloranthus_ in particular characters)._ R. Br. in bot. mag. 2190. (1821) and in Parry, vol. 1824. Lindl. coll. bot. 17. (1821). Blum. fl. jav. (1829) vol. 1.

Flowers disposed in spikes, hermaphrodite or unisexual; with a supporting tridentate calyx. Stamens lateral; if more than one connate definite; anthers 2-4-celled, bursting lengthwise, each adnate to a fleshy connective, which coheres laterally in various degrees; filaments slightly adhering to the ovary, which is 1-celled; stigma simple, sessile; ovulum pendulous. Fruit drupeaceous, indehiscent. Seed pendulous. Embryo minute, placed at the apex of a fleshy albumen; having the radicle inferior, and consequently remote from the hilum; cotyledons divaricate.—Herbaceous plants or under shrubs, with an aromatic taste. Stems jointed, tumid under the articulations. Leaves opposite, simple, with sheathing petioles, and minute interstipulating stipules. Flowers disposed in terminal loose slender spikes.

This order is nearly allied to _Loranthaceae_, from which it differs in the tridentate calyx, in the want of petals, in the fewer stamens, in the structure of the anthers, and in the inferior radicle, &c. It is said to be nearly allied to _Sarúcea_ and _Piperácea_, from both of which it differs in the want of a sack to the embryo, and in the pendulous ovulum, and opposite leaves with intermediate stipules. The anthers consist of a fleshy mass, upon the face of which the cell lies that bears the pollen; whether their anthers are 1 or 2-celled is a matter of doubt, one botanist considering those that have 2 cells to be double anthers, another understanding those with 1 cell to be half anthers. This order comes nearest in affinity to _Rubíaceae_, tribe _Opércularíceae_.

The whole plant of _Chloranthus officinális_ has an aromatic fragrant smell, which is gradually dissipated in drying; but its roots retain a fragrant camphorated smell, and an aromatic somewhat bitter flavour. They are found to possess very nearly the properties of _Aristolóchia serpentina_, and in a high degree. There seems to be no doubt that it is a stimulant of the highest order.

**Synopsis of the genera.**

1 _Chlo'a'ntus_. Flowers hermaphrodite. Anther seated on the side of the ovary, undivided and 2-celled, or trilobed and 4-celled. Ovarium 1-ovulate. Drupe 1-seeded.

2 _Ascarína_. Spikes dioecious. Filament short; anther oblong, 4-furrowed, and probably 4-celled. Stigma 3-lobed. Drupe 1-seeded.

3 _K_
3 Hedysourum. Flowers monoecious. Male amenis oblong, naked; anthers numerous, closely imbricated. Female flowers in racemes, with a tridentate calyx. Drupe trigonal, 1-seeded, clothed by the baccate calyx.

Lyn. s. Monandria, Monogynia, R. Br. Gymnandria, Tridrindria, Spreng. Calyx tridentate or wanting. Corolla wanting. Anther seated on the side of the ovary, undivided, and 2-celled, or trilocular and 4-celled: in the latter case the middle lobe alone is perfect and 2-celled, while the 2 lateral lobes are imperfect and only 1-celled. Ovarium 1-seeded: ovulum pendulous; stigma capitate. Drupe 1-seeded. Small subhemiaceous shrubs: with opposite toothed leaves, and slender spikes of inconspicuous flowers.

1 C. Officinalis (Blum. enum. pl. jay. 1. p. 79. fl. jay. 1. p. 10. t. 1) stem suffruticosus; leaves oblong-lanceolate, acuminate at both ends, serrated; spikes branched, terminal; anther 3-celled; middle lobe perfect and 2-celled; lateral ones imperfect and 1-celled. G. Native of Java, in high mountain woodlands. Stratiophora Doronora, ined. Berries white. The plant has an aromatic and fragrant smell, and is a stimulant of the highest order. It is used in medicine by the Javanese.

Officinal Chloranthus or Chu-Lan. Shrub 3 to 4 feet.

2 C. Brachyspathys (Blum. fl. jay. 1. p. 13. t. 2) stem suffruticosus; leaves oblong-lanceolate, acuminate at both ends, serrated; spikes branched, terminal; anther undivided, 2-celled. G. Native of Java, in the provinces of Bantam and Java, in woods on the highest mountains. Ascarina serrata, Blum. enum. pl. jay. 1. p. 180.

Short-spired Chloranthus or Chu-Lan. Shrub 2 to 3 feet.

3 C. Monostachys (R. Br. in bot. mag. 2190. Lindl. coll. t. 171.) stem suffruticosus; leaves elliptic, serrated, acuminate; spikes solitary, simple; flowers alternate; anther incurved, 2-celled: the middle lobe 2-celled and perfect, and the lateral lobes 1-celled and imperfect. G. Native of China. Flowers yellowish.

One-spiked Chloranthus or Chu-Lan. Fl. Feb. May. Cilt. 1819. Shrub 1 to 2 feet. 4 C. Incognitus (Swartz, in phil. trans. vol. 77. p. 359. t. 15.) suffruticosus; leaves ovate-oblong, obtuse, serrated, pale beneath; spikes axillary, branched; branches alternate; flowers opposite; anther 3-celled; middle lobe perfect and 2-celled, the lateral ones imperfect and 1-celled. G. Native of China and Japan. Nigrina spicata, Thunb. fl. jap. p. 65.

5 C. Monander (R. Br. in bot. mag. under no. 2190.) spikes bracteate; flowers opposite? anther undivided, 2-celled, perfect. G. Native of China.

6 C. Elatiolar (R. Br. l. c.) shrubby; leaves oblong-lanceolate, serrated, petiolate: spikes slender, long, reflexed, crowded, nearly terminal; anther 3-celled, the middle lobe perfect, 2-celled, the lateral lobes imperfect and 1-celled. G. Native of China and Cochinchina. Credos odorifer, Lour. coh. p. 89. Flowers small, yellow, sweet-scented. Branches long, somewhat secedent. In Cochinchina this plant is grown in gardens for the sake of the scent of the flowers.

Taller Chloranthus or Chu-Lan. Shrub 6 feet. 7 C. Serratus (Ran. et Schultes, s. 3. p. 461.) leaves ovate-oblong, acute, doubly serrated; spikes bracteate, axillary. G. Native of Japan, in the interior of the islands. Nigrina serrata, Thunb. act. ups. t. 7. p. 142. t. 5. f. 1. Stem simple, about a foot high. Leaves a hand long, having the serratures acute.

Serrate-leaved Chloranthus or Chu-Lan. Pl. 1 foot. Cult. A mixture of loam, sand, and a little peat, is a good soil for the species Chloranthus; and they are easily increased by cuttings under a hand-glass, or by suckers.

II. ASCARINA (from ascaris, ascaris, ascarides, or small round worms; the name is applied to this genus because the anthers are formed like small worms). Forst. char. gen. t. 59.

1 H. Septanas (Swartz, fl. ind. occ. 2. p. 599. prod. p. 84.) frutescent; branches lax; leaves lanceolate, acuminated; petioles short, connate on both sides from stipulaceous membranous sheaths at the base, which are reflexed and culiata on the margins. G. Native of Jamaica, in woods, on the highest mountains. Shrub branched. Branchlets tetragonal, jointed, rising from the axils of the sheaths of the petioles. Leaves serrated, pale green. Male amenis pendunculate, oblong, obtuse, filiform, rising from the sheaths of the petioles. Female racemes terminal and axillary from the same axils as the male ones, usually tripartite. Calyx tetradenate. Drupe triquetrous, hard, shining, brown, clothed by the roundish, scarlet, fleshy calyx. The whole plant has a grateful smell, and an aromatic hot taste.

Nodding-spiked Hedysosnum. Shrub 1 to 4 feet.

2 H. Racemos a; leaves oblong, serrated, short-acuminated; female peduncles twin, racemose, flexuous. G. Native of Peru, at Cuchero and Pillao, where it is called Carval and Aquacapi. Tafallia racemosa, Ruiz et Pav. fl. per. s. 271. There is a white pellucid sweet-scented resin issues from this plant, which has the scent of gum-arabic.

Racemose-flowered Hedysosnum. Tree 15 feet.

3 H. Arborescens (Swartz. fl. ind. occ. 2. p. 961. prod. p. 84.) arboresecent; branches straight, erect; leaves ovate-lanceolate; sheaths of petioles eucallate, bidentate; male amenis oblong, usually twin; female racemes tripartite. G. Native
of Jamaica and Martinico, on the higher mountains. Branches angular near the sheaths of the petioles, knotty, rather fleshy. Leaves serrated, attenuated and oblong at the apex, brownish green, shining. Stipulaceous sheaths large, cucullate, bidentate at both sides. Female flowers crowded on the racemes by threes, sessile. Scales 3-4 under the flowers. Ovarium trigonal. Style triquetrous: stigma obtuse. Fruit white, rather diaphanous. Calyx baccate, like that of the first species.

**Arborescent Hedyosmum.** Shrub 12 to 16 feet.

4 H. HESI'TUM (H. B. et K. nov. gen. amer. 7. p. 164.) sheaths and leaves oblong, serrated, hairy beneath. S. Native of New Granada.

**Hair-leaved Hedyosmum.** Shrub.

5 H. GLabra'TUM (H. B. et K. nov. gen. amer. 7. p. 165. t. 685.) leaves oblong-lanceolate, serrated, rough; amens and strobiles term. S. Native of Peru, in Pati and Muna, where it is called Ayacupi; and New Granada. Tafalla scabra, Ruiz et Pav. fl. per. syst. p. 270.

**Smooth Hedyosmum.** Tree 20 feet.

6 H. BONPLANDIA'NUM (H. B. et K. nov. gen. 7. p. 164. t. 684-685.) leaves oblong, acuminate, glabrous, serrated; male peduncles tufted, 3-spired; those of the female branched. S. Native of Peru, in the mountains of Cuchero and Aco- mago, where it is called Ayacupi and Almacijas; and New Granada. Tafalla glabra, Ruiz et Pav. fl. per. syst. p. 271. Bonpland's Hedyosmum. Tree 25 feet.

**Cult.** For culture and propagation see Chloranthus, p. 454, with the exception that the species require more heat. They are shrubs of no beauty.

Cailey having the tube adhering to the ovary (f. 77. c.), and the limb free and 5-lobed (f. 77. d. f. 78. a.). Corolla gamopetalous (f. 77. b. f. 78. b. f. 79. b.), inserted in the calyx, with the tube short (f. 77. b.), or long (f. 78. b.), and the limb 5-lobed (f. 77. b.), and sometimes irregular (f. 78. b. f. 79. b.), not valvate in separation. Stamens inserted in the calyx, and adnate to the corolla at the base (f. 82. f. f. 79. c.), and alternating with its lobes, and equal in number to them (one of which is sometimes abortive), sometimes exserted (f. 79. c. f. 78. c.), sometimes inclosed (f. 82. f. f. 81. b.); filaments subulate; anthers ovate, 2-celled. Ovarium adnate to the calyx, while young 3-celled (f. 77. c.). Style exserted (f. 78. c.) or wanting; stigmas 3, sometimes distinct, sometimes combined into a head. Berry crowned by the limb of the calyx (f. 77. d. f. 81. g.), usually pulpy, rarely almost dry, many-celled in the adult state, but often 1-celled from the dissepiments, which are very thin, having vanished. Seeds inverted, solitary, twin, or numerous in the cells, but sometimes many of them are abortive; spermatangia crustaceous. Embryo in the centre of a fleshy albumen; with a superior radicle, and 2 ovate-oblong cotyledons.—Shrubs, rarely herbs or trees. Leaves opposite, extipulate (rarely furnished with 2 small stipules at the base of each petiole) simple, undivided, toothed, rarely pinnate, feather-nerved. Flowers terminal, corymbose, or axillary.

Taking *Lonicera* for the type of the order, there will be found a striking affinity with *Rubiaceae*, Tribe Cinchonaceae in the monopetalous tubular corolla, definite stamens, inferior ovary, and opposite leaves, an affinity which is confirmed by the corolla of the latter being occasionally regular or irregular. With *Apocynaceae* it has an intimate alliance for the same reasons, differing chiefly in their qualities, with the non-convivance of the anthers, the destivation of the corolla, and the structure of the fruit. To *Loranthaceae* they also approach, in the structure of the flowers and berries. Besides these points of affinity, *Caprifoliaceae* probably tends towards *Umbelliferae* through *Sambucus*, from the divided leaves and half herbaceous habit. The genus *Triosteum* appears to be a link between this order and *Rubiaceae*. The fragrance and beauty of the honeysuckle tribe have been the theme of many a poet's song. They consist either of twining or erect shrubs, with clusters of trumpet-shaped, fragrant, white, scarlet, or yellow flowers; or of fine bushes: having cymes of white blossoms. The honeysuckle is the representative of the former and the elder of the latter. Here too is found the modest and delicate *Linnæa boréalis*, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist; but independently of such recommendations, they possess properties of considerable interest. Their bark is generally astringent; that of *Lonicera corymbosa* is used for dying black in Chili. The flowers of the elder are fragrant, soporific, and sudorific, its leaves and inner bark fettid, emetic, and a drastic purgative, qualities which are also possessed by the honeysuckle. The fruit of *Viburnum* is destitute of these properties, but has instead an austere, astringent pulp, which becomes eatable after fermentation, and is made into a sort of cake by the American Indians. *Triosteum perfoliatum* is a mild cathartic; in large doses it produces vomiting; and its dried or roasted berries have been used as coffee. All caprifoliaceous plants love shady and cool places in both hemispheres, but few have been found in such as endure a very severe climate.

**Synopsis of the genera.**

**Tribe I.**

**Sambucus.** Corolla gamopetalous, regular, rotate (f. 74. a. f. 75. a.); petals 5, only connected a little at the base, rarely tubular. Style wanting. Stigmas 5, sessile.

1 *Sambucus.* Limb of calyx 5-cleft. Corolla rotate (f. 74. a.), urceolate. Berry roundish, pulpy, 1-celled, 3-4-seeded (f. 74. b.), hardly crowned (f. 74. c.).

2 *Viburnum.* Limb of calyx 5-cleft (f. 76. a.), permanent. Corolla rotate (f. 75. a. f. 76. b.), sub-campanulate or tubular. Berry ovate or globose, 1-seeded from abortion, crowned by the calycine teeth.

**Tribe II.**

**Lonicera.** Corolla gamopetalous (f. 77. b. f. 78. b.) more (f. 78. b.); or less (f. 77. b.) tubular, usually irregular (f. 78. b. f. 79. b.). Style filiform (f. 78. c.), crowned by 3 distinct or concrete stigmas.
3 Triosteum. Calyx with an ovate tube and a 5-parted permanent limb (f. 77. a.). Corolla gibbous at the base, almost equally 5-lobed (f. 77. b.). Stamens inclosed. Stigmas oblong, thick. Berry coriaceous, ovobovate triquetrous (f. 77. c.), crowned by the calyx (f. 77. d.), 3-celled (f. 77. e.), 3-seeded.

5 LonicerA. Tube of calyx 5-toothed (f. 78. a.). Corolla tubular (f. 78. b. f. 79. b.), funnel-shaped (f. 79. b.), or campanulate (f. 80. a.), with a 5-parted, usually irregular limb (f. 78. b. f. 79. b.). Stigma capitulate (f. 78. c.). Berry 3-celled; cells few-seeded.

6 Leysteirea. Calyx with an ovate tube, and a 5-parted irregular limb, ciliated with glands. Corolla funnel-shaped, with the tube gibbous at the base, and the limb 5-parted and campanulate. Stigma capitulate. Berry roundish, 5-celled, crowned by the calyx; cells many-seeded.

7 Symphoricarpos. Calyx with a globose tube (f. 81. c.), and a small 4-5-toothed limb. Corolla funnel-shaped (f. 81. c.), with an almost regular 4-5-lobed limb. Stigma semi-globose. Berry crowned by the calyx (f. 81. g.), 4-celled, 2 of them empty, and the other 2 containing 1 seed each.

9 Linnea. Calyx with an ovate tube (f. 82. a.), and a 5-parted limb (f. 82. b.). Corolla turbinate (f. 82. d.), somewhat campanulate, 5-lobed (f. 82. d.). Stamens 4, 2 long and 2 short, inclosed. Stigma globose (f. 82. e.). Berry almost dry, small, ovate-globose, 3-celled.

† Genera allied to the present order, but not sufficiently known.

12 Karpathon. Limb of calyx 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-lobed. Style under the superior lip of the corolla; stigma simple. Capsule crowned by the calyx, 1-celled, 4-seeded.

 Tribe I.

I. SAMBU'CUS (from σαμβουκα, which the Latins have changed to sambuca, a musical instrument, which is believed to have been made of elder-wood; this wood has always been renowned for its hardness). Tourn. inst. 376. Lam. gen. no. 372. Gärtn. fruct. t. 27. Lam. ill. t. 211. Schlkr. handb. t. 83. D. C. prod. 4. p. 321.—Phytæm, Lour. coch. p. 158, but not of Lin.

Lin. syst. Pentándria, Trigynia. Calyx small, but divided into 5 deep segments, permanent. Corolla rotate (f. 74. a.), urceolar, 5-lobed; lobes obtuse. Stamens 5 (f. 74. b.), about the length of the corolla; filaments awl-shaped; anthers roundish, heart-shaped. Style none; stigmas 3, obtuse. Berry globose (f. 74. c.), pulpy, of 1 cell, containing 3-5 seeds (f. 74. b.), which are convex on the outside and angular inside. —Shrubs, rarely herbaceous; having a strong disagreeable scent; stems with a solid spongy pith. Leaves opposite, stalked, pinnate; leaflets toothed, pinnate, or jagged, bi-stipellate or bi-glandular at the base. Flowers white or purplish, disposed in terminal cymes, which are in some flat and in others thyrsoid. Berries purplish, cathartic. Those plants of the genus which have pinnate or jagged leaflets are not true species but only varieties, all the true species having only toothed leaflets.

* Leaves pinnate. Flowers cymose or corymbose.

1 S. E'bula (Lin. spec. p. 385.) root fleshy, creeping; stems herbaceous, simple, deeply and unequally furrowed; leaflets ovate-lanceolate, acute, sharply serrated, unequal at their base; stipules foliaceous, cut; cymes of 3 main branches; flowers all hermaphrodite. Υ. H. Native of Europe, even to Caucasus, in waste ground about hedges. In Britain, in like situations, but not common either in England or Scotland. Smith, engl. bot. t. 475. Curt. lond. 3. t. 15. Woody, med. bot. suppl. t. 260. Oed. fl. dan. t. 1156. — Mill. ill. t. 296. S. hūmilis, Lam. fl. fr. 3. p. 370.—E'bulus, Math. valgr. 2. p. 608. with a figure. Cam. epit. 979. with a figure. Leaflets 4-5 inches long, nearly smooth. Flowers all stalked, of a dull purplish hue, with thick white filaments, whose anthers are reddish. Berries globose, black, not always perfumed, 3-4-seeded.

Our ancestors evinced a just hatred of their brutal enemies the Danes, in supposing this nauseous, fetid, and noxious plant to have sprung from their blood; hence it was formerly called Dane-wort. Its qualities are violently purgative, sometimes emetic; yet a rob of the fruit is said to have been taken with safety, as far as an ounce. The foliage is not eaten by cattle, nor will moles come where these leaves, or those of any of the species are laid. They also drive away mice from granaries, and the Silesians strew them where their pigs lie, under the persuasion that they prevent some of the diseases to which swine are liable. The specific name is from εμβολη, ευβολη, an eruption.

Var. β, hūnilis (Mill. dict. no. 5.). Mr. Miller makes this a distinct species. He says that the roots do not creep so much; that the stems do not rise so high; that the leaves have seldom more than 7 leaflets, and towards the top only 5, longer and narrower than in the common dwarf elder, deeply cut on their edges, and ending with winged acute points. Υ. H. Savi collected this variety about Pisa.
Dwarf-elder or Dane-wort. Fl. July. Brit. Pl. 4 to 5 feet.

2 S. CHINE'NSIS (Lindl. hort. trans. 6. p. 297) root creeping; stems herbaceous, warted, with dark furrows; leaves pinnate; leaflets 7-9, oblong-lanceolate, crenately serrated, naked on both surfaces; flowers monoecious; female ones cup-shaped, apetalous and fleshy. H. Native of China. A strong, rough herbaceous plant, very like S. Ebulus.

The male flowers are white and numerous, with brownish-purple anthers.

3 S. PALME'NSIS (Link. in Buch. can. p. 151.) stems unknown; leaves pinnate; leaflets lanceolate, serrated; petals, nerves of leaves, and peduncles, densely hairy. H. Native of the island of Palma, one of the Canaries, near Sauces.

Palma Elder. Shrub?

4 S. ANNA'TA (Wall. cat. no. 482.) stems suffruticose; leaves pinnate; leaflets 5-7, oblong-lanceolate, sharply serrated, pubescent along the nerves, unequal at the base: the lower side decurrent; cymes trichotomous; berries ovate, striped, almost dry. H. Native of Nipaul, at Gassington. Flowers white?

Adnate-leatfletted Elder. Shrub.

5 S. JAV'A'NICA (Reinw. in Blum. bijdr. p. 637.) stem suffruticose; stipulas foliaceous; leaves pinnate; leaflets oblong-lanceolate, acuminate, equal at the base, sharply serrated; stipulas ovate, foliaceous, serrated; corystyl pedunculate, umbellate, of 5 main rays or branches. H. Native of Java, frequent on the mountains, where it is called Kitespon.

Java Elder. Shrub.

6 S. GAUDICHAUDI'NANA (D. C. prod. 4 p. 322.) stem suffruticose; leaves pinnate, glabrous; leaflets ovate-lanceolate, acuminate, equal, both at the base, sharply serrated; stipulas ovate, foliaceous, serrated; corystyl pedunculate, umbellate, of 5 main rays or branches. H. Native of New Holland, at Port Jackson, where it was collected by Gaudichaud. According to the description this appears to be nearly allied to S. Jaténica.

Berries ovate-globose, small.

Gaudichaud's Elder. Shrub 8 to 10 feet.

7 S. MEXIC'ANA (Prel. in herb. Henke, ex D. C. prod. 4 p. 322.) stem suffruticose; leaves pinnate; leaflets 7, ovate or oblong-lanceolate, acute, serrated, rather hairy beneath as well as on the petioles and branches; corystyl of 5 principal rays or branches. H. Native of Mexico. S. subalpinum, Cham. et Schlecht. in Linnana. 5. p. 171.

Mexican Elder. Shrub 5 to 8 feet.

8 S. CANADA'NIS (Lin. spec. 385.) frutescent, glabrous; leaves pinnate or sub-pinnate; leaflets about 4 pairs, oblong-oval, stiffish, acuminate, more or less pubescent beneath, sometimes appendiculated at the base; cymes of 5 main branches. H. Native of North America, from Carolina to Canada, in swamps and near heads, and throughout Canada, as far as the Saskatchewan. Schmidt, arb. 2. t. 142. Flowers said to be almost inodorous. Berries deep bluish-black.

9 S. NIPA'D (Lin. spec. 385.) arboreous; leaves pinnate; leaflets usually 5, smooth, deep green, ovate or oblong-oval, acuminate, the lower leaflets sometimes terebin, with cymes of 5 main branches. H. Native throughout the whole of Europe, Caucasus, Siberia, and probably of Japan, in hedges, coppices, and woods, common; plentiful in Britain, in like situations; the varieties rare, except in gardens. Dunal. arb. 2. t. 65. ed. nov. 1. t. 55. Hayn. term. bot. t. 92 f. 2. Smith, engl. bot. t. 479. Woody. med. bot. t. 78. Fl. dan. t. 645. Branches, after a year's growth, clothed with smooth grey bark, and filled with a light spongy pith. Flowers cream-coloured, with a sweet but faint smell. Berries globular, purplish black; their stalks reddish. It may be remarked that our uncertain summer is established by the time the elder is in full flower, and entirely gone when its berries are ripe. The tree is, as it were, a whole magazine of physic to rustic practitioners, nor is it quite neglected by more regular ones. The berries make a useful and agreeable rob, of a slightly purgative quality, and very good for catarrhs, sore throats, &c. The inner bark is more actively cathartic, and is thought beneficial in rustic ointments and cataplams for burns. The dried flowers serve for fomentations, and make a fragrant but debilitating tea, useful perhaps in acute inflammations, but not to be persisted in habitually. An infusion of the leaves proves fatal to the various insects which thrive on blighted or delicate plants; nor do many of this tribe, in the caterpillar state, feed upon them: cattle scarcely touch them, and the mole is driven away by their scent. A wine is made from the berries, to be taken warm, with spices and sugar; and they are said to frequently enter into the composition of a less innocent beverage—artificial or adulterated port. An infusion of the inner green bark of the trunk in wine, or the expressed juice of the berries, in the dose of half an ounce, is said to purge moderately, and in small doses to prove debilitating. The expressed juice of the berries, inopissipated to the Consistence of a rob, proves an useful aperient medicine, and if continued for a sufficient length of time, is of considerable service in various chronic disorders. The young leaf-buds are strongly purgative, and act with so much violence as to be accounted unsafe. The flowers have an agreeable aromatic flavour, like that of Frontignac wine, which they yield in distillation to water, and impart, by infusion, to vinous and spirituous liquors and oils. Sydenham recommends as an effectual hydragogue diuretic 3 handfuls boiled in a quart of milk and water till only a pint remains, of which one half is to be taken night and morning, and repeated several days. Boehrhaave gave its expressed juice in doses from a drachm to half an ounce. It is said also that if sheep who have the rot can get the bark they will soon cure themselves. An infusion of the leaves is useful for gardeners to sprinkle over the buds of such flowers as they wish to preserve from minute caterpillars, for few insects can bear the elder. In Scotland the tree is called Bountray.

Var. γ, levucocárpa; fruit white. H. H.

Var. δ, laci'niata; leaves cut into fine segments. H. S. laciniata, Mill. di. no. 2.—Lob. icon. 2. t. 164. f. 2. Called Parsley-leaved elder.

Var. ε, rotun'difólia; leaves ternate; leaflets petiolate, roundish, serrated; corystyls few-flowered. H. H. Cultivated in Chelsea garden.

Var. ζ, monstrósa; branches striped; flowers of from 5-15 parts, and with from 5-15 stamens; stigmas 5-12; berries irregular. H. S. monstrosa, Hort.

Var. τ, variegátta; leaves variegated with yellow or white. H. H.

Common or Black-berried Elder. Fl. June. Britain. Shrub 10 to 15 feet.

10 S. PEZUV'INNA (H. B. et Kunth, nov. gen. amer. 3. p. 429.) arboreous; leaves pinnate; leaflets 7, oblong, acuminate, obtuse at the base, nearly equal; petioles glabrous; corystyl somewhat trichotomous; berries usually 5-seeded. H. H. Native of Peru, on the Andes, in cultivated places, at the elevation of 4000 feet. S. suavóleons, Wild. in Schultz, syst. 6. p. 441. Flowers white. Berries black.

Peruvian Elder. Shrub 12 to 20 feet.

11 S. A'bustralis (Cham. et Schlecht. in Linnana. 3. p. 140.) shrubby; leaves pinnate; stipules glabrous; leaflets 11-13, ovate-lanceolate, usually unequal at the base; corystyls branched.
teate: stigmas 5, sessile; berries 5-celled.  ﬤ  H. Native of Brazil, and cultivated at Talcahuano in Chili. Flowers cream-coloured? There is a variety of this having 4 stigmas and a 4-celled berry.

**Southern Elder.** Shrub 5 to 10 feet.

* * * Leaves pinnate. Flowers panicked.

12 S. racemosa (Lin. spec. 386.) shrubby; leaves pinnate; leaflets 5, membranous, obl. acum., serrated, unequal at the base; petioles glabrous; panicle ovate.  ﬤ  H. Native of middle and south Europe, and Siberia on the mountains. Jacq. icon. rar. 1. p. 59. Duham. arb. t. 66. and ed. nov. 1. t. 56. S. montana, Cam. epit. 976. S. cervina, Tabern. t. 1029. —Lob. icon. t. 163. Leaves pale green, pretty smooth. Flowers of a whitish green colour. Fruit red or scarlet when ripe.

**Racemos-flowered Elder.** Fl. April, May. Clt. 1596. Shrub 10 to 15 feet.

13 S. pubens (Michx. fl. bor. amer. 1. p. 181.) shrubby; leaves pinnate; leaflets 5, membranous, ovate-lanceolate or oblong, acum., serrated, pubescent, but chiefly on the under side; panicle thyrsoid.  ﬤ  H. Native from Carolina to Canada, on the highest mountains, as far as the Sacramento. S. racemosa, Hook, fl. bor. amer. 1. p. 279. but not of Lin. Berries red. Flowers whitish. Resembles S. racemosa very much.

Var.  ﬤ, heptaphylla; leaves larger than those of the species; leaflets 7.  ﬤ  H. Native of North America, on the east side of the Rocky Mountains: and shores of the Columbia, near Fort Vancouver, and at its confluence with the sea. The Rocky Mountain specimens, and, more especially those from the Pacific, are remarkable for the great size and length of their leaflets, and there being almost constantly seven upon each brachis.

**Downy Elder.** Fl. May, June. Clt. 1812. Sh. 6 to 10 ft.

* * * Leaves bipinnate.

14 S. ebuloides (Desv. in herb. mus. par.) suffruticosum; leaves bipinnate; leaflets lanceolate, serrated; panicle composed of racemes.  ﬤ  H. Native of China, in the suburbs of Canton. Phyteuma bipinnata, Lour, coch. 158. Branches angular and furrowed. Flowers white. Fruit perforated, 5-celled, many-seeded.

**Danewort-like Elder.** Shrub 5 to 6 feet.

15 S. Phyteumoides (D. C. prod. 4. p. 328.) suffruticosum; leaves bipinnate; leaflets lanceolate, serrated, wrinkled; peduncles many-flowered, divaricata.  ﬤ  H. Native of Cochinchina, on the mountains. Phyteuma Cochinchinensis, Lour. coch. 139. Flowers white. Berry roundish, pustule, small, 1-celled, many-seeded. Very nearly allied to S. ebuloides.

**Phyteuma-like Elder.** Shrub 5 feet.

† Doubtful species, to be inquired into or excluded from the order.

16 S.? Loureiriana (D. C. prod. 4. p. 328.) arboreous; leaves pinnate; leaflets 5, broad-lanceolate, quite entire, glabrous.  ﬤ  H. Native of China, on the mountains. S. nigra, Lour. coch. p. 181. but not of Lin. Cymes 5-parted and 3-parted; peduncles long, nearly equal. Fruit a round, small, reddish-brown, 3-seeded inferior berry. The berries are used by the Chinese in coldness of the extremities, as they are of a heating nature, from which quality, and the quite entire leaflets, it is not likely to be a species of *Sambucus*, but probably a species of *Turpinia*.

Loureiro's Elder. Shrub 8 feet.

17 S.? Japonica (Thunb. fl. jap. p. 125.) shrubby; leaves impari-pinnate, with 3-7 pairs of leaflets and an odd one; leaflets ovate, acute, cartilaginosely serrated, glabrous; flowers disposed in panicked, trichotomous cymes.  ﬤ  H. Native of Japan. Ovarium superior and style filiform, for which reason it ought evidently to be excluded from the genus; it is probably also a species of *Turpinia*. Stigmas capitate, white.

**Japan Elder.** Shrub.

18 S.? Thunbech; shrubs 5-parted; leaves somewhat bipinnate.  ﬤ  H. Native of Japan, near Naga-saki and elsewhere, where it is called by the Japanese Sokuso and Saki-Teki. Shrub perishing just above the earth every year. S. Canadensis, Thunb. fl. jap. p. 126. This plant is hardly known as well as the S. nigra, Thunb. l. c.

**Thunberg's Elder.** Shrub.

Cult. All the species of elder are of the most easy culture, and will thrive in any soil or situation. The perennial herbaceous species creep much at the root, and are difficult to extirpate, having once got hold in the ground. The shrubby and arboreous kinds are easily increased by cuttings, stuck in the ground in autumn or spring. Those species, natives of warmer climates, will require a little protection in severe weather in winter.

**Lin. syst. Pentandria, Trigynia.** Limb of calyx small, 5-cleft (f. 76.a.), permanent. Corolla rotate (f. 75.a. f. 76.b.), somewhat campanulate, or tubular, with a 5-lobed limb (f. 76.b.). Stamens 5, equal (f. 75.b.). Stigmas 3, sessile. Berry ovate or globose, 1 seeded from abortion, crowned by the calycine teeth. Seeds compressed.—Shrubs. Leaves opposite, petiolate. Coryms of flowers terminal. Flowers usually white, but sometimes verging to a rose colour.

§ I. Leaves quite entire or toothed. Style almost wanting; stigmas 3, sessile.

1 V. Tixus (Lin. spec. 383.) leaves ovate-oblong, quite entire, permanent; having the ramifications of the veins beneath, as well as the branchlets, furnished with glandular hairs.  ﬤ  H. Native of the south of Europe, in the region of the olives, and of the north of Africa, as well as Portugal, Spain, Italy, the south of France, and Algiers. Duh. arb. ed. nov. 2. t. 37. Curt. bot. mag. t. 38. V. laurifolius, Lam. fl. fr. 3. p. 385. Tixus, Tourne. inst. p. 607. t. 377. Tinus laurifolius, Bornh.
in Rem. arch. 1. pt. 2. p. 20. Corymbs flat. Flowers white, but rose-coloured before expansion, and sometimes afterwards for a little time. Berries dark blue. The Laurotina or Laurestina is one of the most ornamental of evergreen shrubs, with shining leaves and showy white flowers, which appear during the winter months. The name of Laurestina was given to the shrub by old authors, they supposing it to be a kind of bay or laurel. The berries are very hot, and inflame the fauces violently, like those of Mizeron; and they are also violently purgative, according to Parkinson; but some kinds of birds are said to eat them greedily.

Var. a, hirtum (Ait. hort. kew. 2. p. 166.) leaves oval-oblong, hairy beneath and on the margins. G. Native of Portugal and Spain, and the country of Nice. V. Tinus, Mill. dict. no. 4.—Clus. hist. 1. p. 49. no. 1. The flowers of this variety appear in autumn and continue all the winter. It is the most hardy and most common sort, called Hairie Laurestine. V. lycidum, Mill. Pers. and Schultes.—Clus. hist. 1. p. 49. no. ii.

Var. b, lacedum (Ait. l. c.) leaves ovate-oblong, glabrous on both surfaces, shining. G. Native about Algiers and on Mount Atlas. The cymes as well as the flowers are larger than the common sort; these seldom appear till the spring, and when the winters are sharp the flowers are killed, and never open unless they are sheltered. Called Shining Laurestine.

Var. ε, virgatum (Ait. l. c.) leaves oblong-lanceolate, pilose on the margins as well as on the veins beneath. G. Native of Italy, about Rome and Tivoli, &c.—Clus. hist. no. iii. with a figure. Called Common Laurestine.

3 V. sinsoides (Lin. fil. suppl. p. 184.) leaves elliptic-glabrous, quite entire; branches terete, and are as well as the corymbs hairy. G. Native of South America, where it was collected by MUTIS.

4 V. glabratum (H. B. et Kuntch, nov. gen. amer. 3. p. 428.) leaves ovate-oblong, acuminate, rounded at the base, quite entire, and very glabrous; petioles naked; branches canescent and powdery; corymbs involucrated. G. Native of South America, in woods on the Andes, about Popayan, at the altitude of 5000 or 4000 feet. V. glabrum, Willd. in Schultes, syst. 6. p. 639. Calyx bluntly 5-toothed. Flowers white.

Smooth Laurestine. Tree 15 to 20 feet.

5 V. ayavacense (H. B. et Kuntch, nov. gen. amer. 3. p. 428.) leaves ovate, acute, cordate, quite entire, glabrous, shining above, but with the axis of the veins beneath furnished with stellate hairs, as well as the branchlets and corymbs; petioles naked. G. Native of Peru, near Ayavaca, in temperate places, at the elevation of 4000 or 5000 feet. Teeth of calyx roundish-ovate, acute, ciliated. Flowers white? Perhaps the same as V. sinsoides.

Ayavaca Laurestine. Shrub 4 to 6 feet.

6 V. integerrimum (Wall. cat. no. 457. D. C. prod. 4. p. 324.) leaves oval, acute at the base, acuminate, quite entire, glabrous, rather coriaceous, dotless; petioles, branchlets, and peduncles hairy; corymbs loose, terminal; fruit oval, compressed. G. Native of the island of Pulo-Penang. This species agrees with V. Tinus on the one hand and V. punctatum on the other. Calyces toothed, exceeding the berries.

Quite-entire-leaved Laurestine. Shrub 4 to 6 feet.

7 V. chineense (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) leaves membranous, broad-elliptic, acute and unequally toothed, glabrous above while young, puberulous and dotless beneath; corymbs terminal, pubescent. G. Native of China.

China Laurestine. Shrub.

8 V. punctatum (Hamilt. in D. Don, prod. fl. nep. p. 142.) leaves oval-oblong, quite entire, mucronulate, glabrous on both surfaces, beset with dots beneath; corymbs terminal, smooth, spreading, sessile. G. Native of Napal, at Suemba, where it is called Hemu-say by the Nawar people. Teeth of calyx obtuse. Flowers white.

Dotted-leaved Laurestine. Shrub.

9 V. acuminatum (Wall. cat. no. 465. D. C. prod. 4. p. 325.) leaves elliptic, acuminate at both ends, glabrous, coriaceous, beset with curly dots; corymbs terminal, trichotomous, shorter than the leaves; berries oval-oblong. G. Native of the East Indies, on the Nelligherry Mountains, where it was collected by Notan. Very nearly allied to V. punctatum.

Acuminated-leaved Laurestine. Shrub.

10 V. prennaceum (Wall. cat. no. 461. D. C. prod. 4. p. 325.) leaves elliptic-oblong, acuminated, glabrous above and dotless beneath, and downy along the nerves, having 1 or 3 coarse serratures on each side; petioles short, and as well as the branchlets and peduncles clothed with villous tomentum; corymbs terminal, with 5 main branches, involucrated by 5 elliptic leaves. G. Native of the East Indies, on the Pandua mountains. Leaves 3½ inches long, and 1½ inch broad, feather-nerved; but the lower lateral nerves arise from the base and give the leaf the appearance of being 3-nerved.

Prenna-like Laurestine. Shrub 5 to 7 feet.

11 V. nervosum (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) evergreen; leaves elliptic-lanceolate, glabrous, acute at the base and apex, dotless beneath, with a few serratures towards the apex on both sides; nerves impressed above, but prominent beneath, glabrous in the axils, and with numerous transverse conspicuous veins between them; peduncles and petioles short and glabrous; corymbs terminal. G. Native of China. This is closely allied to V. prennaceum, Wall. in which plant is observed, besides the character given by D. C. that the axis of the leaves are furnished with a tuft of short hairs, which is totally absent from the present species.

Nerved-leaved Viburnum. Shrub.

12 V. Colebrokeana (Wall. cat. no. 460. D. C. prod. 4. p. 325.) leaves elliptic, acuminated, hardy obtuse at the base. Regularly serrate-toothed, glabrous, dotless: petioles, branches, and peduncles scurfy from stellate down; corymbs axillary, pedunculate, without any involucre. G. Native of the East Indies, on the Pandaunas Mountains. The corymbs are not truly axillary, but are borne on short leafless, axillary branchlets or peduncles, which are furnished with 2 leaves at the base. Flowers white.

Colebrookea’s Laurestine. Shrub 4 to 6 feet.

13 V. vugidum (Wall. cat. no. 466. D. C. prod. 4. p. 325.) leaves elliptic-oblong, cuneated at the base, coarsely and minutely toothed, glabrous above, but villous along the nerves beneath; petioles, branchlets, and peduncles villous; corymbs terminal, pedunculate, of 6 main branches, without any involucre; fruit almost sessile, oval. G. Native of the Burman Empire, on Mount Taong-Dong, near Ava. Leaves 2
CAPRIFOLIACEÆ. II. VIBURNUM.

Petid Viburnum. Shrub 4 to 6 feet.

14 V. samu'cinum (Reinw. in Blum. bijdr. p. 656.) leaves elliptic-oblong, attenuated at both ends, almost quite entire, puberulous on the ribs beneath; corymb terminal, distichate, puberulous. % S. Native of Java, among bushes on the mountains. Flowers white. Var. β; leaves oval, acute at both ends, smoothish, serrated at the top. % S. Native of Java, at the foot of Mount Salak.

15 V. lute'sciens (Blum. bijdr. p. 655.) leaves oblong, bluntly acuminate, acutely and coarsely serrated at the base, coriaceous, shining, paler beneath; corymb terminal, distichate, puberulous. % S. Native of Java, in the provinces of Krawang and Tjanjak, among other bushes on the mountains.

Yellowish Viburnum. Shrub 4 to 6 feet.

16 V. punicifolium (Lin. spec. p. 383.) leaves roundish-obovate and oval, glabrous, rather membranous, crenately serrated, ending in a short cuneum; petioles margined, glabrous; cymes sessile; berries ovate or roundish. % H. Native of North America, from New England to Carolina, in hedges and fields; also of Canada about Lake Huron. Wats. indr. t. 23.—Pluck. aln. 46. f. 2.—Duham. 2. t. 38. Flowers white as the rest of the species. Berries dark blue. This species appears to be very nearly allied to V. nuditum, but the leaves are broader and more membranous.

17 V. pyrifolium (Poir. dict. 5. p. 658.) leaves ovate, acute, or ovate, glabrous, sub serrated; petioles smooth; corymb somewhat pedunculate; fruit ovate-oblong. % H. Native of Pennsylvania, New Jersey, &c. on the banks of rivers. Flowers white. Berries black. Resemblances the preceding species, but is not so strongly in its growth.

Pear-leaved Viburnum. Fl. May, June. Shrub 5 to 8 feet.

18 V. len'tago (Lin. spec. p. 384.) leaves broad-ovate, acuminate, sharply serrated, glabrous; petioles with narrow or serrulate margins; corymb terminal, sessile. % H. Native of North America, from New England to Carolina, among hedges, and on the borders of woods. Throughout Canada to the Saskatchewan. Wats. indr. t. 21. Schmidt, arb. 3. t. 176. ex Romet et Schultes, syst. 6. p. 637. Flowers white. Fruit black. Serratures of leaves hooked a little, and somewhat cartilaginous. This species is more inclined to grow to a tree than any of the rest. The specific name is from lento, to make pliant, on account of the pliable propendent branches.

19 V. nuditum (Lin. spec. p. 383.) leaves oval-oblong, angular at the base, bluntish, with revolute obsolete crenately serrate margin, quite glabrous; petioles beset with scale-like scurf or down; corymb pedunculate, infuscvolucrate. % H. Native from Canada to Georgia, in swamps, particularly on a sandy soil; about Quebec, and on the banks of the Saskatchewan; and of Newfoundland. Wats. indr. t. 20. Mill. fig. 274. V. squamatum, Willd. enum. 1. p. 337. ex Torrey, fl. un. st. p. 319. Wats. indr. t. 24. Flowers white. Berries globose, black, or dark blue. In the southern states this shrub becomes evergreen; the young branches are flourescent, and sometimes the under side of the leaves. According to Richard, in Brot's herb, this is the same as V. pyrifolium, Poir.

20 V. obova'tum (Walt. car. p. 116.) glabrous; leaves obovate, crenately toothed, or quite entire, obusse, but acute at the base, on short petioles; corymbs sessile; berries ovate-roundish. % H. Native of Carolina and Georgia, in shady woods. Lodg. bot. cab. 1476. V. cassinodea. Michx. fl. bor. amer. 1. p. 179. but not of Lin. Flowers white. Fruit black, shining. Var. β; acetabulum (Desf. arb. 1. p. 345.) leaves oblong-obovate, obtuse, entire or loosely crenated at the apex. % H. Growing along with the species.

Obovate-leaved Viburnum. Fl. May, June. Clt. 1812. Sh. 3 to 6 feet.

21 V. cassinodea (Lin. spec. p. 384.) leaves ovate-lanceolate, acute at both ends, crenated, glabrous above, with subrevolute edges; under side of leaves, as well as the petals, which are keeled, and branches, which are tetragonal, covered with scurfy dots; corymb sessile; fruit ovate. % H. Native from New York to Carolina, in swamps. V. punctatum, Rafin. in litt. Flowers white. Berries bluish-black.

23 V. nuditum (Ait. hort. kew. 1. p. 371.) quite glabrous; leaves linear-lanceolate, shining above, obsolescently serrate or entire; branches tetragonal. % H. Native of Carolina and Georgia, in sandy barren woods. A low shrub, with small leaves. Flowers white.

24 V. odoratissimum (Ker, bot. reg. t. 456.) evergreen, glabrous; leaves coriaceous, elliptic-oblong, almost entire, with revolute margins; branches of thyrse opposite, having the peduncles of the branches triquetrously pedicellate; style simple, short; berries oblong. % G. Native of China. V. Sinense, Zeyh. in Coll. hort. ripul. 145. app. 2. p. 330. t. 16. V. Chinense, Zeyh. ex Steud. nom. p. 880. Coffea monospérama, Hook. et Arn. Berries red, but at length becoming blackish, shining, 1-seeded, crowned by the lobes of the calyx, which are erect.

Flowers white, with the scent of those of Olea fragrans, or sweet olive. This shrub has scarcely at all the appearance of a Viburnum, from which genus the presence of a style essentially distinguishes it. (F. 76.)

25 V. lan'tana (Lin. spec. p. 384.) leaves cordate, rounded, finely serrated, veiny, clothed beneath, but more sparingly on the upper side, with starry mealy pubescence, like that on the branches, petioles, and peduncles; cymes pedunculate, broad, flat, of numerous crowded white flowers; bracteas several, small, acute. % H. Native throughout Europe, even to Caucasus, in hedges. In Britain in woods and hedges, especially on
a chalky or limestone soil. Smith, engl. bot. t. 331. Jacq. austr. t. 341. — V. tomentosum, Lam. fl. fr. 3. p. 363. — Cam. ept. 122. with a figure. — Duham. arb. 2. t. 103. — Lob. icon. 2. t. 106. A small tree, with copious, opposite, round, peltate, mealy branches. Under side of leaves and branchlets white from mealy down. Berries compressed in an early state, red on the outer side, yellow on the inner, finally black, with a little mealy astrin- gent pulp. Seed large, flat, and furrowed. The leaves turn of a dark red in autumn. This shrub is hardly worth cultivat- ing for ornament, nor is it of any particular use, except that the bark serves to make bird-lime; but that of the holly is much better. It is supposed to be the viburnum of Virgil. The name lantana is from lento to make pliant, on account of the pliant branch

Way-faring Tree. Fl. May, June. Britain. Shrub 6 to 15 feet.

27 V. DENTATOM (Lin. spec. p. 384.) partly glabrous; leaves ovate, and nearly orbicular, plicate, coarsely and dentately serrated, with the nerves thick and feathered, glabrous on both surfaces; cymes or coryllia pedunculate; fruit nearly globose. F. H. Native of North America, from New York to Carolina, in mountain woods, and of Mexico. Jacq. hort. vind. 1. t. 56. Wats. dend. t. 25. V. dentatum lucidum, Ait. Hort. kew. 1. p. 572. V. dentatum glabulum, Michx. fl. bor. amer. 1. p. 179. Flowers white. Berries small, dark blue, crowned by the calyx. In North America the shrub is known by the name of arrow-root.

Downy Viburnum. Fl. June, July. Cilt. 1736. Shrub 3 feet. 29 V. ELLIPITICUM (Hook. fl. bor. amer. 1. p. 280.) leaves elliptic, obtuse, on short petioles, coarsely serrated at the top, very hairy beneath, but most so on the veins, which are parallel; coryllia dense, pedunculate; ovaries hairy; berries oval-globose, deep black. F. H. Native of North America, common on the branches of the Columbia, near its confluence with the Pacific. Bark of branches pale brown. Leaves about 2 inches long.

Var. β; ovaries glabrous. H. H. Growing along with the species.

Elliptic-leaved Viburnum. Shrub 2 to 4 feet. 30 V. Villosum (Swarz, prod. p. 54. fl. ind. occ. 1. p. 564.) leaves ovate, acuminate, quite entire, glabrous above in the adult state, but tomentose beneath from stellate down, as well as the pedicels and branchlets; coryllia terminal, pedunculate; fruit ovate-oblong. S. Native of the south of Jamaica, on the mountains. Peduncles and calyces rather villous. Corollas white. This species agrees with V. Tinus in the leaves being entire, and from the tomentum with V. Lantana. Peduncles quadriangular and channeled.

Villosum Viburnum. Clt. 1824. Shrub 5 to 6 feet.

31 V. Cotinifolium (D. Don, prod. fl. nep. p. 141.) leaves roundish-oval, quite entire, clothed with stellate tomentum on all surfaces, grey beneath, as well as the branches; coryllia terminal, woolly. H. Native of Nipail, at Sirinagur. Flowers white.

Cotinifolia-leaved Viburnum. Shrub.

32 V. Nervosum (D. Don, prod. fl. nep. p. 141.) leaves cordate, acuminate, nerved, serrated, clothed with deciduous stel- late tomentum beneath, as well as on the branches; peduncles terminal, tern, cymose, few-flowered. H. Native of Nipail, at Sirinagur, where it is called Pheelaroom by the natives. V. Lantana, Wall. mss.

Nerved-leaved Viburnum. Shrub 4 to 6 feet.

33 V. Cardifolium (Wall. cat. no. 462. D. C. prod. 4. p. 327.) leaves heart-shaped, acuminate, dentately serrated, membranous, glabrous above, clothed with stellate down on the pedicels and nerves, which is at first dense, but at length scattered; coryllia terminal, sessile, with 5-7 long main branches or rays; berries elliptic. H. Native of Nipail, in Kamaon and Gosainthong. Leaves 4 inches long, and 2½ broad. Petioles 12-15 lines long. There are 4-6 nerves at the base of the limb of the leaf on each side, rising from the midrib.

Heart-leaved Viburnum. Shrub 5 to 6 feet. 34 V. Mullaha (Hamilt. in D. Don, prod. fl. nep. p. 141.) leaves ovate, acuminate, distantly serrated, rounded at the base, densely clothed with tomentum beneath, as well as on the branches; coryllia terminal, compound, spreading, tomentose; teeth of calyx short. H. Native of Nipail, at Suembo. Nearly allied to V. tomentosum. Flowers white.

Mullaha Viburnum. Shrub.

35 V. Stellalatum (Wall. cat. no. 463. D. C. prod. 4. p. 327.) leaves ovate, cordate, acuminate, glabrous above, except on the middle nerve, densely clothed with stellate down beneath, as well as the branchlets and peduncles; the margin serrated: serratures distant, small, callys; coryllia terminal, with 5-7 main branches, exinvolucrate. H. Native of Nipail, in the valley, and at Kamaon. Wall. pl. rar. assi. 2. p. 54. t. 169. Flowers white. Leaves roundish-cordate. Berries scarlet.

Starry-haired Viburnum. Shrub 12 to 20 feet. 36 V. Involucratum (Wall. cat. no. 458. D. C. prod. 4. p. 327.) leaves ovate, acuminate, somewhat cordate at the base, villous from simple hairs while young, as well as the branchlets; coryllia terminal, decomposed; bracteae and bracteoles foliaceous, oval, attenuated at the base, acuminate, nearly entire, exceeding the flowers. H. Native of Nipail. Branches of coryllia and calyces villos. Flowers white.

Involucrated Viburnum. Shrub 4 to 6 feet.

§ 2. Leaves serrated and denticulated. Flowers monogyne from the style being a little elongated, and the stigmas being concrete.

37 V. Erusum (Thunb. fl. jap. p. 124.) leaves broad-ovate, acuminate, closely serrated, rather villous on both surfaces;
petioles tomentose; umbels decompound, pilose; style simple.

39 V. acerifolium (Lin. spec. 383.) branches and petioles pilose; leaves ovate-cordate, usually 3-lobed, acuminated, sharply
and loosely serrated, downy beneath; petioles glandless, when
young stipulaceous at the base, and rather tomentose; corymb
terminal, pedunculate, not radiate. ￡. H. Native of North
America, from New England to Carolina, and of Newfound-
land, in rocky mountainous situations. Throughout Canada from
Lake Huron to the Saskatchewan; and about Fort Vancouver
on the Columbia. Vent. hort. celts. t. 72. Wats. dend. brit. t.
118. Flowers white. Berries black, oval, compressed.

§ 3. Leaves 3-lobed.

39 V. acerifolium (Lin. spec. 383.) branches and petioles
pilose; leaves ovate-cordate, usually 3-lobed, acuminated, sharply
and loosely serrated, downy beneath; petioles glandless, when
young stipulaceous at the base, and rather tomentose; corymb
terminal, pedunculate, not radiate. ￡. H. Native of North
America, from New England to Carolina, and of Newfound-
land, in rocky mountainous situations. Throughout Canada from
Lake Huron to the Saskatchewan; and about Fort Vancouver
on the Columbia. Vent. hort. celts. t. 72. Wats. dend. brit. t.
118. Flowers white. Berries black, oval, compressed.

40 V. orientalis (Pall. fl. ross. t. 58. f. H.) leaves 3-lobed,
acuminated, coarsely and bluntly toothed; petioles glandless,
grabous; corymb terminal, not radiate; fruit oblong, compressed.
￡. H. Native of Siberia, in woods, on the moun-
tains, &c. Bieb. fl. taur. 1. p. 245. O’pulus orientalis, folio
ampissimo tridentato, Tourn. cor. p. 42. Flowers white. Seed
oval, furnished with 2 channels on both sides, as in V. Lantana.

Very like the preceding species.

Sect. II. O’pulus (a name altered from populus, the poplar:
the leaves resembling those of the poplar). Tourn. inst. t. 376.
Moench, meth. p. 605. Outer flowers of the corymbs radiant
and sterile, much larger than the rest, which are fertile. Seed
obcordate.

41 V. O’pulus (Lin. spec. 384.) quite grabous in every part;
leaves broad, 3-lobed, acuminated, unequally serrated, very
petioles beset with glands towards the top, and several oblong
leafy appendages below; cymes pedunculate, white, with
linear bractes: with several of the marginal flowers dilated
flat, radiant, and without stamens or pistils; berries elliptical,
bright red, very juicy, but bitter and nauseous; seed compres-
sed. ￡. H. Native throughout Europe to Caucasus, in watery
hedges and swampy thickets. In Britain in like situations.
Smith, engl. bot. t. 322. Fl. dan. 661. Hayn, term. t. 32. f. 4.
V. lobatum, Lam. fl. fr. 3. p. 363. O’pulus glandulosus,
1002. with a figure. Math. valgr. 2. p. 607. with a figure.
Branches smooth, green. Leaves bright green in summer, but
in autumn assuming a beautiful pink or crimson hue, like other
European species of the genera, that are principally American,
as Cornus, Rhus, &c. Flowers white. Berry crowned by the
limb of the calyx. There is to be found in the gardens a varie-
gated leaved variety.

Var. $\beta$, stérilis (D. C. prod. 4. p. 328) ￡. H. Cultivated in
gardens. This variety is called snow-ball-tree or guelder-rose.
It is commonly planted in shrubberies along with the lilac and
linden, being grouped elegantly with the various purple hues of
the former, and the golden tints of the latter, but they are all mere
summer beauties; nor does any thing profitable or ornamental
follow. The several marginal flowers of the corym in the species
are dilated, flat, and radiant, without stamens or pistils. In this

42 V. edule (Pusch, fl. bor. amer. 1. p. 203.) leaves 3-lobed,
bluntish behind, and 3-nerved: lobes very short, denticulate
serrate: serratures acuminate; pediolas glandular; outer
flowers of corymbas radiate. ￡. H. Native of North America,
from Canada to New York, on the banks of rivers. In Canada
from the Saskatchewan to Slave Lake, in lat. 66°. V. O’pulus
dulce, Michx. fl. bor. amer. 1. p. 180. A smaller and more up-
right shrub than the preceding species. The berries of the same
colour and size, but when completely ripe more agreeable to
eat, and sometimes employed as a substitute for cranberries.
It does not seem to differ much from V. oxyeococcus except in the
broader base of the leaf.

5 to 10 feet.

43 V. oxyeococcus (Pusch, fl. bor. amer. 1. p. 203.) leaves
3-lobed, acute behind, 3-nerved; lobes divaricate, acuminate,
coarsely and distantly serrated; pediolas glandular; cymes ra-
diant; fruit oblong-ovate. ￡. H. Native of North America;
in Kentucky, near Danville; Tennessee and Upper Carolina,
180. V. O’pulus Americana, Ait. hort. kew. 1. p. 375.
Flowers white. Berries subglobose, red, of an agreeable acid,
resembling that of cranberries, for which they are a very good
substitute. Very like the V. O’pulus of Europe.

Var. $\beta$, subintegrifolus (Hook. fl. bor. amer. 1. p. 281.) leaves
but little cut, very pubescent beneath. ￡. H. Native on
the banks of the Columbia.

44 V. molle (Michx. fl. bor. amer. 1. p. 180.) leaves near-
by orbicular, cordate, plicate, toothed, rather tomentose
beneath from very soft down; petioles rather glandular; corymbs
radiant; fruit oblong-ovate. ￡. H. Native of North America,
in Kentucky, near Danville; Tennessee and Upper Carolina,
in woods. V. alnifolium, Marsh. arb. p. 162. Flowers white.
Berries red. Bark deciduous. Very like V. oxyeococcus, and
perhaps only a variety of it.

45 V. microcarpum (Cham. et Schlecht. in Linnaea. 5.
p. 170.) leaves subcordate, orbicular, or obovate, short-acuminated,
remotely and sinutately toothed, pubescent above, and clothed
with hoary tomentum beneath; petioles short, without glands;
rays of cyme almost sessile. ￡. H. Native of Mexico, near
Jalapa and San Meguel del Soldado. Leaves like those of
the filbert. Fruit black.

Small-fruited Guelder-rose. Shrub 6 to 8 feet.

Sect. III. Solochnthus (from σωλην, solen, a tube, and
tinus, the laurestine; in reference to the corollas being tubular.
D. C. prod. 4. p. 328. Corollas not radiant. Corolla obconical
or cylindrical. Seeds oval-oblong. This section agrees with the
tube Lonicerae in the corollas being tubular.

46 V. daivuki (Pall. fl. ross. ed. 8vo. p. 52.) leaves
ovate, somewhat cordate at the base, crenately serrated, beset
with stellate down, as well as the branchlets; corymb dichoto-
mous, few-flowered; corollas tubular, somewhat funnel-shaped,
bluntly 5-toothed. ￡. H. Native of Dahuria. Lonicera
Mongolica, Pall. fl. ross. 1. t. 38. and t. 58. f. F. G. Gmel. sib.
t. 25. Cór纳斯 Daúrica, Laxm. Berry 5-7 seeded, ex Pall
ed. 1, 1-seeded, at first red, but at length becoming black and sweet, ex Pall. ed. 2. Allied to *V. Latifolia*. Flowers yellowish white.

**Dahurian Viburnum**. Shrub 6 to 8 feet.

47 *V. Polycoronum* (Wall. cat. no. 455.) leaves cordate, ovate, somewhat acuminate, glabrous above, and tomentose from dense stellate white down beneath, but at length rather naked; corollas terminal, 5-rayed, on short peduncles; corollas obconically tubular; berry elliptic, glabrous.  \( \frac{1}{2} \). H. Native of Nipaul, at Kamaon and Sirmore. Leaves 4-5 inches long, and 3 inches broad; petioles 4 lines long.

**Many-flowered Viburnum**. Shrub 6 to 8 feet.

48 *V. cylindricum* (Ham. in D. Don, prod. fl. nep. p. 142.) leaves oval-oblong, acuminated, coriaceous, quite entire, pubescent beneath, and on the branches; corollas compound, erect, tomentose; corolla oblong, tubular, with a short 5-toothed limb.  \( \frac{1}{2} \). H. Native of Nipaul, at Narainhatt. This species has the habit of *V. nudum*. Flowers white, tubular, very like those of *V. Dahuricum*.

**Cylindrical-flowered Viburnum**. Shrub.

49 *V. Grandiflorum* (Wall. cat. no. 464. D. C. prod. 4. p. 329.) leaves elliptic, acuminate, dentately serrated, pubescent along the nerves beneath, when young ornamented with pencilled hairs in the axils of the serratures above; corollas terminal, bracteate; corollas cylindrical.  \( \frac{1}{2} \). H. Native of Nipaul, at Kamaon. Very nearly allied to *V. erubescent*, but differs in the singular hairs on the leaves. Bracteas villous, foliaceous, 4-5 lines long. Flowers white.

**Great-flowered Viburnum**. Shrub.

50 *V. Erubescent* (Wall. pl. rar. asiat. 2. t. 134. D. C. prod. 4. p. 329.) leaves elliptic, acuminate, serrated, glabrous; branchlets, petioles, and peduncles rather hairy; corollas terminal; bracteas linear-subulate, small; corollas cylindrical.  \( \frac{1}{2} \). H. Native of Nipaul, at Kamaon. Leaves white young downy and ciliated. Flowers white. Berries oblong, red, 1-seeded, crowned.

**Erubescent Viburnum**. Shrub 10 to 12 feet.

51 *V. Coriaceum* (Blum. bijdr. p. 656.) leaves ovate or oval-oblong, acuminate, denticulated, coriaceous, glabrous: corollas terminal, fastigate; tube of corolla cylindrical.  \( \frac{1}{2} \). H. Native of Java, in woods on the higher mountains.

**Coriaceous-leaved Viburnum**. Shrub 6 to 7 feet.

† Species natives of Japan, but are not sufficiently known.

52 *V. Cuspidatum* (Thunb. fl. jap. p. 125.) leaves ovate, cuspidate, serrated, villous; umbels supra-decompound, terminal, radiant.  \( \frac{1}{2} \). H. Native of Japan. Flowers white.

**Cuspidate-leaved Viburnum**. Shrub.

53 *V. Dilatatum* (Thunb. fl. jap. p. 124.) leaves ovate, acuminate, unequal, toothed; petioles and peduncles villous; panicle axillary, decompound, but not radiant: style simple, very short.  \( \frac{1}{2} \). H. Native of Japan.

**Dilatatum Viburnum**. Shrub.

54 *V. Tomentosum* (Thunb. fl. jap. p. 123.) leaves ovate, acuminate, serrated, veiny, tomentose beneath and on the petioles; umbels lateral, radiant.  \( \frac{1}{2} \). H. Native of Japan, in woods. Sijo vulgo Adsai, Kempf. amen. ex p. 854. Branches glabrous, reddish. Flowers blue, disposed on a dense large round head like the Snow-ball Guelder-rose; some are radiate and sterile, and others are small and pendant.

**Tomentose Viburnum**. Shrub 5 to 6 feet.

**Cult.** The species of *Viburnum* are all beautiful shrubs, and the hardy species are well adapted for ornamental shrubbery. They are either increased by laying in the shoots, or by cuttings under a hand-glass in a shady situation. The greenhouse and hardy kinds are early flowerers, which render them very desirable.

**Prize II.**

**Lonicera** (plants agreeing with *Lonicera* in important characters). R. Br. chart. et descr. (1818) p. 4. D. C. prod. 4. p. 329.—*Caprifoliaceae*. A. Rich. dict. class. 3. p. 173.—Caprifolia, Batsch, tabl. aff. p. 239. Corolla gamopetalous, more or less tubular, often irregular. Style filiform; stigmas 3, free, or combined in one.

**III. TRIOSTEUM** (from treec, three, and osstov, ostov, a bone; in reference to the three bony seeds in each berry). Linn. gen. no. 234. Gærtn. fr. t. 26. Lam. ill. t. 150. D. C. prod. 4. p. 329.

**Lin. Syn.** Pentantria, Monogynia. Tube of calyx ovate; limb 5-parted (f. 77. a.): lobes linear-lanceolate, permanent. Corolla tubular (f. 77. b.), almost equally 5-lobed, gibbous at the base, a little longer than the calyx. Stamens 5, inclosed. Stigma thick, oblong. Berry coriaceous (f. 77. c.), obovately trigonous, crowned by the calyx (f. 77. d.), 3-celled (f. 77. e.), but sometimes only 1-celled at maturity. Seeds 3 in each capsule, rarely 5, boiny, elliptic.—Perennial herbs, rarely suffrutescent. Leaves tapering into the petioles, and somewhat connate at the base. Flowers axillary, sessile, or on very short pedicels.

1 **T. Perfoliatum** (Lin. spec. 250.) leaves oval, acuminate, abruptly narrowed at the base, and connate; flowers sessile, appearing verticillate.  \( \frac{1}{2} \). H. Native of North America, in the states of New Jersey, New England, Upper Carolina, and Virginia, in rich rocky grounds, principally in a lime stone soil. Schkuhr, handb. 1. t. 41. Diggel. med. bot. 90. t. 9. T. majus, Michx. fl. bor. amer. 1. p. 107.—Dill. eth. p. 394. t. 239. f. 378. Flowers and berries deep purple. Leaves sometimes subsinuated. There are glabrous and pubescent varieties of this species. The roots of this species, as well as those of the following, are used in North America as an emetic for ipecacuanha. It was first brought into notice by Dr. Tinkar, and hence it has been called Tinkar's root.

**Narrow-leaved Fever-woe.** Fl. June, July. C1699. Pl. 1 to 2 feet.

3 **T. Himalayana** (Wall. in Roxb. fl. ind. p. 180.) plant covered with long hairs; leaves obovate, acute, connate at the base; lowermost ones free; racemes terminal, bearing the flowers in whorls.  \( \frac{1}{2} \). H. Native of Nipaul, on the Himalaya at Gosangthah, where it grows on very high and exposed rocks. Stems terete. Leaves membranous, rounded at the end, with a short acumen, 6-8 inches long, about 4 fingers broad, somewhat narrow towards the base. Berries oval, about the size of a small gooseberry, 3-furrowed, 1-celled, 3-seeded, hairy, yellow.

**Himalaya Fever-woe.** Pl. 2 to 3 feet.
CAPRIFOLIACEÆ. IV. DIERVILLA. V. LONICERA.

4 T. hirsutum (Roxb. fl. ind. 2. p. 180.) plant suffruticose, hairy; leaves on short petioles, lanceolate, entire, acuminate; flowers axillary, sessile, much shorter than their numerous lanceolate bracteae; berries 5-seeded. 2. H. Native of Chittagong, where it flowers during the hot season.

Hairy Fever-wort. Pl. 2 to 3 feet?

Cult. These species of Triostem will grow in almost any kind of soil, although they prefer a peat or vegetable mould; and they are easily increased by dividing at the root, or by seed, which generally ripen in abundance.

LIN. Syst. Pentándria, Monogónia. Tube of calyx oblong, bisectate at the base; limb 5-cleft. Corolla funnel-shaped, 3-cleft, spreading twice the length of the calyx. Stamens 5, somewhat exerted; stigma capitata. Capsule oblong, acute, 1-celled, not crowned by the limb of the calyx, as in most of the other genera of the present order. Seeds numerous, minute.—Erect shrubs. Leaves ovate, acuminate, serrated. Peduncles axillary, bisectate, usually dichotomous, 2-3 or 4-flowered.

Japan Diervilla. Shrub.

Corea Diervilla. Shrub.

Cult. The species of Diervilla are well fitted for the front of shrubberies; and they are easily increased by cuttings put into the ground in autumn and spring; or by suckers, which rise from the roots in plenty.

V. LONICERA (named after Adam Lonicer, a German who was born in 1528, and died in 1586. There was another Lonicer, John, who wrote comments on Dioscorides). Desf. fl. atl. 1. p. 183. Lam. ill. t. 150. D. C. prod. 4. p. 330.—Lonicera species, Lin. and many other authors.—Caprifolium and Xylotoma, Juss. gen. p. 212.—Xylotomum, Caprifolium, Chamaecerasus, and Periclymenum, Tourn. inst. t. 378 and 379.—Caprifolium and Lonicera, Roem. et Schultes, syst.—Lonicera and Xylotomum, Torrey, fl. un. st.

LIN. Syst. Pentádria, Monogónia. Tube of calyx 5-toothed (f. 78. a.). Corolla tubular (f. 78. b. f. 79. b.), campanulate, or funnel-shaped; with a 5-cleft, usually irregular limb (f. 78. b. f. 79. b.). Stamens 5. Style filiform; stigma capitata (f. 78. c.). Berry 3-celled; cells few-seeded. Seeds crustaceous.—Erect or climbing shrubs. Leaves opposite, sometimes connate, entire, but sometimes somewhat runcinate (f. 79. e.) in the same species. Flowers axillary, variously disposed.

* Flowers rigenti.—Caprifolium, Tourn. inst. p. 608.

1 L. Caprifolium (Lin. spec. p. 246.) branches twining; leaves deciduous, obovate, acute, glaucescent; uppermost ones broader and connate; flowers ringent, terminal, disposed in capitale whors. 5. H. Native of middle and south Europe, even to the Terek, in woods, hedges, and thickets. In England in like situations; in a wood near Elsfield, Oxfordshire, plentifully in Chalkpit Close, Hinton, Cambridgeshire, certainly wild; also in another copice in the same parish. In several woods in the south of Scotland. Smith, engl. bot. t. 799. Jacq. austr. t. 357. Engl. gard. cat. 14. t. 5.—Dodon. p. 137. 411. with a figure.—Math. valgr. vol. 2. p. 321. with a figure. Cam. epit. 713. with a figure.—Rivin. irrit. t. 123. Periclymenum perfoliatum, Ger. emac. p. 891. with a figure. Stem twining from left to right. Buds acute, glaucescent. The lower leaves are distinct and somewhat stalked; 2 or 3 of the upper pairs united; the uppermost of all forming a concave cup. Flowers in one or more axillary whors: the uppermost whorl terminal: with a central bud, 6 in each whorl, highly fragrant, 2 inches long, yellowish, with a bluish-coloured tube. Berries elliptical, of a tawny orange colour, each crowned by an almost entire calyx.

Goat's-leaf or Pale-perfoliate Honeysuckle. Fl. May, June. Shrub tw.

Caprifoliaceae. V. Lonicera.

445

Sic. 1 p. 257. Caprifolium implexum, Rem. et Schultes, syst. 5. p. 261. Flowers purplish before expansion, becoming paler on the outside as they expand; white on the inside; but finally changing to yellow, as in the common woodbine. The leaves in Curtis's figure appear to be ovate and acuate.

4 L. Cyrenica (Viv. fl. lib. spec. 12. t. 8. f. 1.) quite glabrous; branches twining; leaves elliptic, glaucous beneath; lower ones sessile, distinct: upper ones truncate at the base, and confluent; flowers disposed in whorled heads. H. Native of Syria, in the vicinity of Cyren, on hills. Said to be allied to L. Caprifolium, but differs in the upper leaves being much smaller, almost as in L. Periclymenum.

Cyren Honeysuckle. Shrub tw.

5 L. Periclymenum (Linn. spec. p. 247.) branches climbing; leaves all separate, deciduous, sometimes downy, glaucous beneath, ovate, obtuse, attenuated at the base; upper ones the smallest; heads of flowers all terminal, ovate, imbricated; flowers violet. H. Native of Middle Europe, in hedges, groves, and thickets, common; plentiful in Britain, in like situations. Smith, engl. bot. t. 800. Curt. fl. lond. fasc. 1. t. 15. Oed. fl. dan. t. 908. Schmidt. arb. t. 107. Svensk, bot. t. 140. Caprifolium Germânicum, Ræi, syn. p. 458. Engl. gard. cat. t. 5. Periclymenum, Ger. enac. p. 801. with a figure. Periclymenum Germânicum, Riv. mon. irr. t. 122. P. hor-ténea, Gesn. icon. pict. fasc. 1. 98. t. 7. f. 49. Caprifolium Periclymenum, Rom. et Schultes, syst. 5. p. 262. Caprifolium sylvaticum, Lam. fl. fr. 3. p. 365. There are varieties of this species with either smooth, pubescent, or variegated leaves; and when the plant grows by the sea-side they are occasionally more glaucous and rather succulent. Corollas externally deep red, or in the earlier flowering varieties all over buff coloured; in the maritime plant smaller and greenish. Berries nearly globular, deep red, bitter and nauseous, accompanied by permanent bracteas. The early writers attribute virtue to this shrub which are now quite given up, but the beauty and exquisite fragrance of the flowers make it a favourite plant in gardens and shrubberies. This is the true woodbine of poets, though likewise the "twisted elagante" of Milton. Notwithstanding Curtis's imperfect quotation, Shakespear is guiltless of this blunder. He says,

"So doth the woodbine, the sweet honeysuckle,
Gently entwist the maple."

Var. β, serótimum (Ait. hort. kew. 1. p. 378.) branches glabrous; flowers late, reddish. H. Hort. angl. 14. no. 4. t. 7. Mill. fl. t. 79. Riv. mon. irr. t. 122. Periclymenum Germânicum, Mill. dict. no. 4. This, the late red honeysuckle, produces a greater number of flowers together than either the Italian or Dutch honeysuckle, so that it makes a finer appearance than either of them, during the time of flowering. It has not been such a long inhabitant of our gardens as the Dutch honeysuckle, for about the year 1715 it was considered a great curiosity, when it was called the Flemish honeysuckle, and was probably brought over by the Flemish florists.

Var. γ, Belgica; branches smooth, purplish; leaves oblqong-

oval, of a lucid green above, but pale beneath, on long petioles; flowers in terminal, verticillate heads, each flower arising out of a scaly cover, reddish on the outside, and yellowish within, of a very agreeable odour. H. Periclymenum Germânicum, Mill. dict. no. 4.—Hort. angl. 15. no. 5. t. 6. This, the Dutch honeysuckle, may be trained with stems, and formed into heads, which the wild sort cannot, the branches being too weak and trailing for that purpose.

Var. δ, quercifolium (Ait. hort. kew. 1. p. 378.) leaves simulated like those of an oak. H. This variety is to be found in England in a wood near Kimberley, Norfolk; and near Oxford. There is also a kind of this with variegated leaves. The flowers are like those of the species. This is called the Oak-leaved honeysuckle.

7 L. pubescens (Sweet, hort. brit. p. 194.) branches twining; leaves broad-ovate-elliptic, on short petioles, pubescent and ciliated, glaucous beneath; upper ones connate perfoliate; spikes or racemes composed of verticillate heads of flowers; corollas beset with glandular pubescence. H. Native of North America, in Massachusetts, Vermont, New York, and Canada, in many places. Caprifolium pubescens, Goldie, in edib. phil. journ. 1822. april. p. 329. Hook, exot. fl. t. 27. L. hirsuta, Eaton, man. bot. ed. 3. p. 341. ex Torrey, fl. un. st. 1. p. 242. L. Goldii, Spreng. syst. 1. p. 758. Flowers yellow. This appears to hold the place in the more northern parts which L. flava does in the south; of which indeed Dr. Torrey suspects it to be a variety.

8 L. parviflóra (Lam. dict. 1. p. 728.) quite glabrous; branches twining; leaves elliptic, sessile: lower ones somewhat connate: upper ones connate perfoliate, glabrous, very glaucous beneath; flowers disposed in verticillate heads; corollas glabrous; with the tube gibbous at the base on one side; filaments hairy. H. Native of North America, from New England to Carolina, in rocky sandy situations; frequent in Canada, and as far north as the Saskatchewan; and from Hudson's Bay to the Rocky Mountains. Caprifolium parvifolórum, Pursh, fl. amer. sept. 1. p. 161. Lonicëéra dioïca, Lin. syst. veg. ed. 15. p. 181. L. média, Murr. nov. comm. gott. 1776. p. 28. t. 3. Caprifolium bractéatum, Michx. fl. bor. amer. 1. p. 105. Caprifolium dioïcum, Rem. et Schultes, syst. 5. p. 260. Caprifolium glácum, Moench. Flowers yellow, smaller than in any of the foregoing species; but it varies exceedingly in the colour of the flowers, for there is a variety mentioned by Michaux having purplish flowers.

Var. β; leaves pubescent or tomentose beneath. H. Native of Canada, along with the species.

9 L. douglasëa (D. C. prod. 4. p. 392.) branches twining; leaves oval, acute at both ends, petiolate, glabrous, ciliated, tomentose on the outside; upper ones connate; flowers disposed in capitellae or heads; stigma exerted; stamens inclosed. H.
Native of the western coast of North America, on the banks of the
1844. Corollas pubescent, bilabiate, deep orange red.
Leaves 4-6 inches long, deep green. Hooker in his fl. amer.
1. p. 282. considers this nothing but a variety of *L. parviflora*. 

branches twining; leaves small, on short petioles, cordate, ob-
tuse, stiff, hispid from pili as well as the branches, pale and
glaucescent beneath.  h.  c.  H. Native of north-west America,
on the subalpine range of Mount Hood, in rocky, partially
shady places, abundant; sparingly at the Grand Rapids, and on
steep rocks near Oak Point, on the Columbia. The specimens
examined have no flowers, but judging from the habit of the
plant it may perhaps safely be referred to this genus, and to
the present division of it. The leaves are hardly 6 lines long,
uniform, exactly cordate, very villous as well as the stems with
brown hairs.

*Small-leaved Honeysuckle*. Shrub tw.
11 L. crata (Ait. hort. kew. 1. p. 231.) branches twining;
leaves permanent, ovate, rather mucronate, glaucous beneath
and reticulated veined, glabrous: upper ones connately perfo-
litate; spikes composed of approximate flowers of flowers;
corollas ringent.  h.  c.  H. Native of North America, from
Carolina to New York, on the mountains, rambling among
rocks in shady moist situations, but rare. Hort. angl. p. 15.
p. 161. *R. em. et Schultes, syst. 5. p. 262.* L. Virginíana,
Marsh, arb. 136.? Períleymenum Americánum, Mill. dict. no.
7. Branches reddish brown. Flowers inclining to scarlet on
the outside, according to Pursh. Corolla ringent, reddish on
the outside, and yellow inside. Berries red.

* * Limb of corolla nearly equal.—Períleymenum, Tourn.
12 L. sempervivens (Ait. hort. kew. 1. p. 280.) quite gla-
brous; leaves permanent, evergreen, ovate or ovate, glaucous
beneath, glabrous: upper ones connately perfoliate; spikes
nearly naked, composed of whorls of flowers; tube of corolla
ventricose on the upper side; limb nearly regular, with 5
roundish lobes.  h.  c.  H. Native of North America, from
New York to Carolina, in stony dry woods. Hort. angl. t. 7.
amer. 1. p. 105. Períleymenum sempervivens, Mill. dict. no.
1. *Alátérnus sempervivens*, Roehl. ex Steud. Períleymenum
Virgíníicum, Riv. mon. 116. Branches brown. Leaves deep
green above, 2 inches long and an inch broad. Whorls of
flowers usually 3, at the top of each branch. Flowers of a
beautiful scarlet outside and yellow inside, about 1 inch long;
inodorous. There are several varieties of this species, particu-
larly one with an almost upright stem.

Var. a. major (Ait. l. c.) leaves roundish.  h.  c.  H. Curt.
bot. mag. 781. Schmidt, arb. t. 104. Great Trumpet Honeys-
uckle.

Var. b. minor (Ait. l. c.) leaves oblong, acute at both ends:
upper ones obtuse, perfoliate.  h.  c.  H. Sims, bot. mag.
1753. Ker. bot. reg. t. 556. L. connáta, Meerb. icon. t. 11.?
Small Trumpet Honeysuckle. According to the figure in bot.
mag. the flowers are scarlet both outside and inside.

*Evergreen or Trumpet Honeysuckle*. Fl. May, June. Clt.
1656. Shrub tw.
13 L. *siliósa* (Poir. suppl. 5. p. 612.) plant twining; upper
part of the branches hairy on one side; leaves coriaceous, reti-
culated, ovate, on short petioles, glaucous beneath, and ciliated
on the margins; upper ones connately perfoliate; spikes composed
of approximate vittellate heads of nearly sessile flowers; tube
of corolla hairy, ventricose in the middle; limb nearly equal.

14 L. occidentális (Hook. fl. bor. amer. 1. p. 282.) twining;
leaves oval, almost sessile, glabrous, ciliated, glaucous
beneath: upper ones connately perfoliate; flowers disposed in
vittellate heads; corolla glabrous, with an elongated tube,
which is gibbous above the base; the limb nearly equal; sta-
mens almost inclosed.  h.  c.  H. Native about Fort Van-
reg. t. 1457. *Caprifólium ciliósum*, Doug. ms. The flowers
are longer than any other British North American species, and
of a full orange red. Branches and peduncles glabrous.

15 L. *pilósas* (Willd. ms. ex Kunth, D. C. prod. 4. p. 333.)
leaves ovate-oblong, ending in an acute, cuspitate point, ciliated,
pijole on the nerves beneath: upper ones connately perfoliate;
flowers disposed in a vittellate terminal head; heads sessile:
tube of corolla long; limb nearly equal.  h.  c.  H. Native of
New Spain, in frigid places. *Caprifólium pilósas*, H. B. et
Kunth, nov. gen. amer. 3. p. 427. t. 298. Flowers purple.

*Pilosé Honeysuckle*. Shrub tw.

**Sect. III.** Xylóstéum (zólóx, xylon, wood, and oséro, osten,
a bone; the wood of *L. xylóstéum* is as hard as bone).—D. C.
fl. fr. ed. 3. vol. 4. p. 271. D. C. prod. 4. p. 333.—*Xylóstéum,
Juss. gen. 219.—Lonicéra, R. em. et Schultes, syst. 5. p. 10.
—Xylóstéum and Chamácecrasus, Tourn. inst. p. 609.—*Xylóst-
écum and Isiak, Adans. fam. 2. p. 501.—Cóix, Neck. elem.
no. 219. Pedicels axillary, 2-flowered, bibracteate at the apex.
Berries twin, distinct, or joined together more or less, 3-celled
in the young state, rarely 2-celled in the adult state; the limb
of the calyx is generally deciduous, therefore the fruit is usually
not crowned.—Climbing or erect shrubs. Leaves never connate.

§ 1. *Nin-töo* (Nin-töo or Sin-too is the name of *L. Jápónica
in China*).—D. C. prod. 4. p. 333. *Oearia and berries altogether
distinct. Stems scandent. Flowers irregular.*

16 L. macrántiá (D. C. prod. 4. p. 333.) branches twining,
hispid; leaves ovate or oblong, rather cordate at the base, and
acuminated at the apex, of an ash-grey colour and villous beneath,
glabrous above, except along the nerves; peduncles axillary
and terminal, 2-flowered, longer than the petioles, the whole
forming an ample leafy raceme; calycine segments subulate,
hispid; corolla very long.  h.  c.  H. Native of Nipaul, at
Suemóo, and of Silhiet. *Caprifólium macrántihum*, D. Don,
fl. nep. p. 140. *Xylóstéum scándens*, Ham. ms. Lon. Jápó-
nica, Wall. in litt. and in Roxb. fl. ind. 2. p. 174. Leaves 3-5
inches long, shining above, and villous along the nerves and
margins:美丽fully reticulated, glaucous, villous, and hairy
beneath. The flowers are at first snow-white and gradually
changing into a beautiful yellow, acquiring thereby a peculiarly
varied appearance. Berries nearly globose, smooth, deep
purple, covered slightly with a pale bloom, crowned by the
permanent villous calyx, 3-celled; cells 4-seeded. In Nipaul
this species embellishes most of the forests, both in the valley
and on the surrounding hills.

*Large-flowered Honeysuckle*. Fl. April, June. Shrub tw.
17 L. corfú's (D. C. prod. 4. p. 333.) branches twining,
pubescent; leaves ovate, acute, rounded at the base, downy on
both surfaces as well as on the peduncles; peduncles axillary,
longer than the petioles, 2-flowered, opposite, disposed in some-
CAPRIFOLIACEÆ.  V. LONICERA.

447

Loirea's Honeysuckle. Shrub tw.

22 L. COCHICHA'SIS; climbing or twining, much branched; leaves ovate, pubescent, small; peduncles 2-flowered, axillary; berries distinct, roundish. H. Native of Cochinchina, among bushes and in hedges. L. Xylosteum, Lour. coch. p. 150. Tube of corolla very long; limb bilabiate: one of the lips 4-cleft and the other entire. Berry red. Flowers white.

Cochin-china Honeysuckle. Shrub tw.

23 L. TELFAIRII (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) branches twining, pubescent; leaves petiolate, oblong, acute, obrate at the base or cordate, glabrous above in the adult state, and densely clothed with velvety pubescence beneath; peduncles bibracteate at the apex, 2-flowered, axillary, solitary, one half shorter than the pedioles; the terminal ones forming a kind of head; calyx villous; with minute, ovate, acute teeth; tube of corolla elongated, equal, villous. H. Native of China. Lonicera Periclymenum, Lour. coch. p. 150. Closely allied on the one hand to L. confusum, D. C. from which it differs in the leaves being smooth above, and in the shorter peduncles, and on the other to L. Leschenaultii, Wall. which, however, is said to have ovate-subcordate ciliated leaves; and villous branches.

Telfaire's Honeysuckle. Shrub tw.

24 L. LESCHENAU'TII (Wall. in Roxb. fl. ind. 2. p. 173.) branches twining; leaves ovate, subcordate, acute, quite entire, smooth above, hoary and villous beneath; with the margins ciliolate; peduncles 2-flowered, axillary, solitary, or in terminal fascicles. H. Native of the East Indies, on the Nelligery Mountains, where it is called Moule Gudea by the natives. Leaves 1-2 inches long; petioles villous. At the apex of each pedicle there is an involucrum, consisting of six unequal villous bracts, which support the two flowers. Calycine teeth linear, villous. Corolla large, probably yellow; with a villous slender tube, about an inch in length; and a bilabiate limb, which is nearly as long as the tube; the upper lip consisting of 4 ovate, obtuse lobes; under lip deeply divided; throat villous. Ovarium ovate, villous. Stamens long.

Leschenault's Honeysuckle. Shrub tw.

25 L. GLASRA'TA (Wall. in Roxb. fl. ind. 2. p. 175.) glabrous in every part; (branches twining; leaves ovate, acuminate, glaucous beneath, glabrous except on the nerves beneath, which are pubescent; peduncles axillary and terminal, short, villous, bearing towards the apex several opposite, approximate, very short, 2-flowered pedicels; tube of corolla rather short, cylindrical, widening at the apex; bracteas ovate. H. Native of Nipal, on the top of Sheopore, and from Kabelas in the valley: L. nigra, Thunb. jap. p. 89. and in Lin. trans. 11. p. 330. Bark of branches shining, brownish. Leaves 3-5 inches long, seldom obtuse at the base; the upper surfaces polished; petioles about half an inch long, surrounding the stem and branches with an elevated margin, as in L. acuminatea. Flowers yellow, smooth, with a purplish bloom on the outside, supported by a common involucre, consisting of 6 very small, ovate, ciliated bracteas. Calycine segments subulate, ciliolate. Tube of corolla about an inch long, widening at the apex into a bilabiate limb, which as well as the filaments and style are rather hairy; upper lip trifid, obtuse, the intermediate lobe retuse; the under lip oblong. Berries distinct, almost black, 3-celled; cells 4-seeded. Smooth Honeysuckle. Shrub tw.

26 L. ACUMINATA (Wall. in Roxb. fl. ind. 2. p. 177.) branches twining, villous; leaves ovate to oblong, cordate, acuminate, slightly hairy, membranous; peduncles axillary, longer than the pedioles; petioles, 2-flowered; bracteas linear, acuminate, ciliated, longer than the ovaries; corolla not gibbous, funnelform. H. Native of the Himalayas, at Gosangthan.
Leaves 3-5 inches long; petioles half an inch long. At the apex of the peduncles there is usually an involucremum of 6 small bracteas, which are hairy. Flowers like those of _L. Xylésteum_, and about the same size; they are yellow, tinged with pale purple, slightly hairy on the outside. Calycine segments lanceolate, ciliate, bluntest. Style and filaments hairy.

_Acuminate_—leaved Honeysuckle. Shrub tw.

27 _L. Diversifolia_ (Wall. in Roxb. fl. ind. 2. p. 178.) branches twining; leaves ovate, cuspidate, acute, or acuminate, rounded or suborbate at the base, pustulose above, villous beneath; peduncles axillary, shorter than the petioles, 2-flowered; calyx cup-shaped, acutely 5-lobed; corolla gibbose, funnel-shaped, villous; ovaries villous. H. Native of the East Indies, on Mount Curvul. Branches villous. Leaves 3 inches long, on very short petioles. Peduncles smooth. Bracteas ciliate with long hairs. Flowers resembling those of _L. Xylósteum_ both in size and colour.

_Var. β_, Roygeïna (Wall. cat. no. 487. D. C. prod. 4. p. 334.) leaves oval; peduncles length of petiole. H. Native of Nipaul, on Sirmore and Kamaon.

_Diverse-leaved_ Honeysuckle. Shrub tw.

28 _L. Ligustriïna_ (Wall. in Roxb. fl. ind. 2. p. 179.) branches slender, twining, covered with ash-grey, shining, smooth bark; young shoots villous; leaves ovate; ovary petiolate, shining, ciliate, obtuse at the base, acute at the apex; peduncles villous, axillary, very short, 2-flowered; limb of calyx truncate; berries distinct, and are as well as the ovaries covered by a common membrane. H. Native of Nipaul, on the mountains, in woods. Xylósteum ligustriïnum, D. Don, prod. fl. nep. p. 140. X. Naisœca, Hamil. ms. ex D. Don. l. c. Young shoots surrounded at the base with some lanceolate, acute, quadrifidriormly imbricated bud-scales. Leaves dark green above, pale and reticulated beneath; petioles villous. Bracteas 2 at the apex of each peduncle. Corollas yellowish-white, funnel-shaped, half an inch long; tube gibbose and pubescent at the base, villous within: limb nearly equal, spreading, divided into 5 ovate, obtuse, ciliate segments. Filaments smooth, about the length of the limb of the corolla. Ovaries distinct, 3 celled; cells 3-seeded.

_Priët-leaved_ Honeysuckle. Shrub tw.

29 _L. Lanceolatâ_ (Wall. in Roxb. fl. ind. 2. p. 177.) stems almost eect, bushy; leaves lanceolate, acuminate, hairy, acute at the base and glaucous beneath; peduncles axillary, longer than the petioles, and like them villous; berries distinct, glabrous smooth; bracteas 2 linear and 4 ovate. H. Native of Nipaul, at Goksinestham. Stem covered with fibrous epidermis, probably erect. Branches slender, pubescent. Leaves pubescent above and shining, glaucous and hairy beneath, with somewhat repand margins. Petioles short. Berries the size and colour of black currants, smooth, crowned, 3-celled, supported by 2 linear and 4 ovate bracteas, the latter recurved and shorter.

_Lanceolate-leaved_ Honeysuckle. Shrub erect?

30 _L. Canéscens_ (Schousb. mar. 1. p. 88.) branches twining, and are as well as the leaves canescent from down; leaves petiolate, ovate, cordate, blunts!; peduncles 2-flowered, longer than the petioles; bracteas and lobes of calyx oblong. H. Native of hedges about Mogodor, and on Mount Tria in Mauritania; and of Sicily at Palermo. ex Guss. fl. sic. 1. p. 250. L. biblôra, Desf. fl. atl. 1. p. 184. t. 52. Corolla bilabiata, attenuated at the base, velvety on the outside. Berries nearly distinct.

_Canescens_ Honeysuckle. Shrub tw.

§ 2. _Chamaeëdras_ (The name signifies a kind of false cherry; the fruit of some of the species resemble cherries). _D. C. prod._

4. p. 335. Berries distinct, but usually connected together at the base, and diverging at the apex. Corolla hardly gibbose at the base or equal. Erect bushy shrubs.

_Var. γ_, rubíbôra (D. C. l. c.) flowers red. L. Sûbîrica, Hortul. ex Pers. encl.

_Tartarian_ Honeysuckle. Fl. April, May. Clyt. 1752. Sh. 4 to 6 feet.

32 _L. Ciliâta_ (Muhl. cat. p. 22.) erect; leaves ovate or oblong, cordate, thin, ciliate, villous beneath in the young state; peduncles elongated; bracteas 2, ovate, 3 times shorter than the ovaries, which are distinct; corolla blunted spurred at the base: with short, nearly equal lobes; berries distinct, red, divaricate. H. Native of North America, on mountains among rocks, in rich soil; from Canada to Virginia, and throughout Canada to the Saskatchewan, frequent. Xylósteum ciliâtum, Pursh, fl. sept. amer. 1. p. 161. L. Tatârica, Michx. fl. amer. 1. p. 166. but not of Lin. L. Canadésis, Roem. et Schultes 5. p. 260. Flowers white, with a tinge of red or yellow; tube ventricose above; limb with short, acute segments. Style exerted. The variety β of Pursh is _Vaccinium album._

33 _L. Pyreînäca_ (Lin. spec. p. 248.) glabrous, erect; leaves obovate-lanceolate, acute, glaucescent beneath; peduncles 2-flowered, shorter than the leaves; bracteas oblong-linear, folicaceous; flowers almost regular; berries globose, distinct. H. Native of the Pyrenees, on calcareous rocks, in exposed situations. Duham. arb. 2. t. 110. ed. 2. vol. 1. t. 15. Magn. hort. p. 299. with a figure.—Caprîfolium Pyreînâicum, Lam. fl. fr. 3. p. 366.—Xylósteum, Pourn. inst. 605. Corolla white, twice the size of those of _L. Xylósteum_, funnel-shaped; limb 5-cleft, flat: with equal, ovate, obtuse segments.

_Pyreneân_ Honeysuckle. Fl. May. Clyt. 1739. Sh. 4 to 5 ft.

34 _L. Punîceâ_ (Sims, bot. mag. t. 2469.) erect; leaves ovate, subacute at the base of the same colour on both surfaces: peduncles axillary and almost terminal, 2-flowered, shorter than the leaves; tube of corolla rather gibbose at the base; segments of corolla nearly equal, irregularly arranged; one way and 2 another; berries distinct? H. Native country unknown. Symphoricarpus puniceus, Sweet. Flowers deep red or crimson. Leaves sometimes 3 in a whorl on the young shoots.

_Crimson-leaved_ Honeysuckle. Fl. April, May. Clyt. 1821. Shrub 2 to 4 feet.

35 _L. Xylósteum_ (Lin. spec. p. 248.) erect, downy; leaves...
ovate, acute, petiolate, soft; peduncles 2-flowered, shorter than the leaves; bracteas hairy, double: the 2 outer ones lanceolate, spreading: inner a small concave scale under each germ; berries oval, distinct, 1-celled, 6-seeded. ½. H. Native nearly throughout the whole of Europe, even to Caucasus, in thickets, hedges, and rocky places, and by the sides of woods. In Britain in like situations; in the fissures of rocks under the Roman wall near Shewing-Reels, or rather Seven-Rele, in Northumberland, plentiful; and certainly wild, in a copice called the Hacketts, to the east of Houghton Bridge, 4 miles from Arundel, Sussex. Smith, engl. bot. t. 916. fl. græce. t. 223. Oed. fl. dan. t. 808.

Var. ß, leucocéarpa (D. C. prod. 4. p. 335.) berries white.—Duh. arb. ed. 2. vol. 1. p. 52.

Var. γ, zanthocéarpa (D. C. l. c.) berries yellow.—Duham. l. c.

Var. ë, melanocéarpa (D. C. l. c.) berries black.—Baub. pin. 451.

Bony-wooded or Upright Fruity Honeysuckle. Fl. July. Brit. Sh. 4 to 5 ft.

36 L. nigra (Lin. spec. 247.) erect; leaves oval-oblong or elliptic, on short petioles, rather villous white, but nearly glabrous in the adult state; peduncles 2-flowered, elongated, shorter than the leaves. ½. H. Native of middle Europe, in subalpine woods, as in France, Switzerland, Austria, Silesia, Piedmont, &c. Jacq. aust. t. 314. Schmidt, arb. t. 110. Caprifolium roseum, Lam. fl. fr. 3. p. 368. Chamæcærus nigra, Delarb. fl. avv. ed. 2. p. 130.—Gesn. fasc. 37. t. 8. f. 48. Corolla reddish and pubescent on the outside, but whitish on the inside. Bracteas 4 under the ovaries; the 2 outer ones lanceolate, and the inner quadridi. Berries black, globose, joined together at the side.

37 L. hispida (Pall. ex Willd. mss. Led. fl. ross. alt. ill. t. 212.) branches hispid; leaves ovate, ciliæted, petiolar, glabrous on both surfaces; peduncles 2-flowered; bracteas ovate-elliptic, exceeding the berries. ½. H. Native of Siberia, on the Altaiæan Mountains. Branches opposite, glabrous or bristly, brownish. Leaves 2 inches or 1½ inch long, and an inch broad, glabrous on both surfaces, cordate at the base. Flowers greenish white, pendulous. Berries distinct, purple.

Hispida Honeysuckle. Shrub 2 to 3 feet.

38 L. flexuosa (Thunb. in Lin. trans. 2. p. 330. but not of Lod. nor Ker) erect, branched; branches very villous at the apex; leaves ovate-oblong, acute, on short petioles, glabrous; petioles villous; nerves of leaves puberulous; flowers axillary, few, almost sessile; berries globose, glabrous. ½. H. Native of Japan. L. nigra, Thunb. fl. jap. p. 89. but not of Lin. L. brachypoda, D. C. prod. 4. p. 335. Stems flexuous. Leaves about an inch long: upper ones the smallest. Peduncles hardly a line long. Berries distinct, ovate, acuminated, black.

§ 3. Cymæphæra (from κυμα, κυρφος, a curve, and ανθος, a flower; in reference to the flowers being gibbous on one side at the base). D. C. prod. 4. p. 336. Berries either distinct or joined together. Corollæs very gibbous on one side at the base. Erect bushy shrubs.

39 L. gibbosa (Willd. mss. in Schultes, syst. 5. p. 257.) vol. iii.

erect; leaves on very short petioles, ovate-oblong, acuminated, rounded at the base, pubescent beneath; peduncles 2-flowered, shorter than the leaves; bracteas linear, shorter than the ovaria; tube of corolla gibbous on the outer side at the base; berries almost globose, joined at the side. ½. F. Native of Mexico, at Real del Monte, in woods. Xylosteum Mexicænum, B. et Kunth, nov. gen. amer. 3. p. 426. t. 297. Corolla scarlet; with the limb oblique and bluntly 5-lobed.

Gibbous-flowered Honeysuckle. Shrub 3 feet.

40 L. Moenia (D. C. prod. 4. p. 338.) erect; leaves petiolar, elliptic-oblong, acuminated, obtuse at the base, pubescent beneath; peduncles 2-flowered, shorter than the leaves; bracteas oblong, acuminated, longer than the ovaria; tube of corolla gibbous above at the base; berries globose, joined together a little on the inner side. ½. H. Native of Mexico. L. gibboa, Moc. et Sesse, fl. mex. icon. ined. Very nearly allied to L. gibboa, but differs in the corolla being yellowish; but when decayed of a blood colour, permanent, and jagged, with the bracteas spreading. Berries globose, dark purple.

Mocino's Honeysuckle. Shrub.

41 L. involucratâ (Banks, herb. ex Spreng. syst. 1. p. 759.) erect; branches acutely tetragonal; leaves ovate or ovate, petiolar, membranous, beset with adpressed hairs beneath; peduncles axillary, 2-3-flowered; bracteas 4:2 outer ones ovate: 2 inner broad, obcordate, at length widening, clothed with glandular pubescence; corollæs pubescent, gibbous at the base on the outside; style exerted. ½. H. Native of North-West America, between lat. 54° and 64° (but probably confined to the vicinity of the Saskatchewan), thence to the Rocky Mountains. Lindl. bot. reg. 1179. Xylosteum involucratum, Richards, in Frankl. 1. journ. ed. 2. append. p. 6. Corolla yellowish, tinged with red.

Involucrated Honeysuckle. Fl. May. Clt. 1824. Sh. 2 to 3 ft.

42 L. ledboëri (Eschsch. mem. act. soc. petersb. 10. p. 284. Hook. et Arn. in Beech. voy. pt. p. 145.) erect; branches elongated, acutely tetragonal; leaves ovate or oblong, somewhat acuminate, stiff, pubescent, tomentose on the nerves; peduncles axillary, 2-3-flowered; bracteas 4:2 outer ones ovate: 2 inner broad-obcordate, pubescent, at length increasing in size; corollæs gibbous at the base on the outside; berries distinct. ½. H. Native of California. Cham. et Schlecht. in Linneæa. 4. p. 136. Very nearly allied to L. involucrata and hardly to be distinguished from it. Flowers yellow, tinged with red.

Ledeboë's Honeysuckle. Shrub 2 to 3 feet.

§ 4. Isika (a name employed by Adanson for this tribe of the genus Lonicëra, and is probably without a meaning). D. C. prod. 4. p. 336. Berries on each peduncle, joined together in one, which is bivocabulate at the apex.—Erect bushy shrubs.—Isika, Adans. fam. 2. p. 501.—Isika, Mœnch. mth. p. 504.

43 L. altigena (Lin. spec. 248.) erect; leaves oval-lanceolate or elliptic, acute, glabrous, or pubescent, on very short petioles, rather ciliated; peduncles 2-flowered, shorter than the leaves; corollæs gibbous at the base. ½. H. Native of middle and south Europe, in subalpine places of mountains. Jacq. fl. aust. t. 274.—Duh. arb. ed. 2. vol. 1. t. 16.—Mill. fig. t. 167. f. 2. Caprifolium alpinum, Lam. fl. fr. Caprifolium Alpigenum, Gaertn. fr. 1. p. 136. Isika Alpigena, Börck, Isika lucida, Mœnch. Chamæcærus Alpigena, Delarb.—Lob. icon. 173. Corolla greenish yellow, tinged with red or purple. Berries red, size and appearance of those of a cherry; hence it is called Cherry woodbine by Jonstone. Leaves large.

Var. β, Silírica (D. C. prod. 4. p. 336.) lower leaves rather 3 M.
CAPRIFOLIACEÆ. V. LONSDERA.

**Alpine Honeysuckle.** Fl. April, May. Cirt. 1596. Shrub 3 to 5 feet.

44 L. Microphylla (Wild. rel. in Rom. et Schultes, syst. 5. p. 259.) erect; leaves elliptic, acute at both ends, glaucous beneath; peduncles 2-flowered. H. Native of Eastern Siberia. Led. fl. ross. alt. illt. t. 213. L. Alpigena, Sievers. The epidermis falls from the branches. Leaves rather villous on both surfaces, sometimes rounded at the base. Peduncles shorter than the leaves. Corollas greenish, yellow. Berries joined, of a reddish orange colour.

**Small-leaved Honeysuckle.** Cirt. 1818. Shrub 3 to 4 feet.

45 L. Weibiana (Wall. cat. no. 476. D. C. prod. 4. p. 336.) erect; leaves ovate-oblong, acuminate, obtuse at the base, on very short pedicel, pilose along the nerves, and ciliated on the margins; peduncles 2-flowered, 3 times shorter than the leaves; berries semi-concrete. H. Native of the East Indies, in Sirinagur. Habit almost of L. Alpigena, but differs in the leaves being pilose and ciliated, in the peduncles being equal in length to the internodes, not longer than them, &c. Corolla unknown.

**Webb's Honeysuckle.** Shrub 3 to 4 feet.

46 L. Govani'na (Wall. cat. no. 481. D. C. prod. 4. p. 337.) erect; leaves elliptic or lanceolate, acute at both ends, membranous, glabrous; peduncles 2-flowered, 3 times longer than the pedicel, but 4 times shorter than the leaves; bracteas linear, length of ovary; corollas gibbous at the base; berries joined. H. Native of the East Indies, in Sirmore, where it was collected by Mr. Govan. Allied to L. Alpigena, but the leaves are much thinner, the pedicels longer, the flowers smaller and sometimes solitary by abortion.

**Govan's Honeysuckle.** Shrub 3 to 4 feet.

47 L. Augustiformis (Wall. cat. no. 480. D. C. prod. 4. p. 337.) erect; leaves oblong-lanceolate, acuminate, glabrous; peduncles 2-flowered, a little shorter than the leaves; bracteas linear, twice the length of the ovary; berries joined together completely; corollas nearly equal, pubescent on the outside. H. Native of Nipaul, in Kamaon, and of Sirmore. Branches numerous, smooth. Leaves 15 lines long and 4 lines broad, pale and glaucous beneath; pedicels 2-3 lines long. Corolla pale, 4 lines long.

**Narrow-leaved Honeysuckle.** Shrub 3 to 4 feet.

48 L. Obovatoformis (Hook. fl. bor. amer. 1. p. 284. t. 100.) erect; leaves oblong or oval, clothed with velvety pubescence beneath; peduncles elongated, erect; bracteas obsolete; tube of corolla hairy, gibbous at the base on one side; limb unequal, deeply bilabiate: the upper lip 4-toothed, and the lower one nearly entire; berries joined in one, which is bicamellate at the top, bluish black in the dried state. H. Native of North America, in the island of Montreal, in the St. Lawrence; about Montreal, Lake Winnipeg, and of the western parts of the state of New York. Xylóstemon oblongifolium, Goldie, in edinb. phil. journ. 6. p. 323. Corolla hairy, yellow? Berries bluish black, size of a pea.

**Oblong-leaved Honeysuckle.** Fl. April, May. Cirt. 1823. Shrub 4 feet.

50 L. Orientalis (Lam. dict. 1. p. 731.) erect; leaves on very short pedicel, ovate-lanceolate, acute, quite entire, smoothish; peduncles 2-flowered, shorter than the leaves; bracteas 2, setaceous; berries joined in one, somewhat didymous and bimembrate at the apex, 10-seeded. H. Native of Iberia and Asia Minor, in woods. Bieb. fl. taur. et suppl. no. 305. L. Caucaica, Pall. fl. ross. p. 1. p. 57. L. caerulea, Güld. bot. 1. p. 423. ex Pall. Chamaécrasus orientalis litorifolio, Tourn. corr. p. 42. Berries black (Lam. Bieb.), dark blue (Pall.). Leaves stiilik, veiny, larger than in L. Alpigena. Flowers greenish yellow. This is perhaps nothing more than L. caerulea.

**Oriental Honeysuckle.** Fl. April, June. Cirt. 1825. Shrub 3 to 5 feet.

51 L. Iberica (Bieb. fl. taur. et suppl. 395.) erect; leaves petiolate, cordate, roundish, tomentose or pubescent; peduncles 2-flowered, shorter than the leaves; bracteas oblong, ciliated; berries joined together to the middle, globose. H. Native of Iberia, about Tiflis and at the Dervent. Stev. mem. soc. mose. 3. p. 257. Xylóstemon Ibericum, Bieb. cent. pl. rar. t. 13. ex corr. Suppl. Corollas lurid, form of those of L. Alpigena, Ovarium tomentose. Berries blood-coloured. Leaves like those of Cotoneaster vulgáris.

**Iberian Honeysuckle.** Fl. April, May. Cirt. 1824. Shrub 3 to 4 feet.

*Species not sufficiently known.*

52 L. Quinquéfoliáris (Hardw. asiat. res. 6. p. 351. ex fl. ind. 2. p. 174.) shrub bushy; leaves petiolate, elliptic, acute, quite entire; peduncles short, 2-flowered; berries 5-celled. H. Native of the East Indies, in valleys about Shreemagara. Very like L. ligustrina, Wall. but differs in the 5-celled fruit, and is therefore probably a species of Leycestrá. 

**Five-celled-fruited Honeysuckle.** Shrub.

53 L. Corymbosâ (Lin. spec. 249.) leaves ovate, acute; corymb terminal. H. Native of Chili, near Conception, where it is called Yitiu. Itiu. Feuill. obs. 2. p. 760. t. 45. Lorrháthrhus Uitti, Molina, sargg. chil. p. 139. ex Schultes, syst. 7. p. 161. Fréchicha violácea, Spreng. syst. 1. p. 406. but the plant does not belong to Rubiáceae, according to Bertero, in merc. chil. 1829, may. p. 611. nor Lorrháthrhus, in consequence of the fruit being many-seeded. But from the flowers being 4-cleft, it is probably a genus of the present order. Leaves an inch broad, fine green. Corolla blood-coloured; and calyx 4-cleft to the middle. Stamens 4. Style yellow. Fruit form and colour of an olive; with sweetish flesh.

**Corymbos-flowered Honeysuckle.** Shrub 12 feet.

54 L. Quadrifoíliá (Wild. spec. 1. p. 986.) stem unknown;
leaves 4 in a whorl, ovate-lanceolate, glabrous, bluish; peduncles twin, 2-flowered, length of leaves; bracteas 2, linear; berries distinct. H. Native country unknown. Corollas like those of L. Xylosteum, but having the tube narrower.

**Four-leaved Honeysuckle.** Shrub.

**Cult.** All the species of honeysuckle are truly ornamental, particularly the climbing and twining species, which are well adapted for training on trellis work or arbours, or against walls. The greenhouse twining kinds have a fine appearance, trained on the rafters: The upright hardy species are well fitted for decorating shrubberies. They all grow well in any common garden soil, and are easily increased by cuttings taken off in autumn, and planted in a sheltered situation: those of the tenderer kinds under a hand-glass.

**VI. LEYCESTERIA** (named by Dr. Wallich after his friend William Leycester, formerly Chief Judge of the principal native court under the Bengal Presidency, who during a long series of years and in various distant parts of Hindoostan, has pursued every branch of horticulture with a minifice and zeal and success, which abundantly entitle him to that distinction). Wall. in Roxb. fl. ind. 2. p. 181. pl. rar. asiat. 2. p. 21. t. 120.

**Lin. syst. Pentandria, Monogyinia.** Calyx with an ovate tube and an unequally 5-parted, permanent limb; segments unequal, small, linear, glandularly ciliated. Corolla funnel-shaped, having the tube gibbose above the base, and the limb campanulate, and divided into 5 ovate, nearly equal lobes. Stamen 5; filaments exerted. Stigma capitate. Berry roundish, crowned by the calyx, 5-celled; cells many-seeded. Seeds smooth, shining, ovate. Albumen fleshy. Embryo minute, terete, centripetal.-A beautiful large rambling shrub, with elongated fistular branches, which rise from scaly buds. Leaves opposite, ovate-lanceolate, acuminate, petiolar, smooth, entire, membranous, glaucous, with an obtuse, subcordate base; petioles pilose. Flowers white, with a tinge of purple, middle-sized and sessile, in fascicles, disposed in approximate whorls of fives and sixes, the whole forming short leafy drooping racemes, which terminate the branches and branchlets. Bracteas large, foliaceous, purplish, pubescent, and ciliated, lanceolate, acuminate, surrounding the racis with their concave bases; there are generally 6 under each whorl of flowers, of which the 3 outer ones are 2 or 3 inches long, rounded, and generally connate at the base: the inner ones much smaller; those at the base of the flower being considerably larger than the rest. Berries deep purple, approaching to black, as large as a common-sized gooseberry; pulp very soft; cells 8-10-seeded.—This genus appears to be intermediate between the present order and Rubiaceae, but from the last it is distinguished in the want of stipulas.

1 L. FORMOSA (Wall. in Roxb. fl. ind. 2. p. 182.). H. Native on the highest mountains, surrounding the valley of Nipaul; and of the much more northerly situations towards Gosaingsthan. It is also found at an elevation of seldom less than 8000 feet above the plains, among the pine and oak forests of Bishupur, as at Huitoo and Desoo in the Thakoorae of Kionthul, blossoming from June to August, and called by the natives *Nulkaraoo.* Hamelée connata, Puerrari, ms. Dr. Govan remarks, with great propriety, that this is a most beautiful shrub when in blossom, from the contrast of the deep green hue of its stem and leaves with the purple colour of the large bracteas and the berries.

**Cult.** This elegant shrub grows best in a light soil; and it is easily increased by cuttings planted in autumn or spring, or by seeds which ripen in abundance. It is well fitted for decorating the front of shrubberies; but being rather tender, should be protected in winter by a mat, or the haum of herbaceous plants.

**Lin. syst. Pentandria, Monogyinia.** Tube of calyx globose (f. 81. c.); limb small, 4-5-toothed. Corolla funnel-shaped (f. 81. c.), almost equally 4-5-lobed. Stamens 5, hardly exserted. Stigma semi-globose. Ovarium adnate, 4-celled; fertile cells containing only one ovulum each; and the sterile ones few ovula. Berry 4-celled, crowned by the calyx (f. 81. c.), having 2 of the cells empty, and the other 2 containing one seed each. —Erect elegant bushy oppositely branched shrubs. Leaves oval, quite entire. Peduncles short, axillary, one or many flowered. Flowers biciliate, small, white or rose-coloured, on short pedicels.

1 S. VULGARIS (Michx. fl. bor. amer. 1. p. 100.) flowers disposed in axillary capitate clusters, composed of nearly sessile racemules. H. Native of Virginia, Carolina, and Pennsylvania, in sandy dry fields. Lonicera symphoricarpos, Lin. spec. 249. S. parviflora, Deaf. cat. Symphoria conglomerata, Pers. ench. 1. p. 214. Symphoria glomerata, Pursh. fl. amer. sept. 1. p. 162.—Schmidt. arb. t. 115.—Dill. elth. t. 278. f. 360.—Hort. ang. 85. t. 20. Corolla white. Berries red, size of hemp seed; but according to Pursh the flowers are small, red, and yellow; and the berries purple. Branches brown, smooth. Leaves elliptic, ovate, obtuse, glaucous, and pubescent beneath. The berries are cup-shaped, and ripen in winter.

2 S. RACEMOSUS (Michx. fl. bor. amer. 1. p. 107.) flowers disposed in nearly terminal loose interrupted racemes, which are often leafy; corolla densely bearded inside; style and stamens inclosed. H. Native of North America; on mountains near Lake Mistassins; on the banks of the Missouri; of Upper Canada; abundant about the Saskatchewan; on the banks of the Columbia, and at Puget's Sound, and Nootka Sound, north-west coast. Symphoria racemosa, Pursh. fl. amer. sept. 1. p. 162. Sims, bot. mag. 2211.

Lodd. bot. cab. t. 230. S. leucocarpa, Hort. Leaves glaucous beneath. Corolla rose-coloured. Berries large, white. This is a fine shrub, very common in our gardens, easily known by its large white berries, and small red flowers. The S. elongata and S. heterophylla, Presl, in herb. Hanke, which were collected about Nootka Sound, do not differ from this species, in which the lower leaves are sometimes deeply sinuated.

3 S. OCCIDENTALIS (Richards, in Frankl. 1st journ. ed. 2. append. p. 6.) spikes dense, terminal, and axillary, drooping; corolla and segments densely bearded inside; style and stamens a little exerted. H. Native of British North America, in the woody country, between lat. 54° and 64°, and known under the name of wolf-berry; abundant about the Saskatchewan and Red River; and about Fort Vancouver, on the Columbia. According to Dr. Richardson this species comes very near S. racemosus, but is distinguished by the larger, less glaucous,
more rigid, and denser foliage, and by the flowers being arranged in dense drooping spikes, larger than in S. racemösus, and by the prominent style and stamens.

_Symphoricàrpos_. Shrub 4 to 6 feet.

Small-leaved _St. Peter's-wort_. Shrub 3 to 4 feet.

5. **_S. glaucescens_** (H. B. et Kunth, l. c. p. 424. t. 295.) flowers axillary, solitary; leaves elliptic, acute, somewhat mucronate, smoothish. \( f. \) Native of Mexico, on the mountains near Santa Rosa, at the elevation of 4000 feet. *Symphoria montana*, Spreng. syst. 1. p. 757. Leaves glaucescent beneath.

*Glaucescent* _St. Peter's-wort_. Shrub 3 to 4 feet.

_Cult._ *Symphoricàrpos* is a genus of very beautiful and delicate shrubs, well adapted for shrubberies or borders. They grow in any common garden soil; and are easily increased by cuttings, which should be planted either in autumn or spring.

**VIII. Abelìa** (named by Mr. Brown after Clarke Abel, M. D., physician to the embassy to China under Lord Amherst; he collected and brought home many interesting plants). _R. Br._ car. and descrip. _pl._ Abel. 1818. in 4to. p. 5 with a figure.

_Lin. syst._ *Tétrâdría, Monogénia._ Calyx with an oblong tube, and a 2 or 5-petalled foliaceous limb: the segments oblong. Corolla tubular, funnelf-shaped, 5-lobed: lobes obovate, nearly equal. Stamens 4, didynamous or nearly equal. Stigma capitulate. Ovary 3-celled; 2 of the cells contain many ovula, but all become abortive, and the third contains only one ovulum, which comes to perfection. Pericarp 1-seeded, indehiscent, crowned by the foliaceous limb of the calyx.—Decumbent or weak glabrous shrubs. Leaves petiolate, dentately crenated. Peduncles axillary, trichotomous or trifid, or terminal and undivided. Involucre 2 or many flowers, composed of 6 or more leaves.

1. **_A. Chinensis_** (R. Br. l. c.) involucre 2-flowered; peduncles trichotomous; stamens exerted. \( f. \). _G._ Native of China, in the province of Kiang-si at the Lake Po-Yang, where it was collected by Dr. Clarke Abel. Tube of corolla 5-nerved: 4 of the nerves approximate, and the fifth remote. Ovary having one ovary on one side, and 4 on the other. Leaves ovate, finely pubescent.

_China._ Abelìa. Shrub 2 to 3 feet?

2. **_A. trifílora_** (R. Br. in Wall. pl. asiât. rar. 1. p. 14. t. 15.) flowers by threes, forming terminal corymb: lateral flowers furnished with 3 bracts: middle one sessile, naked: calyx 5-parted: the segments foliaceous, linear, and ciliated; leaves obovate-lanceolate, acuminate, quite entire, exsected with hyaline hairs. \( f. \) _G._ Native of the East Indies, on the highest mountains of Northern and Western Kamaon towards the Himalaya, where it is called *Kunki*. Flowers pale red, delightfully fragrant.

Three-flowered Abelìa. Tree small.

3. **_A. unifílora_** (R. Br. in Wall. pl. asiât. rar. p. 16.) peduncles 1-flowered, tribracteate. \( f. \) _G._ Native of China.

One-flowered _Abelia_. Shrub.

_Cult._ A mixture of loam, peat, and sand will be a good soil for the species of *Abélia*; and they may be easily increased by cuttings planted in any light soil, with a hand-glass placed over them.

_Lin. syst._ *Didynamía, Angiospérma._ Calyx double, superior one of one leaf; in 15, 5 deep, erect, lanceolate, acute, equal segments (f. 82. b.). Corolla bell-shaped (f. 82. d.); tube cylindric, gradually dilated upwards, about twice the length of the superior calyx; limb divided into 5, nearly equal, slightly spreading segments (f. 82. d.). Stamens 4, inclosed, didynamous (f. 82. f.): the 2 uppermost ones the shortest. Ovarium globose, of 3 cells. Style cylindrical, gently swelling upwards, declining longer than the corolla (f. 82. c.); stigma obtuse. Berry dry, obovate-oblong, of 1-cell, membranous, closely invested with the inferior calyx, and crowned with the superior one. Seed solitary, filling the cavity.—A trailing, somewhat shrubby plant, of an elegant aspect, and rendered most interesting to a botanist on account of the name given, with the concurrence of Linnaeus, by his friend Dr. J. F. Gronovius.

1. **_L. Borealis_** (Lin. spec. 880.) \( f. \) _H._ Native of Lapland, Sweden, Norway, Russia, Germany, Switzerland, Savoy, Siberia, &c., in dry, stony, shady, mossy, fér woods, on the mountains. In Scotland the plant was first found in an old fir wood at Inglisimdaie, on the borders of Mearns in 1795; it has since been found in several similar situations in the highlands of Scotland. In North America in several parts, as in the states of New England, New Hampshire, Vermont, but more particularly in Canada throughout the whole country from Lake Huron to the Arctic circle; and from Newfoundland and Labrador on the east to the Columbia, Unalascika, and Kotzebue's Sound on the west. _L. fl. succ._ 219. t. 1. fl. lapp. ed. 2. p. 214. t. 12. f. 4. Smith, engl. bot. t. 453. Wahl. fl. lapp. 170. t. 9. f. 3. Oed. fl. dan. t. 3.—A trailing, weak shrub, creeping, and evergreen plant, forming broad leafy patches; the young shoots hairy and leafy. Leaves obovate or ovate, firm, crenate in the fore part, slightly hairy, and of a full green above, paler beneath. Peduncles axillary, about a finger in length, bearing each 2 elegant, pendulous, flesh-coloured flowers at the apex, which are said to be very fragrant at night. A pair of very small leaves stand at the origin of the partial flower-stalks, or pedicles, and there is often a larger pair on two at the lower part of each peduncle. Corolla variegated internally with rose colour and yellow. The American plants are generally stronger than the European ones.

_Northern Linneas._ Fl. May, June. Scotland. _Pl. trailing._

_Cult._ This elegant little trailing evergreen shrub will not grow in cultivation unless in a peat border, where it will thrive and flower freely; and most so if the border is in a shady situation. It is sometimes grown in large pots or pans, filled with peat earth, and grows luxuriantly. It is easily increased by separating the creeping stems when rooted.

† Genera allied to Caprifoliaceæ, but are not sufficiently known.

X. **_Aidía_** (from aideos, aídos, perpetual; in reference to the durability of the wood of this tree). _Lour._ coch. p. 143. _D. C._ prod. 4. p. 940.

_Lin. syst._ *Pentâdria, Monogénia._ Tube of calyx adnate
to the ovary; limb 5-toothed, erect. Corolla superior, salver-shaped, with a woolly throat and a 5-parted limb: the segments lanceolate. Anthers 5, linear, inserted in the recesses between the segments of the corolla. Style equal in length to the stamens; stigma ovate-oblong. Berry ovate, umbilicate, 1-seeded.—A large tree, with very durable wood and spreading branches. Leaves opposite, lanceolate, quite entire, glabrous. Racemes axillary, short, loose. Flowers white.

1 A. Cochinchine'nsis (Lour. 1. c.) H. G. Native of Cochinchina. The wood of this tree is white and heavy, composed of thick fibres; and is used for the purpose of forming the foundation of bridges, being imperishable either by being under water or under ground.

Cochinchina Aidia. Tree large.

Cult. Any common soil will suit this tree; and cuttings will be easily rooted if planted under a hand-glass.

Lin. syst. Tetradria, Monogynia. Tube of calyx adnate to the ovary; limb 8-cleft. Corolla tubular: with a 5-cleft nearly equal limb. Stamens 4, epipetalous, nearly equal. Style filiform: stigma 2-lobed. Fruit 2-celled?—A twining shrub. Leaves opposite, petiolate, somewhat sagittate, a little serrated, acute. Flowers axillary, solitary, bifracteate; bracteas cordate, winged on the outside.—This genus is said by Rafinesque to be allied to Linnae'a, but the plant is wholly unknown to other botanists.

1 V. volubilis (Rafin. l. c.) H. C. G. Native of Abyssinia.

Twining Valentina. Shrub tw.

Cult. See Aidia, p. 452. for culture and propagation. The plant is well fitted for training up the rafter in a greenhouse.

Lin. syst. Diandra, Monogynia. Tube of calyx adhering to the ovary; limb 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-lobed; lobes remote. Style under the upper lip of the corolla; stigma simple. Capsule crowned by the calyx, 1-celled? 4-seeded. Stem herbaceous? angular; branches fastigate. Leaves opposite, sessile, oblong, hastate, unequally toothed at the base, acuminate, glabrous. Flowers small, sessile, disposed in whorls. According to the author it is allied to Dicervilla, but the genus is entirely unknown to any other author.

1 K. hastata'rum (Rafin. l. c.) Ψ. H. Native of Louisiana.

Anonyma, Rob. voy. p. 457.

Hastate-leaved Karpaton. Pl.?

Cult. This plant will grow best in a border of peat earth, and may probably be increased by dividing at the root.

Tube of calyx adhering to the ovary (f. 94. e. f. 97. g.); limb variable, truncate (f. 93. a.); or of many lobes, usually regular; the sepals or lobes equal in number to the petals (f. 84. c.), very rarely intermixed with accessory teeth. Corolla gamopetalous, inserted in the upper part of the tube of the calyx, usually with a 4-5 lobed limb (f. 93. b. f. 84. c.), rarely with a 3 or 9-parted limb (f. 101. b.); the tube either short (f. 84. b.) or long (f. 92. c.); the lobes or segments twisted or valvate in aestivation. Stamens equal in number to the segments of the corolla, alternating with them, and more or less adnate to its tube (f. 83. g. f. 91. b.). Anthers ovard, 2-celled (f. 111. c.), bursting inwardly. Ovarium situated within the calyx, and adh'ring to it (f. 94. c. f. 103. g. f. 93. g.), usually 2 (f. 94. c.) or many celled (f. 103. g.), rarely 1-celled by abortion: always crowned by a fleshy urceolus, or the limb of the calyx (f. 103. f.). Style one, rising from the urceolus (f. 85. d.); styles usually 2, distinct (f. 105. c.), or more or less combined (f. 83. e.), rarely more than 2. Fruit bacate (f. 107. h.), capsular (f. 95. k.), or drupaceous (f. 103. g.), 2 (f. 94. c.) or many celled (f. 103. g.); cells 1-2 or many seeded. The seeds, where they are solitary in the cells, are sometimes fixed by the apex, but usually by the base; but where they are numerous in the cells, they are fixed to a central placenta, and are usually horizontal. Alburnen large, horny or fleshy. Embryo straight, or a little curved, inclosed in the middle of the alburnum; with a terete radicle turned towards the hilum; and foliaceous cotyledons.—Trees, shrubs, and herbs, with terete or tetragonal branches. Leaves simple, girded by a marginal nerve, and therefore quite entire, opposite or verticillate, always bistrupulate. Stipulas variable in cohesion and form, interpetiolar or intrafoliaceous. Flowers arranged in various ways, but usually in panicles or corymbs, rarely unisexual by abortion.

This well marked order is nearly allied to Compósita, from which its distinct stamens, bilocular, and plurilocular ovary and inflorescence, distinguish it, and consequently it participates in all the relation of that extensive order. From Apecyeæ in the aestivation of the corolla, the presence of stipulas, and the inferior ovary distinguish it, yet, according to Mr. R. Brown, there exists a genus in equinoxial Africa which has the interpetiolar stipulas and seeds of Rubiaceæ and the superior ovary of Apecyeæ, thus connecting these two orders, Congo, p. 448. There is a striking affinity between Rubiaceæ and Caprifolium in the monopetalous tubular corolla, definite stamens, inferior ovary, and opposite leaves, which is confirmed by the corolla of the latter being occasionally regular or irregular. The tribe Operculariæ, referred to this order by Mr. R. Brown (Congo, p. 447.) and others (A. Rich. elem. ed. 4. p. 483.), is remarkable for having but 1-seed, and the number of stamens unequal to the lobes of the corolla, and therefore occupies an intermediate station between the Rubiaceæ and Dipsacaceæ. The tribe Stellitae is distinguished from the rest of the order in the stipulas being as large as the leaves, and of the same form and consistence; having from 1-3 between each leaf on both sides, forming with them a kind of star or whorl, from which circumstance the name stellate is applied. The leaves in this tribe can only be distinguished from the stipulas by the axillary buds.

Powerful febrifugal or emetic qualities are the grand features of this order, the most efficient products of which in these two respects are Quinquina and Ipecacuana. The febrifugal properties depend upon the presence of a bitter tonic astringent...
principle, which exists in great abundance in the bark; those of Cinchona are known to depend upon the presence of two alkalies, called cinchonine and quinine, both of which are combined with cinchic acid; two principles which, though very analogous, are distinctly different, standing in the same relation to each other as potash and soda. Turner, p. 648. Dr. Serttiner has obtained some other vegato-alkalies from Cinchona, one of which he calls chinioidia. Brande, journ. 12. p. 417. new series. The existence of this is denied by M. M. Neury and Delordre, ibid, July, 1830, p. 442. A detailed account of the qualities, synonyms, and commercial names of the species of Cinchona is given in Mr. Lambert’s work on the genus Cinchona, 4to. London, 1821. In the same work is the translation of Baron Humboldt’s account of the Cinchona forests of South America. Three species of Cinchona, the C. ferruginea, C. Vellooii, and C. Reniijiana, are found in Brazil, where they are used for the same purposes as the Peruvian bark, to which, however, they are altogether inferior. St. Hil. pl. usel. bras. no. 2. The French Guiana bark possesses properties analogous to those of Cinchona, and is obtained from Portlandia hexandra the Coutoure speciosa, Aublet. Humb. cinch. forest. p. 43. The Quinquina Pitou and Quinquina des Antilles are produced by species of the genus Ecosténuna, and are remarkable for possessing properties similar to those of the true Quinquina, but without any trace of either cinchonine or quinine. St. Hil. pl. usel. bras. no. 3. A kind of fever-bark is obtained at Sierra Leone from Rondetélita febrisfuga. Besides, there are a great number of other species possess barks more or less valuable. Pincknèya pubens is the fever-bark of Carolina; Condaminea corymbosa, Isétha coccinea, Antirhœa, and Morinda Rôjoc, are all of the same description. A lightish brown, bitter, and powerfully astrin- gent extract, called Gambier, is obtained at Malacca by boiling the leaves of Naúclea Gómbr.; it is sometimes substituted for gum-kino, Ainslie, 2. p. 106. A decoction of the leaves, as well as the root, of Cânthium parejflorun, is prescribed in India in certain kinds of flux, and the last is supposed to have antehilminthic properties, though neither has much sensible taste or smell. The bark and young shoots are also used in dysentery. Ainslie, 2. p. 63. Among the emetics, Ipecacuanha holds the first rank; it is the root of Cepheælis Ipecacuanha, a little creeping-rooted half-herbaceous plant, found in damp shady forests of Brazil. Similar properties are found in the roots of other Rubiaceous plants of the same country, as in Richardiænia róæza and R. scébra, Borrèria férregubre, and B. Pòiýa, &c. A peculiar alkaline principle, called emetia, is found in Ipecacuanha, which contains 16 per cent. of it. Turner, p. 653. The Raiz Preta, which is celebrated for its power in curing dropsy, and in destroying the dangerous consequences of bites of serpents, is said to be related to Ipecacuanha. Edinb. phil. journ. 1. p. 218. Several species of Psychótria, as P. eméctica, &c. and Geóptila rensiformis, are substitutes for Ipecacuanha. The spurious barks called Quinquina Pitou, are capable of exciting vomiting. The powdered fruit of Iánistencia durnetérm, is a powerful emetic. An infusion of the bark of the root is administered to nauseate in bowel complaints. Ainslie, 2. p. 186. According to Roxburg, the root bruised and thrown into ponds where there are fish, intoxicates them, as Céccalus Indicus. Ainslie, 2. p. 186. Psychótria Nôxza and Palicóaurea Margvrâvi, both called Erêa de rata, are accounted poisonous in Brazil; but nothing very certain seems to be known of their properties. Edinb. phil. journ. 14. p. 267. The root of Morinda umbellátâ in the Molucases, and that of M. citrifólia in India, is used for dyeing red and brown; and the bark of M. Rôjoc for ink. The leaves of Oldenlandia umbellâta are considered by the native doctors of India as expectorant; and the root is employed in India for staving nankeens. Ainslie, 2. p. 101. Coffe is the roasted seeds of a plant of this order, Coffea Arábica, and is supposed to owe its characters to a peculiar chemical principle called coffee. Turner, p. 699. The part roasted is the albumen, which is of a hard horns consistence; and it is probable that the seeds of most of the plants of the present order, whose albumen is of the same texture, would serve as a substitute. This would not be the case with those with fleshy albumen. The fruit of some Gardénias Gênia and of Vanquérie, the Voa Vanga of Madagascar, and Sarcocôphalus esculentus, are succulent and eatable. The root of Rúbia tinctória, the madder, is one of the most important dyes with which we are acquainted; a quality in which the roots of many other plants belonging to the tribe Stellátæ participate in a greater or less degree. The roots of Rúbia Munístia yield the madder of Bengal. Ainslie, 1. p. 203. The torrefied grains of Gálium are said to be a good substitute for coffee. The flowers of Gálium virum are used to curdle milk. An infusion of Aspérula cymannchica has a little astringency, and has been used as a gargle. Aspérula odoràta, or Woodruff, is remarkable for its fragrance when dried; it passes for a diuretic. Rúbia Nôxza is said to be poisonous. Opposite leaves, with intervening stipulas, a monopetalous corolla, with a definite number of stamens, are the great characteristics of Rubiaceæ; an order of such extent, that it embraces a very large proportion of the whole phenomenous plants, including within its limits humble weeds and lofty trees. Among them the plants of beauty or value are innumerable; of the former description the genera Iódrê, Bouvário, Catesbaeæ, Portlandia, Cardénia, Hamélica, Cepheælis, Augustea, and many others, are notable examples.

Synopsis of the genera.

A. Cells of fruit many-seeded.

TRIBE I.

CINCHONÆÆ. Fruit capsular, 2-celled; cells many secedd. Seeds winged.—Trees or shrubs. Stipulas interpetiolar.

SUBTRIBE I. NAUCLEÆÆ. Flowers capitulate, sessile, upon a globose receptacle (f. 83. e. f. 84. k.).

1 NAUCLEA. Tube of calyx oblong; limb truncate or 5-toothed (f. 83. b.), with linear lobes. Corolla funnel-shaped (f. 83. c.), with a slender tube and naked throat. Stigma tumid, undivided (f. 83. d.). Capsules sessile, not attenuated at the base.

2 UNCA'RIA. All as in Nauclea, but differs in the flowers being scattered on the receptacle. Calyx urceolately 5-cleft. Capsules pedicellate, elavate, attenuated at the base.
3 Adnya. Tube of calyx oblong; limb campanulate, 5-parted (f. 84. a.), permanent. Corolla funnell-shaped, 5-lobed (f. 84. b. c.), with a naked throat and valvate lobes. Anthers almost sessile (f. 84. c.), inclosed. Stigma capitate (f. 84. b.). Capsules membranous, 4-valved (f. 84. g.), pyramidal. Seeds 2-4 in each cell.

4 Breo'nia. Limb of calyx 5-parted. Corolla with a terete tube, and a flat, 5-lobed, spreading limb. Stamens inserted in the throat, half-exserted. Style very long: stigma bipartite. Ovaryum 2-celled; cells 7-8-ovulate: ovula fixed to membranous placenta, and hanging from the axis.

Subtribe II. Cincho'neae. Flowers more or less pedicellate, never seated on a globose receptacle.

6 Stev'nsia. Calyx girded by a 4-lobed involucre; limb bipartite, deciduous. Corolla salver-shaped, with a short tube, and a bluntly 6-7-parted limb. Anthers 6-7, sessile in the throat. Capsule globose, areolate at the apex. Seeds a little winged, pubescent at the base.

7 Cout'area. Limb of calyx 6-parted. Corolla funnell-shaped, with a short tube, and a bluntly 6-lobed limb. Stamens inserted in the bottom of the throat; anthers linear, exserted. Capsule obovate, compressed; valves bifid at the apex. Wings of seeds membranous.

8 Hilla. Calyx girded by a 4-leaved involucre; limb 2-4-parted, permanent. Corolla with a long tube (f. 85. b.), and a 4-6-parted limb (f. 85. b.). Stamens 4-6, inclosed, sessile beneath the throat (f. 85. c.). Capsule elongated, crowned. Seed ending in a pencil-formed tail (f. 85. c.).

9 Hyman'goon. Limb of calyx 5-parted, permanent. Corolla salver-shaped, with a very long tube, and a 5-parted limb. Stamens 5, inclosed, inserted in the top of the tube, which is inflated. Capsule oblong, clavate, 10-nerved, crowned. Seeds appendiculated at both ends.

10 Cincho'na. Calyx 5-toothed (f. 86. a.). Corolla with a terete tube, and a 5-parted limb (f. 86. b.), which is valvate in aestivation. Anthers linear, inserted in the middle of the tube (f. 86. a.), a little exserted. Capsules dehiscing at the valves, crowned. Seeds girded by a membranous lacerated wing.

11 Cosme'nea. Calyx 5-toothed. Corolla with a long tube, and a 5-lobed limb, which is valvate in aestivation. Anthers oblong, exserted. Stigma bipartite. Capsule somewhat 4-valved, dehiscing from the apex. Seeds girded by a lacerated wing.

13 Lucuida. Calyx 5-toothed (f. 87. c.), deciduous; lobes foliaceous. Corolla with a longish tube, and a 5-lobed expanded limb, which is imbricate in aestivation. Stamens almost inclosed (f. 87. a.); anthers linear. Stigma 2-parted (f. 87. b.). Capsule dehiscing at the dissepiment from the apex. Wings of seeds jagged.

14 Hymenoyction. Calyx 5-toothed. Corolla tubular, with a 5-cleft limb, which is valvate in aestivation. Stamens exserted; anthers peltate. Capsule not crowned, dehiscing at the dissepiment. Wing of seeds bifid at the base.

15 Exoste'mma. Calyx 5-toothed. Corolla with a terete tube, and a 5-parted limb, which is plicate in aestivation. Anthers linear, exserted. Capsules crowned, dehiscing at the cells. Seeds girded by a membranous entire border.

16 Dana'is. Flowers dioecious from abortion. Limb of calyx 5-toothed. Corolla funnell-shaped, with a slender tube, a villous throat, and a spreading 5-parted limb. Stamens exserted in the male flowers, and in the female inclosed and abortive. Style bifid at the apex. Capsule globose. Seed girded by a membranous border.

18 Bouya'rdia. Limb of calyx 4-parted (f. 89. a. b.). Corolla funnell-shaped, tubular (f. 89. c.), with a 4-parted (f. 89. a.) spreading short limb. Stamens adnate at the base to the tube, but free above the middle. Anthers linear, inclosed. Capsule membranous, globose, compressed. Seeds girded (f. 89. a.) by a membranous border.

19 Pinckneya. Calyx 5-parted; the fifth lobe expanded into a coloured leaf. Corolla with a cylindrical tube, and a 5-cleft limb, which is valvate in aestivation. Stamens inserted at the base of the tube, exserted; anthers peltate. Capsule compressed, 2-celled, dehiscing at the dissepiment. Seeds surrounded by a wing, which is emarginate at the base.

20 Calycophyllum. Limb of calyx truncate or bluntly toothed; one of the teeth expanded into a membranous stalked coloured leaf. Corolla campanulate or funnell-shaped; limb 5-parted. Stamens rising from the throat; anthers oval, exserted. Style ending in 2 reflexed stigmas. Capsule oblong. Seed fixed to the linear placenta, girded by a narrow wing.

Tribe II.

Gardenia'ceae. Fruit indehiscent (f. 94. b.), fleshy, usually 2-celled, rarely 1-celled. Seeds not winged. Albumen fleshy. —Trees or shrubs, with opposite leaves, and interpetiolar stipulas.

Subtribe I. Sarcoce'phalae. Flowers sessile, collected into a head (f. 90. a. b.) upon the receptacle. The fruit combined together into one (f. 90. b. c.).

21 Sarcoce'phalus. The calyces are closely joined together into a globose fleshy head (f. 90. b.); limb of calyx with a very short margin. Corolla funnell-shaped, 5-cleft. Anthers...

24 Caneúhora. Limb of calyx 5-6 toothed. Corolla with a somewhat campanulate tube, and a 5-6-lobed limb. Anthers 5-6, oblong, almost sessile, inclosed. Stigma bifid. Fruit bac- cate? 2-celled, many seeded. Ovala imbricate, inserted in spongy axillary placentas; but according to Rich the fruit is peashaped, 2-seeded, and crowned by the calyx.

Subtribe II. GARDENIEÆ. Flowers distinct, not joined together into a head.

25 Burcheília. Limb of calyx drawn out beyond the ova- rium, 5-cleft (f. 91. a.) beyond the middle. Corolla clavately funnel-shaped (f. 91. b.); throat naked: lobes imbricated, and twisted in aestivation. Filaments adnate to the tube (f. 91. b.) at the base; anthers inclosed. Stigma bearing 5 convex crests on the outside, and tufts of hairs. Berry crowned by the calyx, turbi-nately globose. Placentas adnate to the dissepiment. Seeds angular. Flowers capitulate.

26 Amaioua. Limb of calyx 6-toothed. Corolla salver- shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb. Anthers 6, inclosed, linear. Stigma clavate. Berry obovate-oblong, 2-3-celled. Seeds disposed in 2 rows in each cell, nearly orbicular, separated by the horizontal dissepiments.

27 Messeúnda. Limb of calyx 5-parted, deciduous, one of the outer lobes usually drawn out into a large petioleate coloured leaf. Corolla funnel-shaped, with a 5-parted limb and a villous throat. Anthers 5, sessile, linear. Stigma bifid. Fruit ovoid, fleshy, indehiscent, many seeded. Seeds scabrous. Placentas rising from the middle of the dissepiment, pedunculate, bifid at the apex. Flowers corymbose.

29 Cassetia. Limb of calyx short, entire. Corolla tubular, ragged on the outside, with a villous throat, and a 5-parted limb. Anthers 6, oblong, nearly sessile, inserted among the hairs in the throat. Stigma bifid. Berry globose, crowned, many seeded. Placentas fixed to the middle of the dissepiment.

32 Posoqueá. Limb of calyx short, 5-toothed. Corolla funnel-shaped, with a very long terete tube, a villous hardly dilated throat, and a 5-parted spreading limb. Stamens 5, rising from the throat, free, a little exserted. Style filiform, bifid at the apex. Berry ovate, crowned, succulent, many seeded.

33 Oxyanthus. Limb of calyx acutely 5-toothed (f. 92. a.). Corolla with a very long slender tube (f. 92. c.), a glabrous throat, and a regular 5-parted limb (f. 92. d.). Stamens 5, exserted (f. 92. f.), free at the throat; anthers acute. Style clavate at the apex (f. 92. e.). Fruit bac-cate.

34 Stylocoryna. Limb of calyx 5-toothed Corolla sal-ver-shaped or funnel-shaped, with a cylindrical tube, and a 5-parted limb. Stamens 5, inserted in the mouth of the corolla; anthers linear, very long. Stigma clavate (f. 92. g.). Berry globose, crowned by the calyx, almost dry. Placentas spongy, adnate to the middle of the dissepiment on both sides. Seeds angular.

35 Guínea. Limb of calyx truncate or subdeterminate. Corolla salver-shaped, the tube not exceeding the calyx, and the limb large and 5-parted. Anthers linear, exserted, sessile in the throat. Stigma clavate. Berry coriaceous, somewhat 4-celled, attenuated at both ends, crowned by the tubular calyx. Seeds many, horizontal, imbedded in pulp.

36 Gareia. Limb of calyx truncate or toothed (f. 93. a.). Corolla funnel or salver-shaped (f. 93. b.), having the tube much longer than the calyx; limb twisted in aestivation (f. 93. c.), 5-9-parted, spreading. Anthers 5-9, linear, nearly sessile in the throat. Stigma clavate, bifid. Berry fleshy, crowned by the calyx, incompletely 2-5-celled. Seeds minute, immersed in the fleshy parietal placentas.

38 Chapeliea. Limb of calyx 5-parted, permanent. Corolla with a slender tube, a 5-parted limb, and a villous throat. Stamens 5, nearly sessile, inclosed, inserted in the middle of the tube. Stigma bipartite. Fruit ovoid, rather fleshy, crowned by the erect, large, spreading limb of the calyx, many seeded. Seeds angular, and clothed with adpressed golden silky down.

39 Heinsia. Limb of calyx 5-parted, permanent. Corolla salver-shaped: tube terete, longer than the calycine lobes, very hairy in the upper part inside; limb 5-lobed: lobes undulated. Anthers 5, linear, sessile towards the top of the tube. Stigmas
2, linear. Fruit globose, crowned, dry, hard. Placentas 2, thick, adnate to the dissepiment. Seed nesting on the superficies of the placentas.

40 Menestòria. Limb of calyx 5-parted. Corolla with a long terete tube, an almost naked throat, and a 5-lobed limb. Anthers 5, oblong, sessile within the tube. Stigma bifid, inclosed. Fruit baccate, nearly dry, not crowned. Placentas adnate to the dissepiment, many seeded.

41 Helo'spora. Limb of calyx campanulate, 4-toothed. Corolla with a long tube, a naked throat, and a 4-lobed spreading limb. Anthers 4, linear, inclosed. Style 4-crested at the apex. Berry crowned, tetragonal, not divided into cells, but having the seeds immersed in the pulp, and disposed crosswise in a double series.

42 Hipp'otis. Limb of calyx sheath-formed, cleft on one side, and drawn out into a mucronate auricle on the other. Corolla funnel-shaped, with the tube a little incurved, and the limb blunt and 5-lobed. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Ovarium girdled by a 5-crenate urceolus. Stigma of 2 adpressed lobes. Berry ovate, crowned. Seeds numerous, minute.

45 Pouche'tia. Limb of calyx small, 5-toothed. Corolla with a short obconical tube and a 5-lobed limb, which is twisted in restitution. Anthers 5, linear, sessile in the tube. Stigmas 2, exserted a little. Berry dry, obovate, crowned. Seeds 4-6 in each cell, deformed, clothed with silky down.

46 Cu'ria. Limb of calyx 5-parted, permanent. Corolla funnel-shaped, with a terete tube, which is a little longer than the calyx, and gradually widening to the throat; and a 5-parted recurved limb. Filaments very short; anthers oblong. Style 2-lobed at the apex, or 10-angled. Berry globose, crowned. Placentas spongy, central, few-seeded at maturity. Seed angular, wrinkled at the hilum.

47 Tare'na. Limb of calyx 5-parted, permanent, reflexed. Corolla unknown. Berry globose, 8-striped, crowned. Placentas central, spongy. Seed 4-6 in each cell, horizontal, siliquinate, rugged.

51 Petu'nja. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a villous throat. Stamens 4, a little exserted. Style villous; stigma bidentate. Berry globose, umbilicate. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb.; but according to Blume scale-formed, and imbricated downwards.

52 Higgi'nsia. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, somewhat campanulate, with a short tube, a 4-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Stigmas 2, exserted. Berry oblong, somewhat tetragonal, crowned, many seeded. Placentas adnate to the dissepiment.

54 Catesbe'a. Limb of calyx 4-toothed or 4-parted. Corolla funnel-shaped, with a very long tube, which is gradually dilated to the throat; and a 4-lobed limb. Stamens 4, inserted in the bottom of the corolla; anthers linear, exserted. Stigma bidentate. Berry globose or oblong, crowned. Placentas spongy, fixed to the top of the dissepiment. Seeds numerous, scale-formed, collected into two fascicles in each cell.

Tribe III.

Hedyot'id'ee. Fruit capsular (f. 95. k.), 2-celled, dehiscing at the cells; and rather membranous and indehiscent; cells many-seeded. Seeds not winged.—Shrubs or herbs, with opposite leaves. Stipulas interpetiolar.

Subtribe I. Rondelet'iae. Stipulas twin on both sides, combined or distinct, but neither sheathed nor divided into many bristles.—Trees or shrubs.

55 Condami'nea. Calyx campanulate (f. 95. a.), 5 crenate or 5-toothed; limb deciduous. Corolla funnel-shaped (f. 95. b.), with a somewhat curved tube, which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. b). Stamens inserted above the middle of the tube (f. 95. c.), or near the throat; anthers oblong-linear, bifid at the base (f. 95. f.), length of corolla. Stigma 2-lobed (f. 95. e.). Capsule turbinate, truncate, opening in the middle of the cells (f. 95. k.). Seeds wedge-shaped (f. 95. l.).

56 Asek'is. Limb of calyx superior, 5-parted. Corolla cup-shaped...
shaped, with a 5-lobed limb and a bearded throat. Stamens 5, free to the base of the corolla, exserted. Stigma divided. Ovary 2-celled, many ovulate.

57 Macropse'num. Limb of calyx minute, 5-toothed, permanent. Corolla tubular, with a widened throat and a 5-lobed limb; tube pentagonal at first. Stamens 5, free from the corolla, except at the very base, hairy above the middle; anthers oblong, inclosed. Stigma obtuse, 2-lobed. Capsule 2-valved; valves dehiscing at the sides. Seeds acute, imbricated.

58 Chima'rrhis. Limb of calyx almost wanting, entire. Corolla with a short tube and a 5-cleft spreading limb: lobes hairy in the middle outside. Stamens 5, inserted at the top of the tube, hairy at the base; anthers oval. Capsule obovate or turbinate, crowned; valves semibifid. Seeds many.

59 Augú'stea. Limb of calyx 5-parted. Corolla funnel-shaped, much longer than the limb of the calyx; tube widened at the apex, a little incurved; limb 5-parted, spreading. Anthers 5, sessile in the sinuses of the corolla, and shorter than its lobes. Style hairy at the base; stigma bifid. Capsule oblong, separable from the calyx, and naked at maturity, but crowned. Seeds many, tetragonal.

60 Portla'ndia. Limb of calyx 5-parted; tube 5-nerved. Corolla large, funnel-shaped, with a short tube, a wide throat, and a bluntly 5-lobed limb. Stamens 5, inserted in the bottom of the throat; anthers long, a little exserted. Stigma undivided. Capsule obovate, crowned, and retuse at the apex; valves dehiscing at the apex. Placentas connivent. Central. Seeds scabrous.

61 Békia. Calyx with an 8-ribbed tube, and a 4-parted limb. Corolla clavate, tetragonal, with a 4-cleft limb. Anthers 4, linear, not exceeding the limb. Capsule ovo-angulate, at length separating from the calyx, 2-celled or nearly 4-celled; valves bifid at the apex. Placentas narrow. Seeds small, crested on the margins.

62 Isido'rea. Limb of calyx 5-parted. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb. Stamens inserted in the very base of the corolla, and equal in length to it, monadophilous and hairy at the base; anthers oblong, obtuse. Stigma bilamellate. Capsule nearly globose, pentagonal, at the apex, crowned. Coccule dehiscence, many seeded. Seeds angular, furnished with a cup-formed membrane at the base.

64 Rosè'del'tia. Limb of calyx 4-5-parted, permanent. Corolla with a cylindrical tube and a 4-5-cleft spreading limb. Anthers 4-5, sessile on the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned; valves cleft in the middle. Placentas central. Seed angular, few in the cells at maturity.

65 Wenda'ndia. Limb of calyx very short, permanent, 4-5-toothed. Corolla with a terete tube, which is longer than the calyx, and a 4-5-lobed spreading limb. Stamens 4-5, rising from the top of the tube; anthers oblong, exserted. Stigma bifid. Capsule ovate-globose, crowned; dehiscing at the cells at top, many seeded.

66 Xanthophy'tum. Limb of calyx 4-5-cleft. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft spreading limb. Stamens 4-5, exserted, inserted in the throat, connivent. Style perforating the disk of the ovary. Stigma 2-lobed, gaping. Drupae didymous, crowned, divided into 2 many seeded cells. Placentas prominent, fixed by the cells on both sides. Seeds angular, minute.

67 Carphá'lea. Limb of calyx 4-parted, permanent. Corolla with a long filiform tube, a ventricose hairy throat, and a 4-parted limb. Anthers oblong, almost sessile, inclosed. Stigma bifid. Capsule crowned, dehiscing at the cells; valves semi-septiferous; cells many seeded.

69 Viré'cta. Limb of calyx divided into 5 setaceous lobes. Corolla funnel-shaped, with an obconical tube, a naked throat, and having the limb divided into 5 linear-oblong ciliated lobes. Stamens 5, much exserted; anthers linear, occasional, bifid at the base. Stigma undivided. Capsule globose, dehiscing at the cells, at first crowned. Seeds numerous, 4-5-sided, a little muricate. Hairy half herbaceous plants.

71 Augoste'mma. Limb of calyx 3-4-5-toothed. Corolla rotate, spreading, 3-5, rarely 3-4-parted. Stamens alternating with the lobes of the corolla. Anthers large, exserted, cohering at the apex. Style perforating the fleshy disk; stigma globose. Capsule crowned, dehiscing radially at the apex. Placentas convex, adnate to the disseminum. Seeds numerous, angular.—Herbs.

74 Dente'lla. Limb of calyx 5-cleft. Corolla funnel-shaped, 5-cleft, with a hairy throat; lobes furnished with one tooth on each side. Anthers 5, inclosed, nearly sessile. Stigmas 2. Capsule or berry dry, almost indehiscent, nearly globose, crowned. Placentas fleshy, prominent on both sides within the cells. Seeds small, ovate.—Creeping herbs.
TRIBE IV

HAMELIEÆ. Fruit baccate, many celled (f. 98. f. h.); cells many seeded. Albumen fleshy. — Shrubs or trees, with opposite or verticillate leaves, and interpetiolar stipules.

87 Hop'pe. Limb of calyx very short, 4-toothed (f. 98. a.). Corolla subrotate (f. 98. c.), 4-cleft. Stamens 4, inserted in the throat (f. 98. b.); anthers ovate, inclosed, or nearly so. Stigma thick or 4-lobed. Fruit crowned (f. 98. g.), 4-celled (f. 98. h.).

88 Sab'ceæ. Limb of calyx 4-parted. Corolla salver-shaped, with a long slender tube, a 4-parted limb, and a hairy throat. Stamens 4-5, inclosed, or nearly so. Style 4-5-lobed at the apex. Berry globose, crowned, 4-5-celled.

89 Olo'styla. Limb of calyx very short, 4-toothed. Corolla subrotate, with a short tube, which is pilose inside, and 4 reflexed lobes. Stamens 5, inserted in the throat; anthers linear, exerted. Style undivided. Berry crowned, 4-celled.

3 x 2

96 Schradera. Limb of calyx truncate or subdenticulated. Corolla funneled-shaped, with a terete tube, a dilated pilose throat, and a 5-8-lobed spreading limb, each lobe usually furnished on the inside with a retrograde callous tooth. Anthers 5-8, linear, nearly sessile, inserted in the throat, hardly exserted. Stigma bifid or quadrifid. Berry pea-formed, 3-4-sided, crowned, 2-4-celled. Seeds imbedded in the pulp.

97 Brignolia. Limb of calyx 4-toothed; teeth unequal. Corolla with a short tube, and a 6-lobed limb, which is very hairy inside as well as the throat. Stamens 6, inserted in the tube; anthers linear. Stigma capitate, undivided. Fruit globose, fleshy, crowned.

98 Patima. Limb of calyx tubular, with a sinuated, very short, 5-toothed border. Corolla tubular, 5-parted, densely clothed with silky down inside. Stamens 5, inserted in the tube; anthers oblong-cordate, inclosed. Style undivided. Berry roundish, crowned, 4-6, but usually 5-celled. Seeds fixed to a fleshy, 2-lobed placenta.

99 Polyphragmon. Limb of calyx entire or 5-toothed. Corolla salver-shaped, bristly, with a terete tube, and a 10-parted limb. Stamens 10, inserted in the middle of the tube; anthers linear, inclosed. Stigmas numerous. Berry globose, 10-20-celled, with 1 series of seeds in each cell.

100 Morelia. Limb of calyx erect, nearly entire. Corolla short, tubular, with a 5-parted limb, which is imbricate in estivation. Stamens 5, inserted in the throat, exserted; anthers linear. Style fusiform towards the apex; stigma bifid. Fruit fleshy, 4-5-celled; cells 2-3-seeded.

B. Cells of fruit usually 1-seeded, rarely 2-seeded.

Tribe VI.

Coriariae. Fruit baccate, of many cells; cells 1-seeded. Differs from the neighbouring tribes in the cells being 1-seeded. Shrubs with opposite leaves, and broad interpetiolar stipulas.

101 Thicalysia. Flowers hermaphrodite.

102 Cordieria. Flowers unisexual.

Tribe VII.

Guttardaee. Fruit drupaceous (f. 101 d. f. 103 f.) composed of 2-5 1-seeded pyrene or nuts (f. 103 g). Seeds terete elongated, usually erect. Albumen fleshy.—Shrubs or small trees. Leaves usually opposite, rarely 3 in a whorl, with interpetiolar stipulas.

Subtribe I. Morindeae. Flowers and fruit concreted, or joined together into a head.

103 Morinda. Character the same as that of the subtribe.

Subtribe II. Guettardeae. Flowers distinct, not concrete. 104 Myrmecodia. Limb of calyx tubular; with an entire border. Corolla funnel-shaped, 4-cleft, the throat closed from arched scales or hairs. Stigma simple (Jack.), or quadrifid (Blum.). Drupe baccate, composed of 4 triquetrous pyrene.

106 Hypobuthrum. Limb of calyx 4-toothed. Corolla small, subcampanulate, with a villous throat, and a 4-cleft spreading limb. Stamens 4, inserted in the mouth of the tube. Stigma bifid. Drupe crowned, 2-celled; cells containing 2 pyrene.

107 Nertera. Limb of calyx small, 4-toothed. Corolla funnel-shaped, sub-campanulate, 4-lobed (f. 100 b) glabrous inside. Stamens arising from the bottom of the corolla (f. 100 c), adnate to the tube; anthers roundish, hardly exserted. Stigmas 2 (f. 100 d), hairy. Berry roundish, umbilicate, containing 2-4 pyrene. Herbs creeping.

108 Mitchella. Limb of calyx large, 4-toothed. Corolla funnel-shaped, with a terete tube: having the throat as well as the lobes hairy inside. Stamens adhering to the tube almost to the throat; anthers ovate, hardly exserted. Stigmas 4, inclosed. Berry nearly globose, crowned, containing 4 pyrene. Creeping herbs.

109 Mephitydium. Limb of calyx 3-6-parted or toothed. Corolla funnel-shaped, 4-6-cleft, usually hairy. Stamens 4-6, inserted towards the throat; anthers linear, exserted, or inclosed. Stigmas 4-9. Drupe baccate, crowned, containing 4-9 pyrene.

111 Guettarda. Limb of calyx permanent or deciduous, truncate or irregularly toothed (f. 101 a). Corolla salver-shaped, with a cylindrical tube (f. 101 c), and a 4-9-lobed limb (f. 101 b). Anthers 4-9, inserted in the throat, sessile, inclosed. Stigma capitate, rarely 2-lobed. Drupe crowned (f. 101 d), containing a 4-9-celled angular putamen (f. 101 e); cells 1-seeded.

112 Malanesia. Limb of calyx 4-toothed. Corolla small, nearly rotate, with a very short tube, and a 4-lobed spreading limb. Stamens exserted; anthers roundish. Drupe dry, crowned, containing a 2-celled putamen; cells 1-seeded.
113 **Antirhoe'a**. Limb of calyx campanulate, 4-toothed. Corolla tubular, 4-cleft. Anthers nearly sessile in the throat, not exerted. Stigma bifid. Drupe sub-baccate, crowned, containing a 2-celled putamen; cells 1-seeded.

114 **Stenostomum**. Limb of calyx small, 5-toothed. Corolla funnel-shaped, having the tube widened at the throat, and a 5-lobe lim. Anthers 5, oblong, hardly exerted. Stigma 2-lobed. Drupe ovate-oblong, crowned, containing a 2-celled putamen; cells 1-seeded.

116 **Timon'ius**. Limb of calyx tubular, truncate, 2-6-toothed. Corolla tubular, salver-shaped, with a 4-6-parted spreading limb, and a naked throat. Stamens 4, almost sessile, inserted in the upper part of the tube; anthers 4, oblong-heart-shaped. Stigmas 2, digitatedly 5-cleft. Druple globose, crowned, containing 7-25 bony 1-seeded nuts.

117 **Hamiltonia**. Limb of calyx 5-parted. Corolla funnel-shaped, with a long tube (f. 102. b.), and a 5-lobe lim (f. 102. c.). Stamens 5, inserted in the throat, inclosed. Stigma 5-cleft. Capsule crowned, dehiscing at the apex, containing 5 1-seeded pyrenae.

118 **Leptode'rmis**. Calyx inclosed by a 2-leaved calyxiform involucrum; limb 5-lobe. Corolla funnel-shaped, scabrous, with a terete tube, which is pilose inside, and a 5-lobe cuspidate limb. Stamens 5, very short, inclosed. Stigma 5-cleft. Fruit 5-celled, 5-seeded?

119 **Psathu'ra**. Limb of calyx campanulate, 5-6-toothed. Corolla bearded inside, with a short tube, and a 5-6-lobe spreading limb. Anthers 5-6, nearly sessile in the throat. Stigma 5-6-lobe. Berry globose, crowned, containing 6 pyrenae.

120 **Myonima**. Limb of calyx small, bluntly 8-toothed. Corolla with a short tube, and a 4-parted limb. Stamens 4; anthers oblong, exerted. Stigmas 4, approximate. Berry globose, not crowned, containing 4 pyrenae.

121 **Pyro'stria**. Limb of calyx 4-5-toothed. Corolla sub-campanulate, 4-5-cleft; throat tomentose. Stamens 4-5, hardly exerted. Stigma capitulate, bifid. Fruit pear-shaped, not crowned, containing 4-8 bony nuts.

122 **Oc'tavia**. Limb of calyx hardly any, truncate. Corolla unknown. Ovarium crowned by a fleshy disk, which is perforated in the middle. Drupes fleshy, globose, not crowned, containing 8 pyrenae.

123 **Litosae'nthes**. Limb of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short, spreading 4-cleft lim. Stamens 4, inclosed; anthers linear. Stigma 4-toothed. Drupe succulent, obovate, umbonate, containing 4 nuts.

124 **Erythalis**. Limb of calyx short, with a 5-10-toothed border. Corolla rotate, without a tube, 5-10-parted. Stamens 5-10, hardly adnate to the corolla at the base; anthers linear. Stigma bilamellate. Drupe globose, crowned, containing 5-10 pyrenae.

127 **Gyno'chtes**. Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside; lobes convolute below and spreading above, each furnished with an inflexed point at the apex. Stamens 4-5, inclosed, inserted in the base of the corolla. Stigma bifid, warted. Drupe globose, umbilicate, containing 4 pyreneae.

128 **Celsospe'rum**. Limb of calyx quite entire, deciduous. Corolla with a short tube, and a 4-6-cleft, spreading limb. Stamens 4-5, exerted, inserted in the throat; anthers linear, incumbent. Stigma bifid. Drupe globose, umbilicate, containing 4 pyreneae.

129 **Anglyan'thus**. Limb of calyx 5-parted (f. 103. a.). Corolla tubular (f. 103. b.), incurved; limb regular, 5-cleft (f. 103. c.); lobes cuspidate. Anthers 5, sessile in the throat (f. 103. c.). Stigma 5-cleft (f. 103. d.). Fruit 5-celled (f. 103. e.); cells 1-seeded.

130 **Phalla'ria**. Calyx with a globose tube, and an acutely 5-toothed lim. Corolla tubular, 5-cleft; lobes spreading or reflexed. Anthers 5, ovate, at the throat. Style filiform, crowned by an elongated thick stigma. Ovarium 2-seeded.

131 **Hylacium**. Limb of calyx 5-toothed. Corolla funnel-shaped, with a long tube and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed. Stigma cylindrical, 5-furrowed. Drupe dry, containing a 2-celled rugged nut: one of the cells usually abortive.

132 **Cuvier'a**. Limb of calyx 5-parted. Corolla campanulate, 5-cleft, spinaceous at the apex. Anthers 5, at the throat, inclosed. Stigma dilated, with a reflexed margin. Fruit baccate, 5-celled; cells 1-seeded.

133 **Donidia**. Limb of calyx very short, hardly 5-toothed. Corolla with a short broad tube, beset with a row of stiff retrograde hairs inside, and a 5-lobe limb. Style tumid in the middle, and hispid. Ovarium 1-celled? many seeded.

135 **Strep'mpia**. Limb of calyx campanulate, 5-cleft beyond the middle. Corolla somewhat campanulate, profoundly 5-cleft, with hardly any tube. Stamens 5, inserted in the base of the tube of the corolla, connate. Stigma bifid. Drupe pea-formed, umbilicate, containing a 2-celled globose nut, rarely 1-celled.

136 **Billio'tia**. Limb of calyx 5-7-parted. Corolla salver-shaped, with a 5-7-parted limb, and the throat bearded by bristles inside. Stamens 5-7, adnate to the tube. Ovarium covered by a nectariferous urceolus at the apex. Style 1, crowned by 4 stigmas. Drupe 1-seeded by abortion.
Tribe VIII.

Pederieæ. Fruit 2-celled, indehiscent, hardly fleshy, the rind easily separated from the seeds or carpels. Carpels compressed, 1-seeded (f. 104. f.), hanging from a filiform axis. Albumen fleshy.—Climbing shrubs, with opposite leaves, and interpetiolar stipules.

137 Lygodysio'dea. Limb of calyx 5-toothed (f. 104. a.). Corolla having the tube much longer than the teeth of the calyx (f. 104. b.), with a hairy throat and a 5-lobed limb (f. 104. c.); lobes revolute. Anthers sessile within the tube (f. 104. e.). Stigmas 2, slender (f. 104. d.). Fruit indehiscent, crowned (f. 104. g.), containing 2 carpella.

138 Lec'ontea. Limb of calyx 5-parted. Corolla with a longish terete tube, a 5-parted limb, and a naked throat. Anthers almost sessile in the throat, exserted. Stigmas 2, linear. Fruit containing 2 winged carpella.

Tribe IX.

Coaffeææ. Fruit 2-celled (f. 105. k, f. 107. c.), baccate, containing 2 1-seeded bony nuts (f. 107. d.), which are flat inside, and usually marked by a furrow on the outside; rarely only containing 1 nut from abort. Albumen fleshy.—Trees or shrubs, with opposite leaves. Stipulas interpetiolar, 2 on each side, combined or distinct.

Subtribe I. Coffeeææ. Flowers distinct, not joined together.

142 Canthan'um. Limb of calyx 4-5-toothed. Corolla with a short tube, a bearded throat, and a 4-5-lobed spreading limb. Stigma undivided, globose or mitre-formed. Berry globose or didymous, crowned.

144 Psy'drax. Limb of calyx 5-toothed, deciduous. Corolla with a short tube, a hairy throat, and a 5-lobed reflexed limb. Stamens inclosed. Style exserted; stigma bilamellate. Berry fleshy, obovate, areolate at the apex.

146 Nesce'dia. Limb of calyx hardly any, quite entire. Corolla with a short tube, a 5-cleft limb, and a naked throat. Stamens 5, inclosed, nearly sessile, inserted in the throat; anthers linear, acute. Stigmas 2, face to face. Ovarium 2-celled.

147 Diplo'stora. Limb of calyx subcampanulate, 4-toothed. Corolla with a broad tube, a pilose throat, and a 4-lobed spreading limb. Stigma bifid. Ovarium 2-celled. Fruit unknown.

148 Epithi'nia. Limb of calyx cylindrical, hardly 4-toothed. Corolla tubular, with a spreading 4-parted acute limb, and a villous throat. Stamens 4, exserted; anthers linear. Style exserted; stigma bifid. Berry 8-furrowed.

149 Sidero'dendron. Limb of calyx hardly any, somewhat 4-toothed. Corolla with a long terete tube, a 4-lobed obtuse limb, and a glabrous throat. Anthers 4, oblong, sessile at the throat. Style bifid at the apex. Berry dry, subglobose, not crowned.

150 Euma'chia. Limb of calyx 4-toothed, deciduous. Corolla funnel-shaped, with a short tube, a naked throat, and a 4-parted spreading limb. Stamens 4, inserted at the bottom of the tube; anthers oblong, inclosed. Stigma bifid. Berry globose, not crowned.

151 Declie'vixia. Limb of calyx 4-parted (f. 105. b.). Corolla funnel-shaped (f. 105. g.), with a terete tube (f. 105. f.), a bearded throat, and a 4-lobed reflexed limb. Stamens 4, inserted in the throat; anthers linear, incumbent, exserted (f. 105. c.). Stigma bifid (f. 105. c.). Berry nearly dry, somewhat didymous, compressed (f. 105. k.), crowned (f. 105. b.).

152 Tebte'ena. Limb of calyx 4-parted. Corolla short, funnel-shaped, 4-cleft; lobes spreading; throat beset with long hairs. Stamens inserted in the upper part of the tube, exserted. Style inclosed; stigmas 2. Drupe oblong, compressed, crowned.

153 Choco'eca. Limb of calyx 5-toothed. Corolla funnel-shaped, with an obconical tube or throat, and a 5-lobed acute limb. Stamens 5, downy, hardly adnate at the bottom of the corolla; anthers linear, inclosed. Style clavate or 2-lobed at the apex. Berry somewhat didymous, compressed, crowned.

154 Mar'ca'ris. Limb of calyx somewhat turbinate, semi-quinquifid. Corolla funnel-shaped, with an obconical tube, which is bluntly 5-toothed or 5-lobed at the apex. Stamens inserted into the middle of the tube, inclosed; anthers ovate. Stigma undivided or somewhat 2-lobed. Berry globose, crowned.

155 Salde'nia. Limb of calyx somewhat campanulate, obsolescently repand. Corolla with a short tube, an acute 4-parted limb, and a hairy throat. Stamens 4, inserted in the throat, hardly exserted; anthers oblong, nearly sessile. Fruit ovoid, compressed, crowned, drupaceous, 1-celled and 1-seeded by abortion, small.

156 Sco'losanh-thus. Lobes of calyx 4, linear-lanceolate. Corolla tubular, tetragonal before expansion. Stamens adnate to the lower part of the tube, downy, not exserted; anthers linear. Stigmas 2. Drupe nearly globose, crowned, containing a 2-celled 2-seeded nut.

157 Chome'lia. Limb of calyx 4-toothed. Corolla salver-shaped, with a long slender tube, a glabrous throat, and a 4-lobed limb. Anthers 4, almost sessile in the throat. Style bifid at the apex, situated among the anthers. Drupe ovate, crowned, containing a 2-celled 2-seeded nut.

158 Bacònia. Limb of calyx bluntly 4-cleft. Corolla fun-
nel-shaped, with a short terete tube, a bearded throat, and 4 oblong lobes, which are longer than the tube, and twisted in aestivation. Anthers 6, linear, almost sessile, exserted. Style exserted. Stigma undivided. Berry dry, 2-celled, 2-seeded.

159 Ixóra. Limb of calyx small, 4-toothed (f. 106. a.). Corolla salver-shaped (f. 106. b.), with a slender terete tube (f. 106. c.); and a 4-parted spreading limb (f. 106. b.). Anthers 4, almost sessile in the throat. Style bifid (f. 106. c.) at the apex, equal in length to the corolla or a little longer. Berry drupaceous, crowned, nearly globose.

160 Páve'tta. All as in Ixóra, but differs in the style being exserted beyond the corolla, and clavate, undivided, or hardly bifid at the apex.

162 Couss'a'rea. Limb of calyx tubular, sinuately 4-toothed. Corolla with an elongated terete tube, which is hardly subuliform under the apex, and a glabrous throat. Stamens 4, inserted in the upper part of the tube, inclosed; anthers oblong-linear. Stigma bipartite, hardly exserted. Berry ovate-globose, hardly fleshy, crowned, 1-celled, 1-seeded.

163 Polýózus. Limb of calyx absolutely denticulated, deciduous. Corolla with a cylindrical tube, which is shorter than the 4-5 lobes of the limb, and a villous throat. Anthers hardly exserted. Style short; stigma bifid. Berry drupaceous, nearly globose, not crowned.

166 Fara'mea. Limb of calyx very short, 4-toothed, or entire. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear lobes. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, marked by 8 crenæ at the apex, 1-celled by abortion at maturity.

167 Strempel'ia. Limb of calyx campanulately tubular, 4-5-toothed. Corolla tubular, with a 4-5-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube, pilose in the free part; anthers linear, inclosed. Fruit ovoid, crowned.

168 Coff'e'a. Limb of calyx small, 4-5-toothed (f. 107. a.). Corolla tubular, funnel-shaped, with a 4-5-parted spreading limb (f. 107. b.). Stamens 4-5, inserted in the middle of the upper part of the tube, exserted or inclosed. Style bifid at the apex. Berry umbilicate (f. 107. b.), not crowned.

169 Anther'ea. All as in Psychótria, but differs in the corolla being rotate and 5-parted; in the anthers being sagittate at the base and caduate at the apex; in the style being subulate, and longer than the corolla, and in the stigma being simple.

171 Psychótria. Limb of calyx 5-lobed or 5-toothed. Corolla funnel-shaped, short, 5-cleft; limb spreading or recurved; throat bearded or glabrous. Stamens 5: anthers exserted or inclosed. Stigma bifid. Berry drupaceous, crowned.

173 Palico'rea. All as in Psychótria, except the corolla, which is tubular and cylindrical, and a little gibbous at the base or curved, 5-cleft, bearded beneath the middle inside. The teeth of the calyx, and the lobes of the corolla, sometimes rather unequal.

174 Chasa'lla. Limb of calyx urceolate, rather tubular, entire or 5-toothed at the apex. Corolla with an elongated equal tube, and 5 short acutish erect or spreading lobes. Anthers 5, inserted in the mouth or top of the tube, inclosed or a little exserted. Stigmas 2. Berry ovate, crowned, hardly dry.

175 Jaćkia. Limb of calyx unilateral, trifid at the apex. Corolla funnel-shaped, with a filiform tube and a campanulate 5-parted limb. Anthers a little exserted, filiform, sessile at the throat. Style exserted, pilose in the middle; stigma ovate, globose, longitudinally furrowed.

Surthræ II. Cephæ'l'is. Flowers disposed in heads, involucrated by bracteas.

177 Carap'chea. All as in Cephæ'l'is, but the anthers and stigmas are a little exserted. Berry dry, salate, divisible into two parts, crowned. The nuts are smooth on the outside, not as in Cephæ'l'is striated on the outside.

180 Pata'bæa. Limb of calyx very short, entire, or 4-toothed, rarely 5-6-toothed. Corolla with a short, nearly terete tube, and 4-6 spreading lobes. Anthers 4-6, sessile within the throat. Stigma bluntly bifid. Berry globose, crowned, smooth, 2-celled, 2-seeded.

181 Salzma'nnia. Limb of calyx bluntly 4-toothed or sinusated. Corolla with a short tube and a 4-lobed limb. Stamens with very short filaments, and very long linear anthers. Style undivided. Berry dry, crowned, compressed, 1-celled and 1-seeded from abortion.
Tribe X.

Spermacoceae. Stigma bilamellate (f. 189. b.). Fruit dry, and rather fleshy, usually composed of 2 1-seeded mericarps, rarely of 3-4, which are sometimes joined together and sometimes separating, indehiscent, but sometimes dehiscing in various ways. Albumen between fleshy and horny. — Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually divided into many bristles at the apex.

Subtribe I. Cephalantheae. Flowers and fruit sessile, densely aggregate, seated on a globose receptacle. Fruit divided into two parts. Shrubs.

Subtribe II. Euspermacoceae. Flowers distinct. Fruit dry, usually divided into 2 parts, and sometimes in 3 or 4 parts. — Usually herbs, rarely shrubs.

183 Democrita. Lobes of calyx 5, lanceolate, acute, stiff. Corolla, stamens, and style unknown. Fruit 2-celled, 2-seeded when young, but becoming 1-celled from the dissepiment having vanished at maturity. Seeds free within the pericarp. — A shrub.

184 Octodon. Limb of calyx with 8 very short teeth. Corolla campanulate, 4-cleft, beset with adpressed hairs inside, which are tipped with glands. Stamens inserted in the bottom of the tube. Stigma globular. Capsule turbinate, obsolescently tetragonal, 2-celled, 2-valved, dehiscing at the dissepiment.

185 Borreia. Limb of calyx 2-4-toothed. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamens 4, exerted or inclosed. Stigma bifid or undivided. Capsule crowned, 2-celled, dehiscing at the dissepiment when mature; cocciula bursting by a longitudinal chink inside.

186 Spermacoce. Limb of calyx 2-4-toothed (f. 108. a.), with sometimes accessory teeth. Corolla salver-shaped or funnel-shaped, 4-lobed (f. 108. c.). Stigma bifid or undivided (f. 108. e.). Capsule crowned (f. 108. f.), 2-celled: nuts divisible into two parts from the apex, one open and the other closed.

187 Hexasepalum. Limb of calyx 6-parted. Corolla campanulate funnel-shaped, with an obconical tube and 4 lanceolate lobes. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, divisible into two parts at the dissepiment; the dissepiment being double the nuts are both closed.

188 Dioenia. Calyx with a 2-4-toothed limb, rarely more. Corolla funnel-shaped, with a 4-lobed limb. Stamens 4, exerted or inclosed. Style bifid or undivided. Fruit crowned, divisible into two parts: the parts indehiscent.

189 Triodon. Limb of calyx 2-4-toothed, with sometimes other accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bifid. Capsule papery, crowned, 2-celled: nuts 2, indehiscent, having the axis tridentate and remaining after the nuts have fallen.

190 Crussea. Limb of calyx constricted above the ovarium, profoundly cleft into 4 linear lobes, and 4 accessory small ones. Corolla salver-shaped, with a long tube, a glabrous throat, and 4-lobed limb. Stamens exerted. Style exerted, bifid at the apex. Fruit of 2 indehiscent nuts, adhering to a flat membranous permanent axis, but at length separating from it.

192 Knoxia. Teeth of calyx 4, unequal. Corolla salver-shaped, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stigma 2-lobed. Fruit 2-celled: the 2 nuts usually separating from the base to the apex at the dissepiment. Seed ovate-triquetrous.

194 Mitracarphus. Limb of calyx 4-toothed; teeth unequal. Corolla salver-shaped, with a terete tube, having a circular line of hairs near the base inside, a glabrous throat, and a 4-lobed limb. Anthers exerted or inclosed. Stigma bifid. Capsule membranous, crowned, 2-celled, circumcised about the middle.

195 Cruckshanka'sia. Limb of calyx 4-toothed: teeth usually having an accessory tooth on each side, 1 or 2 of which are usually expanded into roundish wings. Corolla salver-shaped, with an elongated tube, a 5-cleft spreading limb, and a glabrous throat. Stamens 5, exerted, inserted in the mouth of the corolla. Anthers linear-oblong, fixed by the base. Stigma bifid, pilose. Capsule globose, subdidiomous, crowned, 2-celled, 4-valved: cells 2-seeded. Seed ovate, tubercular.

198 Gallonéia. Limb of calyx 5-7-toothed; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb. Stamens 5-7, exerted from the throat. Style filiform: stigma 2-lobed. Fruit ovoid, containing 2 separable indehiscent nuts.

199 Machaonía. Limb of calyx small, 5-parted. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 5, inserted in the throat; anthers subulate, exerted. Stigma bipartite. Capsule somewhat tetragonal, crowned, containing 2 1-seeded indehiscent nuts, which are fixed to the top of a linear axis. — Shrubs or trees.
Subtribe III. Putorieae. *Fruit rather fleshy, not divisible.*

—Shrubs and herbs.

200 *Serissa.* Limb of calyx 5, rarely 4-cleft, with sometimes accessory teeth. Corolla funnel-shaped, having the tube hairy inside, and the limb 5, rarely 4-parted; lobes induplicate in estivation, hence somewhat trifid at the apex. Stamens 5, rarely 4; anthers linear, exserted. Style inclosed, bifid at the apex. Berry nearly globose, 2-celled, 2-seeded.

201 *Ernônea.* Limb of calyx 4-6-parted, permanent. Corolla salver-shaped, with a terete subtetragonal tube, a naked throat, and 4-6 lanceolate revolute lobes. Stamens longer than the corolla; anthers acute. Style exserted; stigma emarginate. Berry roundish, crowned, 2-celled, 2-seeded.

**Tribe XI.**

Anthospermee. *Flowers sometimes dioecious. Corolla rotate (f. 110. b.).* Styles 2, separate to the base, ending each in an elongated plumose stigma (f. 110. c.). Fruit constantly composed of 2 indehiscent 1-seeded mericarps at maturity (f. 110. g,f.), which are easily separated. *Alumen fleshy.—Herbs or subshrubs. Leaves opposite or in whorls. Stipulas small, 1-3-toothed, rather adnate to both sides of the petioles.*

207 *Capròsa.* Limb of calyx 4-7-toothed, short. Corolla campanulate turbinate, with a short broad tube, a naked throat, and 4-7 acute lobes. Stamens 4-7. Style nearly bipartite to the base, pilose, exserted. Berry obovate, pulpy, containing 2-3 bony indehiscent nuts.

208 *Phyl’lis.* Limb of calyx obsolete. Corolla tubular, with a 5-lobed spreading limb. Stamens 5. Style almost wanting; stigmas 2. Capsule obovate, compressed, naked at the apex, divisible into two parts; mericarps hanging from the central axis.

209 *Galófina.* Flowers hermaphrodite. Limb of calyx very minute, hardly any. Corolla subrotate, 4-parted. Stamens inserted in the bottom of the corolla. Styles 2, ending in very long pilose stigmas. Fruit didymous; nuts separable, indehiscent, warted.

210 Anthospermum. *Flowers dioecious, rarely polygamous or hermaphrodite. Limb of calyx small, 4-5-toothed (f. 110. a.), deciduous. Corolla with a short tube, and a 4-5-parted limb (f. 110. b.), which is longer than the tube. Stamens 4-5, inserted at the base of the tube (f. 110. d.); anthers oblong, terete. Stigmas 2, very long (f. 110. c.), hairy. Fruit constantly of 2 easily separated nuts (f. 110. g.).

211 Amdra’ria. *Flowers dioecious, with the same structure as Anthospermum, but the fruit is falsely 3-4-celled; mericarps joined by a concave commissure, hence the central cell is empty, and the 2 lateral ones filled.*

**Tribe XII.**

Stella’xe. *Flowers hermaphrodite, rarely unisexual. Corolla rotate or funnel-shaped; lobes valvate in estivation. Styles 2, distinct from the base, or joined together more or less; stigmas capitate. Fruit constantly of 2 indehiscent 1-seeded mericarps. Seed hardly distinct from the calyx and pericarp. *Alumen horny.—Sometimes subshrubs, but usually herbs. Leaves opposite, bearing buds in the axils, having 1-2 or 3 leaf-formed stipulas, on each side, forming whorls along with them. The leaves are only to be distinguished from the stipulas by being furnished with axillary buds.*

212 She’radia. Limb of calyx 4-6-toothed, permanent. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stamens 4. Style one, 2-lobed. Fruit crowned, dry, bipartite.

213 Aspe’rula. Limb very short, 4-toothed, deciduous, or obsolete. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined at the base, and sometimes nearly to the apex. Fruit didymous, not crowned, almost dry.

214 Crucianella. Limb of calyx none. Corolla tubular, elongated, funnel-shaped, 4-5-lobed; lobes usually drawn out into a bristle-like inflexed appendage. Stamens 4-5, inclosed. Style 2-lobed at the apex. Fruit bipartite, not crowned.

217 Calliphéltis. Limb of calyx not perspicuous. Corolla 4-parted, campanulate. Stamens 4, very short. Stigmas 2. Fruit oblong, somewhat incurved, 1-seeded from one of the mericarps being abortive.

218 Vailla’ntia. *Flowers by threes: the middle one hermaphrodite and fertile, the 2 lateral ones male, and joined to the middle one. Limb of calyx denticulated, permanent:*
teeth many, irregular, stiff. Corolla of the male flowers trid, of the hermaphrodite one quadrifid. Stamens 3-4. Styles in the female flower 2. Fruit 3-horned.

**Tribe XIII.**

**Opecriharia.** Fruit 1-celled, 1-seeded, joined together laterally into a head (f. 112. b.), and at length opening by 2 valves at the apex.—Herbs or subshrubs, with opposite leaves. _Stipulas_ twin on each side, distinct or concrete.

220 _Opulharia._ Limb of calyx 3-4-lobed. Corolla 3-4 cleft. Stamens 1-5. Style short; stigmas 2, slender. Seeds nearly smooth.—Herbs suffruticoso at the base (f. 112.).

221 _Lipo'stoma._ Limb of calyx 4-parted. Corolla with a tubular base, a ventricose throat, and a 4-lobed limb; tube hairy inside, bearded at the top. Stamens 4, inserted in the throat. Stigmas 2. Capsule globose, 2-celled, but usually only 1-celled from the rupturing of the dissepiment, many seeded, crowned by a deciduous operculum.

† _Rubaceae_ genera not sufficiently known.

222 _Psilophium._ Limb of calyx spreading, 5-parted. Corolla with a short tube and a 5-parted limb. Stamens 5, fixed to the base of the corolla. Stigma clavate, 10-winged, exserted. Fruit cylindrical, siliquoid, crowned, 2-celled, many-seeded. Seeds fixed to the central axis, 2 series in each cell.—Shrubs.

223 _Platyphëriu._ Limb of calyx rotate, 5-parted, rarely 4-parted. Corolla coriaceous, funnel-shaped, with a short tube, which is woolly inside, and a 5, rarely 4-parted limb, which is twisted in orientation. Anthers sessile in the tube. Style clavate, spirally 10-ribbed. Ovarium 2-celled, crowned by an epigynous disk.—Shrub, very nearly allied to _Psilophium._

224 _Stipula._ Calyx small, tubular, with a 5-toothed border. Corolla tubular, slender. Stamens 5? Heads of flowers axillary, nearly sessile, surrounded by a large calyciform 5-toothed villous involucrem.

226 _Himatalhth._ Calyx with a turbinate tube, and a loose permanent 5-parted unequal limb. Corolla funnelf-shaped, having the tube much longer than the calyx, and a 5-cleft limb. Stamens 5, capillary, very short, inserted in the tube. Style clavate: stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Flowers spicate, sessile, involucrated by a large deciduous bractea before expansion. Perhaps belonging to _Rubiacceae._

**Tribe I.**

**Cinchonaceae.** (this tribe contains plants agreeing with _Cinchona_ in important characters). D. C. prod. 4. p. 343. _Cinchonae._ Rich. diss. p. 108. Flowers capitate, sessile upon a globose receptacle (f. 83. e. f. 84. k.)

**Linn. syyst. Pentandria, Monogynia._ Calyx with an oblong tube (f. 83. a.), and a short, truncate, or 5-toothed limb (f. 83. b.); lobes linear. Corolla funnel-shaped (f. 83. c.), with a slender tube, a naked throat, and 5 spreading, oval-oblong lobes (f. 83. c.). Anthers incised (f. 83. g.), or exserted, always shorter than the lobes of the calyx. Style filiform (f. 83. e.), exserted; stigma oblong (f. 83. d.), or ovate, tumid, undivided. Capsules 2-celled (f. 83. b. i.), sessile upon the receptacle, not gradually attenuated to the base. Seeds numerous, imbricate, winged, fixed to oblong placentas, which are adnate to the dissepiment. Embryo inserted in a fleshy albumen.—_Unarmed trees, rarely shrubs, natives of India and Africa._ Leaves opposite, or 3-4 in a whorl, petiolate or sessile. Stipulas interpetiolar, deciduous. Peduncles terminal and axillary, each bearing a globose head of flowers. Bracteas wanting at the base of the head of flowers, but with linear palea among the flowers. Flowers crowded, sessile. This genus differs from _Cephalanthus_ in the parts of the flowers being quinary, and in the cells of the capsules being many-seeded; and from _Sarcococphalus_ in the fruit being capsular, not baccate; and from _Uncaria_ in the capsules being sessile, not attenuated at the base.

**Sect. I. Naucleari (altered from Nauicla).** Lobes of calyx short, acute, or wanting.

§ 1. Capsules growing together in the head.

1 N. _undulata_ (Roxb. fl. ind. 2. p. 117.) arboreous; branches brachiate; leaves petiolate, ovate-oblong, obtuse, undulate, shining; stipulas elliptic, obtuse, almost the length of petioles; peduncles terminal, solitary; capsules united. h. S. Native of the Moluccas. Peduncles drooping, each bearing a large globular head of numerous, small, most beautiful yellow fragrant flowers. Anthers seated in the 5 fissures of the corolla, with hardly any filaments.

2 N. _glabrerrima_ (Bartl. in herb. Hbmnk ex D. C. prod. 4. p. 344.) branches tetragonal; leaves ovate, glabrous, flat; stipula oval, length of petioles; peduncles solitary, terminal; capsules united. h. S. Native of the island of Luzon. This species differs from _N. undulata_ in the leaves not being undulate or shining, in the petioles being 1 inch long, not 2 inches. The heads are referrible to the fruit of _Platanus_, but are smooth. Quite-glabrous Nauclea. Trec 12 to 15 feet.

3 N. _Wallacei (R. Br. in Wall. cat. 6098.) branches quadrangular; leaves broad, roundish-elliptic, obtuse at both ends, but sometimes cuneate at the base, glabrous; peduncles terminal, solitary; stipulas elliptic, obtuse; stamens exserted;
fruit combined. Native of the East Indies, on the banks of rivers.

Wallich's Nauclea. Shrub.

4 N. caudata (Roxb. in Rees' cyclo. vol. 24. no. 6.) arborescent; leaves petiolate, broad-ovate, coriaceous, ovate, smooth; stipulas ovate; peduncles terminal, solitary; capsules united. Native of Ceylon. C. nauclea, Roxb. fl. ind. 2. p. 118. Peduncles drooping, each bearing a large beautiful globular head of very fragrant bright yellow flowers. Bracts a small irregularly 4-toothed withering ring, round the peduncles near the base, within the stipulas. Anthers coriaceous, on very short filaments, from the mouth of the tube just under the fissures of its border.

5 N. sericea (Wall. cat. no. 6095.) branches tetragonal; leaves elliptic, obtuse at both ends, almost sessile, smooth; heads terminal by threes: middle one on the shortest peduncle; corollas clothed with silky villi. Native of the Burman empire, on the banks of the Irrawaddy at Hennrava; and at Chittagong. Capsules united.

Silky Nauclea. Shrub.

6 N. brunonis (Wall. cat. no. 6097.) branches obscurely tetragonal; leaves broad, roundish, coriaceous at the base, smooth above and pubescent beneath, as well as on the petioles; peduncles terminal, trichotomously pinnacled: the middle ones shortest; stamens exerted; fruit combined; stipulas elliptic, obtuse, pubescent. Native of the East Indies, at Plavong.

Brown's Nauclea. Shrub.

7 N. Bartlingii (D. C. prod. 4. p. 344.) branches from compressed to terete; leaves nearly sessile, coriaceous at the base, oblong, acute, shining above, at length glabrous, pubescent beneath as well as on the petioles; peduncles terminal, trichotomously pinnacled: the middle ones shortest; stamens exerted; fruit combined; stipulas elliptic, obtuse, pubescent. Native of Luzon, near Sorsogon. M. mollis, Bartl. in herb. Hanke, but not of Blume. Heads size and form of the fruit of Pittundas.

Bartling's Nauclea. Tree 20 feet.

8 N. diversifolia (Wall. cat. no. 6096.) branchlets tetragonal; leaves of various sizes and shapes, but usually elliptic, obtuse at the apex, and somewhat coriaceous at the base, smooth, on longish petioles: peduncles terminal, trichotomously pinnacled: the middle one always short; heads globose; fruit combined; stamens exerted. Native of the East Indies, in various parts of the Burman empire.

Diverse-leaved Nauclea. Shrub.

9 N. Polychealais (Wall. cat. no. 6100.) leaves oblong-lanceolate, long-acuminated, glabrous; peduncles forming a terminal peduncle; heads small; fruit combined. Native of the East Indies, on the mountains of Silhet.

Mony-headed Nauclea. Shrub.

§ 2. Capsules distinct in the heads.

10 N. macrophylla (Roxb. fl. ind. 2. p. 120.) arborescent; leaves stem-clasping, very broad, ovate, obtuse, villous on the nerves beneath; stipulas linear-lanceolate; peduncles terminal, coriaceous, recurved; capsules distinct. Native of Ambonya. Trunk of tree straight, like that of a pine or fir. Branches deciduous. Leaves 8-24 inches long, and 6-8 inches broad. Peduncles length of the stipulas; each supporting a head of numerous, short, beautiful pale yellow sweet-smelling flowers, which is 3 inches in diameter. Stigmas exerted, pure white. Place to which the seeds are attached linear.

Long-leaved Nauclea. Tree 30 to 40 feet.

11 N. sessilifolia (Roxb. fl. ind. 2. p. 124.) arborescent; leaves oblong, sessile, rather coriaceous at the base and clasping the stem, rounded at the apex; heads terminal, coriaceous; capsules distinct, 4-valved. Native of the East Indies, in the forests of Chittagong. The rest unknown.

Sessile-leaved Nauclea. Tree.

12 N. ovatifolia (Roxb. fl. ind. 2. p. 124.) arborescent, glabrous; leaves sessile, ovate, or elliptic; heads of flowers terminal, solitary. Native of the East Indies, in the forests of Bilhet, where it is called Shal by the natives. The rest unknown.

Oval-leaved Nauclea. Tree.

13 N. Cadamba (Roxb. fl. ind. 2. p. 121.) arborescent, glabrous; branches brachiately: leaves petiolar, coriaceous, ovate, obtuse at the base, and acuminate at the apex; stipulas triangular; heads terminal, solitary, usually shorter than the heads, which are globose; lobes of calyx linear; stamens exserted, shorter than the lobes of the corolla. Native of the East Indies, about Calcutta; and of Malabar. Katon-jaka. Rheed. vol. 3. t. 33. and therefore Cephalanthus orientalis, Lin. spec. ed. 1. p. 95. N. citrifolia, Poir. dict. 4. p. 435. Flowers orange-coloured, collected into heads about the size of a small apple (Roxb.). Style white, exserted; stigma thickish, oblong. Capsules distinct, 4-celled at top. Seeds not winged. Leaves 5-10 inches long. Kudumba is the native name of the tree. It is common about Calcutta, where it grows to be a large tree, and is not only highly ornamental, but very useful from the extensive close shade it yields.

Cadamba Nauclea. Cited? Tree 30 to 40 feet.

14 N. parvifolia (Roxb. fl. ind. 2. p. 122.) arborescent, glabrous; branches brachiate; leaves petiolar, ovate, obtuse, or short acuminate; stipulas ovate; peduncles terminal, solitary, or by threes, when 3 the middle one is shortest; heads globose, bracteate; limb of calyx truncate. Native of the East Indies, almost everywhere; and is a native of all the coast of Coromandel, but chiefly in the mountains and in the Philippines. Ham. in Lin. trans. 15. p. 94. N. parviflora, Pers. encycl. 1. p. 292. Wall. in litt. N. orientalis, Gmütt. fruct. 1. p. 151. t. 30. exclusive of the synonyms, ex Ham. Branches numerous, spreading, forming a large oval shady head. Heads of flowers light yellow, globular, size of a plum. Anthers on short filaments. Style much exserted. The wood is of a light chestnut colour, firm and close grained; is used for various purposes, where it can be kept dry, but exposed to wet it soon rots. (f. 83.)

Small-leaved Nauclea. Tree 30 to 40 feet.

15 N. glabra (Roxb. fl. ind. 2. p. 121.) leaves elliptic, smooth; stipulas linear; peduncles terminal by threes; lobes of calyx triangular; stigma globose; cells of capsule 3-4-seeded. Native of the Moluccas. The leaves, according to Blum. bijdr. p. 1009. are oval, bluntish, attenuated at the base; and the peduncles are trifid from the falling of the leaves. Glabrous Nauclea. Tree.

16 N. Missionis (Wall. cat. no. 6099.) leaves lanceolate, glabrous; peduncles terminal, solitary, bracteate at the base; fruit distinct. Native of the East Indies. N. orientalis, Herb. Madras. Stipulas lanceolate, acute.

Mission Nauclea. Shrub.

17 N. excelsa (Blum. bijdr. 1009.) leaves oval, acute, rounded at the base, coriaceous, glabrous; stipulas oblong, obtuse, pubescent; peduncles terminal by threes (or trifid from
the leaves having fallen).  R. S. Native of Java, in the mountains of Seribu and Panang. Said to be allied to R. glabra. Heads of flowers globose. Fruit sometimes sessile and sometimes pedicellate, but probably from abortion.

Tall Nauclea. Tree 30 to 40 feet.

18 N. osti'a (Blum, bijdr. p. 1009.) leaves obovate-oblong, obtuse, coriaceous, glabrous, downy in the axils of the veins beneath; stipulas oblong, obtuse; peduncles solitary or by threes, terminal, length of pedioles. R. S. Native of Java, in the woods on Mount Tjerimai.

Obovate-leaved Nauclea. Tree.

19 N. stellaris (Wall. cat. no. 6102.) branches terete, smooth; leaves lanceolate, glabrous; peduncles solitary, terminal, bearing each a globose crowded head of flowers. R. S. Native of Cochin-China. Cephalaanthus stellaris, Lour. coch. Flowers apparently red.

Stellate Nauclea. Shrub.

20 N. rotundifolia (Roxb. fl. ind. 2. p. 124.) arboreous; leaves petiolate, roundish-oblong, obtuse; stipulas oblong, obtuse, many-nerved; heads terminal, on short peduncles; capsules distinct. R. S. Native of the East Indies, in Chittagong; and of the Society Islands. The rest unknown.

Round-leaved Nauclea. Tree.

21 N. Africana (Willd. spec. 1. p. 929.) shrubby, smoothish; leaves oval, acute, petiolate; stipulas oblong, acute; peduncles short, terminal, solitary, rarely by threes; bearing each a globose head of flowers; tube of calyx short, truncate; anthers exerted, reflexed. R. S. Native of Guiana, at Cape Coast, and Senegal, and all along the western coast of Africa. Uncaria inermis, Willd. in Ust. del. 2. p. 199. t. 3. N. Africana, Schum. pl. guin. p. 104. Cephalaanthus Africanaus, Reichb. in Sieb. fl. exsic. ser. no. 20. Flowers red.

Var. β, Luzoniensis (D. C. Prod. 4. p. 345.) pubescent; leaves pubescent beneath, but less so above; throat of corolla densely bearded. R. S. Native of the island of Luzon, one of the Philippines. N. Africana, Cham. et Schlecht. in Linmea. 4. p. 140. Perhaps a proper species.

African Nauclea. Shrub 6 to 10 feet.

22 N. Cinchone (D. C. Prod. 4. p. 345.) leaves ovate, obtuse at the base, and acutish at the apex, glabrous above, pale beneath and rather pilose on the nerves; petiole terminal, elongated: having the branchlets opposite, and at the apex bearing each a globose head of flowers, 5-5 in number; bracteae ovate-oblong, deflexed, under the branchlets of the petiole. R. S. Native of South America, probably in Peru. Cinchona globifera, Par. auct. T. Mut. ex R. Rich. mem. soc. hist. nat. par. 5. p. 280. Heads dense, many-flowered. Flowers velvety on the outside. Fruit unripe. Perhaps a species of Cephalaanthus, but differs from that genus in the flowers being pentamericous.

Cinchona Nauclea. Shrub.

23 N. microphylla (Delile, in Caill. pl. afr. p. 67. no. 54.) shrubby, glabrous; leaves 4 in a whorl, lanceolate, tapering into the petioles; stipulas united into a 4-toothed ring; peduncles axillary, smooth, slender, longer than the petioles; heads of flowers globose; calyxes and corollas small, pubescent. R. S. Native of the north of Africa, at Singue.

Small-headed Nauclea. Shrub.

24 N. Lanceolata (Blum, bijdr. p. 1000.) leaves on short petioles, oblong-lanceolate, acuminate at both ends, coriaceous, glabrous; stipulas oblong, obtuse; peduncles terminal, solitary. R. S. Native of the west of Java, in mountain woods. Cephalaanthus orientalis, Blum. cat. hort. buitenz. p. 38. Flowers vary to tetradromous.

Lanceolate-leaved Nauclea. Shrub.

25 N. grandifolia (D. C. Prod. 4. p. 345.) leaves rather large, obovate or ovate-oblong, obtuse, acute at the base, rather undulate, pubescent; stipulas oval, about equal in length to the pedioles; peduncles terminal, solitary, length of pedioles. R. S. Native of Java. N. macrophylla, Blum. bijdr. p. 1010. but not of Roxb. There is a variety of this species in the province of Bantam, having the leaves all obovate and undulated, and another in the province of Rembang having larger and more undulated leaves.

Great-leaved Nauclea. Tree or shrub.

26 N. cordata (Blum. bijdr. p. 1011. but not of Roxb.) leaves roundish-cordate, retuse at the apex, glabrous; stipulas oblong-roundish, united at the base, length of pedioles; peduncles terminal, solitary. R. S. Native of Java, on Mount Salak.

Cordate-leaved Nauclea. Shrub or tree.

27 N. orientalis (Lam. ill. 153. f. 1.) arboreous, glabrous; leaves oval-oblong, on short pedioles, smooth; stipulas oblong; peduncles axillary, opposite: upper ones solitary, 3 times longer than the heads of flowers, which are globose. R. S. Native of the East Indies, Java, and China. Poir. dict. 4. p. 433. Blum. bijdr. p. 1006. Ham. in Lin. trans. 15. p. 94.—Bancélius, Rumph. arb. 3. t. 55. f. 1. Anthers inclosed. Style much exerted; stigma ovate.

Eastern Nauclea. Tree 15 to 20 feet.

28 N. canescens (Bartl. in herb. Haeke, ex D. C. Prod. 4. p. 346.) branches tetragonal, velvety; leaves of short pedioles, elliptic, short-acuminate, glabrous above and canescent beneath; peduncles compressed; lower ones axillary, opposite: the upper ones from the falling of the leaves appear racemose, and are as well as the heads tomentose; lobes of calyx linear, obtuse. R. S. Native of the Island of Luzon. Stipules deciduous, at the sides of the leaves, oblong-linear, twin, on both sides in the upper part of the racemes.

Canescent Nauclea. Shrub or tree.

29 N. rotundifolia (Bartl. in herb. Haeke, ex D. C. Prod. 4. p. 340.) glabrous; branchlets tetragonal; leaves petiolate, roundish-cordate, short-acuminate, paler beneath; peduncles axillary, opposite; stipulas, terminal; compressed, articulated in the middle; heads glabrous, tomentose; segments of the calyx ovate, obtuse. R. S. Native of the Island of Luzon. Corolla hoary from tomentum; with an elongated tube; and roundish lobes. The sterile peduncles become hardened and hooked, as in the genus Uncaria.

Round-leaved Nauclea. Tree or shrub.

Sect. II. PENTACORY'NA (from pente, pente, five, and corony, coryne, a club; in reference to the 5 club-shaped lobes of the calyx). D. C. Prod. 4. p. 345. Segments of calyx (or bracteoles) elongated and club-shaped.

30 N. coriifolia (Roxb. cor. 1. p. 40. t. 53. fl. ind. 2. p. 122.) arboreous; leaves petiolate, roundish-cordate, villous beneath; stipulas oval, peduncles 1-3 together, axillary; bearing each a globose head of flowers; lobes of calyx and stigmas clavate. R. S. Native of Coromandel and Cottala, on the mountains, in the southern peninsula of India. Petioles terete, rather villous, equal in length to the peduncles. Flowers yellowish. Seed 6 in each cell of the capsule, membranaceously winged, never imbricated, but bifid at the apex. Leaves 4-12 inches each way, on pedioles from 2-3 inches long. Peduncles downy, from 1-4. The wood is exceedingly beautiful, it colour is like that of box-wood, but much lighter, and at the same time very close-grained. It is to be had of a large size, from 1-2 feet or more in diameter, and is used for almost every purpose, where it can be kept dry. For furniture it answers exceedingly well, being light and durable. This is probably the N. sterilisifolia, A. Rich. mem. soc. hist. nat. par. 5. p. 289.

Heart-leaved Nauclea. Tree 40 to 50 feet.
31 N. purpurea (Roxb. cor. 1. p. 41. t. 54. fl. ind. 2. p. 123.) sub-arborescent, glabrous; leaves petiolate, oval-oblong, acuminate, smooth; stipulas ovate, obtuse, large, deciduous; peduncles terminal, solitary, or by threes, bracteate in the middle; lobes of calyx 5, clavate. ♀. S. Native of the East Indies, in the moist valleys up amongst the Céspit mountains. Cephalanthus Chinensis, Lam. dict. 1. p. 678. exclusive of the syn. of Rumph. Branches decussate. Leaves shining. Heads of flowers large, purple. Capsules turbinate, dehiscing from the base. Seeds imbricate, winged.

Purple-flowered Nauclea. Tree 20 feet.

32 N. Roxburghii; shrub glabrous; leaves roundish, obtuse, cordate at the base, on long petioles; stipulas large, oblong, obtuse. ♀. S. Native of the East Indies. N. stipulacea, Roxb. herb.

Roxburgh's Nauclea. Shrub.

33 N. Peduncularis (Wall. cat. no. 6091.) arborescent, smooth; leaves ovate-elliptic, coriaceous, acuminate, smooth; peduncles terminal by threes, not so long as the upper pair of leaves; heads of flowers globose. ♀. S. Native of Pulo Penang. N. purpurea, Roxb. herb. Flowers purplish?

Peduncular Nauclea. Shrub.

34 N. Calycina (Barl. in Henn. herb. ex D. C. prod. 4. p. 346.) glabrous; leaves petiolate, oblong, attenuated at both ends; stipulas deciduous; peduncles terminal, solitary, or by threes, bearing caducous bracteae under the apex; lobes of calyx 5, clavate; style not exerted. ♀. S. Native of the Island of Luzon, one of the Philippines. Very nearly allied to N. purpurea, and is probably the same, but the calyx is paler, not purple, and the branches are tetracyclogrammed, not terete.

Large-calycine Nauclea. Tree 15 to 20 feet.

35 N. stipulacea (D. C. prod. 4. p. 346.) arborescent; leaves broad-obovate, glabrous, downy on the nerves on the under surface, as well as on the petioles and branchlets; stipulas ovate, large, leafy; heads of flowers globose; corolla villous on the outside; calyx quite entire, truncate; bracteoles or lobes of calyx 5, club-shaped. ♀. S. Native of Africa, on the banks of the Gambia near Alberda. N. macrophylla, Perr. et Leprieur. ms. but not of Roxb. nor Blum. The dehiscence of the capsule exhibits distinct carpella within the calyceine tube, which is cleft lengthwise; the segments cohereing at the apex, and propped by 3 claviform bracteoles on the outside.

Stipulaceous Nauclea. Tree 20 to 40 feet?

♀ Species not sufficiently known.

36 N. morinifolia (Blum. bijdr. p. 1011.) arborescent; leaves oval, acute, rounded at the base, ribbed, glabrous, bearing depressed glands in the axils of the ribs on the under surface; stipulas stipulate, coloured, viscid, one half shorter than the petioles. ♀. S. Native of Java, on Mount Salak. Flowers unknown.

Morinda-leaved Nauclea. Tree.

37 N. mollis (Blum. bijdr. p. 1010.) leaves rather large, oval, acute, rounded at the base, sometimes subcordate, glabrous above but rather villous beneath and on the branchlets; stipulas oval, obtuse, rather villous beneath. ♀. S. Native of Java, on Mount Salak. Flowers unknown. Allied to N. macrophylla, Roxb.

Soft Nauclea. Tree.

Cult. All the species of this genus are of the most easy culture. A mixture of loam, sand, and peat is the best soil for them; and cuttings root readily in the same kind of earth under a hand-glass, in heat.

Lin. syst. Pentândria. Monogynia. All as in Náuclea, but differs in the flowers being less crowded on the receptacle. Calyx tubularly urceolate, 5-cleft. Capsules pedicellate, clavate, attenuated at the base. Scandent shrubs, hanging to other trees by the old peduncles, which are hooked for the purpose. The greater portion are natives of India, but a few are natives of America. The old or lower peduncles are converted into compressed, hooked, axillary spines. Perhaps only a section of the genus Náuclea. 1 U. Gâmbier (Roxb. fl. ind. 2. p. 186.) branches terete; leaves ovate-oblong, acute, on short petioles, smooth on both surfaces; stipulas ovate; peduncles axillary, solitary, opposite, bracteolate in the middle: the lower ones sterile, and converted into hooked spines. ♀. S. Native of Pulo Penang, Sumatra, Malacca, &c. Náuclea Gâmbier, Hunt. in Linn. trans. 9. p. 218. t. 22. Fleming in asiat. res. 11. p. 187. Smith, in Rees' cyc. vol. 24. no. 7. Hayn. geogr. gew. 10. t. 8. U. jasminifolia, Wall. herb. Fúsus uncatus angustifolius, Rumph. amb. 5. p. 63. t. 34. f. 2. and 3. The upper peduncles bear each a solitary, globular head of beautiful green and pink flowers. Bracteaxes forming a 3 or 4-cleft annular, perianth-like cup, about the middle of each peduncle. Calyx silky on the outside. Corollas villous on the outside, and hairy in the center of the inside. Capsules pedicellate, clavate, grooved longitudinally. Seeds imbricate, winged. Gâmbier is the Malay name of an extract prepared from the leaves of this plant, and one of the drugs, if not the only one, formerly called Terra Japonica in Europe. For the following account of the tree we are indebted to Dr. Charles Campbell of Bencoolen, who says, "This material is called by the Malays gambier. It is chewed by the natives, mingled with betel-leaf and areca, after the manner in which the cutch is used on the continent of India. With some sweetness it has a more highly concentrated astringent principle than terra Japonica. I am solicitous that a trial should also be made of its power in tanning. In regard to the natural history of the gambier, it is procured from a climber. It is the Fúsus uncatus, or Dâna gatta gambier of Rumph. amb. 5. t. 34. The variety from which it is chiefly made is that denominated by Rumphius the Fúsus uncatus angustifolius. The preparation is simple: the young shoot and leaves are shred, and broiled in water for some hours, until a feculum is deposited; this, inspissated in the sun to the consistence of paste, is thrown into moulds of a circular form, and in this state the gambier is brought to market.

Rumphius has fallen into error in asserting that gambier is not made from this plant; for in my journey to Cochinchina I had an opportunity of inspecting the whole process, having resided some days at a small village near the foot of the mountains, where the Sultan of Moco has established a colony for the purpose of carrying on the manufacture to a considerable extent. The price at which it can be procured from the northern parts of this coast I have ascertained to be nearly 10 dollars per hundred weight; it can be supplied in any quantity desired, for the plant abounds in these districts, and the mode of eliciting the astringent matter is such as requires neither much attention nor labour." But Dr. Wallich has learned that in other parts to the eastward of the Bay of Bengal, the process is carried on by boiling the leaves and young shoots, evaporating the decoction by fire, and the heat of the sun. When sufficiently inspissated, it is spread out thin, and cut into little square cakes and dried. The same substance is mentioned by Marsden in his history of Sumatra at pp. 242 and 243, who
refers for a particular detail of the cultivation of the plant and manufacture of gambier to the 2d volume of the Transactions of the Batavian Society. Mr. Hunter (Lin. trans. 9. p. 220.) says, that in Prince of Wales's Island the substance is prepared by boiling the leaves for an hour and a half; adding more water as the first wastes, till towards the end of the process, when it is inspissated to the consistence of thin syrup, and when taken off the fire and allowed to cool it becomes solid. It is then cut into little square pieces, which are dried in the sun, turning them frequently. The gambier, prepared according to this process, is of a brown colour; but prepared in the way described by Dr. Campbell above, it is perfectly white. In medicine it is found beneficial in angina and aphthea, as well as diarrhoea and dysentery. The drug is infused in water, to which it gives the colour of black tea. By the Malays it is mixed with lime, and applied externally to cuts, burns, boils, &c. The finest is alone selected to chew along with leaves of betel, in the same manner as cutch or kut, the catechu in other parts of India. The brown being strong tastered and rank is exported to China and Batavia, to be used in dyeing and tanning.

For the cultivation of the shrub a rich soil is preferred. It gives the most luxuriant crop when the rains are frequent, but does not thrive in grounds that are apt to be flooded. On this account the side of a hill is esteemed better than any other situation. The plants are propagated from seed; an when they are about 9 inches high they may be finally removed to the field, and planted at distances of 8 or 9 feet. At the end of one year from the time when they are planted in the field, a small crop of leaves is obtained. A larger is got in eighteen months, and the third at the end of two years, when the plants are at their full growth. They continue in their prime, and admit of being cut twice a year, for the space of 20 or 30 years, provided care be taken to keep the ground clean, and the roots free from weeds. Their tops must be cut to prevent them growing to a greater height than 5 or 6 feet. It is said that the young leaves produce the whitest substance. In Prince of Wales's Island, gambier, if good, is sold for 8½ dollars per peck, while in the same island sago is sold for 3 dollars per peck; hence the manufacturer is tempted to adulterate the gambier with this article, which mixes intimately, but may be easily detected by solution with water.

2 U. Aéïda (Roxb. fl. ind. 2. p. 129.) branches tetragonal, smooth; leaves ovate, acuminate, smooth on both surfaces; stipules acuminate, twin on both sides; peduncles axillary, solitary, bearing each a single head of flowers, bracteolate in the middle, but after flowering becoming recurved and spinose. $\gamma$, $\omega$. S. Native of the Island of Pulo-Penang, at Soongey Cloon, ex Hunter; of Java, ex Blum. bijdr. 1011.; also of the Moluccas, ex Rumph. Nauclea aëïda, Hunter, in Lin. trans. 9. p. 223. Fünis uncétus atfïïïals, Rumph. amb. 5. p. 63. t. 34. f. 1. Nauclea longiflóra, Poir. suppl. p. 65.—Cinchôna Kattu-Kâbar, J. Kœn. in Retz. obs. 4. p. 6, to which it is nearly allied. The leaves have an acid taste.

Aéïda Uncaria. Shrub cl.

3 U. sclérophyllâ (Roxb. fl. ind. 2. p. 130.) branches tetragonal, pubescent; leaves elliptic, short-pointed, stiff, roughened beneath; stipules lateral, lanceate, 2-lobed; peduncles axillary, solitary, simple, jointed, bracteolate above the middle, bearing each one head of flowers, after flowering becoming recurved and spinose. $\gamma$, $\omega$. S. Native of Pulo-Penang, on the top of the mountain called Soongey Cloon. Nauclea sclérophyllâ, Hunter, in Lin. trans. 9. p. 223. Leaves pubescent beneath. Bracteas 6 in a whorl, at the joint of the peduncle. Calyx pubescent outside. Corolla villous on the outside. Flowers on long pedicels.

**Rubiaceae.**

**II. Uncaria.**

**Hard-leaved Uncaria.** Shrub cl.

4 U. valifòlia (Roxb. fl. ind. 2. p. 128.) leaves oval, petiolar, acute, smooth on both surfaces; peduncles axillary, and terminal, compound; receptacle of flowers as well as the capsules villous. $\gamma$, $\omega$. S. Native of Pulo-Penang. Leaves sometimes ovate, from 3-6 inches long. Peduncles bearing from 1-3 heads of flowers, on pedicels which are as long as the common peduncle, and furnished with a sheathing 4-6-cleft bracte in the middle of each. Petioles short, recurved, channelled.

**Oval-leaved Uncaria.** Shrub cl.

5 U. pilôsa (Roxb. et Wall. in fl. ind. 2. p. 130.) leaves villous, obscurely tetragonal; leaves oval, acuminate, sometimes subcoriaceous, hairy on both surfaces, on very short pedioles; stipulas bi-partite or twin: segments lanceolate, acute, longer than the petioles; peduncles axillary, opposite, villous, divaricate, at length recurved and spinose. $\gamma$, $\omega$. S. Native of Nipa or, in the valley of Sankoo, and at Bhempedi; and of Chittagong and Java. Wall. pl. rar. asiat. 2. p. 55. t. 170. Nauclea sîcknîns, Smith, in Rees's cyc. vol. 24. no. 9. Nauclea pilôsa, Blum. bijdr. p. 1013. Branches clothed with rusty hairs; young shoots silky. Leaves from 5-7 inches long. Peduncles jointed, and bear a whorl of about 6 small linear-lanceolate bracteas, which are hairy without and smooth within. Flowers hairy, whitish, forming round dense heads of 2 inches in diameter. In the Java plant there are 4-6 ovate-lanceolate, acuminate, pilose, rather membranous bracteas in a whorl at the top of each peduncle, under the head of flowers. Perhaps distinct from the plant of Roxburgh.

**Pilose Uncaria.** Shrub cl.

6 U. lactoïsa (Wall. in Roxb. fl. ind. 2. p. 131.) every part of the plant is clothed with long rust-coloured hairs; leaves ovate-lanceolate, acuminate, smooth above, on short pedioles; stipulas twin, on both sides, ovate, membranous; peduncles axillary, opposite, short, at length converted into spinose hooks; corollas almost smooth; capsules on long pedicels. $\gamma$, $\omega$. S. Native of Pulo-Penang and Sumatra, and other East Indian islands. Nauclea lactoïsa, Poir suppl. 4. p. 54. Nauclea setigera, Blum. bijdr. 1013. Branches rather quadrangular. Leaves 3-4 inches long. Stipulas hairy without, permanent. Peduncles about an inch long, surrounded by a whorl of 6 lanceolate bracteas. Capsules smooth, ash-coloured. In the Java plant, the branches are almost smooth, hardly hispid; and the upper surfaces of the leaves are glabrous, or scarcely hispid, but villous beneath on long adpressed hairs; fruit oblong, glabrous, shorter than the pedicels; lobes of calyx oblong, ciliated.

**Woolly Uncaria.** Shrub cl.

7 U. leûgôta (Wall. cl. 190. no. 6111.) branches quadrangular, smooth; leaves ovate-elliptic, acuminate, smooth; peduncles axillary, solitary, opposite, divaricate, bracteate above the middle, some of which are converted into hooked spines. $\gamma$, $\omega$. S. Native of the Burman empire at Amherst. Fruit sessile.

**Smooth Uncaria.** Shrub cl.

8 U. macrophyllâ (Wall. in Roxb. fl. ind. 2. p. 132.) branches tetragonal, pubescent, with 2 opposite furrows; leaves petiolar, broad-ovate, acuminate, smooth and shining above, villous beneath, coarsely nerved and reticulated; stipulas cadose; heads of flowers axillary, solitary, opposite, tomentose. $\gamma$, $\omega$. S. Native of the East Indies, from Silhet. Leaves from 6-7 inches long. Peduncles opposite, axillary, and terminal, 2 inches long, covered with rusty hairs, about 5 lines under the apex they are jointed and surrounded by a ring of 5-6 lanceolate, spreading, villous bracteas. Flowers covered with ash-coloured dense pubescence.

**Long-leaved Uncaria.** Shrub cl.
9 U. tessellana (D. C. prod. 4. p. 348.) branches acutely tetragonal; leaves on short petioles, having a narrow cordate recess at the base, roundish-elliptic, short-acuminate, shining above, reticulately veined beneath, and canescent from down between the veins; peduncles axillary, solitary, recurved, compressed; flowers on long pedicels. \( \hat{\eta} \) \( . \) S. Native of the island of Luzon, one of the Philippines. Calyx tubular, 5-cleft. Corolla large, clothed with silkyomentum inside. Style exerted. Ovarium containing 2 bodies, perhaps seeds or placentas.

**Famous Uncaria.** Shrub cl.

10 U. elliptica (R. Br. in Wall. cat. no. 6104.) branches rather tetragonal; leaves elliptic, acuminate, tapering at the base, on longish pedicels, glabrous except on the nerves beneath while young; peduncles axillary, solitary, opposite, shorter than the leaves, usually not longer than the pedicels: the lowermost ones converted into sterile hooked spines. \( \hat{\eta} \) \( . \) S. Native of Pulo Penang. Nauclea ovalifolia, Roxb. herb. Corolla downy outside.

**Elliptic-leaved Uncaria.** Shrub cl.

11 U. cirrhiflora (Roxb. fl. ind. 2. p. 120.) leaves ovate-oblong, smooth; stipulas bifid; peduncles recurved, floriferous at the apex. \( \hat{\eta} \) \( . \) S. Native of the Malay Islands. The rest unknown.

**Tendril-flowered Uncaria.** Shrub cl.

12 U. glabrata (D. C. prod. 4. p. 348.) leaves oblong-lanceolate, acuminate, glabrous as well as the branches, which are tetragonal; stipulas bifid; peduncles solitary, spreading, articulated above the middle, at length hooked. \( \hat{\eta} \) \( . \) S. Native of Java, on the mountains of Scribu. Nauclea glabrata, Blum. bijdr. p. 1012. Allied to U. cirrhiflora, Roxb. ex Blume.

**Glabrous Uncaria.** Shrub cl.

13 U. pedicellata (Roxb. fl. ind. 2. p. 119.) leaves oval, acutish, rounded or subcordate at the base, shining above, reticulately and clothed with rustily tomentose, as well as the branches, which are tetragonal; stipulas bifid; peduncles axillary, solitary, bearing each a single head of flowers, spreading, articulated above the middle; flowers on long pedicels. \( \hat{\eta} \) \( . \) S. Native of the Molucca islands, and probably of Pulo Penang and Java. Nauclea pedicellata, Blum. bijdr. p. 1012. Flowers forming round heads of about an inch and a half in diameter, covered with rusty tomentum.

**Pedicellate-flowered Uncaria.** Shrub cl.

14 U. speciosa (Wall. cat. no. 6106.) branches tetragonal, clothed with brown villi, as well as the under side of the leaves and nerves on the upper side, petioles, peduncles, and calyxes; leaves ploise on both surfaces, ovate-elliptic, cordate at the base, and short-acuminate at the apex, on very short petioles; peduncles axillary, solitary, opposite. \( \hat{\eta} \) \( . \) S. Native of Pulo Penang and Singapore. Nauclea cordifolia, herb. Findl. Heads of flowers large. Calyx and fruit clothed with brown villi, and the corolla with white. Flowers pedicellate. Lower peduncles converted into spinose recurved hooks.

**Shiny Uncaria.** Shrub cl.

15 U. ferruginea (D. C. prod. 4. p. 348.) leaves ovate, acuminate, rounded at the base, shining above, reticulately and clothed with rusty tomentum as well as the branches, which are tetragonal; stipulas bipartite; peduncles solitary, spreading, articulated in the middle. \( \hat{\eta} \) \( . \) S. Native of Java, on the mountains. Nauclea ferruginea, Blum. bijdr. p. 1013. Very like U. pedicellata, but differs in the flowers and the capsules being 3 times smaller.

**Rusty Uncaria.** Shrub cl.

16 U. ferrea (D. C. l. c.) leaves on very short petioles, ovate-oblong, acuminate, rounded and subcordate at the base, pubescent above, densely tomentose beneath, as well as on the branches, which are obscurely tetragonal; stipulas bifid; peduncles solitary, spreading, articulated in the middle. \( \hat{\eta} \) \( . \) S. Native of Java, on the mountains of Scribu. Nauclea ferrea, Blum. bijdr. p. 1014.

**Iron Uncaria.** Shrub cl.

17 U. sessiliflora (Roxb. fl. ind. 2. p. 130.) leaves elliptic, smooth, acuminate; peduncles axillary, bearing from 1-3 heads of flowers: also terminal, bearing many heads of flowers; capsules sessile. \( \hat{\eta} \) \( . \) G. Native of the East Indies, in the forests of Chittagong. The shrub supports itself by strong spiral axillary hooks. The terminal peduncles form themselves into a kind of racemose panicle.

**Sessile-fruited Uncaria.** Clt. 1829. Shrub cl.

18 U. africana; leaves ovate-lanceolate, acuminate, on short petioles; flowers disposed in a loose globular head; heads terminal; calyx and corolla villous on the outside; hooks axillary, twisted, or refrlected. \( \hat{\eta} \) \( . \) S. Native of Sierra Leone, on the banks of rivulets. Corolla greenish yellow.

**African Uncaria.** Shrub 4 to 6 feet, cl.

19 U. Guianensis (Gmel. syst. 1. p. 370.) branches tetragonal; leaves petiolate, ovate, acute, glabrous; stipulas solitary, on both sides, triangular; peduncles solitary, bracteolate in the middle, axillary, opposite, and terminal: lower ones sterile and converted into flat, hooked spines. \( \hat{\eta} \) \( . \) S. Native of Guiana, on the banks of rivers and rivulets. Ourouparia Guianensis, Aubl. guian. 1. p. 177. t. 68. Nauclea aculeata, Lam. ill. t. 153. f. 2. Poir. diet. 4. p. 456. Hayn. term. bot. t. 29. f. 5. U. aculeata, Willd. in Ust. del. opusc. 2. p. 200. The flowers in the same head are variable in color, yellow, white, green, red, rufous, and blackish: they are very fragrant.

**Guiana Uncaria.** Shrub cl.

20 U. tomentosa (D. C. prod. 4. p. 349.) arboreous; branches somewhat quadrangular, downy; leaves ovate-elliptic, acute, clothed with fine pubescent tomentum beneath, and shining above with the nerves downy; stipulas broad ovate; peduncles villous, disposed in a terminal panicle: and the lowermost ones converted into axillary hooks. \( \hat{\eta} \) \( . \) S. Native of New Granada, on the banks of the river Magdalena, near Naers. Nauclea tomentosa, Willd. in Rom. et Schultes, syst. 5. p. 221. N. aculeata, H. B. et Kuntz, nov. gen. amer. 5. p. 282. Corolla clothed with silky pubescence on the outside. Peduncles also axillary, bearing 1-3 stalked heads.

**Tomentose Uncaria.** Tree.

**Cult.** See Nauclea, p. 409. for culture and propagation.

III. ADINA (from \( \alpha \)\( \iota \)\( \nu \)\( \iota \)\( \varepsilon \)\( \rho \)\( \iota \)\( \varepsilon \)\( \nu \)\( \iota \), crowded; in reference to the flowers being disposed in heads). Salisbury. par. lond. t. 115. Juss. mem. mus. 6. p. 405. D. C. prod. 4. p. 349. - Nauclea species of some.

**Lin. syst.** Pentádria, Monogynia. Calyx with an oblong tube, and a campanulate 5-parted, permanent limb (f. 84. a.). Corolla funnel-shaped, 5-lobed (f. 84. b. e.): throat glabrous; lobes valvate in stivation. Anthers almost sessile (f. 84. c.): at the recesses between the lobes, inclosed. Style exerted (f. 84. d.); stigma capitate-ovate. Capsule membranous, ob-pyramidal, 2-celled; valves 4 (f. 84. g.): dehiscing from the apex; central axis permanent, bearing the calyx at the apex. Seeds 2-4 in each cell, oblong, marginate (f. 84. h.): inserted near the top of the cell, hanging by spongy funicles. - Glabrous shrubs, natives of China. Branches terete, opposite. Stipulas twin, on both sides, joined at the base, yellowish, lanceolate. Leaves lanceolate, glabrous. Peduncles axillary, rarely terminal, solitary. Heads of flowers globose, without any involucra, yellowish. Flowers sessile, crowded, intermixed with paleae. Receptacle pilose. - This genus is intermediate between Nauclea and Cephalánthus, and probably not distinct from the first.

 Cult. The culture and propagation of the species of Adina are the same as those of Nauclea, p. 469, but do not require so much heat.

IV. BREÖ'NIA (this name is not explained, but is perhaps so called after some botanist of the name of Breon.) A. Rich. mem. soc. hist. nat. par. 5. p. 290. D. C. prod. 4. p. 620.

Lin. syst. Pentándria, Monogynia. Calyx with a 5-parted limb, and truncate sub-cuneate lobes. Corolla with a terete tube, and a flat, spreading, 5-lobed limb: having the lobes ovate-lanceolate. Stamens half exserted, inserted in the throat of the corolla. Style very long, exserted: stigma bicornate, with the lobes approximate. Ovarium 2-celled; cells 7-8-ovulate; ovaries fixed to the membraneous placentas, which hang from the axis. Fruit somewhat crustaceous, indehiscent.—A tree. Leaves opposite, very large. Stipulas connate. Flowers disposed in axillary, solitary, globose heads, which stand on long peduncles; each peduncle girded by a beaked involucrem, which at length bursts on one side and falls off.—This genus is nearly allied to Nauclea, but probably referrible to Sarcocœphalus, by the fruit being indehiscent.

 Madagascar Breönia. Tree.

 Cult. See Nauclea, p. 469, for culture and propagation.

Lin. syst. Pentándria, Monogynia. Limb of calyx campanulate, dilated, coloured, divided irregularly. Corolla with a short tube, and a 5-lobed limb, which is valvate in aestivation. Anthers large, inserted in the tube of the corolla. Style bicornate; stigmas linear, thick. Ovarium 2-celled; cells many-seeded; placentas semi-cylindrical or convex, central. The rest unknown.—A radican shrub, with tetragonal stems, with 2 of the angles more prominent than the other 2. Leaves opposite, on short petioles. Stipulas ligulate. Flowers pale red, disposed in terminal, dense, globose heads; each head involucrated by a salver-shaped involucrem.—This genus is nearly allied to Nauclea.

1 L. erubescens (Jack, l. c.). [1. S. Native of Singapore. Leaves on short petioles, ovate-lanceolate, acute at both ends, about 8 inches long. The involucrum which surrounds each head of flowers is entire and cup-shaped. Flowers sessile. Ovarium crowned by a prominent nectarial ring. Reddish-flowered Lecananthus. Shrub.

 Cult. See Nauclea, p. 469, for culture and propagation.

Subtribe II. CINCH'ONÆ (shrubs and trees agreeing with Cinchona in important characters). D. C. prod. 4. p. 349.

—Cinchonæe and Manetæææ, Cham. et Schlecht, in Linnaaes. p. 4. 178. Flowers on longer or shorter pedicels, not seated on a globose receptacle, as in those of the first subtribe. (f. 86. f. 86. f. 89.)

VI. STEVENSIA (in honour of Edward Stevens, who rendered important services to St. Domingo, while he was consul of the United States there). Poit. ann. mus. 4. p. 231. t. 60. Gaertn. fruct. 3. p. 99. t. 197. Juss. mem. mus. 6. p. 389, but not of Neck.

Lin. syst. Pentándria, Monogynia. Calyx with a sub-globose tube, girded at the base by an unequally 4-lobed involucrum; limb biparted, deciduous: having acute lobes. Corolla salver-shaped, with a short tube and a spreading bluntly 6-lobed limb. Anthers 6-7, sessile in the throat of the tube. Stigma bilamellate. Capsule globose, areolate at the apex, and pubescent in the areole, 2-celled, containing 2 cocci, which are separable from the calyx: one of them only deciduous. Placentas central, connecting the margins of the valves. Seeds minute, numerous, oval, winged a little, rather pubescent at the apex. Embryo straight in the fleshy albumen: having the radicle turned towards the hylium.—A much branched shrub, native of St. Domingo; having the branches clothed with resin. Leaves oval, white beneath, finely reticulated. Stipulas joined into a short sheath. Flowers axillary, solitary, white, on short pedicels, girded by 4 concrete bracteas, forming a kind of involucre to each flower.

1 S. buxifoìa (Poit. l. c.). [1. S. Native of St. Domingo, near La Vigne du Cap Frances.

Bux-leaved Stevensia. Shrub 10 to 12 feet.

 Cult. See Nauclea, p. 469, for culture and propagation.

—Portàndia species, Schreb.

2. C. campanilla (D. C. prod. 4. p. 350.) leaves glabrous above, but villous beneath as well as the calyces and peduncles; peduncles trifid, 3-flowered. Ț. S. Native of South America, about the Caracas, where it was collected by Vargas, who says it is called Campanilla by the natives. Flowers and fruit one half smaller than those of C. speciosa, and the capsule is less compressed, and ribless.

Campanilla Coutarea. Shrub 3 to 4 feet.

3. C. mexicana (Zucc. et Mart. in litt. 1829. ex D. C. prod. 4. p. 350.) leaves glabrous on both surfaces; peduncles 1-flowered, bibracteolate at the base; corolla funnel-shaped, with very blunt lobes. Ț. S. Native of Mexico.

Mexican Coutarea. Shrub or tree.

† Species hardly known.

4. C. latifolia (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 350.) pedicels 1-flowered, bracteate; the diameter of the flower equal to its length. Ț. S. Native of Mexico, where it is called Copalehi by the natives. Leaves oval, attenuated at the base. Pedicels axillary, usually twin. Corolla white. Stigma bilamellate. Capsule less compressed, ornamented with 6 ribs and scattered tubercles.

Broad-flowered Coutarea. Shrub or tree.

5. C. flavescens (Moc. et Sesse, l. c. ex D. C. l. c.) pedicels numerous, bracteate; the diameter of the flower almost one half smaller than its length. Ț. S. Native of Mexico. Superior leaves sometimes by threes, oval, attenuated at the base. Pedicels 3 in a whorl, twice bifid, only bracteate under the ramifications. Flowers yellowish, smaller and narrower than in the preceding species.

Yellow-flowered Coutarea. Shrub or tree.

Cult. For culture and propagation see Nauclea, p. 469.

Lin. syst. Tetra-Hecandria, Monogynia. Calyx with an obvate tube, girded by a 2-4-leaved involucre at the base; limb 2-4-parted: segments narrow, acute, permanent. Corolla with a long terete tube, a short ventricose throat, and a 4-6-parted limb (f. 85. b.), with spreading flat oval lobes. Stamens 4-6, sessile beneath the mouth of the tube, inclosed (f. 85. c.). Stigma thick, bifid (f. 85. d.). Capsule elongated, 2-celled, crowned by the limb of the calyx; cells dehiscing from the top inside. Placentas 2, central. Seeds imbricated downwards, rather compressed, ending each in a pencil-formed tail (f. 85. e.). Embryo straight, in sparing fleshy albumen; having the radicle turned towards the hyllum.—Small glabrous shrubs or subshrubs. Leaves ovate, green, rather fleshy. Sepals ovate, membranous, foliaceous, deciduous, the 2 upper ones constituting an involucel. Flowers terminal, solitary, elongated, white. Fruit follicle-formed.

1. H. longitudinalis (Swartz, obs. p. 135. t. 5. f. 1.) flowers hexandrous; corollas 6-cleft, with linear-lanceolate, rather revolute segments. Ț. S. Native of Jamaica, Guadalupe, Martinico, Cuba, the hotter parts of Mexico, on the decayed parts of old trees, and among moss. H. parasitica, vol. III.

2. H. brasiliensis (Cham. et Schlecht. in Linnæa. 4. p. 201.) corollas 6-cleft, hexandrous: segments ovate-lanceolate, obtuse. Ț. S. Native of Brasil. Leaves oval, acuminate. Tube of corolla 3 inches long.

Brasilian Hillia. Shrub.

3. H. tetrandra (Swartz, fl. ind. occ. 1. p. 630. icon. t. 11.) flowers 4-cleft, tetradrous: segments ovate. Ț. S. Native of Jamaica, on the high mountains among the roots of bushes. Leaves ovate, pale green. Roots creeping, tuberous. Lobes of calyx 4, cuneate-oblong, nearly an inch long and tetragon. Seeds papose at the apex.—Perhaps H. tuxtlensis, Moc. et Sesse, fl. mex. ined., which was collected about Tuxtla in Mexico, is distinct from this species, in consequence of the calyx being 2-lobed, and the involucre 2-leaved.

Cult. The species of this genus delight in a mixture of turfy loam, peat, and sand; and cuttings will soon strike root in the same kind of soil, or in sand under a hand-glass, in heat.

IX. HYMENOPOGON (from ἕμην, hymen, a membrane, and πογον, pagon, a beard; the seeds are furnished with a membranous appendage at each end). Wall. in Roxb. fl. ind. 2. p. 156. D. C. prod. 4. p. 351, but not of Beauv.

1. H. parasiticus (Wall. 1. c.) Ț. S. Native of the East Indies, growing on trees, and sometimes on rocks, on Sheeopore, Chandagiri, near Hetoumma, and between that place and Chitlog. Stems rooting, as well as the branches, covered with pale ash-coloured bark. Leaves 5-7 inches long. Seeds linear, smooth, terminated by a long linear membranous, sometimes bifid appendage, measuring altogether 3 lines in length.

Parasitical Hymenopogon. Shrub.

Cult. See Hillia above for culture and propagation.

X. CINCHO'NA (said to be named in honour of the Countess de Chinchon, vice queen of Peru, who was cured of a fever in the 3 P

Fee, hist. nat. pharm. 2. p. 240.

§ 1. Capsule dehiscing at the base.—Normal species.

1 C. Lanceolata (Ruiz et Pav. fl. per. 3. p. 1. t. 238.) leaves oval - lanceolate, acute, naked on both surfaces, as well as the branches, shining; panicle brachiate, much branched, smooth; calyce teeth ovate, acuminate; segments of corolla linear-lanceolate; stigma emarginate; capsule ovate, ribbed. 1. s. Native of Peru, in the mountains of Loxa, and other cold mountainous regions; as well as of New Granada, between Guaduas and Santa Fe de Bogotá, where it was collected by Mutis. C. lancefolia, Mutis, period. de Santa Fé, p. 465. Hum. in mag. der. gesell. nat. fr. berl. 1807. p. 116. Alib. tract. des fievres, p. 374. C. nifida, Ruiz et Pav. fl. per. 2. p. 50. t. 191. C. angustifolia, Ruiz et Pav. quin. suppl. 14. with a figure. C. glabra, Ruiz, quin. 2. p. 94. C. Cucumenfolia, Pavon, mss. Quinquina orange, Mutis, quin. Carassarilla officinal. Ruiz, quin. 56. Carassarilla Lampa, Ruiz, quin. 2. p. 64. Cinchona Condaminia, Humb. et Bonpl. pl. equin. 1. p. 33. t. 10. Hum. in mag. der. gesell. nat. fr. berl. 1807. p. 112. nov. gen. amer. 3. p. 400. C. officinalis, Lin. syst. veg. ed. 10. p. 929. Condamine in mem. de l’Académie de Paris, 1738. p. 114. Lam. ill. t. 164. f. 1. Vahl, skrifter. af. natur. selfkab 1. t. 1. Lamb. mon. t. 1. C. stüpea, Pav. mss. Carassarilla fina de Uritucinga de los Spaniards. This species varies extremely in the form of the leaves. The celebrated Mutis has, with great propriety, considered his C. lancefolia the quina Naranganda or Quinquina orange of Santa Fé, as identical with the Quina fina de Uritucinga of Humb. et Bonpl. C. Condaminia. Although it is probable that several species of this important genus afford the Peruvian bark of the shops, of these three only are admitted into our national pharmacopoeias, to which the names of C. lancefolia, C. oblongifolia, and C. cordifolia have been applied, designating respectively the pale, the red, and the yellow bark. The present species was first described and figured by the astronomer Con-
respecting the Countess Chinchon, vice-queen of Peru, is probably still more doubtful than it is generally supposed to be. There certainly was a Count Chinchon, Don Geronimo Fernandez de Cabrera Bobadella y Mendoza, who was Viceroy of Lima from 1639 to 1639. It is very probable that his wife, after her return to Spain in 1640, was the first to introduce the Cinchona bark to Europe. The name of *Pulvis Comitissae* appears even more ancient than that of *Pulvis Jesuiticus* or *Pulvis patrum*. But I do not believe that the Corregidor of Loxa, Don Juan Lopez de Cunñizares, who is said to have cured the Countess of ague, received this remedy from the Indians. In Loxa there is no tradition whatever of this kind, nor is it probable that the discovery of the medicinal power of the Cinchona belongs to the primitive natives of America; if it is also considered that these natives (like the Hindoos) adhere with unalterable pertinacity to their customs, to their food, and to their nostrums; and that notwithstanding all this the use of the Cinchona bark is entirely unknown to them in Loxa, Guancahambu, and far around. In the deep and hot valleys of the mountains of Cata-mango, Rio Calvas, and Macara, agues are extremely common. But the natives there, as well as in Loxa, of whatever cast, would die rather than have recourse to Cinchona bark, which, together with opiates, they place in the class of poisons, exciting mortification. The Indians cure themselves by lemonades, by the oleaginous aromatic peel of the small green wild lemon, by infusions of *Scoparia dolicos*, and by strong coffee. In Malacatis only, where many bark-peelers live, they begin to put confidence in the Cinchona bark. In Loxa, there is no document to be found which can elucidate the history of the discovery of the Cinchona; an old tradition, however, is current there, that the Jesuits, at the felling of the wood, had distinguished, according to the custom of the country, the different kind of trees by chewing their barks; and that on such occasions they had taken notice of the considerable bitterness of that of the Cinchona. There being always medical practitioners among the missionaries, it is said they had tried an infusion of the Cinchona in the tertian ague, a complaint which is very common in that part of the country. This tradition is less improbable than the assertion of European authors, and among them the late writers Ruiz and Pavón, who ascribe the discovery to the Indians. The medicinal powers of the Cinchona was likewise entirely unknown to the inhabitants of the kingdom of New Granada."

Cinchona bark is stripped from the trunk and branches in the dry season, from September to November; it is dried by exposure to the sun, and after being imported into Europe is sorted for sale. It is brought to this country in chests, each of which contains from 100 to 200 pounds weight of bark, mixed with dust and other impurities. According to Humboldt, the quantity of this drug annually exported from America is from 12,000 to 14,000 quintals. The kingdom of Santa Fe furnishes 2000 of these, which are sent from Carthagena; 110 are furnished by Loxa, and the provinces of Huamanga, Cuenca, and Jean de Bracamoros, and the thick forests of Guacamamba and Ayavaca, furnish the rest, which is shipped from Lima, Guayaquil, Payta, and other ports on the South Sea.

The pale bark of the shops, the *Quina Naranjada*, and *Cascaiculina fina de Uritsinga* of the Spaniards, which is obtained from *C. lanceolata*, is preferred in South America to all the other kinds of bark. It is in pieces, 3 or 6 inches long, singly or doubly convoluted, externally of a greyish brown colour, to which crusts of lichens often adhere, and is internally when fresh broken of a bright cinnamon hue. There are often intermixed with this others of a coarser texture, thicker, and nearly flat, which appears to be obtained from the trunk and larger branches. The fracture is smooth and even; its powder is of a pale colour; its taste is bitter and astringent; its smell peculiar and aromatic.

The yellow bark, named *Quina Amarilla*, *Cascarilla de Loxa*, and *Cascarilla amarailla*, is less rolled than the pale bark, and the pieces are larger and thicker. Externally it is of a greyish brown, and covered with lichens; internally of a much deeper orange than the pale bark. It has a more bitter taste, with a less aromatic odour, and with scarcely any sensible degree of astringency.

The red bark is sometimes rolled, but more commonly in flat thick pieces, covered with rough entire reddish brown epidermis. It has a smooth fracture. It is composed of three layers; the inner one being of a dark ferruginous colour, it is more bitter and astringent than the pale and yellow bark.

These three kinds of bark are only distinguished in Britain; but M. Von Berken, a drug broker of Hamburg, who has written a valuable monograph on the Cinchonas, enumerates eight kinds as distinguished in commerce; and the drug merchants of Spain enumerate about 50 different kinds of bark: these are probably obtained from as many species of *Cinchona*, or several of them may be obtained from the same species—the difference depending upon the age, state, and habitats of the trees.

**Qualities and chemical properties.**—Few vegetable substances have undergone so many analyses, by the most eminent chemists, as the different varieties of Peruvian bark. The basis of all of them is woody fibre, combined with which are various principles capable of being abstracted by different solvents. The taste of all is more or less bitter and astringent. Boiling water extracts all their active principles, affording a solution of a pale brown colour; this infusion is transparent when hot, but on cooling becomes turbid, and a precipitate is deposited, which is insoluble in alcohol. The decoction has a very astringent taste, and a deep brown colour. By long boiling the virtues are nearly destroyed, owing to the chemical change and precipitation of its active matter. Alcohol, in all its modifications, is a powerful solvent of the active principles of Cinchona. A saturated solution of ammonia is also a solvent of them, but acetate acid acts less imperfectly than even water. Vauquelin found that an infusion of the *pale bark* reddened litmus paper; was copiously precipitated by solution of galls, and in a smaller degree in yellowish emulsions by solution of isinglass. A solution of tartar emetic was rendered turbid, and slowly precipitated by it; solution of superacetate of lead produces quickly a copious precipitate. The addition of a solution of the sulphate of iron to the infusion changed the colour to a bright olive green, but was scarcely precipitated. The powder macerated in sulphuric acid afforded a golden yellow tincture, which reddened litmus paper, and left a pellicle of bitter resin when evaporated on the surface of water, to which it gave the colour of the tincture. This coloured water did not precipitate the solution of galls and of tartar emetic, and occasioned no precipitate on the addition of the solution of sulphate of iron. With alcohol it produced a deep orange coloured tincture, which precipitated sulphate of iron, tartarized antimony, and tannin. The agency of the different menstrua on the red and yellow varieties of the *Cinchona* produce nearly the same results as on the common or pale bark. The filtered solution of yellow bark has a pale golden hue, with a shade of red; it is bitter, reddens litmus paper, and precipitates solution of galls. On adding a solution of isinglass, a pinkish yellow precipitate is produced; superacetate throws down a precipitate; tartarised antimony gives a precipitate in pale yellowish flakes. A solution of the sulphate of iron changes its colour to a bluish green, and slowly lets fall a precipitate of the same colour. The alcoholic tincture appears to be in every respect the same as that afforded by the pale bark. The red bark has a more nauseous taste than the barks of the other species.
Rubiaceae. X. Cinchona.

The aqueous infusion is of a pale ruby colour; its action on the solutions of galls and of isinglass is nearly the same as those of the two former species, but it is not altered by tartarised antimony, nor by the superacette of lead; and the solution of iron occasions a dirty yellow colour only, little being precipitated. The alcoholic tincture is of a deep brownish red colour, and precipitates the solution of the sulphates of iron and of tartarised antimony; the former of a black colour, and the latter red. From the experiments of Vaquelin, Fabroni, and others, it appears that the active principles of Cinchonas consist chiefly of cinchonine, resin, extractive gluten, a very small portion of volatile oil, and tannin. Vaquelin has determined the presence of a peculiar acid, to which he gives the name of cinine acid, in some varieties of the bark. The following are the most important results that have been obtained by MM. Pelletier and Caventou, respecting the composition of the three official species. — 1st. In pale bark they found aciculoid inate of cinchonine, a green fatty matter, which they term red cinchonine; tannin, a yellow colouring matter, kinate of lime, gum, starch, and woody fibre. 2nd. In yellow bark they found that the alkaline base differs from cinchonine in being uncrystallizable, very soluble in ether, and forming salts with the acids very different from those of cinchonine. The chemical constituents of the yellow bark are an aciculoid kinate of this salt, which they have named quinine, a deep yellow fatty matter, red cinchonine, tannin, yellow colouring matter, kinate of lime, starch, and woody fibre. 3rd. Red bark contains aciculoid kinate of cinchonine, kinate of quinine, reddish fatty matter, red cinchonine, tannin, kinate of lime, yellow colouring matter, starch, and woody fibre. The difference between the pale, the red, and the yellow barks, depends principally on the quantity of the two alkaline bodies, cinchonine and quinine, found in them. The pale bark contains cinchonine, but a very small portion of quinine; the alkali, again, which predominates in the yellow bark, is quinine; while in the red bark, and some spurious kinds, there is a combination of both these substances. The presence of cinchonine, as a distinct vegetable principle, was first discovered in Peruvian bark by Dr. Duncan, of Edinburgh.

The separation of cinchonine from the pale bark, and of quinine from the yellow bark, is a very simple operation. It consists in digesting the bark, coarsely powdered, in weak sulphuric acid, and then to repeat this digestion with about half the quantity of liquid, till all the soluble matter is extracted. To this decoction a small quantity of powdered shelled lime is added, somewhat greater than is necessary to saturate the acid; the precipitate that ensues (a mixture of cinchonine and the sulphate of lime) is collected, dried, and boiled for a few minutes in alcohol, which takes up the cinchonine, but will not dissolve the sulphate of lime; the solution is decanted off while still hot, and fresh portions successively added for the repetition of the same operation, until it ceases to act on the residuum, which is then merely sulphate of lime. The different alcoholic solutions are then put into a retort, and considerably evaporated, during which and on cooling acicular crystals of cinchonine are deposited. By repeating the solution once or twice, in boiling alcohol, and again crystallizing, the cinchonine will be obtained in a perfectly pure state. Its crystals are semi-transparent, have a pearly lustre, and are usually obtained in the form of small needles. It has but little taste, and requires 700 parts of water for its solution, but boiling alcohol dissolves it much more abundantly; it is sparingly soluble in oils and sulphuric ether. At a moderate heat it is partly volatilized, and partly decomposed. It combines with different acids, forming neutral salts. Mr. Brande found that it contained no oxygen, 100 parts consisting of about 80 parts of carbon, 13 of nitrogen, and 7 hydrogen. It has an intensely bitter taste, and exerts the same action on the animal economy as the bark itself, but it is less generally used in medicine than the other active principle of the bark, quinine, because the yellow bark from which it is procured is more plentiful; the quinine, therefore, is cheaper than cinchonine, and equally efficacious. Quinine may be obtained from the yellow bark in the same manner as cinchonine is prepared from the pale bark, or by adding an alkali to the solution of the sulphate of quinine. Quinine is not crystallizable like cinchonine, but on the application of heat it melts into a kind of paste. It has a much more bitter taste than the other, and is very sparingly soluble in water. They differ also remarkably in their chemical composition, cinchonine containing no oxygen, while in quinine there is a notable proportion of this element. According to Mr. Brande, it consists of about 5.55 parts of oxygen, 7.65 hydrogen, 13 nitrogen, 73.80 carbon. By digesting quinine in a weak solution of sulphuric acid, the sulphate of quinine is obtained, which is the salt now generally used for medicinal purposes. The most approved process for preparing this salt was pointed out by Mr. Henry. A kilogramme of bark (2 lbs. 3 oz. 5 dr.) is reduced to a coarse powder, and boiled twice for about a quarter of an hour in 14 or 15 pints of water, 2 ounces of sulphuric acid being added to it each time. The decoctions containing the sulphate of quinine are of a reddish colour, which gradually acquire a yellow tint, and have a very strong bitter taste. They are to be filtered through a linen cloth, and about half a pound of powdered quicklime added to the solution. The sulphate of quinine is decomposed in this manner, the alkali being precipitated along with the sulphate of lime. This is digested repeatedly in alcohol, till it no longer imparts any bitter taste to this fluid; the alcoholic solutions are then evaporated till a very bitter viscid substance is obtained, which becomes brittle as it cools. This is the quinine separated from almost all the other ingredients of the bark, and by digesting it in dilute sulphuric acid a solution of sulphate of quinine is obtained, which crystallizes on evaporation. It is a white pulvulent substance; it crystallizes in small white 4-sided prisms, which are distinguished by their pearly lustre. It is not very soluble, therefore not affording a very bitter taste; but by adding a drop or two of acid to the solution, its solubility is increased, and then it becomes intensely bitter. It is decomposed by the alkalies and earths; it volatilizes at a moderate heat, and it can unite with an excess of acid, forming a bisulphate of quinine. The sulphate of quinine is frequently adulterated with starch, pipe-chay, and various other substances. To determine its purity, the simple process of heating it is sufficient; if it evaporate entirely without charring and melting, it is pure; but if it should turn black or smell sweetish, it is probable that sugar or starch is present. Pure quinine is seldom used in medicine, but the sulphate possesses in a very eminent degree the medicinal properties of Peruvian bark, one grain, or one grain and a half, being equivalent to a drachm of the bark in substance. In Paris it has superseded, in a great measure, the Peruvian bark, and is now extensively used in this country in all cases where that valuable medicine is indicated, in doses of from 2 to 5 grains.

Medical properties and uses.—Peruvian bark has been long known as one of the most powerful and valuable tonics we possess, and may be administered with great freedom in all cases where that class of remedies are indicated. The only effects of an overdose are headache and nausea. It also possesses antiseptic and astringent powers in a very eminent degree, and is universally employed as a febrifuge in the cure of intermittent and remittent fever, in diseases of debility, such as typhus, cynanche maligna, in passive lumorrhages, confluent small pox, in dysentery, in some cutaneous diseases, as lichen agris, and livida, in purpura, in some varieties of erysipelas, in gangrene, in dyspepsia, and even in acute rheumatism and gout. The
decoration of yellow cinchona bark, given in large quantities, is the best antidote to the poison of tartar-emetic.

**Cordate-leaved Cinchona or Yellow Peruvian-bark.** Tr. 30 to 40 ft.

3 C. **Rudolphia** (Humb. et Bonpl. pl. equin. 1. p. 65. t. 19. nov. gen. 3. p. 403.) leaves oval or ovate, naked above and shining, but pilose on the veins beneath; calycine teeth very short; corolla clothed by silky tomentum outside, with a bearded limb; style exerted; stigma bipartite; capsule linear, terete. **S.** Native of Peru, in the forests of Loxa, in the province of Quito. Segments of corolla ovate. Anthers shorter than the filaments. Lobes of stigma linear, flat, and obtuse. This is a very distinct species, being easily distinguished from all its congeners by its narrow cylindrical capsules, and by the narrow linear divisions of the stigma.

**Round-leaved Cinchona.** Tree 30 to 40 feet.

4 C. **ovalifolia** (Humb. et Bonpl. pl. equin. 1. p. 65. t. 19. nov. gen. 3. p. 403.) leaves oval or ovate, naked above and shining, but pilose on the veins beneath; calycine teeth ovate, acute; corolla clothed by silky tomentum outside, with a bearded limb; anthers twice longer than the filaments; stigma bipartite; capsules oval, constricted at the apex. **S.** Native of Peru, in the forests of Loxa, in the kingdom of Quito; Pavon; and on the Andes of Peru, near Cuenca; Humboldt and Bonpland. Panicle brachiate, pubescent. Flowers white. Segments of corolla linear. Lobes of stigma linear, obtuse. This species must not be confounded with the C. ovalifolia of Mutis, the C. macrocarpa of Vahl, or Quinquina blanca of New Granada, which are totally different.

**Oval-leaved Cinchona.** Tree 15 to 20 feet.

5 C. **purpurea** (Ruiz et Pav. fl. per. 2. p. 52. t. 193.) leaves oval or ovate, acute at the apex, and attenuated at the base, at length naked on both surfaces and shining; panicle corymbose, pubescent; anthers shorter than the filaments, but exceeding the throat; corolla clothed by silky tomentum outside, with a bearded limb; stigma 2-lobed, inclosed; capsules narrow, ovate-oblong, attenuated at the apex. **S.** Native of the lower mountains of the Andes, in forests, at Chinchao, Pati, Muna, Casape, Casapillo, &c. (Pavon); and of the Andes of Peru, near the city of Jaen de Bracamoros. C. serobicul-éa, Humb. et Bonpl. pl. equin. 1. p. 165. t. 47. nov. gen. amer. 3. p. 402. Casarciina fina Bracamoreamium and Casarciina morada, Ruiz et Pav. p. 67. Casarciina boba de hochamorada. Corolla rose coloured. Capsule bislicate, pubescent when young, but glabrous in the adult state. This is distinguished from the preceding species by its more acute smoother leaves; by its corymbose panicles; by its filaments being longer than the anthers, and their surpassing the throat of the corolla; by the capsules, which are ovate-oblung, narrowed, and without ribs; and, lastly, by the shorter and broader lobes of the stigma.

**Purple-flowered Cinchona.** Tree 40 feet.

6 C. **pueróscens** (Vahl, in act. havi. 1. p. 19. t. 2. Lamb. mon. t. 2.) leaves broad-ovate, or roundish-ovate, acute, on long petioles, rounded at the base or acutish, naked and shining above, but clothed with pilose tomentum beneath, as well as the branches; panicle brachiate, diffuse, clothed with rusty tomentum; corolla clothed by silky down on the outside, with a bearded limb; anthers almost sessile; stigma 2-lobed; capsule oval-oblong, oblongly ribbed, tomentose. **S.** Native of Peru, in forests on the lower mountains of the Andes, towards Pausuo and Panao; and also of the forests of Huamaco, Ruiz et Pavon. C. ováa, Ruiz et Pav. fl. per. 2. p. 52. t. 193. Casarciina páliidaa, Ruiz, quinol. p. 74. Casarciina de Pato de Gal-áratea. Petioles 2 inches long. Teeth of calyx very short, acute. Corolla purplish outside and white inside, with ovate oblong segments. Glandulas included. Style exceeding the anthers. Lobes of stigma ovate.

**Pubescent Cinchona.** Tree 30 to 40 feet.

7 C. **mierá'ntha** (Ruiz et Pav. fl. per. 2. p. 52. t. 194.) leaves broad, oval or ovate, naked and shining above, but pilose in the axils of the veins beneath; panicle crowded, pubescent; anthers shorter than the filaments, hardly exerted; style very short; stigma 2-lobed; capsule elliptic, attenuated at the apex. **S.** Native of the Andes of Peru, in cold elevated forests towards St. Antonio de Playa Grande, where it was first observed by John Taffall. Corolla clothed with silky down on the outside, with a bearded limb, and ovate segments. Calycine teeth very short, acute. Lobes of stigma ovate. Capsule bisulate, ribless. This species has some affinity with C. Condamin-éa, but its small flowers, and elliptical ribless capsules, together with its very short style, and other marks, readily distinguish it.

**Small-flowered Cinchona.** Tree 20 to 30 feet.

8 C. **Humboldtiana** (Lamb. cinch. p. 7.) leaves lanceolate, acute at both ends, naked above, but villous beneath, as well as on the branchlets; panicle glomerate, villous; calycine teeth very short, acute; corolla clothed by silky down outside, with a bearded limb; anthers sessile, inclosed; stigma exerted, emarginate; capsules ovate, hairy, glomerate. **S.** Native of Peru, in the kingdom of Quito, in forests near the town of Jaen de Bracamoros. Pavon. This is a strongly marked and very distinct species; there is none with which it can be confounded; it is the C. villósa, Pavon, mss.

**Humboldt's Cinchona.** Tree.

9 C. **glandulífera** (Ruiz et Pav. fl. per. 3. t. 224.) leaves oval, acutish at both ends, naked and shining above, very pilose beneath, as well as on the branchlets, with undulated rather revolute margins; panicle brachiate, very pilose; corolla pilose outside, with a bearded limb; calycine teeth very short, mucronulate; segments of corolla ovate; stigma emarginate; capsules ovate, drooping. **S.** Native of Peru, in the kingdom of Quito, at Loxa. Pavon. C. microphylla, Mutis, mss. C. quercifólia, Pavon, mss. C. Mutisi, Lamb. cinch. p. 9. Anthers exserted, shorter than the filaments. Corolla white. Var. β; leaves oval, obtuse, rounded at the base, and rather cordate. **S.** C. quercifólia, var. crispa, Pavon, mss.

**Gland-bearing Cinchona.** Tree 10 to 15 feet.

10 C. **hirsíta** (Ruiz et Pav. fl. per. 3. t. 51. t. 192.) leaves oval, acute at the base, beset with bristly hairs, as well as on the branchlets, very short, and at length naked; flowers glomerate, beset with bristly hairs; calycine segments lanceolate, acuminated; corolla pilose outside, with a bearded limb; stigma 2-lobed; capsule ovate. **S.** Native of Peru, on the Andes, in forests in cold elevated places, towards Pillao and Acamoyo. Ruiz et Pavon. Casarciina delgado, Ruiz, quinol. p. 60. Flowers red. Humboldt and Bonpland have confounded this with the C. cordifólia of Mutis, with which it has not the least resemblance.

**Hairy Cinchona.** Tree 20 to 30 feet.

11 C. **stenočípa** (Lamb. cinch. p. 18.) leaves lanceolate, acute at both ends, naked above, but pilose on the veins beneath; teeth of calyx ovate, acute; corolla clothed by silky tomentum outside, with a glabrous limb; anthers sessile; style very short; stigma emarginate; capsule linear, terete. **S.** Native of Peru, in forests in the kingdom of Quito, near the city of Jaen de Bracamoros. Pavon. C. species nova, Pavon, mss. Panicle diffusely branched, pubescent. Segments of the corolla linear, obtuse. Very like C. Condaminéa, but very distinct.

**Narrow-fruited Cinchona.** Tree.

12 C. **caducifólia** (Bonpl. in pl. equin. 1. p. 167. H. et Kunth, nov. gen. amer. 3. p. 411.) leaves broad-ovobrate, acute at the base, naked and shining above, but pilose in the axils of the veins beneath; panicle brachiate, pubescent; calycine teeth ovate, obtuse; corolla clothed with silky down outside, having the limb glabrous above, and the segments linear-oblung; an-
thers a little exserted; style very short; stigma bipartite; capsules oval-oblong.  S. Native of Peru, on the Andes, near the city of Jaen de Bracamoros. Humboldt and Bonpland. C. magnifölia, Humb. et Bonpl. pl. equin. 1. p. 139. t. 39. exclusive of the synonyme of Flora Peruviana. Cascarilla bova of the Peruvians. Segments of corolla shorter than the tube. Lobes of stigma linear, flat.

Caduceous-flowered Cinchona. Tree 100 feet.

§ 2. Capsule dehiscing at the apex.—Aberrent species.

13 C. macrocrapá (Vahl, in act. havn. 1. p. 20. t. 3. exclusive of the synonymes. Lamb. mon. p. 22. t. 3.) leaves broad-elliptic, very blunt, densely clothed with rough tomentum beneath, as well as on the branches; calyx entire, with rather prominent teeth; corolla large, clothed by silky down outside, with a bearded limb, and lanceolate segments, which are recurved at the apex; stigmas inclosed; stigma emarginate; capsule pear-shaped, tomentose.  S. Native of Peru, in the forests of Loza, Guayaquil, and Cuenca; and of New Granada. C. ovatifolia, Mutis, mss. Humb. in mag. &c. p. 118. Cosmobuéna species nov. Pavon, mss. Called Quina blanco, and Quinquina blanco de Santa Fe. Corymb few-flowered. Calyx urceolate, entire. Style furrowed. This species ought not to be confounded with the C. ovatifolia of Humb., to which it has not the least resemblance.

Large-fruited Cinchona. Tree 30 to 40 feet.

14 C. oblongifolia (Mutis, mss. Humb. in mag. &c. p. 118. Rhode, mon. p. 57. exclusive of the synonymes,) leaves oblong or cordate, densely clothed with scabrous hairs on both surfaces, as well as the branchlets; pedicel bractate, corymbosus, scabrous from hairs; segments of corolla pilose outside, but glabrous inside, linear; genicula inclosed; anthers 3 times longer than the filaments; stigma bipartite; capsules ovate.  S. Native of Peru, in forests in the mountains of Loza; and of New Granada, near Maraquita. H. B. et Kunth, nov. gen. amer. 3. p. 401. exclusive of syn. of fl. per. and Ruiz, quimol. Called Quina roga and Cinchona vulgar Azahar. Flowers white. This is a very distinct plant from C. magnifölia of Ruiz et Pav. It is distinguished from it by its leaves being rounded at the base, often cordate, covered on both sides with rough pilose tomentum, sometimes the older leaves, however, become nearly naked above; the corolla is covered on the outside with bristly pilose hairs, while that of C. magnifölia has short down, and in the shape of the capsules.

Oblong-leaved Cinchona. Tree 12 to 20 feet.

15 C. magnifölia (Ruiz et Pav. fl. per. 2. p. 52. t. 196. but not of Humb. et Bonpl.) leaves broad-roundish-oval, naked and shining above, and densely clothed with tomentum beneath; pedicel bractate, corymbosus, tomentose; calycines teeth short, acute; corolla clothed with silky tomentum outside, but having the limbs glabrous above, and the segments lanceolate; anthers inclosed; style exserted; stigma bipartite; capsules linear, terete.  S. Native of Peru, on the Andes, in very hot places in forests, on the banks of the mountain streams, at Chinchao, Cuchero, and Chacabuaya. Ruiz et Pavon. C. oblongifolia, Steph. and Churchhil, med. bot. 4. t. 184. Cascarilla amarilla, Ruiz, quinol. p. 71. This species of Cinchona is regarded as yielding the red bark of the shops. Flowers white, sweet-scented.

Large-leaved Cinchona or Red Peruvian-bark. Tree 40 feet.

16 C. Pavonii (Lamb. cinch. p. 8.) leaves orbicular or cordate, naked above, but clothed with rusty tomentum beneath, as well as the branchlets; corolla clothed with rusty tomentum; calyx urceolate, entire, obsolescently denticulated; tube of corolla very long, clothed by silky tomentum outside, with a bearded limb; anthers sessile; stigma deeply bipartite; capsules very long, terete.  S. Native of Peru, in the kingdom of Quito, in groves at Loxa. C. cáva, Pavon, mss. Called Canela. Corollas crowded with flowers. Corollas large, with ovate-oblong obnute segments; anthers hardly exserted above the throat. Style inclosed; lobes of stigma linear, obtuse, with revolute edges. Capsule length and thickness of a finger. This species has considerable affinity with C. macrocrapá. The form of its leaves, the deeply bipartite stigma, its very long cylindrical capsules, however, widely separate it.

Pacoes's Cinchona. Tree.

17 C. acutifölia (Ruiz et Pav. fl. per. 2. p. 51. t. 225.) leaves lanceolate, acuminate, naked and shining above, but pilose at the veins beneath; segments of the calyx-linear-oblong, obnute; corolla clothed with silky tomentum on the outside, having the limb glabrous above, and the segments linear, acute; genicula inclosed; stigma bipartite; capsule pear-shaped, hairy, attenuated at the base.  S. Native of Peru, on the Andes in groves at the river Chilopaya. Cascarilla detrona aguda, Ruiz et Pav. suppl. quinol. p. 8. Pedicel bractate, densely clothed with pili. Lobes of stigma linear, obtuse.

Acute-leaved Cinchona. Tree 20 feet.

18 C. hexáandra; leaves large, oval, obtuse, clothed with ochraceous villi beneath, as well as on the branchlets and flowers; calyces 5-6-locelli; stamens 5-6.  S. Native of Brazil, in mountain woods, in the provinces of Rio Janeiro and Minas Geraes. Buena hexandra, Pohl. pl. bras. 1. p. 10. t. 8. China, Eschwege, journ. bras. 2. p. 86. Quino do Rio de Janeiro, mem. acad. Lisb. 3. pt. 2. p. 96. The bark is thin, of a bay colour on the outside, but blood-coloured within, very bitter, and is used by the Brazilians as a febrifuge, in place of Peruvian bark. Corolla purple.

Hexaandrous Cinchona. Tree.

§ 3. Flowers disposed in interrupted elongated axillary racemes. Capsules dehiscing from the apex. Seeds peltate, girdled by a membranous ring.—Remíjia, D. C. bibl. univ. 1829. scienc. vol. 2. p. 185; prod. 4. p. 357. The species are called Quina de Serra or Quina de Remijo throughout Brazil.

19 C. ferruginea (St. Hil. append. voy. p. 8. pl. usuel. bras. 1. t. 3.) leaves oblong-lanceolate, rather narrow, coriaceous, clothed with rusty villi beneath, as well as the branches, with revolute margins; racemes interrupted, hardly branched; corolla tomentose outside.  S. Native of Brazil, in the province of Minas Geraes, on arid mountains. Remijia ferruginea, D. C. prod. 4. p. 357. —Macrocnemum no. 1. Velloz. in Vand. fl. p. 14. Leaves usually 3 in a whorl. The fascicles of flowers on the raceme are opposite. The bark is bitter and astringent, and is used in place of Peruvian bark in Brazil, under the name of Quina de Remijo and Quina de Serra.

Rusty Cinchona. Shrub 4 to 5 feet.

20 C. vellózii (St. Hil. pl. usuel. bras. p. 1. no. 2.) leaves ovate, coriaceous, acuminated at both ends, clothed with rusty villi beneath as well as on the branchlets; racemes interrupted, hardly branched; corolla tomentose outside.  S. Native of Brazil, in the preceding. Remijia Vellózii, D. C. prod. 4. p. 357. —Macrocnemum, no. 2. Velloz. in Vand. fl. p. 14. This differs from the preceding species in the flowers being on shorter pedicles, in the bracteas being less linear, and in the flowers being longer and more numerous. Fascicles of flowers on the racemes opposite. The bark of the species is used in Brazil in place of Peruvian bark, under the name of Quina de Serra.

Vellós's Cinchona. Shrub 4 to 5 feet.

21 C. remijía (St. Hil. pl. usuel. bras. p. 1. no. 2. in a note) leaves broad-elliptic, obtuse, cuspidate; the upper ones decurrent at the base, clothed with rusty villi beneath, as well as the branchlets; racemes interrupted, hardly branched; corolla
villous on the outside. Ͻ. S. Native of Brazil, along with the two preceding species. C. Remýána, Spreng. syst. 1. p. 705. Remýána Hilárii, D. C. prod. 4. p. 357. Clusters of flowers opposite, on the raceme. The bark of this species is also used in place of Peruvian bark, under the name of Quina de Remýáno.

Remýáno’s Cinchona. Shrub.

22 C. Candollii; leaves oblong, acute, attenuated at the base, undulated, coriaceous; panicules axillary, verticillately branched: the branches interruptedly racemose; corolla villous on the outside. ϫ. S. Native of Brazil, Remýána paniculata, D. C. prod. 4. p. 357. Branches trigonal. Branches and branchlets of panicule angular. Leaves clothed with rusty down beneath, as well as the branchlets and panicle. Fruit unknown.

De Candolle’s Cinchona. Shrub.

† Species not sufficiently known.

23 C. Pelábera (Pav. quinol. ined. D. C. bibl. univ. 1829. &c.) leaves roundish, hardly apiculated, membranous, beset with velvety hairs on the petioles and on the nerves beneath, and velvety between the nerves, but puberulous above; stipulas oval, obtuse, equal in length to the petioles; panicule glabrous, much branched; fruit oblong-seriate, crowned by the calyx, glabrous. ϫ. S. Native of South America, and probably of Peru. This is a very distinct species. Fruit 6-7 lines long. Stipulas an inch long.

Pelábera Cinchona. Tree.

24 C. Muzonii (Goudot, in phl. mag. 1828. febr. p. 132.) leaves ovate-oblong, acute, attenuated at the base; stipulas revolute; panicule brachiate; corolla white, with a bearded limb. ϫ. S. Native of Columbia, in the extensive forests about the town of Muzo.

Muzo Cinchona. Tree.

25 C. Lamberti (Mart. in bot. zeitung, no. 7. p. 119. 1831.) branches and all the younger parts of the tree clothed with rusty hairs; leaves oblong-lanceolate, tapering into the short petioles, flat; thyrse axillary, interrupted, brachiate at the base; capsule oblong-cylindrical. ϫ. S. Native of South America, on the banks of the Amazon.

Lambert’s Cinchona. Tree.

26 C. Bergia (Mart. in bot. zeitung no. 7. p. 119. 1831.) branches and all the younger parts of the tree clothed with rusty hairs; leaves oblong-lanceolate, tapering into the short petioles, flat; thyrse axillary, interrupted, brachiate at the base; capsule oblong-cylindrical. ϫ. S. Native of South America, on the banks of the Amazon.

Bergius’s Cinchona. Tree.

Cult. All the species of this very interesting genus are grown with great difficulty in the stoves of our gardens. The best soil for them is a mixture of turfy loam and sandy peat. Cuttings should be taken off when ripe, and planted in a pot of sand, which should be plunged under a hand-glass in a moist heat.

XI. COSMIBUENA (named by Ruiz and Pavon after Cosimi Bueno, a Spanish physician, who has written on the natural history of Peru).  

LIN. SYST.  

Pentándria, Monógynia. Calyx 5-toothed. Corolla tubular, with a 5-lobed limb, which is imbricate in estivation. Stamens exerted; filaments bearded in the middle; anthers roundish, peltate; cells loosened at the base. Stigma 2-lobed. Capsule 2-celled, dehiscent in the middle of the cells, many-seeded: having the dissepiment complete. Seeds small and narrow.—A tree, native of Peru, with panicled inflorescence.

ovate. Capsules ovate, bisulcate, glabrous. Humboldt, on the authority of Zed., has joined this with Cinchona lanceifolia of Mutis, with which it has not the least affinity. Called Ascioniach in Peru.

Rose-colored-flowered Lasiocoma. Tree.

Cult. See Cinchona, p. 479, for culture and propagation.

XIII. LUCULIA (Luculi sava is the name given to the tree by the Nipaulese). Sweet. brit. fl. gard. t. 145. D. C. prod. 4. p. 357. D. Don, in Lin. trans. vol. 17. ined.

Lin. syst. Pentándria, Monogynia. Calyx 5-parted (f. 87. c.). segments foliaceous. Corolla tubular, with a 5-lobed limb, which is imbricate in astivation. Stamens almost inclosed (f. 87. a.). Anthers linear. Stigma bipartite (f. 87. b.) Capsule 2-celled (f. 87. b.), dehiscing from the apex, many-seeded, crowned by the calyx. Seeds samaroid, surrounded by a jagged membranous margin.—A tree, native of Nipal: having cymose bracteate inflorescence.

1 L. gratissima (Sweet, l. c.). f. Native of Silhet and Nipal, on the mountains. Cinchona gratissima, Wall. in Roxb. fl. ind. 2. p. 154. tent. fl. nep. t. 50. t. 21. Musse'n'da Luculia, Hamilt. in D. Don, prod. fl. nep. p. 129. A small branching tree, with terete pubescent branches; elliptic, acuminate leaves, which are glabrous above and villous on the veins beneath, on short petioles. Cymes terminal, many-flowered. Flowers rose-coloured, rather fleshy, sweet-scented. Stipulas solitary on each side, broad at the base and cupulose at the apex, longer than the petioles. Segments of calyx deciduous. It is impossible to conceive anything more beautiful than this tree, when covered with its numerous cymes of pink-coloured very fragrant flowers.

Very fragrant-scented Luculia. Fl. Aug. Sept. Cl. 1823. Tree 16 to 20 feet. Cult. A very good rich light soil will suit this tree; and cuttings may be rooted under a sand-glass, but with great difficulty.

Lin. syst. Pentándria, Monogynia. Calyx 5-toothed. Corolla tubular, with a 5-crested limb, which is plicate in astivation. Anthers linear, exerted. Stigma 2-lobed. Capsule 2-celled, dehiscing at the cells, many-seeded; valves ventricose, membranous. Dissemination complete. Seeds germinated by a membranous, reticulated border, which is bifid at the base.——Trees, natives of the East Indies, with compressed branches: coriaceous, petiole leaves; deciduous, glabrously ciliated stipules; and small, inconspicuous, greenish, pubescent flowers, disposed in fascicles, the whole forming racemose panicles. Floral leaves one under each branch of the panicle, lanceolate, convex, veiny, on long petioles, similar to the large calyceine teeth of Musa‘n’dā, but placed in a different situation.

1 H. excélim (Wall. in Roxb. fl. ind. 2. p. 358.) leaves oblong, downy: floral ones coloured and blunted; stipulas cordate, serrated; panicles axillary and terminal; anthers almost sessile in the mouth of the tube; partition of capsule contrary. f. S. Native of the East Indies, in the mountainous parts of the Circars, and chiefly of the valleys, where it grows to be a large tree. It is called Bönderőu in the Telinga language. Cinchona excélsa, Roxb. cor. 2. p. 3. t. 106. Tratt. tab. t. 170. The lower pair, or two of the ramifications of the panicle, are ornamented each with a pair of coloured floral leaves. Panicles terminal, large. Flowers fasciéd, small, greenish white. The infusion of one fresh leaf in water all night had little taste, but struck quickly a deep purplish blue with a chalybeate. The two inner coats of the bark (the outer light spongy stratum is tasteless) possess both the bitterness and astringency of Peruvian bark, and when fresh in a stronger degree; the bitterness is not so quickly communicated to the taste on chewing the bark, as that of the former, but is much more durable, and chiefly about the upper part of the fauces. The wood is firm, close-grained, of a pale mahogany colour, and very useful for many purposes.

2 H. thyrsiflorum (Wall. in Roxb. fl. ind. 2. p. 151.) leaves ovate, downy, pale beneath: the floral ones coloured and reticulated; thyrs terminal and axillary, drooping; stipulas oblong, fringed with coloured glands; limb of corolla cucullate; partition of capsule contrary. f. S. Native of the East Indies, in the interior parts of Bengal. Cinchona thyriflora, Roxb. Branches forming a large ovate head to the tree. Leaves from 2-8 or 10 inches long. Thyrs very dense. Flowers small, greenish yellow, fasciéd. The floral pair or two of leaves are on longer petioles than the rest.

3 H. fláccidum (Wall. in Roxb. fl. ind. 2. p. 152.) leaves ovate-elliptic, smooth, and shining above; stipulas oblong-spatulate, ciliate; racemes axillary, slender, pendulous; capsules oblong. f. S. Native of the East Indies, on the north side of Sheopore, towards the bottom; and in the valley of Noakote. Leaves from 6-10 inches long: having the margins slightly waved. Common peduncle pubescent, bearing a hardly coloured, lanceolate-oblong, pubescent, reticulated floral leaf, which is convex on the upper side, and concave on the under. It comes very near the preceding species, but differs, however, in having broader, elliptic, downy leaves, and much thicker both terminal and axillary subcompound racemes; its capsules too are much broader.

Flaccid Hymenodictyon. Tree 20 to 30 feet.

4 H. obovatum (Wall. in Roxb. fl. ind. 2. p. 153.) leaves obovate, acuminate, smooth; floral ones lanceolate, acuminate, reticulated, convex, glabrous; stipulas ovate, acute, glandularly ciliated; racemes axillary and terminal, a little branched, erect. f. S. Native of the East Indies, and perhaps of Wynand. Young shoots green, much compressed. Rachis of peduncles villous. At the apex of each peduncle there is a floral palel leaf, 2 inches long, convex and a little rugose above: glaucous and concave, beautifully veined, and rather pubescent beneath.

Obovate-leaved Hymenodictyon. Tree.

Cult. See Cinchona, p. 479, for culture and propagation.

Lin. syst. Pentándria, Monogyinia. Calyx 5-toothed. Corolla tubular, with a 5-parted limb: having linear, elongated
segments, which are undiplicate in section. Stamens exserted; anthers narrow-linear, having the cells adnate at the base. Stigma undivided. Capsule 2-celled, dehiscing at the dissepiment from the apex, many-seeded. Seeds girded by an entire membranous border.—Trees or shrubs, usually glabrous. Leaves oval or lanceolate, on short petioles. Stipules solitary on each side. Peduncles axillary and terminal. Flowers white or red. The barks of all the species are destitute of quinine and cinchonine, according to St. Hilaire.

**Sect. I. Pitaonia** (the bark of some of the species is called Quinquina Piton in the Antilles). D. C. prod. 4. p. 359. Limb of calyx parted almost to the base into teeth of various lengths. Corolla glabrous; having the tube longer than the segments. Stigma undivided.—Species all natives of the Caribbean Islands. The bark is febrifugal, somewhat emetic, and is sold in the shops under the name of Quinquina Piton of the Antilles.

1. **C. Caribbeum** (Rœm. et Schultes, syst. 5. p. 18.) leaves ovate-lanceolate, acuminate, glabrous; pedicels axillary, 1-flowered, rather shorter than the petioles; calyx bluntly 5-toothed; style and stamens about equal in length to the corolla. § S. Native of the Caribbean Islands, Guadaloupe, St. Domingo, Jamaica, Santa Cruz, &c.; and of Mexico. Cinchona Caribbea, Jacq. amer. t. 179. f. 65. obs. 2. t. 17. Lamb. mon. t. 4. Gaertn. fruct. 1. t. 33. f. 4. Cinchona Mayacensis, Wright, in roy. soc. trans. lond. p. 67. f. 504. t. 10. Andr. bot. rep. t. 481. Flowers white, sweet-scented, about the length of the leaves; but according to Jacquin they are pale flesh-coloured. Stamens, according to Andrews's figure, shorter than the segments of the corolla. Dr. Wright says that the jersuits' bark of Jamaica rises only to 20 feet, with leaves of a rusty green colour; and the young buds of a bluish green hue. The bark is generally smooth and grey on the outside, though in some rough and scabrous, when well dried, and the inside of a dark brown colour. Its flavour is at first sweet, with a mixture of the taste of horseradish and of the aromatics of the East, but when swallowed of that very bitterness and astringency which characterises the Peruvian bark. It grows near the sea shore, and is called in Jamaica Sea-side beech.

2. **C. Longifolium** (Rœm. et Schultes, syst. 5. p. 18.) leaves linear-lanceolate, acuminate, glabrous; pedicels axillary, very short; teeth of calyx linear, long-lanceolate, glabrous; corollas 3 or 4 times longer than the leaves. § S. Native of St. Domingo. Cinchona longifolia, Lamb. mon. p. 38. t. 12. exclusive of the synonyms. Flowers white, 5 inches long before expansion; segments linear; tube very long.

**Long-flowered Exostemma.** Fl. June, July. Clt. 1820. Tree 20 feet?

3. **C. Canescens** (Bartl. in herb. Henke, ex D. C. prod. 4. p. 359.) leaves ovate-oblong, acuminate, canescent from villi on both surfaces as well as on the branches; pedicels axillary, 1-flowered. § S. Native of Mexico. The canescent down on the leaves, branches, pedicels, and young fruit distinguishes it from all the other species. Flowers unknown. Capsule naked at the apex, not crowned by the calyx. Pedicels length of fruit. **Canescens** Exostemma. Tree.

**Narrow-leaved Exostemma.** Tree. 10 to 15 feet.

5. **E. Coriaceum** (Rœm. et Schultes, syst. 5. p. 20.) leaves ovate, scarcely acute, coriaceous, glabrous on both surfaces, shining; branches and flowers glabrous; pedicules axillary, 2-3-flowered; teeth of calyx short, acute; corollas about the length of the leaves; capsules ovate, smooth. § S. Native of St. Domingo. Cinchona coriacea, Poir. dict. 6. p. 38. Pedicules 2 or 3 times shorter than the leaves. Seed girded by a membranous wing. Corolla glabrous, 2 inches long, with a terete tube and narrow reflexed segments. Branches of pericarp dichotomous.

**Coriaceous-leaved Exostemma.** Tree.

6. **E. Lineatum** (Rœm. et Schultes, syst. 5. p. 18.) leaves ovate, acuminate, and are as well as the branches and flowers glabrous; pedicules terminal, coriaceous; calyce segments linear; capsule pentagonal. § S. Native of St. Domingo. Cinchona lineata, Vahl. symb. 1. p. 27. act. soc. hist. nat. hafn. 1. p. 20. t. 4. Lamb. mon. p. 26. t. 6. Panicle coriaceous, terminal, trichotomous. Leaves marked with lines on the upper surface. Flowers an inch long, white.

**Lined-leaved Exostemma.** Tree. 20 to 30 feet.

7. **E. Parvifolium** (Rich. in Humb. et Bonpl. pl. equin. 1. p. 132.) leaves ovate, mutic, furnished with porose glands in the axils of the nerves; petioles, branches, and pedicules pubescent; fascicles of flowers axillary and terminal, crowded; teeth of calyx short. § S. Native of the Caribbean Islands.

**Small-flowered Exostemma.** Tree.

8. **E. Brachycarpum** (Rœm. et Schultes, syst. 5. p. 19.) leaves elliptic, obtuse, and are as well as the branches and flowers glabrous; pedicules terminal, coriaceous; teeth of calyx short, acute; capsules ovate or obovoate, ribbed. § S. Native of the eastern parts of Jamaica, in shady parts of mountains. Cinchona brachycarpa, Swartz, prod. p. 42. fl. ind. occid. 378. Lindsay, roy. soc. trans. edinb. 1794. p. 214. t. 5. Vahl. act. soc. hist. nat. hafn. 1. p. 22. Lamb. cinch. p. 18. t. 8. Panicle terminal, coriaceous, trichotomous. Corolla 3/4 inches long before expansion, pale red or flesh-coloured. Leaves 5-6 inches long, deep green. The bark, when wounded, emits a whitish juice; which becomes of a brownish purple colour on drying, and is easily reduced into a greyish purple powder, which is at first sweet, but afterwards very bitter and astringent.

**Short-fruited Exostemma.** Tree. 20 feet.

9. **E. Triploium** leaves lanceolate, obtuse, attenuate at the base, quite glabrous, and shining on both surfaces; branches glabrous; coriums compound; pedicules 2-3-flowered; calyce teeth subulate; corolla with a very long filiform tube, and long, narrow, linear, dependent segments; capsule obovoate. § S. Native of Jamaica. Cinchona triflora, Wright, in edinb. med. journ. p. 240. Lamb. cinch. p. 15. It comes nearest to E. floribunda, but differs from it in the leaves being ovate-elliptic, acuminate, not attenuated at the base; the coriums of flowers are also much larger and closer; the teeth of the calyx are shorter and broader; the tube of the corolla is much shorter and wider; and the capsules oblong-cylindrical.

**Three-flowered Exostemma.** Tree. 20 feet.

10. **E. Floribunda** (Rœm. et Schultes, syst. 5. p. 19.) leaves elliptic, acuminate, and are as well as the branches and flowers glabrous; pedicules terminal, coriaceous; teeth of calyx short, acute; capsules turbinate, smooth. § S. Native of the Caribbean Islands, Jamaica, Guadaloupe, St. Domingo, St. Lucia, and Trinidad, in woods on the banks of mountain streams. Cinchona floribunda, Swartz, prod. p. 41. fl. ind. occid. p. 375. Lamb. mon. p. 17. t. 7. Cinchona montana, Badier, in journ. phys. 1789. febr. p. 129. t. 1. Cinchona, St. Lucie, David, phil. vol. III.

**Bundl-flowered Exostemma.** Ckt. 1794. Tree 20 to 80 ft.

11 E. capítât'um (Spreng. new. entd. 2. p. 143.) leaves ovate, coriaceous, glabrous; flowers capitae; calyx small, 5-toothed; corolla with a long tube, and revolute segments. & S. Native of South America. Perhaps only a variety of E. floribándum. Specimens of this tree were received under the name of St. Lucia bark.

**Capitate-flowered Exostemma.** Tree.

**Sect. II. Brachy'a nthum (from βραχύς, brachyús, short, and ἀνθος, anths, a flower; in reference to the tube of the flower being shorter than the segments).** D. C. prod. 4. p. 560. Limb of calyx divided even to the base into teeth. Corolla having the tube shorter than the segments of the limb, or at the longest hardly equal in length to them. Stigma sometimes undivided, and sometimes somewhat 2-lobed. Corolla glabrous, or pubescent on the outside.

12 E. philipp'cum (Rem. et Schultes, syst. 5. p. 366.) leaves oval, acute, crowded, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; teeth of calyx short, acute; tube of corolla rather shorter than the segments of the limb, filaments hairy. & S. Native of the Philippine Islands, at Manila: and in Santa Cruz de la Laguna. Cinechôna Philippica, Cav. icon. 4. t. 329. Peduncles axillary, trichotomous, corymbose, bearing 2 leaves at the origin of the branches, about the length of the leaves. Corolla 9 lines long before expansion. Stigma clavate, marked by a furrow on each side, probably from the cohesion of the lobes. Capsule turbinate, 5 lines long, crowned by the calycine limb. Bark bitter and astringent.

**Philippine Exostemma.** Tree 10 to 15 feet.

13 E. corymbos'um (Rem. et Schultes, syst. 5. p. 20.) leaves oblong, acute, and are as well as the branches and flowers glabrous; peduncles axillary, corymbose, bearing 2 leaves just below the ramifications; teeth of calyx short, acute; segments of corolla hardly shorter than the tube. & S. Native of the islands of Tongatabu and Enoe, in the Pacific Ocean, where it is cultivated for the elegance and colour of its flowers. Cinechôna corymbifera, Forst. act. nov. ups. 3. p. 176. Lim. fil. suppl. p. 144. Lamb. cinch. p. 25. t. 5. Leaves deep green, size of those of Coffea Arabica: having the nerve purplish beneath. Corollas trichotomous. The bark is very bitter and sub-astringent, and very like Jesuits' bark. Flowers white, but reddish on the outside.

**Corumb-bearing Exostemma.** Tree 10 to 15 feet.

14 E. peruv'ianum (Humb. et Bonpl. pl. equin. 1. p. 133. t. 38.) leaves ovate or oblong, acute, rounded at the base: the superior ones sessile and coriâte; corymbal terminal, sessile; peduncles and calyxes pubescent; corolla silky outside. & S. Native of Peru, on the declivities of the Andes, in cold places by the sides of streams, at the altitude of 3000 feet. H. B. et Kunth, nov. gen. amer. 3. p. 404. Cinechôna Peruviana, Poir. suppl. 4. p. 640. Flowers rose-coloured. Leaves smooth, deep green above. Segments of corolla hardly shorter than the tube. Filaments glabrous, adnate to the throat of the corolla. Stigma obsolete 2-lobed. Teeth of calyx acute.

**Peruvian Exostemma.** Tree 10 to 12 feet.

15 E. corymbos'um (Spreng. syst. 1. p. 706.) leaves oblong-lanceolate, acute, and are as well as the branches and flowers glabrous; corymbose terminal, bracteate; teeth of calyx almost linear, acute, spreading: segments of corolla about equal in length to the tube. & S. Native of Peru, in hot places between Chaulla and Muna. Portândia corymbosa, Ruiz et Pav. fl. per. 2. p. 49. t. 190. f. a. Leaves shining above, 2-3 lines long. Corolla white: having the limb reflexed. Capsule fuscous, turbinate. Seeds girdled by a membranous wing, hence it is not a species of Portândia.

**Corymbose-flowered Exostemma.** Tree 15 to 18 feet.

16 E. dissimiliflorum (Rem. et Schultes, syst. 5. p. 17.) leaves cordate-oblong, quite glabrous; limb of corolla longer than the tube; capsules almost linear, very narrow. & S. Native of South America, at the altitude of 6000 or 7000 feet. Cinechôna dissimiliflorum, Mutis, in Humb. berl. mag. nat. 1. p. 120.

**Dissimilar-flowered Exostemma.** Tree.

**Sect. III. Pseudosté'mma.** Limb of calyx campanulate, sub-tubular, truncate, or somewhat 5-toothed. Corolla usually villous on the outside: having the tube shorter than the segments of the limb. Stigma usually 2-lobed. Fruit unknown. Flowers disposed in panicules. Species natives of Brazil. Perhaps a proper genus.

17 E. cuspidat'um (St. Hil. pl. usuel. bras. 1. t. 3. f. A.) leaves ovate-lanceolate, cuspidate, nerved, villous beneath; pedicel terminal; limb of calyx campanulate, tubular, obscurely 5-toothed, longer than the ovariun; corolla villous on the outside: with the segments longer than the tube; filaments glabrous; stigma undivided. & S. Native of Brazil, in woods. Leaves 9-15 lines long. Corolla white, 2-4 lines long. Fruit unknown. It is called Quin do moto, and the bark is used as a substitute for Peruvian bark.

**Cuspidate-leaved Exostemma.** Tree 8 to 10 feet.

18 E. austral'è (St. Hil. pl. usuel. bras. 1. t. 3. f. B.) leaves ovate, nerved, rather villous beneath; pedicel terminal, sessile, tripartite; limb of calyx campanulate, shorter than the ovariun, bluntly 5-toothed; corolla rather pubescent on the outside: with the segments longer than the tube; filaments glabrous; stigma undivided. & S. Native of Brazil, in woods. Leaves 12-15 inches long, and 7-8 broad. Style villous. The bark of this and the preceding species is employed by the Brazilians in the cure of intermittent fevers, from the want of more efficacious remedies. It is bitter and a little astringent.

**Southern Exostemma.** Tree 8 to 10 feet.

19 E. romos'um (Cham. et Schlecht. in Linnaea. 4. p. 170.) leaves obovate-elliptic, acute at both ends, rather granular when examined under a lens; panicle trichotomous, loosely pyramidal; limb of calyx quite entire; corolla glabrous on the outside, but the throat is villous, and the segments are rather pilose on the inside, and a little longer than the tube; stigma 2-lobed. & S. Native of Brazil, within the tropics.

**Grow Exostemma.** Tree.

20 E. souza'num (Mart. reis. ex Linnaea. 5. p. 45.) leaves obovate or ovate, acute, glabrous; corollas few-flowered, terminal; capsules hardly an inch long, obovate, compressed; valves usually 4-nerved; seeds transversely oblong, with a broad margin. & S. Native of Brazil.

**Souza's Exostemma.** Tree.

21 E. macrocômeanus; branches naked; leaves oblong-spathulate, acuminate, tapering into the short petiolo, smooth on both
surfaces, shining; stipulas connate at the base, and running sound the petioles, and forming a cumbous semicircular margin to them; thryse axillary, panicled, loose; flowers minute, tetramerous; fruit cylindrical; seeds furnished with a quite entire rounded membrane at both ends. H. S. Native of South America. Cichorea macrocnemia, Mart. in bot. zeit. no. 7. p. 119. 1831.

Long-stemmed Exostemma. Tree.

Cult. See Cichorea, p. 479., for culture and propagation. The species are of freer growth than those of Cichorea; and the cuttings should not be too ripe when taken off.

Lin. syst. Pentândria, Monogyinia. Flowers dioecious from abortion. Calyx with a short ovate tube, and a small limb, which is 5-toothed to the base. Corolla funnel-shaped, with a slender tube, a villous throat, and a 5-parted limb. Stamens exerted in the male flowers, but abortive and inclosed in the female flowers. Style exerted in the female flowers, and bifid at the apex, but abortive in the male flowers. Capsule globose, coriaceous ciliate, marked by an areola at the apex from the fallen calyx, 2-celled, dehiscing at the cells, 2-valved. Seeds small, fixed to central placenta, imbricated downwards, gilt by a membranous wing; albumen fleshy.—Smooth, climbing, or straggling shrubs, natives of the Mauritius. Roots exuding a yellow juice when bruised. Leaves oblong or roundish. Stipulas solitary on each side, broad, very short. Peduncles axillary, many-flowered, corymbose, with opposite branchlets. Flowers fragrant, orange-coloured, sometimes hexamorous.

Fragrant Danais. Shrub cl.

2 D. laxiflôra (D. C. prod. 4. p. 361.) leaves ovate, oblong, obtuse, and cuspidate; coryrbms loose, sub-panicled; capsule not furrowed, crowned by the erect permanent calyceal teeth. H. C. Native of Madagascar and Bourbon. Peti¬oles 4 lines long. Panicle of female flowers 2—3 inches long, but that of the males is unknown.

Loose-flowered Danais. Shrub cl.

3 D. rotundifôlia (Poir. suppl. 2. p. 450.) leaves ovate-roundish, leath W the apex; corybms crowded; capsule not furrowed, crowned by the toothless truncate limb of the calyx. H. C. Native of the Mauritius, where it is called Liane de bois jaune. Cinchôna chloorhiza, Bory, in litt. Malânea verticillata, Sieb. fl. maor. exsic. 2. p. 264. exclusive of the synonyms. Peti¬oles 7—8 lines long. Corybms hardly an inch, much shorter than the leaves. Flowers small. Leaves 2—3 inches long.

Round-leaved Danais. Shrub cl.

4 D. sulcâta (Pers. ench. 1. p. 198.) leaves ovate; capsule furrowed, crowned by the calycine segments, which are folia¬ceous. H. C. Native of the Mauritius, where it climbs over the highest trees.

Furrowed-fruited Danais. Shrub climbing.

Cult. A mixture of loam, peat, and sand will be a good soil for the species of Danais; and cuttings will easily rooted under a hand-glass, in heat. They are well fitted for training up the rafters in a stove.

Lin. syst. Tetra-Pentândria, Monogyinia. Calyx with a turbinate tube, and the limb parted into as many lobes as there are corolline segments, or double that number (f. 88. a), and often furnished with lobes in the recesses between the segments. Corolla funnel-shaped, with a terete tube, a hairy throat (f. 88. c), and a 4 (f. 88. b), rarely 5-parted limb. Anther sessile in the throat. Capsule ovate, compressed, crowned by the calycine lobs (f. 88. d), dehiscing from the apex to the base at the dissepiment (f. 88. d); the divisions boat-shaped. Placentas somewhat exerted from the dissepiment. Seeds innumbered, almost sessile, peltate, surrounded by a winged membranous border, which is usually too small. Embryo erect in the albumen; cotyledons foliaceous, lanceolate.—Perennial, herbaceous, or suffruticose plants: having the stems and branches twining and slender. Leaves ovate-oblong, or subcordate. Stipulas broad, short, acute, usually adhering to the petioles at the base. Peduncles axillary, 1 or many-flowered.

Sect. I. Lygìstum (from aygos, hygos, a twig; in reference to the twiggy stems). D. C. prod. 4. p. 362. —Lygìstum, P. Browne. —Manettia, Mutis, Lin. and Schreb. Lobes of calyx twice the number of those of the segments of the corolla, usually 8 (f. 88. a), rarely 10; besides the accessory lobules.

1 M. reclinâta (Lin. mant. p. 553.) stem herbaceous, re¬cline, weak, branched; leaves ovate, acute, pubescent beneath; peduncles axillary, many-flowered, shorter than the leaves; pedicels opposite, hairy. C. Native of Mexico. Corolla white. Calyx 8-lobed; lobes linear, concave, hairy. Nacibea reclinata, Poir. in Lam. dict. 4. p. 416.

Recline-branched Manettia. Pl. tw.

2 M. racemoâsa (Ruiz et Pav. fl. per. 1. p. 58. t. 89.) stems twining; branches tetragonal; leaves ovate or oblanceolate, acuminated; stipulas semi-circular, acuminated, ciliated; racemes axillary, few-flowered, longer than the leaves; corollas hairy. H. C. Native of Peru, in groves at Cuchero and Chinchao.

M. mutâbilis, Pers. ench. 1. p. 134. Nacibea mutâbilis, Poir. suppl. 4. p. 55. Lobes of calyx 8, but in the ultimate flowers 10, according to the figure; and sometimes 4-5, according to the description. Corolla purplish.

Racemose-flowered Manettia. Shrub tw.

3 M. cocêcina (Willd. spec. 1. p. 625.) stems twining; branches tetragonal; leaves ovate, acuminated, glabrous, shining; stipulas oblanceolate, acuminated, ciliated; racemes axillary, racemose, few-flowered, shorter than the leaves. H. C. Native of French Guiana. Ker. bot. reg. 693. Nacibea cocêcina, AUBL. 3 q 2
RUBIACEÆ. XVII. MANETTIA.

guian. 1. p. 96. t. 37. f. 1. Calyx oblong, compressed: having 4 furrows on each side, and 8-lobed at the apex; lobes narrow, acute, fleshy. Corolla having a white tube, spotted with red, a throat closed by yellow hairs: and 4 oval, acute lobes, which are scarlet and villous above.

4 M. lygistum (Swartz, prod. 4. p. 362. fl. ind. occ. p. 323.) stem suffruticosus, flexuous, scandent; branches filiform; leaves ovate, acute, veiny, roughish on the nerves beneath; stipulas subulate, very short; peduncles axillary, longer than the leaves, many-flowered. Ψ. ♂. S. Native of the south of Jamaica, on the higher mountains. Spreng. syst. 1. p. 413. exclusive of the syn. of Kunth. Lygistum, Browne, jam. p. 144. t. 3. f. 2. but the calyx is said to be 4-lobed and the fruit bacate and 4-celled, and is therefore the Petesia Lygistum, Lin. spec. 160. the Lygistum assimilare, Lam. ill. 1. p. 826. t. 67. f. 2., in which the calyx is also delineated with 4 lobes, and therefore also the Cococypsilum biforum, Wild. spec. 1. p. 618.; the Fernélia bifóra, Roem. ut Schultes, syst. 3. p. 187. Perhaps 2 species are here confused, one with a 4-lobed calyx and the other with an 8-lobed calyx: having 4 of the lobes lanceolate, and 4 of them tooth-formed and smaller.

5 M. havanense (H. B. et Kunth, nov. gen. amer. 3. p. 388.) stems twining; branches angular; floriferous branchlets by threes; 1-3-flowered; leaves ovate-oblong, acuminate, glabrous. Ψ. ♂. S. Native of Cuba, in humid places near the Havana. Leaves usually 3 in a whorl. Flowers unknown. Capsule roundish, crowned by the 8 linear lobes of the calyx. Seeds girded by a jagged wing.

Havanah Manettia. Shrub tw.

6 M. cuspidata (Bert. in Spreng. syst. 1. p. 415.) plant glabrous; stems twining; branches filiform, rather tetragonal; leaves oval-oblong, acuminate; stipulas broad, very short, peduncles axillary, bipartite; pedicels elongated, 1-flowered. Ψ. ♂. S. Native of Jamaica, Trinidad, and Mexico. Calyx roughish, turbinate, with 8 linear elongated subulate lobes. Corolla smoothish. Capsule oval, compressed, glabrous, with 8 nerves, which remain after the seeds have fallen. Seeds girded by a toothed wing.

Cuspitate-leaved Manettia. Shrub tw.

 Sect. II. Nafiâea (Aublet does not give the meaning of this word). D. C. prod. 4. p. 363. Lobes of calyx equal in number to the lobes of the corolla, usually 4, without any accessory lobules.

8 M. cordifolia (Mart. spec. mat. med. bras. 1. p. 19. t. 7.) stems herbaceous, twining, terete, roughish; leaves ovate, corolate at the base, acute at the apex, finely pubescent on both surfaces; peduncles axillary, 1-flowered. Ψ. ♂. G. Native of Brazil, in the province of Minas Geraes, at Villa Rica, in hedges and on the margins of woods. Roots woody, brown, and are an excellent remedy in dropsy and dysentery. Lobes of calyx 4, ovate-lanceolate, downy. Corolla scarlet, an inch long, glabrous outside, and villous inside.

9 M. glabra (Cham. et Schlecht. in Linnaea. 4. p. 159.) plant quite glabrous; stems twining; leaves corolate, acuminate; peduncles axillary, 1-flowered. Ψ. ♂. G. Native of the South of Brazil, among bushes, on the banks of rivers and rivulets, as on the Uruguay. Corolla scarlet, glabrous on the outside, but clothed with white villi above the base inside. Stigma club-shaped. Stipulas with a subulate point in the middle. Segments of calyx narrower than in M. cordifolia, which plant is very similar, and which Hook. and Arnott consider identical.

Glabrous Manettia. Pl. tw.

10 M. graecilis (Cham. et Schlecht. in Linnaea. 4. p. 169.) plant puberulous, twining; leaves petiolar, ovate-lanceolate, acuminate; peduncles axillary, 1-flowered; calyx glabrous. Ψ. ♂. S. Native of the south of Brazil. Very like M. glabra, but is distinguished by the characters given, in the flowers being smaller and slenderer, also scarlet; in the calycine lobes being narrower, and in the anthers being linear.

Slender Manettia. Pl. tw.

11 M. pubescens (Cham. et Schlecht. l. c. p. 170.) plant cinereous from down; stems twining; leaves petiolar, ovate, obtuse at the base, and acuminate at the apex; stipula furnished with a short acumen; peduncles axillary, 1-flowered; calyx segments longer than the tube, but at length equal with it. Ψ. ♂. S. Native of the south of Brazil. Very like the two preceding species. Corolla scarlet, 3 times longer than the limb of the calyx.

Pubescent Manettia. Pl. tw.

12 M. villosa (Cham. et Schlecht. l. c. p. 172.) plant twining; branches cinereously tomentose from roughish down; leaves petiolar, ovate, somewhat acuminate, acutish at the base; stipulas triangular; peduncles axillary, 1-flowered; segments of the calyx linear, one half shorter than the tube of the corolla; corolla pubescent on the outside; capsule ovate, rather villous. Ψ. ♂. S. Native of the south of Brazil.

Villos Manettia. Pl. tw.

13 M. attenuata (Nees et Mart. in nov. act. bonn. 12. p. 14.) stem scandent, almost terete, roughish; leaves ovate-lanceolate, attenuated at both ends, clothed with pubescent tomentum beneath; peduncles axillary, 1-flowered. Ψ. ♂. S. Native of Brazil, on the road to Felisbert, and in fields at the mountain called Grão-major, in the province of the Mines. Lobes of calyx 4, lanceolate, acuminate, erect, pubescent. Corolla glabrous, 2 inches long, crimson, with ovate acutish reflexed lobes. Upper leaves 3 in a whorl.

Attenuated-leaved Manettia. Shrub tw.

14 M. acutifolia (Ruiz et Pav. fl. per. 1. p. 58. f. 89. f. b.) plant glabrous; stems twining, terete; leaves lanceolate, very acute, petiolar; stipulas acuminate, adpressed, broad at the base; peduncles axillary, 1-3-flowered; tube of corolla hardly longer than the calyx. Ψ. ♂. S. Native of Peru, in groves, in the province of Panathula. M. acutifóra, Roem. et Schultes, syst. 3. p. 203. Nacibe acutifóra, Poir. suppl. 4. p. 55. Lobes of calyx 4, lanceolate-linear, acute. Corolla purple, villous outside, as well as in the throat.

Acute-flowered Manettia. Shrub tw.

15 M. umbellata (Ruiz et Pav. fl. per. 1. p. 58. f. 90. f. a.) plant glabrous; stems scandent, terete; leaves ovate and rather corolate, acute; stipulas broad at the base, acuminate, adpressed; peduncles axillary, many flowered, umbellate. Ψ. ♂. S. Native of Peru, in groves, at Muna. Nacibea umbellatâ, Poir. suppl. 4. p. 55. Bracteas 2-4, surrounding the flower in the manner of an involucrum. Lobes of calyx 4, lanceolate. Corolla blue, with a bearded throat.

Umbellate-flowered Manettia. Shrub cl.
16. M. rosea (Pohl, in litt. ex D. C. prod. 4. p. 364.) stems rather twining, compressedly angular, rather pubescent; leaves oblong, acuminate, glabrous; stipules broad, short, acuminate; peduncles axillary, bifid, 2-flowered, shorter than the leaves.  5. S. Native of Brazil. Lobes of calyx 4, lanceolate, longer than the tube of the corolla. Corollas rose-coloured, larger than in any other species of the genus, pubescent outside, with oblong ciliated segments.

Painted-leaved Manettia. Shrub tw. 18. M. fimbriata (Cham. et Schlecht. in Linnaea. 4. p. 173.) plant twining and quite glabrous; leaves petiole, elliptic, acuminate, acute at the base; peduncles lateral, 1-3-flowered; lobes of calyx ovate-lanceolate, a little shorter than the tube of the corolla; lobes of corolla fringed with long hairs; stigma 4-lobed.  5. S. Native of the south of Brazil.

Fringed-flowered Manettia. Pl. tw. 19. M. pseudodidyma (Cham. et Schlecht. l. c. p. 174.) stems twining, obscurely tetragonal, glabrous, marked by a ciliated line at the apex; leaves petiole, broad-oval, acuminate, acute at the base; stipulas triangular, ciliated; peduncles lateral, 1-3-flowered; segments of calyx lanceolate, acuminate, ciliated; corolla clothed with glabrous tomentum outside; capsule tetragonal, apex-ridged. 5. S. Native of the south of Brazil.

Didyma pedunculata, Spreng. syst. 1. p. 405.

False-Didyma Manettia. Pl. tw. 20. M. ciliata (Cham. et Schlecht. l. c. p. 176.) stems twining, tetragonal; angles winged, ciliated; leaves on short petioles, lanceolate, acuminate, ciliated, rather coriaceous; stipulas ciliated, ending each in a reflexed acumen; peduncles 1-3-flowered, pubescent; segments of calyx lanceolate, acuminate, ciliated; corolla clothed with rusty tomentum on the outside; capsule obconical. 5. S. Native of the south of Brazil.

Ciliated-stemmed Manettia. Pl. tw. 21. M. albiflora (Schott, mss. ex Pohl, in litt. D. C. prod. 4. p. 364.) stems herbaceous; branches tetragonal, rather pilose; leaves oblong, acuminate at both ends, pubescent on both surfaces; stipulas broad, short, cuneate; pedicles numerous, 1-flowered, rising unembarrassedly from the axis of the leaves. 5. 5. S. Native of Brazil. Calyx with a turbinate, rather tetragonal tube, and 4 lanceolate lobes. Corolla white. Fruit unknown.

White-flowered Manettia. Pl. tw.

† Species not sufficiently known.

22. M. gertneri (D. C. prod. 4. p. 364.) stems and leaves unknown; capsule ovate, compressed a little, hisulate, crowned by the 4-parted limb of the calyx.—The rest unknown. Nacibea ghabara, Gertn. fil. carp. 3. p. 102. t. 197. f. 5. Gertner's Manettia. Pl. tw.

Second-flowered Manettia. Pl. cl.

Cult. All the species of Manettia are worth cultivating for the beauty and elegance of their flowers. A mixture of loam peat and sand is the best soil for them. They are easily propagated by young cuttings in the same kind of soil under a glass-

Lil. syst. Tetrandria, Monognia. Calyx with a subglobose tube (f. 89. a.), and a 4-parted limb (f. 89. b.); lobes linear-subulate (f. 89. b.); sometimes with a tooth between each lobe. Corolla funnel-shaped (f. 89. e.), tubular, elongated, beset with velvety papilla outside, with a naked throat, and a 4-parted spreading short limb (f. 89. d.). Stamens having the filaments adnate to the tube at the base, and free from about the middle (f. 89. e.); anthers linear, inclosed. Stigma bilamellate (f. 89. g.), exserted. Superior part of the ovary naked. Capsule membranaceous, globose, a little compressed, 3-celled, and dehiscing at the cells above; valves semi-septiferous. Placentas orbicular. Seeds many in each cell, compressed, imbricated downwards according to the figure of Salisbury, but upwards according to the figure in fl. mex., girded by a membranous wing.—Shrubs, natives of Mexico. Leaves opposite or in whorls. Stipulas narrow, acute, adnate to the pedicels on both sides. Peduncles terminal, 3-flowered or trichotomous and corymbose.—This genus is very nearly allied to Manettia.

§ 1. Leaves disposed in whorles. Corollas flesh-coloured or pale red, having the tube bearded inside.

1 B. linearis (H. B. et Kunth, nov. gen. amer. 3. p. 383.) branches terete, when young pubescent; leaves 3 in a whorl, linear, with revolute edges, scabrous above, but canescent from hairs beneath; corollas trichotomous; lobes of calyx 5 times shorter than the tube of the corolla, which is hairy. 5. G. Native of the temperate parts of Mexico, near St. Augustin de Las Cuevas, Morán, &c. Corolla 8 lines long, pale red.

Linear-leaved Bouvardia. Shrub 5 feet.

2 B. angustifolia (H. B. et Kunth, l. c. p. 384.) branches terete, smoothish; leaves 3 in a whorl, lanceolate, with revolute edges, glabrous above, but beset with fine hairs beneath; corollas somewhat trichotomous; lobes of calyx 2 or 3 times shorter than the tube of the corolla, which is hairy. 5. G. Native of temperate parts of Mexico, along with the preceding. There is a variety of this species with 5-cleft flowers. Flowers pale red.

Narrow-leaved Bouvardia. Shrub.

3 B. hartellii (H. B. et Kunth, l. c.) branches terete; branchlets and leaves hairy on both surfaces, lanceolate, with revolute edges; flowers corymbose; lobes of calyx 5-6 times shorter than the tube of the corolla, which is hairy. 5. G. Native about the city of Mexico. Flowers pale red or flesh-coloured.

Hairy Bouvardia. Shrub.

4 B. quadriflora (D. C. prod. 4. p. 365.) branches striated, rather downy; leaves 4 in a whorl, lanceolate, acuminate, rather scabrous above, and pubescent beneath; corollas trichotomous; lobes of calyx 6 times shorter than the tube of the
corolla, which is pilose. \( \text{G} \). Native about the city of Mexico. Carphâlea? pubiflora, Moc. et Sesse, fl. mex. icon. ined. Flowers scarlet, 12-14 lines long. Perhaps only a variety of \( B. \) kietëlla.

Four-leaved Bouvardia. Shrub.

5 B. Jacquinii (H. B. et Kunth, l. c. p. 385.) branchlets trigonal, and are, as well as the under side of the leaves, hairy; leaves smoothish above, 3 in a whorl, oblong; corymb somewhat trichotomous; lobes of calyx 5 times shorter than the tube of the corolla, which is hairy. \( \text{G} \). Native near the city of Mexico. Isôra Americana, Jacq. hort. schöenbr. 3. p. 9. t. 257. Isôra termifolia, Cav. icon. 4. p. 3. t. 305. exclusive of the description of the seeds.

\( \text{Var. } \beta. \) exögyra (D. C. prod. 4. p. 365.) leaves oblong-lanceolate, acuminate; style exerted. \( \text{G} \). Cultivated in gardens.

\( \text{Var. } \gamma. \) ovita (D. C. l. c.) leaves ovate, acute. \( \text{G} \). Bouvardia triphylla, var. \( \beta. \) Salmis. parad. t. 88.

Jacquin's Bouvardia. Fl. April, Nov. Cit. 1794. Shrub 2 to 3 feet.

6 B. ? obovA (H. B. et Kunth, l. c. p. 385.) branches tetragonal, striated, and are, as well as the leaves, smoothish; leaves 4 in a whorl, obovate; corymb trichotomous. \( \text{G} \). Native of Mexico, between Chapo-tepec and Tzecuaro. Herb 1-3 feet high, ex Bonpland. Perhaps this is a true species of Bouvardia, ex Kunth.

Obovate-leaved Bouvardia. Pl. 1 to 3 feet.

§ 2. Leaves opposite. Corolla with a beardless tube.

7 B. versicolor (Ker, bot. reg. t. 254.) branches terete, glabrous, velvety while young; leaves opposite, lanceolate, ciliated; corymb 3-flowered, trichotomous, drooping; lobes of calyx 8 times shorter than the tube of the corolla, which is glabrous both inside and outside. \( \text{G} \). Native of South America, but in what place is unknown. Corolla with a scarlet tube, which is 9 lines long, but having the limb yellowish inside.

8 B. triflôrâ (H. B. et Kunth, nov. gen. amer. 3. p. 386. t. 288.) branches terete, glabrous; branchlets rather hairy; leaves opposite, lanceolate-oblong, acute, rounded at the base, beset with fine hairs; peduncles terminal, 3-flowered; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. \( \text{G} \). Native of the temperate parts of Mexico. Céstrum spermocociflórum, Willd. reflex. miss. in Rcm. et Schultes, syst. 4. p. 808. Corolla white, with the tube 5-6 lines long.

Three-flowered Bouvardia. Shrub.

9 B. longiflôrâ (H. B. et Kunth, l. c. p. 386.) branches compressedly tetragonal, glabrous; leaves opposite, oblong, acute, cuneated at the base, glabrous; flowers terminal, solitary, sessile; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. \( \text{G} \). Native of temperate parts of Mexico, near Santa Ana, where it is called by the natives \( \text{Flor de San Juan}; \) also near Queretaro and Huanacuajuto, ex Cav.; and at Pasquaro, ex Cervantes, in herb. Haecke. \( \text{G} \). Bouvardia longiflora, Cav. icon. 6. p. 51. t. 572. f. 1. Corolla white, with the tube 3 or 3 inches long. Stipules usually cleft into 2 awns at the apex.

Long-flowered Bouvardia. Clt. 1827. Shrub 2 to 3 feet.

10 B. Cavanillesii (D. C. prod. 4. p. 366.) suffrutescous; leaves opposite, ovate-lanceolate, acuminated, rather villous beneath; peduncles terminal, trifid, 3-flowered; capsule transversely ovate, somewhat dundum. \( \text{G} \). Native of Mexico. Bouvardia multiflora, Cav. icon. 6. p. 52. t. 572. f. 2. Without flowers.

Cavanilles's Bouvardia. Shrub.

11 B. cordifolîa (D. C. prod. 4. p. 366.) suffrutescous; leaves opposite, very short petioles, corotate, acute; corymb terminal, sessile, 8-10-flowered. \( \text{G} \). Native of Mexico. Isôra cordifolia, Moc. et Sesse, fl. mex. icon. ined. Corolla from dirty yellow to scarlet, 6-7 lines long.

Heart-leaved Bouvardia. Shrub.

Cult. The species of this genus usually bear red or scarlet flowers, and are therefore worth cultivating in gardens. The quickest way of increasing them is by pieces of the roots, planted in a pot of good mould, and placed in a warm situation; or they may be increased by young cuttings, which root readily under a hand-glass, in a mixture of sand, peat, and loam, in heat.

XIX. PINCKNEYA. XX. CALYCOHYLLUM.

L. sit. Pentändria, Monogynia. Calyx 5-parted, having one of the segments large, coriaceous, and coloured. Corolla tubular, with a 5-cleft limb, which is valvate in aestivation. Stamens 5, exerted, inserted in the base of the tube; anthers peltate. Stigma emarginate. Capsule 3-celled, dehiscing at the dissepiment. Seeds compressed, surrounded by a winged membranous margin, which is emarginate at the base.—A tree, native of North America. Branches opposite. Leaves ovate, acute at both ends, tomentose beneath, as well as the branches. Stipulas deciduous. Flowers rather large, pubescent, pale red, bracteolate, disposed in cymes; the cymes arising from the axils of the upper leaves. Large calyceous leaves, white, tinged with red.

1 P. pêrens (Mich., l. c.) ? F. Native of North America, in Georgia, on the banks of the river St. Maria, in muddy places; and on the banks of the New river in South Carolina. Pursh, fl. amer. sept. 1. p. 158. Ell. sketch. 1. p. 268. Cinchona Caroliniana, Poir. dict. 6. p. 40. Pinckneya pubescens, Pers. ench. 1. p. 197. The bark of this tree is used in place of Peruvian bark in Georgia and Carolina, under the name of fever bark.

Downy Pinckneya. Fl. June, July. Cit. 1786. Tree 20 ft. Cult. This tree is usually treated as a greenhouse plant in Britain; but thrives much better against a south wall, with the protection of a mat in severe weather. A mixture of sand and peat is the best soil for it; and cuttings planted in sand, with a hand-glass placed over them, will strike root.

XX. CALYCOHYLLUM (from καλύς, calyx, a calyx, and ψιλλον, phyllon, a leaf; in allusion to one of the teeth of the calyx being expanded into a large petiolate coloured leaf.) D. C. prod. 4. p. 367.—Macrocenêmum, Vahl, symb. 2. p. 38. but not of Browne.—Mussaenda species, Poir.
Lin. syst. Pentândria, Monogyniâ. Limb of calyx truncate, or bluntly 5-toothed; one of the teeth expanded into a petiole coloured membranous leaf. Corolla campanulate or funnel-shaped, with a 5-parted limb. Stamens 5; filaments rising from the throat, free, length of corolla; anthers oval, exerted, Style ending in 2 reflexed stigmas. Capsule dehiscing at the apex, oblong, 2-celled, many seeded. Seeds fixed to the linear placentas, imbricate, oblong, girdled by a very narrow membranous wing.—Small smoothish trees, natives of the West Indies. Leaves opposite, petiolate, membranous, glabrous above, but villous on the veins beneath. Stipulas short, broad, deciduous. Flowers disposed in axillary and terminal trichotomous corymbs; peduncles compressed. Habit of Musse'a nda.

1 C. candidissimum (D. C. prod. 4. p. 367.) leaves ovate, bluntly acuminated; corymbs terminal; limb of calyx bluntly 5-toothed; corolla somewhat funnel-shaped, glabrous. ë. S. Native of St. Martha, Vahl, and near St. Fernando de Atabapo, on the banks of the Orinoco, H. B. et Kuntz; and of Cuba, about the Havannah. Macrocnêmum candidissimum, Vahl, symb. 2. p. 38. t. 30. Musse'nda candidi- smini, Roem. et Schultes, syst. 5. p. 251. M. candida, Poir. dict. 4. p. 395. The peduncles of the corymbs are 2-edged. Calyces villous. Flowers 3 together, the middle one bearing a petiole leaf, but the 2 lateral ones are naked. Leaves 2-3 inches long. Leaf of calyx hardly an inch long, white, sometimes ovate, and sometimes subcordate.

Very-white-leaved Calycophyllum. Tree 20 feet.

2 C. occesi'num (D. C. prod. 4. p. 367.) leaves elliptic-lanceolate; corymbs axillary, disposed in an elongated panicle; limb of calyx bluntly 5-toothed; corolla somewhat funnel-shaped, glabrous. ë. S. Native of the island of Trinidad. Macrocnêmum occesi'num, Vahl, symb. 2. p. 38. t. 29. Musse'nda occesi'na, Poir. dict. 4. p. 395. Leaves a foot long and a hand broad. Flowers crowded, few, bearing each an oval-oblong, purple or scarlet calyce leaf, which is about 6 inches long.

Scarlet-leaved Calycophyllum. Cité 1823. Tree 20 feet.

3 C. tubulosum (D. C. prod. 4. p. 367.) leaves oval, acute at the base, acuminate at the apex, clothed with fine velvety down on both surfaces; panicles terminal; limb of calyx bluntly 5-toothed; corolla tubular, pubescent on the outside; large lobe of calyx petiolar, obicular and pubescent on the nerves and veins. ë. S. Native of Brazil. Macrocnêmum tubulosum, A. Richard, in herb. mus. par. Capsule ovate, truncate, dehiscing from the apex to the base at the dispersion. Anthers exerted. Filaments joined together beyond the middle into a tube.

Tubular-stamened Calycophyllum. Tree.

Cult. Like Musse'nda this genus is remarkable for the large coloured segment of the calyx, which see for culture and propagation, p. 492.

Tribe II.

GARDENIA'CEÆ (this tribe agrees with the genus Gardenia in important characters). A. Rich. dis. p. 108. D. C. prod. 4. p. 367.—Gardeniæ and Coccyxœâæ, Cham. et Schlécht. in Linnaeâ. 4. p. 138. and 197. Fruit baccate, 2-celled, or from abortion only 1-celled; cells many seeded. Alumum fleshy, Seeds not winged.—Trees or shrubs, with opposite leaves, and interpetiolar stipulas.

Subtribe I. Sarcoc'ephallæ (agreeing with Sarcocéphalus in the fruit being combined and fleshy). D. C. prod. 4. p. 367. Flowers collected into a bracteated head (f. 90. a.), sessile upon the receptacle. Fruit combined (f. 90. b.).

XXI. SARCOC'EPHALUS (from σάρξ, σαρκος, sarx sarkos, fleshy, and κεφαλι, kephale, a head; in allusion to the fruit being combined into a fleshy head). Afz. in herb. Banks, Sabin. hort. trans. 5. p. 442. t. 18. D. C. prod. 4. p. 367.—Cephalina, Thonn. in Schum. pl. guin. p. 105.

Lin. syst. Pentândria, Monogyniâ. Flowers 5-6-parted, sessile upon the globose receptacle (f. 90. a.), which with the calyces are combined into a globose fleshy mass. Limb of calyx with a very short margin. Corolla funnel-shaped, 5-cleft: lobes erect, obtuse. Anthers sessile in the throat of the corolla. Style exerted; stigma oblong, capitate, undivided. Berries 1-celled? many seeded, the whole combined into one mass (f. 90. b.), which is areolate from the margins of the calyces. Seeds small, somewhat kidney-shaped.—A spreading branchy shrub. Leaves opposite, on short petioles, roundish-oval, acute, shining above, and pubescent in the axils of the veins beneath. Stipulas solitary on each side, triangular, undivided, almost concrete at the base. Heads terminal, on short peduncles or sessile, about the size of a peach. Flowers rose coloured or yellowish.

1 S. escu'entus (Sabin. in hort. trans. 5. t. 18.) Native of Guînea, in many parts, as of Sierra Leone and Câhibia. Lindl. bot. reg. t. 1827. Cephalina scândens, Thonn. in Schum. pl. guin. 105. Naîceâa latîfòlia, Smith in Rees' cyc. 24. no. 5. The heads of fruit are edible, and by the negroes of Sierra Leone called peach; they are brown when ripe. Cephalina scândens of Schum. is probably a distinct species, as the Sierra Leone plant does not climb at all. (f. 90.)

Cult. A mixture of loam and peat is the best soil for this plant; and cuttings are easily rooted in the same kind of soil under a head-glass, in heat. The shrub requires to be kept in a strong heat, or it will neither flower nor fruit.

XXII. ZUCCARIN'IA (J. G. Zuccarini, a professor in the academy at Monach; author of some papers in the transactions of that academy). Blum. bijdr. (1826.) p. 1905. but not of Spreng. (1827.)

1 Z. macrophylla (Blum. l.c.) ë. S. Native of the west of Java, in woods on the mountains, where it is called Kibara. Leaves more than a foot long.

Long-leaved Zuccarina. Tree.

Cult. See Sarcocéphalus above for culture and propagation.

XXIII. LUCINE'EA (Lucina is one of the names of Juno or Diana). D. C. prod. 4. p. 368.

Lin. syst. Tetran'ária, Monogyniâ. Flowers combined into a dense head. Margin of calyx entire. Corolla funnel-shaped,
—A glabrous somewhat dichotomous shrub. Leaves petiolate, ovate, acuminate, smooth, coriaceous. Stipulas short, interpetiolar. Axillary peduncles opposite, but the terminal ones are subumbellate. Heads few-flowered. This genus differs from *Morinda* in the fruit being many seeded, not 1-seeded.

*Morinda*-like Luciencæ. Shrub cl.

Cult. See *Sarcocéphalus*, p. 487. for culture and propagation.

Lin. syst. *Penta-Hexandria*, *Monogynia*. Calyx with an obvate tube, a 5-6-toothed limb; and triangular, lanceolate, blunting, rather concave teeth. Corolla with a campanulate tube, and a 5-6-lobed spreading limb. Anthers 5-6, oblong, almost sessile, not exerted. Stigma bifid. Fruit bacate? 2-celled; cells many seeded. Seeds compressed, imbricated, inserted in an axillary spongy receptacle. The fruit, according to A. Rich. l. c., is pea-formed, crowned, and 2-seeded.—A glabrous shrub, native of Madagascar. Leaves elliptic, coriaceous. Stipulas solitary on both sides, triangular, acute. Flowers on the top of dilated peduncles, or sessile on the tops of the branches, intermixed with distinct scales, girded by a tubular toothed involucrem. This genus appears to be intermediate between the subtribes *Sarcocéphaleæ* and *Gardenieæ*.

1 C. *Axilla’s* (Lam. ill. t. 151. f. 1.) leaves elliptic, acute, on short petioles; peduncles axillary, thickened from the base to the apex, ending in a 5-6-lobed cupula at the apex, which bears the flowers. Ë. S. Native of Madagascar, where it is called *Allou-gala-lay* by the natives. Poir. suppl. 2. p. 77. exclusive of the diagnosis.

Axillary-flowered Canephora. Shrub.

Cult. See *Sarcocéphalus*, p. 487. for culture and propagation.

Subtribe II. Gardenieæ (containing shrubs agreeing with the genus *Gardenia* in having distinct flowers). D. C. prod. 4. p. 568. Flowers distinct, never combined into a head.

Lin. syst. *Pentandria*, *Monogynia*. Limb of calyx tubular, terete, 6-toothed, falling off very slowly. Corolla salver-shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb; lobes oblong. Anthers 6, inclosed, linear. Stigma clavate. Berry obovate-oblong, corticate, arculate at the apex, 3-2-celled. Seeds disposed in 2 rows in each cell, flat, depressed, nearly orbicular, separated from each other by small horizontal dissepiments.—Trees or shrubs, natives of South America. Leaves opposite or 3 in a whorl, on short petioles, nerved, glabrous. Stipulas oblong, deciduous. Flowers almost sessile, disposed in corystums at the tops of the branches.

Perhaps the fruit is at length 1-celled, from the dissepiment having vanished, ex Aubl.

1 A. *Guianæ’nis* (Aubl. guian. suppl. p. 13. t. 375) branchlets triquetrous, furrowed, clothed with adpressed pubescence; leaves usually 3 in a whorl, broad-elliptic, acuminate, nerved; flowers crowded, almost sessile; limb of calyx tubular, elongated. Ë. S. Native of Cayenne. The leaves in the specimens examined are all 3 in a whorl, but are sometimes op-
posite according to Desfontaines, mem. mus. 6. p. 12. t. 4.
Hamelia sessiliflora, Wildl. spec. 1. p. 981. Hameia glabra, Lam. dict. 3. p. 65. Duhamelia glabra, Pers. ench. 1. p. 203. Berry obovate, arculate at the apex, from the calyx having fallen off, 2-3-celled; cells bearing each 2 rows of seeds, and distinct sepal; hence the fruit appears 4-6-celled at first sight in the dry state.

Guiana Amiaou. Shrub 4 to 6 feet.
2 A. Fagiellia (Desf. mem. mus. 6. p. 14. t. 5.) branchlets nearly terete, smoothish; leaves opposite, oblong, acuminate, much nerved; corymbs of flowers on short peduncles; flowers crowded, almost sessile; limb of calyx tubular, short. h. S. Native of Cayenne. Fruit unknown.

Beach-leaved Amiaou. Shrub 4 to 6 feet.
3 A. INTERM?DIA (Mart. in Schultes, syst. 7. p. 90.) branches terete, glabrous; leaves opposite, oblanceolate, attuned at both ends, ciliated; flowers crowded, almost sessile, silky; upper 2 stipules forming an involucrum to the head of flowers. h. S. Native of Brazil, in the province of Bahia, in woods.

Intermediate Amiaou. Shrub 4 to 6 feet.
4 A. corymbosa (H. B. et Kuntth, nov. gen. amer. 3. p. 419. t. 299.) branchlets almost terete, smoothish; leaves opposite, ovate-elliptic, nerved, acuminate; corymbs panicked, pedunculate; limb of calyx tubular, short. h. S. Native of New Andalusia, near Cumanacoa, in bushy shady places. Desf. mem. mus. 6. p. 15. Hexactina corymbosa, Wildl. rel. ex Schlecht. in Schultes, syst. 1. e. Peitole 6-10 lines long. Fruit unknown. Flowers by threes.

Corymbose-flowered Amiaou. Shrub 8 to 9 feet.
5 A. PERUVIANA (Desf. mem. mus. 6. p. 16. t. 4. f. B.) leaves opposite, elliptic, nerved, acuminate, shining on the upper surface; flowers aggregate, corymbose. h. S. Native of Peru. Said to be nearly allied to the preceding.

Peruvian Amiaou. Shrub 4 to 6 feet.
6 A. ? Saccifera (Mart. in Schultes, syst. 7. p. 91.) branches angular and slightly curved at the apex; leaves 3 in a whorl, obturate-lanceolate, attenuate at the base, sessile, smooth, hairy, costate nerved; flowers terminal, crowded, on short peduncles; calyx elongated. h. S. Native of Brazil, in woods, at Barra do Rio Negro, where it is called by the natives Folko de Cominato and Coa-Jusara.

Sack-bearing Amiaou. Shrub 4 to 6 feet.
7 A. Brasiilia'na (A. Rich. dios. ex D. C. prod. 4. p. 370.) plant suffrutescent, creeping; branches assurgent; leaves elliptic, acuminate; flowers small, disposed in crowded corymbs; segments of corolla very short. h. S. Native of Brazil.

Brazilian Amiaou. Shrub creeping.

 Cult. See Mussaenda, p. 492. for culture and propagation.

Lin. syst. Pentandria, Monogynia. Calyx with an obovate-turbinate tube, a 5-parted limb, and deciduous erect acute lobes, one of which is usually drawn out into a large petiole, reticulately nerved, coloured leaf. Corolla tubular-shaped, with a 5-parted limb, and a villous throat. Anthers 5, sessile within the tube, linear, inclosed, and sometimes a little exserted. Stigma bifid. Fruit ovoid, fleshy, naked at the apex from the limb of the calyx being deciduous, indescent, 2-celled; cells many seeded. Placentas pedunculate, bifid at the apex, rising from the dissepiment, and appearing like a Burgundian cross. Seeds very numerous, small, lenticularly compressed, scabrous. Embryo in fleshy albumen, with the radicle thick, and turned towards the

hylum.—Small trees or shrubs. Leaves ovate, petiolate, villous or glabrous. Stipulas twin on both sides, free or combined at the base, acuminate. Flowers corymbose, terminal. Branches small under the pedicels or branches of the corolla, and ought to be cautiously distinguished from the large coloured calyces lobes.

Sect. I. Belilla (the name of one of the species in Malabar). Rheed, mal. and Adams. One of the calyces lobes is always drawn out into a large coloured reticulately veined bractea-formed leaf, which has been through want of proper caution taken for, and called bractea. Anthers sessile within the tube of the corolla, inclosed. Capsule ovate.

1 M. speciosa (Poir. suppl. 4. p. 37.) leaves broad-oval, acute, rather villous at the nerves and veins above, pubescent beneath; teeth of calyx obtuse, one of which is usually petiolate, large, and coloured; corolla tubular, with obtuse lobes. h. S. Native of South America, in Caracas. Macrogynum speciosum, Jacq. hort. schembr. 1. p. 19. t. 49. The bractea-formed calyces leaves are rose coloured. Corymbs fastigate, rather villous; bractea subulate. Style exerted. Anthers inclosed. Corolla villous on the outside, an inch long, with a rose-coloured limb.

2 M. ACUTIFLORA (Bartl. in Hanke, herb. ex D. C. prod. 4. p. 370.) leaves oval, acuminate, acute at the base, glabrous, except the nerves and veins, which are pubescent on the under surface; corymbs trichotomous pubescent; teeth of calyx acute, one of which is usually large, petiolate, ovate, and coloured; corolla tubular, with acute lobes. h. S. Native of Mexico. Stipulas villous on the outside, bidentate, acuminate, and deciduous. The large calycine leaf is 5-nerved and acuminate. Perhaps only a variety of M. speciosa.

Acute-flowered Mussenda. Shrub 5 to 6 feet.

3 M. FRONDOSA (Lin. spec. 251.) leaves oblong, acuminate, villous; branchlets and corymbs downy; stipulas subulate; corymbs terminal, dichotomous, somewhat panicled; lobes of calyx elongated, subulate, one of which is petiolate, ovate, acuminate, membranous and puberulous. h. S. Native of the East Indies, Java, Malabar, &c. Belilla, Rheed. mal. 2. p. 27. t. 17. M. Zeyllánica, Burt. zeyl. 163. t. 76. M. formosa, Lin. mant. p. 338. M. frondosa, Roxb. et Wall. in fl. ind. 2. p. 227. Lam. ill. t. 157. f. 1. Flowers of a deep golden colour. The bractea-formed leaf of the calyx is 2 inches long and white.

4 M. GLABRA (Vahl. symb. 3. p. 38.) leaves oval, acuminate at both ends, glabrous on both surfaces, as well as the branches; corymbs terminal, smoothish; segments of calyx subulate, acute, one of which is large, petiolate, glabrous, and acute. h. S. Native of the East Indies. Lodd. bot. cab. t. 1269. Fólium Principissae, Rumph. amb. 4. t. 51. Flowers yellow. The bractea-formed leaf of the calyx is about 4-5 inches long, white.

5 M. CALYCINA (Wall. cat. no. 6253.) leaves ovate or oblong, acuminate, tapering to both ends, almost glabrous, except on the nerves; stipulas villous, cuspitate at the apex; calyxes downy; segments large, ovate, cuspidate; the large foliaceous segment petiolate, ovate, elliptic, acuminate, yellow; young branches and peduncles villous; peduncles terminal and axillary, corymbose, or trichotomous, bearing a single flower in each fork; fruit turbinate. h. S. Native of the East Indies, in the Burmese empire, on Mount Taung Dong, and at Prome. Flowers yellow.

Large-calycine Mussenda. Shrub 5 to 6 feet.
6 M. Villo'sa (Wall. cat. no. 624.) leaves oblong, acuminate.
ated, tapering at the base, on short petioles, hispid from villi on both surfaces; petioles, young branches, and peduncles very villous; stipular linear-lanceolate, cuspitate, very villous; corymb terminal, chlamydeous; calyx villous: segments linear: the large, foliaceous segment petiolate, elliptic, yellow.  h. S. Native of Penang.  Flowers yellow.

Villous Mussendana.  Shrub 4 to 6 feet.

7 M. Sumatraeus (Roth, nov. gen. et spec. p. 152.) leaves elliptic, tomentose on the under surface, as well as the petioles and branches; corymbs terminal; bracteole-formed leaf of calyx roundish, pubescent, reticulately veined.  h. S. Native of the East Indies.

Sumatra Mussendana.  Shrub 5 to 6 feet.

8 M. acumina (Blum. bijdr. p. 986.) leaves lanceolate, acuminate at both ends, pubescent on the mid-rib on both sides; corymbs terminal, chlamydeous, pubescent: lobes of calyx linear, acuminate: one of which is drawn out into an elliptic-oblong leaf.  h. S. Native of Java, at the head of the river Tjikimdul, on Mount Gede.

Acuminated-leaved Mussendana.  Shrub 5 to 6 feet.

9 M. hispida (D, Don, prod. fl. nep. p. 139.) leaves oval, acuminate, pilose; branchlets hispid; pedicels and calyces very bristly; stipular lanceolate; segments of calyx ovate, acute: one of which is petiolate, ovate, acuminate, hispid on the petiole and villous on the nerves.  h. G. Native of Nepal, at Narainbhetty.  The lobes of the corolla are rounded and mucronate.  It comes near to M. frondosa, but the leaves of that species are crenate from tomentum beneath, and the segments of the calyx are linear and elongated.

Hispid Mussendana.  Shrub 5 to 6 feet.

10 M. krythophylla (Schum. pl. guin. p. 116.) branches velvety from short soft down; leaves ovate, cuspitate, pubescent above, and villously tomentose beneath; stipulas villous, deciduous; corymbs terminal, chlamydeous, villous; calyce segments subulate: one of which is large, petiolate, ovate-acuminated, and very villous; tube of calyx hispid.  h. S. Native of Guinea, where it was collected by Thonning.  The bractea-formed calyce segments are 4-5 inches long, and 2 inches broad, 5-nerved, and of a reddish colour.  Corolla hardly twice the length of the calyx.  Habit of M. frondosa, under which name it was received from Puerari.

Red-leaved Mussendana.  Shrub 5 to 6 feet.

11 M. lutetoliana (Delin. in Caill. pl. afr. p. 65. t. 1. f. 1. Caill. voy. t. 63.) leaves almost sessile, ovate-lanceolate, acute, nerved, and tomentose beneath; stipulas twin on each side, lanceolate-subulate; corymbs terminal, chlamydeous; calyce teeth subulate: one of which is often petiolate, oval, and acute.  h. G. Native of Arabia, on the mountains of Hadie and elsewhere; and about Singue in Nubia.  Ophioliriza lanceolata, Fosk. egyp. arab. p. 42. Manettia lanceolata, Vahl, symb. 1. p. 12. Mussendana lanceolata, Spreng. syst. 1. p. 705. but not of Poir.  The bractea-formed calyce leaf is yellowish, as well as the flowers.  Corolla an inch long, slender.

Yellow-bractea Mussendana.  Shrub 5 to 6 feet.

12 M. iserti (D. C. prod. 4. p. 871.) leaves elliptic, on short petioles, and as well as the branches glabrous; flowers disposed in corymbose panicles; pedicels and corollas clothed with canescent villi; bractea-formed calyce lobes large, roundish, and glabrous.  h. S. Native of Guinea, where it was collected by Isert.  M. macrophylla, Schum. pl. guin. 118. but not of Wall.

Isert's Mussendana.  Shrub 5 to 6 feet.

13 M. arzelnii; every part of the shrub is villous; leaves ovate-lanceolate: having the veins clothed with rusty hairs beneath, as well as the petioles; corymb panicled, crowded; bractea-formed calyce segment large, white, and villous; capsules villous.  h. S. Native of Sierra Leone, by the sides of rivulets, among other bushes.  Flowers yellow.

Afzelia's Mussendana.  Shrub 4 to 6 feet.

14 M. pubescens (Art. hort. kew. ed. 2. vol. 1. p. 372.) leaves ovate-oblong, acuminate, pubescent on the nerves; stipulas twin on each side, subulate; corymbs terminal; calyce lobes subulate: one of which is petiolate, ovate, and acute; corolla with a slender tube, and acute lobes.  h. G. Native of China, where it is called Cam mun fa.  M. pubescens, Sims. bot. mag. 2099. Loddis. bot. cab. t. 451. but not of Humb. et Bonpl.  Corollas small, yellow, clothed with adpressed down on the outside.  The branches are rather scendent, and the bractea-formed calyce segments are white.

15 M. variosdora (Wall. cat. no. 6259.) branches and peduncles hispid and warded; leaves elliptic-lanceolate, hispid from stiff hairs on both surfaces, as well as on the petioles; corymbs chlamydeous, terminal; the large foliaceous segments of the calyx roundish, mucronate, triple-nerved, somewhat coriaceous, and sometimes cuneated at the base, white; fruit roundish, not crowned, warded; calyce teeth short.  h. S. Native of the East Indies, at Amherst, Chappedong, and Tavoy.

Warted-fruited Mussendana.  Shrub 5 to 6 feet.

16 M. cordylosa (Roxb. fl. ind. 2. p. 226.) leaves oblong, pointed, and are as well as the branches smooth; corymbs terminal, smooth; stipulas coriaceous at the base, and cuspitate at the apex; calyx segments cuneate: the bractea-formed one ovate-lanceolate; lobes of corolla ovate, acute.  h. S. Native of Ceylon, Malabar, and other parts of the East Indies.  The bractea-formed calyce segment is white, and the border of the corolla orange-coloured, but greenish underneath.  In some parts of India the white floral leaves are brought to table as an excellent herb.

Coryllosa-flowrered Mussendana.  Shrub 5 to 6 feet.

17 M. macrophylla (Wall. in Roxb. fl. ind. 2. p. 228.) branchlets beset with soft silky hairs; leaves ovate, acuminate, pubescent; stipulas broad-ovate, bifid, acuminate and recurved at the apex; corymbs terminal, chlamydeous, very pilose, on short peduncles; calyce segments foliaceous, broad, oblanceolate; bracteae large, very hairy.  h. S. Native of Nepal, on the mountains of Chundugiri and Nagaroon.  Branches tetragonal, brown.  Leaves green above and pale villous beneath.  Stipulas nearly twice as long as the petioles.  Corinmy shorter than the uppermost pair of leaves.  There are generally 3 floral leaves in each corymb, which are snow white, and 2-3 inches long.  Bracteae large under each division of the inflorescence.  Flowers large, orange-coloured, hairy outside.  Berries dark purple, hairy, size of a marrowfat pea.

Long-leaved Mussendana.  Shrub 5 to 6 feet.

18 M. Wallichii; leaves long, elliptic, tapering much to both ends, acuminate, quite glabrous; corymbs glabrous, tri- chomatous, terminal; the large petiolar calyce leaflets glabrous, triple-nerved, white, acuminate; fruit roundish, crowned by the calyce segments, which are linear.  h. G. Native of the East Indies, at Tavoy and Rangoon.  M. longifolia, Wall. cat. no. 6258., but not of Lam.

Wallieh's Mussendana.  Shrub 6 to 8 feet.

19 M. incana (Wall. in Roxb. fl. ind. 2. p. 229.) shrub hoary in every part from adpressed soft hairs; leaves ovate-oblong, almost sessile, white beneath; stipulas broad at the base, lanceolate at the apex, adpressed; corymb terminal, sessile, fasciculate, few-flowered; bracteae linear-subulate; bractea-formed segment of the calyx large, ovate, petiolate, and acuminate.  h. G. Native of Nepal, towards Gosaingthang.  Root simple, slender.  Stem about the thickness of a goose quill, undivided, though seldom with 1 or 2 slender alternate
braches. Leaves rather longer than the interstices, which are pretty equal, about 5-6 inches long, villous above. Stipulas about the length of the petioles, furnished with a number of glands inside on the lower part. Corymba very hairy. Floral leaves subcordate, milk white, downy. Tube of corolla very long, hairy.

_Hoary Mussenda._ Shrub 2 to 3 feet.

20 _M. ceriophylla_ (D. Don, prod. fl. nep. p. 139.) leaves cuneate-oblong, acuminate, downy on both surfaces as well as on the branches; stipules lanceolate, acuminate; corollas terminal, bracteas lanceolate; calyx segments linear, acute, 5 times shorter than the corolla: one of which is bracteato-formed, petiole, oval, acuminate; tube of corolla villous. _f._ G. Native of Nipal. The large calyceine segment is probably white, and the flowers are probably yellow.

_Wedge-leaved Mussenda._ Shrub 4 to 6 feet.

**Sect. II. L. Andia (M. De la Land, a correspondent of the Museum of Natural History at Paris).** Comm. herb. D. C. prod. 4. p. 372. Lobes of calyx equal or nearly so: having none of the segments expanded into bracteate-formed leaves. Capsule naked at the apex, not crowned by the calyx. Leaves opposite.

21 _L. Andia_ (Lam. ill. t. 157. f. 2. Poir. dict. 4. p. 392.) leaves ovate, acuminate, clothed with villous pubescence on both surfaces; branches, petioles, coryms and corollas villous; lobes of calyx equal, triangularly lanceolate, 12 times shorter than the tube of the corolla. _f._ S. Native of the Mauritius, where it is called Quinquina indigene, or Indigenous Peruvian bark, and is used in the cure of fevers. M. latifolia, Poir. suppl. 4. p. 36. dict. scient. nat. 53. p. 452. Rodelinia L.ндia, Spreng. symb. 1. p. 707. M. holosericea, Smith, in Rees' cyc. vol. 24. no. 6. Bracteas linear, acute. Corolla an inch long, hairy outside.

22 _M. uniflora_ (Wall. cat. no. 6261.) young branches, tube of corolla, calyxes, and fruit villous; leaves small, rather villous, roundish, acute, running down the petioles at the base; stipulas villous, narrow; calyceine segments subulate; corolla with a long tube and a spreading limb; flowers solitary, terminal. _f._ S. Native of the East Indies, at Tavoy. Flowers as large as those of the common jasmine, probably white.

_One-flowered Mussenda._ Shrub 1 to 2 feet.

23 _M. Stadmani_ (Michx. med. ex Bory in litt. D. C. prod. 4. p. 372.) leaves oval, ending in short cuspitate points, hardly pubescent, unless on the nerves; branches, coryms, and corollas pubescent; lobes of calyx equal, elongated, lanceolate, 6 times shorter than the tube of the corolla. _f._ S. Native of the Mauritius. Oxylanthus cymosus, Reichb. in Sieb. fl. maur. excis. 2. no. 78. M. Ländia, Smith, in Rees' cyc. vol. 24. no. 5. Tube of corolla 1½ inch long, as in _L. Andia._ The lobes of the calyx are 3 lines long in the present plant, while in that of _L. Andia_ they are hardly a line and a half long.

_Stadmann's Mussenda._ Shrub 4 to 6 feet.

24 _M. arcuata_ (Lam. dict. 4. p. 392.) leaves oval-oblong, acuminate, rather pilose on the nerves beneath; branchlets, coryms, and corollas pubescent; lobes of calyx linear-subulate, a little unequal; tube of corolla very villous inside. _f._ S. Native of the Mauritius. Sieb. fl. maur. excis. 2. no. 78. Ländia stelligera, and Ländia astrographica. Comm. ex herb. mus. Paris. The flowers are yellow, and when immersed in water tinged it with the same colour. Limb of corolla glabrous outside. Branches arching.

_Arch-branched Mussenda._ Clt. 1822. Shrub 4 to 5 feet.

25 _M. tomentosa_ (Wall. cat. no. 6265.) branches downy; leaves elliptic or ovate-elliptic, acute, clothed with white woolly down on both surfaces; calyx downy, with subulate segments; stipulas subulate, twin on both sides; tube of corolla long, slender, hairy, with a broad, spreading border; berries roundish, crowned by the calyceal teeth; coryms terminal, trichotomous. _f._ S. Native of the East Indies, on the Gingee mountains. Flowers apparently white, as large as those of jasmine.

_Tomentose Mussenda._ Shrub 4 to 6 feet.

26 _M. elegans_ (Schum. pl. guin. p. 117.) leaves oval, ending in short cuspitate points, and are as well as the branches glabrous; coryms terminal, trichotomous, pubescent; segments of calyx linear, spreading a little; tube of corolla very hispid, but the lobes are glabrous. _f._ S. Native of Guinea, where it was collected by Thonn. _M. discolor._ Thonn. in Herb. Vahl, ex Puerari. Very distinct from _M. discolor._ Willd.

_Elegant Mussenda._ Shrub 4 to 6 feet.

27 _M. cordifolia_ (Wall. cat. no. 6260.) glabrous in every part; leaves ovate-oblong, acuminate at the apex and coriaceous at the base, glabrous, coriaceous, on short petioles; coryms trichotomous, terminal; berries turbinate, not crowned. _f._ S. Native of Pulo Penang.

_Heart-leaved Mussenda._ Shrub 5 to 6 feet?

28 _M. farvra_ (Wall. cat. no. 6261.) branches and leaves rather hispid from scattered hairs; leaves ovate-lanceolate, acuminate, tapering to both ends; stipulas subulate; coryms terminal, crowded; tube of corolla very long, slender, rather swollen near the top; calyceine segments linear. _f._ S. Native of the East Indies, at Tavoy. _M. angustifolia._ Wall. mss. Apparently a rambling, small shrub.

_Small Mussenda._ Shrub rambling.

29 _M. sericea_ (Blum. bidr. p. 986.) leaves ovate-oblong, acuminate, attenuated at the base, glabrous, except on the veins underneath; branches silky; coryms terminal, trichotomous, silky. _f._ S. Native of the Moluccas. Segments of calyx-linear-lanceolate, silky, all equal. Tube of corolla elongated, densely tomentose.

_Silky Mussenda._ Shrub 4 to 6 feet.

30 _M. repens_ (Wall. cat. no. 6263.) root creeping; leaves elliptic, acuminate, rather hispid; petioles, young branches, and coryms clothed with brown villi; stipulas subulate, villous; coryms terminal; calyx downy, with linear-subulate segments; corolla long, slender, swelling a little near the top. _f._ S. Native of Silhet. The leaves oppose each other are unequal in size.

_Creeping Mussenda._ Pl. ½ to 2 feet.

**Sect. III. C. anthe (from antis, to burn or rip, and anthes, a flower; the flowers of the species are deprived of the large calyceine leaves)._ D. C. prod. 4. p. 372. Lobes of calyx equal, all large or setaceus, permanent, therefore the fruit is crowned. Leaves 3 in a whorl. Stipulas broad at the base, acute at the apex, adpressed, coriaceous.—Species natives of Madagascar. Perhaps a proper genus.

31 _M. citriophylla_ (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, ovate, almost sessile, coriaceous, and are as well as the branches glabrous; stipulas broad at the base, acute, short, coryms terminal; lobes of calyx linear. _f._ S. Native of Madagascar. Habit of Rauwolfia. Corolla small, yellow.

_Citron-leaved Mussenda._ Shrub 5 to 6 feet.

32 _M. longirifolia_ (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, lanceolate-oblong, rather tomentose from short down; stipulas broad at the base, acute; coryms terminal; lobes of calyx setaceous; capsule ribbed. _f._ S. Native of Madagascar. Very similar to the preceding species. Leaves green above and whitish beneath. Fruit pyriform, with 5 or 10 longitudinal ribs.

_Long-leaved Mussenda._ Shrub 5 to 6 feet.

3 R 2
33 M. ? glomerulata (Lam. in Poir. dict. 4. p. 393.) leaves ovate, acute, smoothish beneath, but clothed with fuscous velvety down above and on the petioles; branches rather villous; flowers terminal, glomerulate; calyx campanulate, with a 5-6-toothed limb. \( \beta \). S. Native of French Guiana. Rodelétia glomerulata, Spreng. syst. 1. p. 707. Peduncles and calyces beset with white silvery hairs. Corolla tubular, white, rather villous outside. Stamens 5-6.

Glomerate-flowered Mussenda. Shrub 5 to 6 feet.

34 M. discolor (Pet. Th. in Wildl. rel. ex Schultes, syst. 5. p. 254.) hairy; leaves scabrous, stirigose above, and clothed with canescent pili beneath; flowers corymbose, permanent. \( \beta \). S. Native country unknown, as well as flowers.

Two-coloured-leaved Mussenda. Shrub.

35 M. ? Chiná'zasa (Lour. coch. p. 152.) leaves in fascicles, lanceolate, glabrous; flowers solitary, terminal; berries 4-celled, many-seeded. \( \beta \). G. Native of China, in the suburbs of Canton. Calyx 5-parted, with lanceolate segments. Seeds borne, almost kidney-shaped. This is certainly not a species of Mussaenda.

China Mussenda. Shrub 5 to 6 feet.

36 M. echinoides (Wildl. rel. in Schultes, syst. 5. p. 251.) leaves oblong, acute, glabrous; flowers corymbose. \( \beta \). \( \sigma \). Native country unknown. A climbing shrub.

Echitis-like Mussenda. Shrub cl.

37 M. tetraédra (Schultes, syst. 5. p. 254.) leaves smooth, glabrous, acute; coryms triplicate; flowers tetrandrous. \( \beta \). S. Native country unknown. Macrénömum tetraérdum, Cav. ann. sc. ex Schultes.

Tetrandrous-flowered Mussenda. Shrub.

Cult. Some of the species of this genus are very pretty, and worth cultivating in collections. A mixture of loam and peat is the best soil for them; and cuttings are easily rooted in the same kind of mould under a hand-glass, in heat.

XXVIII. KUTCHUBE'A (named after — Koutchouba, minister of the home department of Russia; a promoter of the sciences). Fisch. in litt. ex D. C. prodr. 4. p. 378.

Lin. syst. Octándria, Monogynía. Calyx with a turbinate tube, and a tubular truncate limb, which is longer than the ovary. Corolla with a cylindrical tube, much longer than the calyx, a villous throat, and an 8-parted limb, which is twisted in rotation; segments of corolla lanceolate, acuminate. Anthers 8, almost sessile, oblong, acute, inserted in the throat of the corolla among the hairs. Style filiform; stigma large, clavate, with 2 lobes, which are applied to each other, hairy and convex on the outside, but flat and smooth on the inside. Fruit unknown.—A glabrous tree, native of Guiana. Branches terete. Leaves obovate, bluntish, on short petioles. Stipulas ovate, broad, short, combined, permanent, sometimes bifid. Flowers terminal, somewhat corymbose, pedicellate, large, bracteolate. Corolla purple at the base and pale at the apex.—This genus comes very near Genipa and Cassipa; from the first it differs in the tube of the corolla being much longer than the calyx; and from the second in the calyx being tubular, and in the stigma being clavate; and from both in the greater number of the parts of the flower.

1 K. rysin'um (Fisch. 1. c. with a figure). \( \beta \). S. Native of French Guiana, where it was collected by Martin. A tall elegant tree. Tube of corolla 2 inches long, coriaceous.

Famous Kutchubea. Tree.

Cult. For culture and propagation see Mussaenda above.

Lin. syst. Hezândria, Monogynía. Calyx with a globose tube and a short entire hardly perspicuous limb. Corolla much longer than the calyx, tubular, wrinkled on the outside, with a villous throat, and a 6-parted short limb; lobes acute and spreading a little. Anthers 6, almost sessile, inserted in the throat of the corolla among the villi. Stigma bifid, slender, inclosed. Berry almost globose, crowned, 2-celled, many-seeded; placenta fixed to the middle dissepiment. Seeds minute.—An American tree. Leaves obvate-oblong, on long petioles, coriaceous, rather tomentose, about a foot long. Thyrse panicled, terminal, with opposite flowers. Bracteoles 2-3 each under each flower, sometimes adnate to the calyx. Corolla 1-2 inches long, pale red.

1 C. verrucosa (Humb. et Bonpl. l. c.). \( \beta \). S. Native of South America, in shady places on the banks of the Rio Negro, near San Carlos. H. B. et Kuth, nov. gen. Amer. 3. p. 412. Warted Cassupa. Tree 30 to 40 feet.

Cult. See Mussaenda above for culture and propagation.

Lin. syst. Pentándria, Monogynía. Limb of calyx turbinate, urceolate, almost quite entire, deciduous. Corolla with a short tube, a 5-parted spreading limb, and a bristly throat. Stamens 5, seated in the mouth of the tube; filaments short; anthers linear, rather incumbent, exserted. Style short; stigma thick, 2-lobed, exserted. Berry globose, umbonate, crowned by the circular base of the calyx, 2-celled, many-seeded; placenta membranous, stipitate, rather fleshy, transversely lamellate. Seeds compressed.—Climbing shrubs, natives of Java. Leaves distich. Stipulas interpetiolar, undivided, or twin and rather concrete. Flowers rising from the axis of the leaves in dense coryms, unilateral.—This genus comes near to Canthium and Bertiera, but differs from them in the uniovular limb of the calyx, and in the short tube of the corolla.

1 G. acumina (Blum. l. c.) leaves ovate or elliptic-oblong, acuminate, almost sessile, glabrous; cymes short, interfoliaceous; pedicels numerous, 1-flowered. \( \beta \). \( \sigma \). Native of Java, on the west side, on the mountains. Leaves 7-8 inches long.

Acuminated-leaved Gynopachys. Shrub cl.

2 G. tomástica (Blum. l. c.) leaves sessile, rather cordate-oblong, acuminate, shining above, but clothed with deciduous rufous tomentum on the veins beneath and on the coryms, which are dichotomous and interfoliaceous. \( \beta \). \( \sigma \). Native of Java, on Mount Burangrang, in woods.

Tomástica Gynopachys. Shrub cl.

3 G. corymbosa (Blum. l. c.) leaves almost sessile, elliptic-oblong, bluntnet, glabrous; coryms trichotomous, interfoliaceous, divaricate. \( \beta \). \( \sigma \). Native of Java, on Mount Salak, in woods. Throat of corolla beset with yellowish rufous breasts. Fruit globose, size of a pea.

Corymbose-flowered Gynopachys. Shrub cl.

Cult. See Mussaenda above for culture and propagation.

Lin. syst. Pentándria, Monogynía. Calyx with a turbinate tube, and a very short 5-toothed limb. Corolla with a very
long tube, a naked dilated throat, and a 5-parted spreading limb; the lobes obulate. Anthers rising from the throat of the corolla, exerted, linear-sagittate, furnished each with a blunt appendage at the base. Style filiform, fusiform at the apex; stigma clavate, bilamellate. Berry rather fleshy, 2-celled, crowned. Seeds numerous, roundish-ovate, imbedded in soft pulp.—Unarmed shrubs or undershrubs. Leaves opposite, on short petioles. Stipulas triangular or ovate. Flowers terminal, corymbose.

1 T. longifolia (Aubl. guian. 1. p. 131. t. 50.) stem tetragonal, quite simple; leaves lanceolate-oblong, acuminated at both ends, glabrous; flowers almost sessile, aggregate. h. S. Native of French Guiana, at Arauca. Lam. ill. t. 163. f. 1. Ucriana speciosa, Wildl. spec. 1. p. 961. Tocoyena longifolia, Poir. dict. 7. p. 602. but not of Kunt. Leaves a foot long, and 4-5 inches broad. Corolla 5-9 lines long, with the tube yellow, and the limb white. Stipulas triangular.

Long-flowered Tocoyena. Clt. 1826. Shrub 3 to 6 feet.

2 T. macrophylla (H. B. et Kunth, nov. gen. amer. 3. p. 412.) branches tetragonal; leaves broad-ovate, short-acuminate, glabrous; stipulas roundish, coriaceous; flowers terminal, racemose. h. S. Native of South America, on the banks of the river Magdalena, between Mompox and El Penon, and near Honda. Ucriana insignis, Wildl. rel. Spreng. syst. 1. p. 761. exclusive of the synonyme of Lam. T. insignis, Roem. et Schultes, syst. 5. p. 299.

Large-leaved Tocoyena. Shrub.

3 T. longifolia (H. B. et Kunth, nov. gen. amer. 3. p. 411. but not of Poir.) branches tetrate; leaves oblong-oblong, acute, glabrous, shining, with revolute margins; stipulas ovate, acuminate; flowers racemose; teeth of calyx short, acute. h. S. Native of New Granada, in hot places. Ucriana Humboldtii, Spreng. syst. 1. p. 761.

Long-leaved Tocoyena. Shrub.

4 T. Mutisii (H. B. et Kunth, nov. gen. amer. 3. p. 411.) branches tetrate; leaves oblong, acutish, glabrous, shining, with somewhat revolute margins; stipulas ovate, acuminate; flowers terminal, corymbose; teeth of calyx short. h. S. Native of New Granada, in hot places. Ucriana Mutissii, Spreng. syst. 1. p. 761.

Mutis’s Tocoyena. Shrub.

5 T. hirsuta (Moricand, herb. ex D. C. prod. 4. p. 375.) leaves elliptic, ending each in a short cuspidate point, clothed with villous down above, and with soft velvety hairs beneath. h. S. Native of Brazil. Tube of calyx 4 inches long.

Hairy Tocoyena. Shrub.

Cult. See Oxyanthus, p. 494., for culture and propagation.

Linn. syst. Pentadactyla, Monogynia. Calyx with an obovate tube, and a short 5-toothed limb. Corolla fimbriated, with a very long terete tube, a villous hardly dilated throat, and a 5-parted limb; the segments spreading, obtuse, and nearly equal; the alabastra gibbous on one side. Stamens 5, rising from the throat of the corolla, free, unequal, a little exserted. Style filiform, slender, and bifid at the apex: with the lobes unequal, rather papillose and acute. Berry ovate, crowned by the calyx, succulent, 2-celled, many-seeded. Seeds unknown.

—Glabrous shrubs or small trees, natives of Guiana. Branches terete. Leaves opposite, on short petioles, coriaceous. Stipulas oblong-triangular, at length falling off. Flowers white, very long, disposed in terminal corymb.

1 P. longiflora (Aubl. guian. 1. p. 134. t. 51.) leaves oblong, acuminated, acute at the base; stipulas oblong; calyx bluntly 5-toothed; tube of corolla very much incurved, and nutant at the apex. h. S. Native of French Guiana, on the banks of rivers. Lam. ill. 163. Solanum longiflorum, Wildl. spec. 1. p. 961. Kyranthus longiflorus, Gmel. syst. 1. p. 162. Corolla white, with the tube very long, and green at the base; and the hairs in the throat are very long. Berry yellow, about the size of a hen’s egg. Seeds 12, imbedded in the red pulp, according to Aublet. The limb of the corolla is said to be regular. Coryms composed of about 6 flowers; and the flowers are pedicellate and scaly at the base from bracteas.

Long-flowered Posoqueria. Clt. 1820. Shrub 5 to 6 feet.

2 P. latifolia (Roem. et Schultes, syst. 5. p. 227.) leaves ovate, acuminated, obtuse at the base, or a little cordate; stipulas broad, triangular; calyx bluntly 5-toothed; tube of corolla straight; and the limb irregular; alabastra gibbous on one side. h. S. Native of French Guiana. Allied to P. latifolia, but differs from all the species in the form of the stipulas. Tube of corolla 3-4 inches long. Flowers terminal, corymbose.

Narrow Posoqueria. Shrub.

3 P. decora (D. C. prod. 4. p. 375.) leaves ovate, ending each in a short cuspidate point, obtuse and rather cordate at the base; stipulas oval, obtuse, large, foliaceous, and coriaceous; calyx bluntly 5-toothed; tube of corolla straight; alabastra rather gibbous on one side. h. S. Native of French Guiana. The corolla of this species differs from all the others described before it, by the tube being ovate; and the calyx being obtuse, and the limbs acuminate. This species is allied to P. latifolia, but differs from all the species in the form of the stipulas. Tube of corolla 3-4 inches long. Flowers terminal, corymbose.

Trinidad Posoqueria. Shrub. 5 to 6 feet.

5 P. hayannensis (D. C. prod. 4. p. 375.) leaves oval, acute, membranous, bluishish at the base; stipulas lanceolate, acute; calyx bluntly 5-toothed; tube of corolla straight; alabastra gibbous on one side. h. S. Native of Cuba, about the Havana. Tube of corolla slender, 4½ inches long. Petioles 6 lines long.

Havana Posoqueria. Shrub. 5 to 6 feet.

6 P. graecilis (Roem. et Schultes, syst. 5. p. 277.) leaves oval-lanceolate; stipulas oblanceolate; calyx acutely 5-toothed; tube of corolla curved, and the limb irregular. h. S. Native of French Guiana, in remote woods, from the river Darapa to Kaw. Solanum gracilex, Rudge, pl. guian. p. 27. t. 41. It differs from P. longiflora in the character given, and in the slender nerves of the leaves. Flowers white, 4-5 in a coryb.

Sleender-flowered Posoqueria. Clt. 1825. Shrub 5 to 6 ft.

7 P. revoluta (Nees, in flora, 1821. p. 328. Schrad. gatt. anis. 1821. p. 714.) leaves elliptic-ovate, each ending in a short cuspidate point, with revolute margins; stipulas deciduous; coryms dense; tube of corolla straight; throat villous, and limb irregular. h. S. Native of Brazil. P. insignis, Neuw. in flora. 1821. p. 301. in reis. bras. with a figure. Flowers white.

Revolute-leaved Posoqueria. Shrub 5 to 6 feet.
XXXIII. Oxyanthus. Native panicles of a flower, the corolla being glabrous, and its parts being acute, and in the clavate stigma.

1 O. speciosus (D. C. I. c. and in diss. ined. with a figure) branchlets, leaves, and calyces quite glabrous; calyceal teeth very much acuminated; racemes many-flowered; tube of corolla one half shorter than the leaves. \( \gamma \). S. Native of Sierra Leone on the mountains, where it was collected by Smeathmann. Flowers about 30 in each raceme, apparently red, according to the dried specimens, but are probably white or milk-coloured in their recent state.

Shiny Oxyanthus. Shrub 3 to 4 ft. long, roots by planting them in a pot of sand, and placing it under a hand-glass, in heat.

XXXIV. Stylocoryna. Native flowers corolla being glabrous, and its parts being acute, and in the clavate stigma.

1 S. Racemosâ (Cav. l. c. t. 368.) leaves elliptic-oblong, acute at the base, acuminated at the apex, glabrous; panicles axillary, dichotomous, loose, one-half shorter than the leaves; corolla salver-shaped, having the lobes longer than the tube. \( \gamma \). S. Native of the Philippines. Corolla whitish-yellow. Berry spherical, about the size of a pea. Seeds nesting in pulp, ex Cav. but not according to Gaertn., nor in the fruit examined. Cymes of fruit large, spreading. Segments of corolla ovate, obtuse.

Racemose-flowered Stylocoryna. Shrub 10 to 12 ft. long, roots by planting them in a pot of sand, and placing it under a hand-glass, in heat.

2 S. fragrans (Blum. bijdr. p. 982.) leaves elliptic-oblong, acute at both ends, glabrous, these with minute stigmas on the veins beneath; corymbs terminal, fastigate, dense-flowered; corolla salver-shaped, having the segments shorter than the tube. \( \gamma \). S. Native of Java, in shady parts of woods. Wahlbergia fragrans, Blum. cat. hort. but. p. 13. Ceriscus fragrans, Nees, in flora, 1825. p. 116. Style very long.

Fragrant Stylocoryna. Shrub 5 to 6 ft. long, roots by planting them in a pot of sand, and placing it under a hand-glass, in heat.

3 S. laxiflora (Blum. bijdr. p. 983.) leaves oblong, acuminated at both ends, stigmas on the veins beneath; corymbs terminal, trifoliate, dense-flowered; corolla salver-shaped. \( \gamma \). S. Native of Java, on the mountains of Parang, in the province of Bantam. The flowers are smaller, and the styles less elongated than those of the preceding species.

Loose-flowered Stylocoryna. Tree 10 to 15 ft. long, roots by planting them in a pot of sand, and placing it under a hand-glass, in heat.

4 S. tomentosa (Blum. bijdr. p. 983.) leaves oblong, acuminated at both ends, stigmas on the veins beneath; corymbs terminal, dense-flowered; corolla salver-shaped, 5-parted. \( \gamma \). S. Native of Java, in the province of Bantam, on the mountains.

Tomentose Stylocoryna. Tree 10 to 12 ft. long, roots by planting them in a pot of sand, and placing it under a hand-glass, in heat.

5 S. pubescens (Batr. in herb. Hanke, ex D. C. prod. 4. p. 377.) leaves oblong, acuminated, downy on both surfaces, as well as on the branchlets; corymbs terminal, pedunculate, of 5 rays. \( \gamma \). S. Native of the island of Luzon. Branches compressedly tetragonal, opposite. Stigmas triangular, acuminate. Calyx minutely 5-toothed. Lobes of corolla linear. Style filiform, undivided, exserted.

Pubescent Stylocoryna. Shrub.

6 S. macrophylla (Batr. in herb. Hanke, ex D. C. prod. 4. p. 377.) leaves oblong, acuminated at both ends, and
495

Long-leaved Stylocoryna. Shrub or tree.

1. S. Pan'aká (D. C. prod. 4. p. 377.) glabrous; spines scattered; leaves oblong, minutely apiculate at the apex; racemes axillary, short; pedicels in fascicles, 1-flowered; tube of corolla shorter than the lobes. h. S. Native of the East Indies. Gardénia Pandáki, Val., herb. ex Puer. Ránda Málabáríca, Lam. Branches spinose on one side. Leaves coriaceous, an inch long, and 4 lines broad. Peduncles axillary, very short, bearing the pedicels in an umbel. Stigma oblong, undivided. Fruit unknown. Perhaps sufficiently distinct from the following.

Pandaki Stylocoryna. Shrub.

2. S. Malábáríca (D. C. prod. 4. p. 377.) spines opposite, 3 times shorter than the leaves; leaves oblong-obovate, obtuse, cuneated at the base, glabrous, beset with glandular pili in the axis of the veins beneath; umbels 8-10-flowered, almost terminating the branches; flowers on short pedicels; limb of calyx 5-toothed. h. S. Native of Coromandel and Malabar near Cochin, in arid places. Gardénia frágans, Roxb. corom. t. 197. Posoquéra frágans, Roxb. fl. ind. 2. p. 167. Flowers small, white, sweet-scented. Berry globose, size of a cherry, red, 2-celled. Seeds orange colored. Perhaps G. frágans, Roth, nov. spec. 150. is the same. The Benkára of Rüd. s. c. cited by Lam. for this species, is a distinct plant, from the flowers being said to be purple. The shrub is well adapted for making hedges, being well armed with thorns.

Malabar Stylocoryna. Clt. 1820. Shrub 4 to 5 feet.

Cult. For culture and propagation see Oxyambús, p. 494.

Lin. syst. Pentándria, Monogénia. Calyx with an ovate tube, and a tubular truncate or subdentate limb. Corolla salver-shaped, not exceeding the tube of the calyx; limb large, 5-parted; segments ovate, acute. Anthers linear, sessile in the throat of the corolla, exserted. Stigma clavate, obtuse, undivided. Berry coriaceous, sometimt 4-celled, crowned by the tube of the calyx, attenuated at both ends. Seeds numerous, horizontal, nesting in the pulp. Albumen cartilaginous. Embryo with a common radicle, and foliaceous cotyledons.—Tress. Leaves opposite, oval or oblong. Stipules interpetiolar, ovate, acuminate, decumbent. Flowers axillary or terminal, solitary or few, white, at length yellow. Fruit when young yielding a black juice. Genipá agrees with Stylocoryna in the undivided stigma, and with Gardénia in habit; but from both it is easily distinguished by the truncate limb of the calyx and fruit.

1 G. Americana (Lin. spec. 251.) leaves oblong-lanceolate, quite glabrous on both surfaces; peduncles axillary, dichotomous, coriaceous. h. S. Native of the Caribbean islands, as in St. Domingo, &c., and now cultivated in many parts for the sake of the fruit, especially in Brazil and Guiana. Plum. ed. Burm. t. 136. Gertn. fil. carp. t. 190. Gardénia Genipá, Swartz, obs. p. 84.—Janípába, Márgr. bras. p. 92, with a figure. Pis. bras. 159, with a figure. Flowers small, white. Fruit large, greenish-white, full of dark purple juice; pulp edible, rather acid.

American or Common Genipa. Clt. 1779. Tree 20 to 30 ft.

2 G. Carú'to (H. B. et Kunth, nov. gen. amer. 3. p. 407.) leaves obovate, obtuse, glabrous above, clothed with velvetyomentum beneath; peduncles terminal, 2-3-flowered; pedicels longer than the peduncle. h. S. Native on the banks of the Orinóco and Río Negro, and near Caracas and Carthagena, where it is called Caruto by the natives. Corolla white, having the tube silky both inside and outside.

Caruto Genipa. Tree 20 feet.

3 G. Puré'scens (D. C. prod. 4. p. 378.) leaves obvate, obtuse, glabrous above, and clothed with velvety pubescence beneath; flowers by threes, almost terminal, on very short pedicels. h. S. Native of Cuba, about the Hanavannah. Flowers very like those of G. Americana, but are on shorter pedicels, and fewer in number; and the leaves are broader and blunter.

Downy Genipa. Tree 20 feet.

4 G. Oblongófólia (Ruiz et Pav. fl. per. 2. p. 67. t. 220. f. a.) leaves oblong-ovate, obtuse, shining above, and downy on the nerves beneath, with rather revolute margins; flowers crowded at the tops of the branches, on short pedicels, and disposed somewhat racemously. h. S. Native of Pern, on the Andes, in groves in hot places, and at Guayaquil. The corolla is said to be yellow, but is probably white in the recent state as in the rest of the species. Fruit size of a peach. The seeds and pulp of the fruit are used by the Indies to dye their face and hands of a permanent black colour.

5 G. ? stripesíflora (D. C. prod. 4. p. 378.) leaves elliptic, membranous, acuminated at both ends, glabrous, on short pedicels; stipulas small, deciduous; pedicels axillary, short, 1-flowered; limb of calyx broadly truncate, ciliated, short; tube of corolla broad, conical, striated, hairy on the inside at the base, and closed in the middle inside by a circle of hairs; stigma thick, 2-lobed. h. S. Native of Brazil. Perhaps a proper genus. Leaves somewhat sinuated from some cause.

Striped-flowered Genipa. Tree.

† Species not sufficiently known.

* American.

6 G. Mexíí'ne (Rich. act. soc. hist. nat. par. p. 107.) hairy; leaves oblong-obovate; flowers crowded at the tops of the branches; fruit globose, very villous, crowned by the tube of the calyx. h. S. Native of Cayenne and Surinam. Poir. suppl. 2. p. 708. Duróíía críopíla, Lin. fil. suppl. p. 30. and p. 209.—Merian. s. t. 43. The tree has the habit of Isáritín cocícena. Flowers hexameroe and hexandrous, nearly sessile, very like those of Jasminum Sémíbur. Berry hairy, about the size of the clenched fist, umbellate. Seeds imbedded in the pulp, which is graceful and tube.

** Asiatic.

7 G. ? Buffá'íína (Lour. cosh. p. 149.) prickles long, straight, opposite; leaves ovate, glabrous, in fascicles; flowers solitary; calyx bluntly 5-cleft; berry almost dry, roundish. h. S. Native of Cochinchina. Flowers greenish-white. Berry brownish. Perhaps a species of Ránda or Gardénia, but the berry is said to be 2-celled. Corolla rotate, 5-cleft.

Buffá'íína Genipa. Shrub 9 feet.

8 G. ? Esculeíí'nte (Lour. l. c.) stem quite simple; spines long, straight, opposite; leaves opposite, hairy, in fascicles; flowers lateral, in fascicles; calyx acutely 5-cleft; berry fleshy, roundish, 1-celled. h. S. Native of Cochinchina. Flowers greenish-white. Segments of corolla oblong, acuminated. Berry size of a cherry, edible.

9 G. ? Flá'íí' (Lour. l. c.) prickles few, scattered, straight; leaves broad-lanceolate, glabrous; flowers solitary, terminal; corolla rather hairy. h. S. Native of China, about Canton. Corolla yellow, rotate. Fruit unknown.

Yellow-flowered Genipa. Shrub 5 feet.
Cult. For culture and propagation see Gardénia, p. 499.

Lin. syst. Πenténidia, Monogrýnia Calyx with an ovate, usually ribbed tube, and a tubular truncate, toothed (f. 93. a.), cleft, or parted limb. Corolla funnel-shaped (f. 93. b.), or salver-shaped, having the tube much longer than the calyx, and the limb twisted in aestivation (f. 93. c.), but afterwards spreading, from 5-9-parted. Anthers 5-9, linear, almost sessile in the throat of the corolla or exserted (f. 93. c.). Stigma clavate, bifid or bidentate, lobes thick, erect. Ovarium 1-celled, half divided by 2-5 incomplete dissepiments. Berry fleshy, crowned by the calyx, chartaceous or nuclearle, incompletely 2-5-celled. Seeds minute, immersed in the fleshy parietal placenta. Embryo albuminous.—Unarmed or spinaceous trees or shrubs. Leaves opposite, and sometimes, though rarely, in whorls, oval or ovate. Flowers axillary or terminal, usually solitary, white, and generally sweet-scented. The fruit of the greater number of the species not being sufficiently known, they cannot be divided into proper sections.

§ 1. Shrubs without prickles. Tube of calyx or ovarium ribbed. Tube of corolla cylindrical.

1. G. florída (Lin. spec. p. 303.) shrubby, unarmed, erect; leaves elliptic, acute at both ends; flowers solitary, almost terminal, sessile, salver-shaped; calyx segments vertical, lanceolate-subulate, equalling the tube of the corolla in length; berry elongated, tubinate, ribbed. h. G. Native of China, and cultivated in Japan, East Indies, the Cape of Good Hope, &c. Ker, bot. reg. t. 449. G. jamasíneoides, Sol. phl. trans. 52. t. 20.—Pluk. amal. t. 448. f. 4. Jasminum Capénsé, Mill. dict. no. 7. fig. 180. Ehret. pict. t. 15. Flowers white, sweet-scented, 5-9-parted. Berry 5-6-angled, 5-6-celled at the base, and 1-celled at the apex, orange coloured, size of a pigeon’s egg, and the pulp is used for dyeing yellow in China and Japan. Var. β, flore pléno; flowers double white, when fully blown about the size of the middle rose. h. G. This variety is very frequent in gardens. G. jamasíneoides, Ellis in phl. trans. vol. 51. t. 23. Jasminum Capénsé, Mill. fig. 180.—Rumph. amb. t. 7. t. 14. f. 2.

2. G. radícans (Thunb. diss. gard. no. 1. t. 1. f. 1.) shrub, unarmed; stems radicant; leaves lanceolate; flowers solitary, almost terminal, and nearly sessile, salver-shaped; segments of the calyx vertical, linear-subulate, equal in length to the tube of the corolla. h. G. Native of Japan, and cultivated in the East Indies, and at the Cape of Good Hope. Thunb. fl. jap. t. 20. Ker, bot. reg. t. 75. Andr. bot. rep. t. 491. Flowers white, very fragrant.

3. G. angustípíólia (Lodd. bot. emb. 512.) very like G. florída, from which it chiefly differs in being smaller, with narrower leaves. h. S. Native country unknown. Flowers white, sweet-scented.

Narrow-leaved Gardenia. Fl. July. Clt. 1823. Shrub 3 ft. 4. G. tomeníosa (Blum. mas. ex D. C. prod. 4. p. 379.) unarmed; branchlets, leaves, and calyces clothed with velvetyomentum; leaves obovate-cuneate; flowers terminal, sessile, solitary; tube of calyx angularly ribbed: calyxic teeth 10, subulate, short. h. S. Native of the island of Java. Lobes of corolla 10, obovate-oblong; tube hardly longer than the calyx. Flowers white, sweet-scented. Fruit unknown.

Tomentósa Gardenia. Shrub.

5. G. calycúlata (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves ovate, petiolate, acuminated, smooth; flowers terminal, solitary, sessile, involucrated; calyce segments entire; anthers inserted within the tube of the corolla. h. S. Native of the East Indies. Flowers large, white, fragrant, 5-parted.

Calycúlata Gardenia. Tree.

6. G. costáta (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves ovate, petiolate, acuminated, smooth; flowers terminal, salver-shaped; calyce segments reflexed, caducous; berry droopaceous, oval, 15-ribbed, 1-celled, containing a 2-valved shell; placentas 2, opposite. h. S. Native of the mountainous parts of India; from those of Chittagong it has been introduced to the botanical garden of Calcutta. G. coronária, Hamilt. in Synes. emb. to Ava, p. 474. with a figure. Flowers large, white, sweet-scented, the tube being 3 inches long, and the border above 4 in diameter; limb 5-parted. Berry yellow, containing a soft and rather fetid pulp.

Ribbed-fruited Gardenia. Tree 20 feet.

7. G. carína (Wall. in Roxb. fl. ind. 2. p. 560.) arboreous, unarmed, resinous on the younger parts; leaves elliptic-ovate, ribbed, villous beneath; flowers terminal, salver; limb of calyx truncate, broad, obscurely 5-lobed, and 5-keeled; tube of corolla very long: limb 6-8-lobed. h. S. Native of Penang, where it grows on the hills. Flowers smaller than those of G. costáta, at first snow white, but afterwards yellow, becoming when dry of a beautiful orange colour. Fruit precisely as in G. costáta.

Keel-calycy Gardenia. Tree.

8. G. grandíflóra (Lour. coch. p. 147.) arboreous, unarmed; leaves lanceolate, shining; flowers solitary, terminal, and hexamous; segments of the calyx reflexly-salver; corolla salver-shaped, 5-parted; berry oblong, acute at both ends. h. G. Native of Cochinchina, on the banks of rivers. Blum. bijdr. p. 1013. Flowers large white, sweet-scented. Berry globose, 1-celled, glabrous, yellow. Seeds nestling in red pulp. Anthers 6, rarely 5-7.

Great-flowered Gardenia. Tree middle-sized.

9. G. taréflórie (D. C. prod. 4. p. 380.) unarmed, glabrous, resinous at the tops of the branches; leaves obovate, almost sessile; stipulas broad, connate, permanent, short-acuminated; flowers solitary, in the axils of the upper leaves, pedicellate; tube of calyx angular: limb 3-4-parted, with vertical-oblong foliaceous lobes; corolla with a long terete tube, and a 5-7-parted limb. h. G. Native of the island of Tahiti, where it was collected by D’Urville. Lobes of calyx fewer by abortion than the lobes of the corolla. Stigma bifid, the lobes long, and acute. Fruit unknown.

Tahiti Gardenia. Shrub.

10. G. marúba (Siebold, in Blum. bijdr. p. 1013.) unarmed; leaves opposite, or 3 in a whorl, obovate, coriaceous, glabrous; calyx angular, 5-leaf: segments subulate, spreading. h. G. Native of Japan. The rest unknown.

Marúba Gardenia. Tree.

11. G. suléata (Garten. fil. carp. 3. p. 79. t. 194.) berry obovate or elliptic, attenuated at the base, angular from obtuse funrows, 1-celled; seeds imbedded in the pulp. h. G. Native country unknown. Perhaps allied to G. florída.

Furrowed-fruited Gardenia. Shrub.

§ 2. Unarmed shrubs or trees. Tube of calyx or ovarium not
ribbed; having the limb equally toothed or parted, rarely truncate. Tube of corolla cylindrical.

12 G. mutabilis (Reinw. in Blum. bijdr. p. 1016.) unarmed? leaves oblong, acuminate, glabrous, but pubescent in the axils of the ribs on the upper surface; flowers axillary, solitary; limb of calyx rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. S. Native of the island of Cebu. Said to be allied to G. carinata and G. tobobiflora.

Changeable-flowered Gardenia. Tree.

13 G. calycula; leaves oblong-lanceolate, rather coriaceous, glabrous, on short pedicels; flowers axillary, solitary, almost sessile; corolla with a long tube, and a 5-cleft equal border; calyx 5-cleft. S. Native of Sierra Leone, on the edges of woods. Flowers pale red, pendulous.

Large-calyxed Gardenia. Shrub.

14 G. Reinwardtiana (Blum. bijdr. p. 1913.) unarmed? leaves oblong, attenuated at both ends, bluntish at the apex, coriaceous, glabrous; corymbs axillary, trifid, shorter than the leaves; limb of calyx obsolescent 5-toothed, rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. S. Native of the Moluccas. Ignatia, Reinw. herb. ex Blum. Ovarium half 2-celled, many seeded. Reinwardt's Gardenia. Shrub.

15 G. latifolia (Ait. hort. kew. 1. p. 294.) arboreous, unarmed; leaves almost sessile, ovate or obovate: in the axils of the veins beneath are hollow glands with hairy margins; flowers terminal, 1-4-together, almost sessile, salver-shaped, 7-11-parted; limb of calyx short, subdeterminate; berry drupaceous, round, 1-celled, 5-valved. S. Native of the East Indies, on barren rocky hills, in the Circars and Carnatic. Roxb. cor. 2. p. 18. t. 134. fl. ind. 2. p. 552. G. enencandra, Koen. mss. ex Roxb. Flowers very large and very fragrant, when they first open in the morning white, gradually growing yellow before night. Berry size of a pillate's egg, crowned by a small part only of the tube of the calyx. Leaves opposite or 3 in a whorl. — G. latifolia, Gaertn. fr. 5. p. 78. t. 193. is a distinct species from the fruit being crowned by the whole of the calyx, not with part of it.

16 G. lucida (Roxb. fl. ind. 2. p. 553.) subarboreous, unarmed, with resinous buds; leaves oblong, smooth, shining, with lateral simple parallel veins; flowers almost terminal, solitary, on short pedicels; lobes of calyx 5, subulate, 3 times shorter than the tube of the corolla; berry drupaceous, containing a 2-valved shell. S. Native of Chittagong, and various other parts of India; and of the island of Luzon. Leaves about 6 inches long and 3 broad. Peduncles clavate, 1 to 1½ inch long. Flowers large, pure white, fragrant, 5-parted.

Shining-leaved Gardenia. Cilt. 1819. Shrubb or tree.

17 G. arborea (Roxb. fl. ind. 2. p. 554.) arboreous, unarmed; leaves ovate-oblong; flowers terminal, almost sessile, usually by threes; corolla with a filiform tube, and a 5-parted limb; berry drupaceous, smooth, containing a 4-5-valved shell. S. Native of the East Indies, among the Circars. The leaves are deciduous during the cold season, and the shrub continues naked till the hot season is pretty far advanced. From the buds and wounds made in the bark there exudes a very beautiful yellow resin, like that from G. gunnifera. The size, number, fragrance, mutability, and beauty of the flowers of this species render it more deserving of a place in the garden than any other species. The natives eat the fruit when ripe.

Arboreous Gardenia. Tree.

18 G. gunnifera (Linn. fl. suppl. 1. p. 164.) shrubby, unarmed, with resinous buds; leaves oblong, bluntly acuminate, (hairy, ex Linn.); flowers sessile, solitary; almost terminal; segments of the calyx ovate, acute, very short; tube of corolla equal in length to the limb. S. Native of Ceylon and Coromandel. Thunb. Diss. gard. no. 4. t. 2. f. 3. Rottil and Wildl. in act. bonn. 4. (1803) p. 198. G. inermis, Dietr. lex. 4. p. 285. Allied to G. arborea. Flowers white, sweet-scented. From the bark of this tree exudes a yellow resin, similar to gum elemi.

Gum-bearing Gardenia. Shrub 3 to 4 feet.

19 G. clusiaefolia (Jacq. coll. append. 37. t. 4. f. 3.) shrubby, unarmed, glabrous; leaves ovate, retuse, and somewhat emarginate, coriaceous, on short pedicels; peduncles almost terminal, racemose; flowers on long pedicels; limb of calyx short, 5-toothed; corolla salver-shaped, with 5 linear acute segments, which are about the length of the tube. S. Native of the Bahama islands, where it is called by the inhabitants seven years apple, ex Catesb. car. 1. p. 59. t. 59. Flowers white, sweet-scented, with a greenish tube. Berry large, oval. Seeds imbedded in the pulp. The internal structure of the berry is unknown. It differs from Gardenia in the shape of the stigma and disposition of the flowers.

Clusia-leaved Gardenia. Shrub 5 feet.

20 G. tetrasperma (Roxb. fl. ind. 2. p. 555.) shrubby, unarmed; leaves ovate-cuneated, smooth; flowers axillary, solitary, on short pedicels, pendulous; calycine segments 5, subulate; limb of corolla 5-parted; berry round, 4-seeded. S. Native of the East Indies, on the mountains near Shree-nugur. Gardenia, no. 3. Hardw. in asiat. res. 6. p. 354. Leaves on short pedicels. Flowers greenish yellow, sweet-scented, with a long tube, which widens upwards, and partly closed about the middle by a ring of silky down.

Four-seeded Gardenia. Shrub 2 feet.

21 G. tubifera (Wall. in Roxb. fl. ind. 2. p. 562.) subarboreous, unarmed; leaves cuneate-oblong, petiolate, slightly scabrous above, and pubescent beneath; drupe round, uneven, crowned by the very long truncate calycine tube. S. Native of the East Indies, in Singapore. All the young parts of the tree are resinous. Leaves 5-6 inches long. Drupe containing a putamen, which is divisible into 8 valves. Flowers unknown.

Tube-bearing Gardenia. Tree or shrub.

22 G. anisophylla (Kt. in Roxb. fl. ind. 2. p. 561.) arboreous, unarmed; leaves elliptic, those opposite each other unequal, densely clothed with villi; stipules concrete at the base, bearded inside; corymbs axillary, villous; limb of calyx 5-toothed; tube of corolla short; drupe oval, villous. S. Native of the islands of Pulo-Parent and Singapore, on the hills. Leaves tapering to the base, 6-12 inches long. Flowers rather small, white, by threes, villous outside: limb 5-parted. Stigma clavate, 2-lobed. Drupe size of a walnut, containing a 2-valved putamen. Perhaps a species of Génipa or Posoqueria.

Unequal-leaved Gardenia. Tree.

23 G. formosa (Cham. et Schlecht. in Linnæa, 4. p. 200.) unarmed; leaves on short pedicels, nearly orbicular, terminating in a very short acumens each, clothed with canescent tumentum along the veins on the upper surface, but clothed with hoary tumentum underneath, as well as the petioles, cymes, and flowers; calyx 5-toothed; stigma bilamellate. S. Native of Brazil. Corolla white, having the tube about 4 inches long, and the throat an inch in diameter; limb 5-parted. Fruit unknown.

Beautiful Gardenia. Shrubb.

24 G. sellowiana (Cham. et Schlecht. l. c. p. 198.) unarmed, glabrous; leaves broad-lanceolate, on short pedicels, shining above; stipules connate between the petioles; cymes 3-5-flowered; calyx 5-toothed; stigma bilamellate. S. Native of Equinoctial Brazil. Corolla white, hairy; the tube about 3 inches long and coriaceous, and the limb 5-parted. Fruit spherical, smooth.
Sello’s Gardenia. Shrub.

25 G. hexa'ndra (Willd. rel. in Rœm. et Schultes, syst. 5. p. 243.) unarmed; leaves obovate, pubescent beneath; flowers usually hexandrous; corollas hairy both inside and outside, with the tube very short. h. S. Native of South America, where it was collected by Humboldt and Bonpland. The rest unknown.

**Hexandrous-flowered Gardenia.** Shrub.

§ 3. Unarmed shrubs. Tube of calyx or oecarium not ribbed; but the limb is tubular and ribbed, 5-6-cleft, as well as being cleft laterally. Tube of corolla cylindrical.—Piranga, Juss.

§ 4. Unarmed shrubs. Tube of calyx ribbed or angular from the decurrent segments. Tube of corolla with a dilated obconical throat. Berry 2-celled.—Rothenhaim, Thunb.

27 G. Rot'mañ'nia (Lin. fil. suppl. p. 165.) arboreous, unarmed; leaves oblong, acute, glabrous, on very short pedioles, having glandular hairs in the axils of the veins underneath; flowers axillary, and almost terminal, solitary, sessile, 5-parted, and pentandrous; calyx ribbed, having the segments subulate, terete, and erect; corolla with an obconical tube, a campanulate throat, and spreading acute segments. h. G. Native of the Cape of Good Hope. Thunb. diss. gard. no. 6. Sims, bot. mag. 690. Rothmañna Capeñas, Thunb. act. holm. 1776. p. 65. f. 2. Flowers white, spotted with red, sweet-scented; tube of corolla glabrous. Young branches downy.

§ 5. Unarmed or spinose shrubs. Leaves 3 in a whorl.

28 G. Terni'folia (Thonn. in Schum. pl. guin. p. 147.) unarmed, glabrous; leaves 3 in a whorl, ovate, cuneated at the base, almost sessile; flowers solitary, almost terminal, girded at the base by a short truncate involucel; calyx with a smooth tube, and a tubular short toothed limb; corolla with a long terete tube, and a 6-7-parted limb. h. S. Native of Guinea. Flowers 3 inches long, white; lobes of corolla oval-oblung, acuminate.

**Tern-leafed Gardenia.** Shrub 4 to 5 feet.

29 G. Thys'n'ca (D. C. prod. 4. p. 382.) glabrous; branches 3 in a whorl, spinosecent; leaves 3 in a whorl, ovate, cuneated at the base, almost sessile; flowers solitary, terminal, sessile; calyx with a smooth tube, and a tubular semi-5-cleft limb; lobes acute; corolla with a long almost terete tube, and a 5-parted limb; lobes thick, ovate. h. S. Native of the Gambia, in woods. Leaves hardly an inch long. Corolla 2 inches long. Berry ovate-globose. Fruit size of a walnut. Spines thick, short, conical, spreading.

**Three-spined Gardenia.** Shrub 4 to 5 feet.

30 G. Medicine'lis (Vahl, in Schum. pl. guin. p. 148.) glabrous; spines tern, stiff, leafy at the apex; leaves elliptic, glabrous; flowers terminal, sessile, solitary; limb of calyx bifid, with roundish recesses, and trifid segments; corolla with the tube dilated upwards, and the lobes ovate. h. S. Native of Guinea.

**Medicinal Gardenia.** Shrub 4 to 5 feet.

31 G. Am'ena (Sims, bot. mag. t. 1904.) shrubby; spines axillary, short, straight; leaves oval, acute, glabrous, on short petioles; flowers almost terminal, solitary, sessile, 5-parted, and pentandrous; tube of calyx with short teeth; corolla salver-shaped, with a long terete tube. h. G. Native of China. Flowers white, having the lobes purple on the outside in that part, which is exposed to the air, while the corolla is in restoration; the tube greenish.

32 G. Tur'egida (Roxb. fl. ind. 2. p. 557.) arboreous, with swollen mealy bark, and brachiante branches; spines opposite and terminal; leaves obovate, tapering into the petioles at the base, smooth; flowers lateral, usually solitary; limb of calyx tubular, 5-toothed; corolla smooth, salver-shaped; anthers almost inclosed. h. S. Native of the East Indies, at Botiam. Leaves 1-4 inches long, and 1-3 broad. Stipulas broad at the base, and subulate at the apex. Flowers 5-6-perted. Berry oval, scabrous outside, containing a hard 5-valved putamen. Seeds imbedded in the pulp. Stigma clavate, 5-grooved.

**Spiny-barked Gardenia.** Tree.

33 G. Mont'ana (Roxb. fl. ind. 2. p. 556.) arboreous; spines opposite, short, acute, stilt; leaves obovate, obtuse, almost sessile, downy beneath, with revolute edges; flowers rising 3-5 in a fascicle from the buds, on short pedicels; limb of calyx usually 5-toothed; corolla 5-7-cleft; stamens inclosed; berry drupaceous, roundish, containing a 5-6-valved putamen. h. S. Native of the East Indies, among the Cercar mountains. Bark white, soft, and spongy. Leaves deciduous in December, 3 inches long, and 2 broad, smooth and shining above. Flowers pretty large, fragrant, when first open white, but soon becoming more or less yellow. Corolla with a somewhat gibbous tube, and a smooth throat. Nectary a moniliform fleshy ring, surrounding the insertion of the style. Berry the size of a pullet’s egg, ash coloured, and yellow mixed. Seeds imbedded in the pulp.

**Mountain Gardenia.** Clt. 1819. Tree or shrub.

34 G. Campanula'ta (Roxb. fl. ind. 2. p. 557.) shrubby; branches short, spiny at the apex; spines solitary; leaves lanceolate, smooth, acuminate at both ends; flowers on short pedicels, in terminal and lateral fascicles; limb of calyx campanulate, with a short acutely 5-toothed border; corolla subcampanulate, 5-lobed; berry roundish-ovate. h. S. Native of the East Indies, in the forests of Chittagong. Thorns generally terminating the little lateral opposite branches. Leaves 2-5 inches long. Stipulas triangular, acute. Flowers small, of a pale yellow colour, crowded at the extremities of short stiff lateral spinose branches. Stigma somewhat 5-grooved. Anthers inclosed. Berry round, the size of a golden pippin apple, smooth, 1-celled; placentas 5, parietal. Seeds imbedded in the yellow pulp.

**Campanulate-calved Gardenia.** Clt. 1815. Sh. 5 to 10 ft.
35. G. Blumana (D. C. prod. 4. p. 388.) shrubby, spinose; leaves lanceolate, glabrous; flowers axillary, and almost terminal, usually solitary; calyce segments ovate, bluish; corolla somewhat campanulate.  G. S. Native of Java. Among bushes on the mountains. G. campanulata, Blum. bijdr. p. 1017. This differs from G. campanulata, Roxb. in the figure of the calyx.

Blume’s Gardenia. Shrub 5 to 6 feet.

† Species not sufficiently known.

* Unarmed shrubs.

36. G. ? Volubilis (Louv. coxh. p. 148.) shrubby, unarmed, twining; leaves lanceolate, acuminate, glabrous, on short peduncles; peduncles long, axillary, many flowered; calyce segments 5, acute, erect; corolla funnel-shaped, with a dilated throat; berry roundish, 2-celled.  G. S. Native of China beyond the suburbs of Canton. Flowers pale. Stigma thick, warty, subulate at the apex. Seeds round. This shrub should be excluded from Gardénia. Segments of corolla, long, repand.

Twining Gardenia. Shrub tw.

37. G. ? Pubescens (Roth. nov. spec. 151.) unarmed; leaves roundish-oval, acuminate at both ends, clothed with brown tomentum beneath young, as well as on the branchlets; corollas axillary, dichotomous, divaricate; calyx minutely 5-toothed; corolla funnel-shaped, tomentose.  G. S. Native of the East Indies. Flowers the size of those of Rhamnus frangula. Berry the size of a cherry, rugged from dots, glabrous.

Pubescent Gardenia. Ch. 1824. Shrub 4 to 6 feet.

38. G. ? Acuminata (Spreng. syst. 1. p. 765.) unarmed; leaves oblong, coriaceous, opaque; branchlets hairy; peduncles axillary, 3-4-flowered, shorter than the leaves; calyce segments subulate, shorter than the tube of the corolla.  G. S. Native of Brazil.

Brazilian Gardenia. Shrub.

40. G. ? Longifolia (Wall. in Roxb. fl. ind. 2. p. 559.) shrubby, stiff; branches numerous, deciduous, spinose at the apex; leaves in fascicles, obovate, almost sessile, smooth; flowers solitary, sessile, terminal; limb of calyx tubular, 5-toothed; teeth subulate; corolla with a 5-parted limb, and lanceolate acuminate lobes.  G. S. Native of Nipau, on the southern face of Shoepore, above Thoka. Branches obscurely 4-cornered. While young the thorns are pubescent, and covered by a flor of approximate stipula-like scales. Flowers small, of a yellowish white colour, fragrant. Corolla pubescent within, and closed by a circle of silky hairs about the middle. Stigma obscurely 2-lobed. Very nearly allied to G. tetrapérla. Cells of ovary 3-seeded.

Dense Gardenia. Shrub 4 to 5 feet.

42. G. seamarin (Thum. diss. gard. no. 9. t. 2. f. 5.) shrubby, climbing; spines straight, very short, deciduate; leaves ovate, glabrous; peduncles axillary, solitary, 1-flowered; corolla with a terete tube, and lanceolate segments; calyx 5-toothed.  G. · G. Native of China. G. jasminoides, Retz. obs. 2. p. 14. Perhaps a species of Rândia. Corolla white, glabrous. Stigma clavate.

Climbing Gardenia. Shrub cl.

43. G. ? Patula (Horsf. ex Willd. in Roem. et Schultes, syst. 5. p. 244.) spines hooked, shorter than the pediole; leaves ovate, acute; corollas axillary.  G. S. Native of Java. The rest unknown.

. Spreading Gardenia. Shrub.

G. ? Stipularis (Rottl. et Willd. in act. bonn. 4. (1803.) p. 183.) shrubby; spines setaceous; leaves elliptic, acute at both ends, short; flowers sessile, terminal, calyce segments obtuse, and are as wide as the tube glabrous.  G. S. Native of the East Indies. Spines very short. Leaves like those of G. spinosa. Corolla with a long slender tube. The spines, according to Rottler, are stipular; hence the name.

Stipular-spined Gardenia. Shrub.

45. G. ? Fagiollia (Willd. rel. ex Roem. et Schultes, syst. 5. p. 243.) branchlets terminated by 4 spines; flowers solitary; leaves roundish-ovate, downy beneath, stiff, plicate, veined.  G. S. Native of South America, where it was collected by Humboldt and Bonpland. Willdenow says the leaves are acutely angulated, but this is probably a mistake.

Beach-leaved Gardenia. Shrub 5 to 6 feet.

46. G. ? Cornifolia (D. C. prod. 4. p. 384.) shrubby, spinose; branches glabrous; leaves acuminate, ovate, rather coriaceous, and are, as well as the branches, downy; flowers 6-8-together at the tops of the branches, sessile, subcorollate, each furnished with a bifid involucre; calyx 4-toothed; corolla villos on the outside, with a terete tube, and a spreading 4-parted limb.  G. S. Native of the temperate parts of New Granada, near Guadua. Gardenia parviflora, H. B. et Kunth, nov. gen. amer. 3. p. 408. t. 293. but not of Poir. Flowers white, sweet-scented. The ovary and fruit being unknown, it is doubtful whether it belongs to the genus.

Dogwood-leaved Gardenia. Shrub 5 feet.

47. G. ? Microcarpa (Bartl. in herb. Huenke ex D. C. prod. 4. p. 384.) spines few, short, straight; leaves oblong, coriaceous, shining above, quite glabrous on both surfaces, as well as the branchlets; stipitates subulate acuminate; flowers 1-3-together, terminal, pedicellate; limb of calyx short, tubular, with subulate teeth, which are much shorter than the corolla, which is glabrous; fruit ovate, crowned.  G. S. Native of the Philippine islands, as in Luzon, &c. Perhaps a species of Rândia.

Small-fruited Gardenia. Shrub 5 to 6 feet.

Cult. All the species of Gardenia bear elegant sweet-scented flowers, which in most of the species are large. They are generally free flowerers. The soil best suited for them is a mixture of loam, peat, and sand. The stave species thrive best in a moist heat; and cuttings of all root readily if taken off while not too ripe, planted in a pot of sand, which should be plunged in a moist heat under a hand-glass. The double-flowered varieties of G. flórida and G. radécçus are cultivated to a considerable extent, under the name of Cape jasmine, for the beauty and fragrance of their flowers; the best manner of getting these to bloom freely is to set them in a close frame, on a little bottom heat, in spring, but the pots should not be plunged; and in winter they may be set in the green-house.
ceros, Lour. coch. p. 151.—Posoquèria and Rándia species, Roxb. fl. ind.

Lin. syst. Pentandria, Monogynia. Calyx with an obovate tube and a 9-lobed limb. Corolla salver-shaped, with a short tube, which is hardly longer than the calycine lobes in the first section, but in the second section 2 or 3 times longer, always with a 5-parted limb, which is twisted in revolution. Anthers sessile within the tube of the corolla, inclosed. Stigmas 2, thick. Berry nearly dry, crowned by the calyx, corticate, 2-celled. Seeds many in each cell, fixed to a central placenta, wingless, imbedded in the pulp, or imbricated downwards. Albumen cartilaginous. Embryo straight, with a terete radicle, and orbicular flat cotyledons.—Much branched small trees or shrubs, with axillary opposite or subverticillate thorns. Leaves sessile or on very short petioles. Stipulas solitary on each side, sometimes evidently formed from 2 being combined. Flowers almost sessile, usually solitary, rising from the axis of the leaves.—This genus is nearly allied to Posoquèria, but differs in the dry fruit, and in its being truly 2-celled.

§ 1. Flowers axillary, solitary, on short pedicels.

1 R. latifolia (Lam. dict. 3. p. 24. ill. t. 156. f. 1.) branchlets glandular; leaves obovate, quite glabrous, almost sessile, cuneated at the base; flowers axillary, sessile, solitary, salver-shaped; tube of corolla twice the length of the calycine teeth, with a pilose throat. ț. S. Native of the West India islands, in arid places among bushes; and probably of Mexico. Rándia aculeata, Lin. spec. p. 214. Gardënia aculeata, Ait. hort. kew. Gard. Rándia, Swartz, fl. ind. occ. p. 526.—Browne, jam. t. 8. f. 1. Sloan. hist. t. 2. f. 4. Spines axillary, opposite, spreading, forming a straight angle, 4-5 lines long. Corolla white, with the tube 4-5 lines long, and green. Berry the size of a small cherry, white or yellow. Seeds 6-8 in each cell, surrounded by pulp. Browne called this species Indigo berry, because the pulp of the fruit stains paper and linen of a fine fixed blue colour. The spines at the tops of the branchlets are usually solitary.

Var. b. mitis (D. C. prod. 4. p. 385.) the larger leaves are nearly oval; the thorns are few or wanting altogether, and the flowers are fewer and larger than in the species. ț. S. Native along with the species, but in more moist situations. Rándia mitis, Lin. spec. p. 213. Gardënia Rándia b. mitis, Swartz, fl. ind. occ. p. 528. Gard. Rándia, Sim., bot. mag. t. 1841.—Sloane, hist. t. 161. f. 1. Flowers white. The juice of the fruit is deep blue.

2 R. obovata (H. B. et Kunth, nov. gen. amer. 3. p. 409, but not of Ruiz and Pav.) branchlets clothed with hairy tomentum; leaves obovate, glabrous; thorns straight, spreading; flowers solitary, sessile, almost terminal; tube of corolla twice the length of the calyx, with a silky throat? ț. S. Native of New Granada, at the mouth of the river Sinu. Flowers small, white. Very like R. latifolia, but differs in the branches being tomentose, and in the flowers being smaller.

Obateau-leaved Rándia. Shrub 5 to 8 feet.

3 R. purpureascens (Ruiz et Pav. fl. per. 2. t. 120. f. b.) leaves obovate, acute, downy; thorns opposite, axillary, spreading, much shorter than the leaves; flowers solitary, sessile, girdled at the base by numerous short adpressed bracteas; tube of corolla equal in length to the calycine lobes. ț. S. Native of Peru, on the Andes, in hot places among broken rocks. R. obovata, Ruiz et Pav. fl. per. syst. 2. p. 68. Rosi. et Schultes, syst. 5. p. 246. but not of Kunth. Gardënia obovata, Dietr. Spreng. Floriferous branches spinose, the rest unarmed, spreading, and somewhat tetragonal; stipulas subulate. Leaves 4-5 inches long. Corolla white, twice the length of the calyx. Berry pubeuscent, of a greyish yellow colour, crowned by the lobes of the calyx, which are acuminate.

Downy Rándia. Fl. June, Aug. Clt. 1820. Shrub 5 to 6 ft. 4 R. rotundifolia (Ruiz et Pav. fl. per. 2. p. 68.) thorns and branches somewhat verticillate; leaves roundish and ovate, downy on both surfaces, wrinkled; flowers solitary, sessile; corolla twice as long as the calyx. ț. S. Native of Peru, in groves about Huassa-Huassi. Gardënia rotundifolia, Dietr. ex Róm. et Schultes, syst. 5. p. 246. Stipulas ovate, acute. Flowers solitary in the centre of the leaves. Corolla white. Berry yellowish, 1-celled, size of a filbert, when young, crowned by the lobes of the calyx, which are elongated and linear. Seeds compressed, imbedded in the black pulp.

5 R. echinocaíps (Moç. et Sesse, fl. mex. icon. ind. ex D. C. prod. 4. p. 385.) thorns in a whorl, spreading; leaves ovate, acuminate, rather villous, crowded at the tops of the branches; flowers solitary, sessile, almost terminal; fruit globose, echinate. ț. S. Native of Mexico. Flowers white. Limb of calyx 5-lobed; lobes linear-subsulate. Allied to R. tetractintha, but differs in the calyx being 5-parted, not tubular and 5-toothed, and in the tube of the corolla being one-half shorter.

Hedgehog-fruited Rándia. Shrub 4 to 6 feet.

6 R. dumetorum (Lam. ill. t. 156. f. 4.) thorns opposite; leaves ovoid, bluntish, cuneated at the base, glabrous; flowers sessile, solitary, almost terminal; limb of calyx 5-parted, with oblong lobes, which are a little shorter than the corolla, which is villous. ț. S. Native of the East Indies, frequent on the sea shore. Cánthium coronatum, Lam. dict. 1. p. 602. Gardënia dumetorum, Retz, obs. 2. p. 14. Róxb. cor. t. 136. Gardënia spinosa, Lin. fl. suppl. t. 164. Rándia spinosa, Blum. bijdr. p. 981. Posoquèria dumetorum, Róxb. fl. ind. 2. p. 564. Gardënia spinosa, Thunb. diss. gard. no. 7. t. 2. f. 4. Cerisëus Malahabícas, Garnt. fr. t. 1. 28.—Pluën. t. 98. f. 6. Flowers white, clothed on the outside with adpressed villi, sweet-scented. Branches downy while young, but afterwards glabrous. Berry almost globose, yellow, about the size of a small apple, 2-celled, and crowned; cells many seeded. This shrub is employed for fences in the places of its natural growth. The fruit bruised and thrown into ponds where fish are, they are soon intoxicated, and seen floating. Fishermen sometimes follow this mode to enable them to take the fish with more ease. They are not deemed less wholesome from the effects of the fruit. Cécceus Indicus does not grow in those parts, nor is it known or used there for this purpose.

7 R. uliginosa (D. C. prod. 4. p. 386.) thorns almost terminal, opposite; branches tetragonal; leaves obovate, somewhat cuneated, glabrous; flowers solitary, sessile, almost terminal; limb of calyx tubular, almost entire, a little shorter than the tube of the corolla, which is villous in the throat. ț. S. Native of the East Indies, delighting in moist places, such as the banks of rivers, low lands, &c. Gardënia ulignosa, Retz, obs. 2. p. 14. Róxb. cor. t. 135. Posoquèria ulignosa, Róxb. fl. ind. 2. p. 563. Thorns 1-2-13 or 4 at the extremities of the branchlets. Leaves 2-3 inches long, and 1½ broad. Flowers 1-2 or 3 at the ends of the branchlets, large, white, and fragrant. Berry size and shape of a pullet's egg, ash coloured, or olive grey, 2-celled.
Seeds flattish, nesting in the pulp. The flowers of this species render it deserving of a conspicuous place in a hot-house. The uncommon appearance of the plant is also in its favour.

8 R. _longissima_ (D. C. prod. 4. p. 386.) thorns opposite or alternate, horizontal; branches long, dependent; leaves obovate-cuneate, smooth; flowers axillary, and almost terminal, solitary on short pedicels; tube of calyx cylindrical, 5-lobed; lobes ovate-cordate, permanent; corolla villous on the outside; berry obovate, smooth. _See S._ Native of the coast of Coromandel. Posoquêria longissima, Roxb. fl. ind. 2. p. 566. Link, enum. hort. b. 225. Thorns sharp, from 1 to 2 inches long. Leaves on the young shoots opposite, on the old ones in fascicles. Stirpilas subulate. Flowers pretty large, pure white, and fragrant. Tube of corolla as long as the calyx, with a villous throat. Berry size of a nutmeg. Seeds immersed in the pulp.

9 R. _nutans_ (D. C. prod. 4. p. 386.) thorns slender, opposite, spreading; branches long, dependent, pubescent while young; leaves narrow-obovate-oblong; flowers axillary, solitary, on short peduncles; corolla silky on the outside; berry globose, crowned by the tube of the calyx, which is entire. _See S._ Native of the East Indies. Posoquêria nutans, Roxb. fl. ind. 2. p. 565. Ceriscus Malabáricus, Gaertn. fr. 1. t. 28. Leaves on short pedioles, opposite on the young shoots, but fascicled on the old ones, from 1 to 2 inches long, by about 1 broad. Flowers solitary, under the spines, middle-sized, white, and fragrant; throat of corolla villous. Berry size of a nutmeg, 2-celled.

§ 2. Flowers in fascicles or racemes, in the axils of the leaves, or extremities of the branches.

10 R. _parviflora_ (Lam. dict. 3. p. 25.) thorns opposite, very short; leaves ovate, petiolate, glabrous; racemes villous; flowers axillary, disposed in fascicles, on short pedicels; limb of calyx with 5 short teeth. _See S._ Native of the East Indies. The thorns, according to Lamark, are arched. Gardênia Sonnerâtii, Spreng. syst. 1. p. 762. Perhaps Gardênia macrâthâ, Thunb. diss. gard. no. 8. t. 1. f. 2. is referable to this species, but the spines are said to be straight; but the fruit in both are unknown, therefore the genus to which they belong is doubtful. Flowers small, 3-together.

_Small-flowered Randia._ Fl. April, June. Clt. 1818. Shrubs 4 to 5 feet.

11 R. _floribunda_ (D. C. prod. 4. p. 386.) thorns axillary, stiff; leaves opposite and in fascicles, obovate-cuneate, smooth; flowers disposed in lateral fascicles, on short pedicels; tube of calyx longer than the lobes, which are lanceolate; corolla silky outside; berry ovate, cordate, polished. _See S._ Native of the coast of Coromandel. Posoquêria floribunda, Roxb. fl. ind. 2. p. 569. A large stiff-branched shrub, in a good soil growing to a small tree. Flowers middle-sized, white at first, but soon becoming yellow, and fragrant, produced in fascicles, from short scaly spurs. Segments of corolla obvolute. Berry size of a prune, 2-celled, many seeded, crowned.

_Bundle-flowered Randia._ Shrubs or small tree.

12 R. _longiflora_ (Lam. dict. 3. p. 26. ill. t. 156. f. 3. but not of Salish.) arboreous; thorns opposite, recurved; leaves lanceolate-oblong, smooth; coriaceous terminal and axillary, 11-13 flowers; limb of calyx tubular, 5-lobed; lobes semilunar; tube of corolla long and slender. _See S._ Native of Chittagong, in the East Indies, where it grows to a pretty large tree. Posoquêria longiflora, Wall. in Roxb. fl. ind. 2. p. 568. Gardênia multiglobosa, Willd. spec. 1. p. 1231. Posoquêria multiglobosa, Blum. bijdr. p. 980. Branches terete, smooth. Leaves 6 inches long, and 1½ or 2 broad. Flowers large, pale, or nearly white when they first expand, becoming yellow by the second day, fragrant. Berry the size of the cherry, yellow when ripe, smooth, fleshy.

13 R. _fasciculata_ (D. C. prod. 4. p. 386.) thorns axillary, spreading; leaves obovate-oblong, almost sessile, smooth; fascicles of flowers nearly sessile, axillary, and in the forks of the branches; calyx hairy, with 5 subulate lobes. _See S._ Native of the East Indies. Posoquêria fasciculata, Roxb. fl. ind. 2. p. 568. A much branched shrub. Thorns straight. Flowers middle-sized; at first white, but in the course of a day changing to a pale yellow colour. Segments of corolla oblong. Ovary 2-celled, many seeded.

_Fascicled-flowered Randia._ Shrubs 4 to 5 feet.

14 R. _rigida_ (D. C. prod. 4. p. 386.) thorns opposite, subulate, each having an annular joint, rarely 2 above the middle, the lower half downy, the upper smooth and shining; branches tetragon, and are, as well as the calyces, villous; leaves ovate, smooth, on short pedioles; flowers by threes, axillary, and almost terminal; tube of corolla long, slender; berry downy. _See S._ Native of the valley of Nipaul, and the surrounding mountains; and also at Nokote. Posoquêria rigida, Roxb. fl. ind. 2. p. 570. A strong rigid branchy shrub. Leaves in approximate fascicles, ending each in a cuspitate point. Flowers white and fragrant. Leaves shining above, but with a few short hairs along the nerves beneath. Corolla smooth on the outside. Berry purple, 2-celled, many seeded. Perhaps a true species of _Posoquêria._ Said to be allied to _R. fasciculata._

_Stiff Randia._ Shrubs 5 feet.

15 R. _stricta_ (Roxb. fl. ind. 2. p. 145.) branches stiff, decussate; leaves smooth, oblong, acute, on short pedioles; fascicles of flowers sessile, dense, globose, axillary, bracteate; tube of corolla short, hairy inside; berry globose. _See S._ Native of the East Indies, on the mountains north of Bengal. Macróneum strictum, Willd. rel. in Rom. et Schultes, syst. 5. p. 6. Smith, in Rees's cyclo. vol. 22. no. 5. Rodelênia stricta, Roth, nov. spec. p. 140. Flowers small, white. Berry size of a pea, 2-celled, smooth. Seeds imbricated in 2 rows in each cell, attached to the partition above its middle. Perhaps a distinct genus.

_Straight Randia._ Shrubs 5 to 10 feet.

16 R. _scandens_ (D. C. prod. 4. p. 387.) stem scendent prickly; prickles recurved; leaves oval, acuminate, coriaceous, glabrous; peduncles almost terminal, usually 3-flowered at the apex; tube of corolla short; limb of calyx tubular, rather truncate. _See S._ Native of Java, on the mountains of Parang and Salak. Tocoyêna scandens, Blum. bijdr. p. 980. Flowers white.

_Climbing Randia._ Shrubs cl.

17 G. _tetrandra_ (D. C. l. c.) thorns scattered, straight; leaves ovate, acuminate, narrowed at the base, rather coriaceous, and are as well as the branchlets downy; stipulas ovate, acuminate; flowers 6-8 in a fascicle at the tops of the branches, sessile, tetrandrous; bracteates connate; teeth of calyx 4, subulate; corolla clothed with silky hairs outside. _See S._ Native of New Granada, in temperate places near Guadua. Gardênia parviflora, H. B. et Kunth, nov. gen. amer. 3. p. 408. t. 293. Flowers small, white.

_Tetrandrous-flowered Randia._ Shrubs 5 feet.

18 R. _arma'ta_ (D. C. prod. 4. p. 387.) thorns 4 together at the tops of the branchlets, short, spreading; leaves ovate, acute at both ends; flowers usually 4 on the tops of the branchlets, on short pedicels; lobes of calyx linear-cuneiform; tube of corolla long, cylindrical, glabrous. _See S._ Native of Cartha-

_Armed Randia._ Chit. 1813. Shrub 5 to 10 ft.

19. _R. pedunculata_ (D. C. 1. c.) thorns decussate, spreading, acute; leaves ovate, or oval, glabrous above and pubescent beneath; stipulas pellucida; flowers disposed in cyosome fascicles; tube of calyx tubular, but the limb is acute and 5-cleft beyond the middle; segments of corolla almost orbicular. _S._ Native of Brazil, at Rio Padre. Gardénia ferox, Cham. et Schlecht. in Linnæa. 4. p. 198. Flowers white, sweet-scented.

_Fierce Randia._ Shrub 4 to 5 ft.

20. _R. capitata_ (D. C. 1. c.) thorns stiff, short, 4 at the top of each branchlet; leaves ovate, acute, hairy on both surfaces as well as on the branchlets; flowers sessile, 6-8 in a capitiate fascicle at the tops of the branchlets; limb of calyx tubular, with stiff, subulate teeth; tube of corolla 3 times longer than the segments, villous on the outside. _G._ Native of Mexico. Flowers white, sweet-scented.

_Capitate-flowered Randia._ Shrub 4 to 6 ft.

21. _R. tetracantha_ (D. C. 1. c.) branches opposite, horizontal, bearing each 4 thorns at the apex; leaves lanceolate, acuminate, villous; flowers sessile, 4 at the top of each branch; limb of calyx tubular, terminating in 5 subulate teeth; tube of corolla long, villous. _S._ Native of Mexico, about Acapulco and Regionioni. Mussæí'a tetracanthœ, Cav. inon. 5. p. 29. t. 455. Gardénia armata, Bartl. but not of Swartz. Corolla pale yellow. Berry size of a pigeon's egg; not crowned by the calyx.

22. _R. propinquœ;_ branches slightly downy, armed with 4 spines at the apex, placed crosswise; leaves ovate, cordate, undulate, acuminate, downy, petiolate; flowers in terminal fascicles. _S._ Native country unknown. Gardénia propinquœ, Lindl. bot. reg. t. 975. Thorns straight, infra-axillary. Leaves clustered at the ends of the branchlets, rather longer than the flowers. Corolla with a long cylindrical tube, and a 5-parted, spreading limb, with coriaceous, ovate, acute, flat segments, which are rather longer than the tube. Anters semi-exserted. Flowers large, white.

_Allied Randia._ Fl. July. Chit. 1823. Shrub 6 to 8 ft.

_Humboldt's Randia._ Shrub 5 to 10 ft.

24. _R. nitida_ (D. C. 1. c.) branches rather angular, furnished with 2 spines at the apex; leaves ovate-elliptic, acute, glabrous, shining; flowers terminal, twin, or by threes or fours, sessile; corollas glabrous. _S._ Native of New Granada, near Turbaco. Mussæí'na nitida, H. B. et Kunth, nov. gen. amer. 3. p. 410. Flowers white, sweet-scented. Fruit unknown.

_Shrubbing-leaved Randia._ Shrub 5 to 8 ft.

25. _R. triflœra_ (Hamilt. in D. Don, fl. nep. p. 158.) thorns opposite, subulate, adnate to the branches above the petioles; petioles and branchlets hairy; stipulas ovate, cuspidate; leaves ovate; peduncles axillary, 3-flowered; calyx campanulate; having the lobes ovate at the base, and linear-subulate at the apex. _G._ Native of Nipaul, at Hetaaura. Peduncles solitary, very short, usually 3, sometimes 4-flowered. Flowers usually 6-cleft and hexadromous. Anters semi-exserted.

_Three-flowered Randia._ Shrub.

_Horrid Randia._ Shrub 8 ft.

27. _R. Sine'sis_ (Rœm. et Schultes, l. c.) thorns short, opposite, rather recurved; leaves lanceolate (Lour.): superior ones ovate, nerved, glabrous; corymbs small, terminal, few-flowered; limb of calyx tubular, 5-lobed; tube of corolla long, glabrous; having the throat hardly inflated; anters linear, exserted, about equal in length to the lobes, which are spreading. _S._ Native of China, about Canton. Oxygethera Sinensis, Lour. cooh. p. 151. Randia Chinensis, Spreng. syst. 1. p. 768. R. longiflora, Lam. ill. 156. f. 3. Flowers white, salver-shaped, with a very long tube. Berry small, roundish, 2-celled, many-seeded.

28. _R. africana;_ thorns spinose; fruit woody, oblong, or roundish. _S._ Native of Sierra Leone. Flowers small, greenish yellow.

_African Randia._ Shrub 3 to 4 ft.

Sect. II. _Euclénia_ (from eu, eu, well, and kléw, kline, to bend; the segments of the corolla are well bent over each other before expansion). _D._ C. prod. 4. p. 388. Unarmed shrubs. Tube of corolla usually dilated and obconical at the throat. Perhaps a proper genus.

29. _R. maculata_ (D. C. prod. 4. p. 388.) shrubby, unarmed; branchlets rather downy; leaves oval, smooth, glandular in the axis of the nerves beneath, not pilose; flowers terminal, solitary from the axes on the ultimate leaves; tube of corolla very long, dilated at the apex. _S._ Native of Guinea. Rothmannia longiflora, Salisbar. t. 65. Limb of calyx rather villous, 5-toothed. Corolla 5 inches long, white, spotted with purple at the throat; segments ovate, spreading. Ovary 2-celled.

30. _R. specio'sa_ (D. C. prod. 4. p. 388.) shrubby, unarmed, glabrous; leaves elliptic-oblong, shining above; flowers from the tops of the branchlets, solitary in the axes of the ultimate leaves; tube of corolla very long, clothed with adpressed down on the outside: the segments acuminate. _S._ Native of Cayenne, where it was collected by Patris. Tube of corolla 9 inches long, hardly dilated at the apex. Genitals inclosed. Berry ovate. Tube of calyx cylindrical, semi-quinquepod; lobes subulate, erect.

_Elegant Randia._ Shrub.

31. _R. Mussæí'na_ (D. C. l. c.) shrubby, unarmed; leaves ovate or lanceolate, acute, downy on the veins underneath; flowers solitary, sessile, terminating the branchlets; tube of calyx semi-quinquepod: the lobes subulate; corolla villous on the outside, with a long tube, and acuminate segments. _S._ Native of Carthagina in woods (Jacoquin.); on the banks of the river Magdalena, near Honda (H. B. et Kunth, nov. gen. amer. 3. p. 408.); Dutch Guiana (Meyer, ceseq. p. 128.); Mexico, Demerara, French Guiana, and probably of Tobago. Mussæí'na formosæ,
Jacq. Amer. p. 70. t. 48. Gardénia marítima, Vahl, herb. Gardénia Mussae'nda, Thunb. disn. no. 5. Perhaps 2 or 3 allied species are here confused. The branches are glabrous in Jacquin's and De Candolle's specimens, but hairy in those of Kuntz and Thunberg. Corolla with an incurved or straight tube, villous and green on the outside (ex Jacq.), but the segments are white within. Berry coriaceous, ovate, crowned by the calyx, 2-celled. Stigmas 3, acute, revolute.

Musae'nda-like Randia. Clt. 1820. Shrub 5 to 6 feet

32. R. RUIZ'IZA (D.C. prod. 4. p. 388.) shrub, unarmed; leaves lanceolate, acute, on short petioles, glabrous above, rather hairy on the veins underneath; flowers terminal, solitary, sessile; calyx hairy, with subulate, erect segments; corolla hairy on the outside, with a very long tube, an oblong, villous throat, and spreading acute segments. \( \delta \). S. Native of Peru, on the Andes, in groves at Pozuzo. Gardénia longiflora, Ruiz et Pav. fl. per. 2. t. 219. but not of Ait. Branches very long, when young rather tetragonal. Berry cylindrical, large, yellowish, striated longitudinally by 10 brown nerves, 2-celled, containing a sweet edible pulp. Flowers white. Stigmas 2, thick, reflexed.

RUIZ'IZA's Randia. Shrub 10 to 12 feet.

33. R. MACRA'YTHA (D.C. l. c.) shrub, unarmed; leaves oval-oblong, acuminate, rather ciliated; flowers sessile, almost terminal, 5-parted; lobes of calyx subulate, spreading; corolla with a long tube, which is dilated at the apex, and revolute segments. \( \delta \). S. Native of Sierra Leone. Rândia longiflora, Salsib. par. t. 93. but not of Lam. Gardénia longiflora, Ait. hort. kew. ed. 2. vol. 1. p. 388. but not fl. per. Gardénia macrânya, Roem. et Schultes. syst. 5. p. 295. Flowers 6-7 inches long, cream-coloured, fragrant. Stigmas 2, thick, obtuse, flat inside and convex outside. Ovarium 2-celled. According to Salisbury, this with others he proposes to separate into a distinct genus to be called Eulitonia.

34. R. longísYLGA (D.C. l. c.) shrub, unarmed; leaves oval, villous above, but villously tomentose beneath, as well as the petioles; stipules ovate, glabrous, scarious, deciduous; flowers almost terminal, disposed in corystome fascicles; lobes of calyx parted to the base of the limb, erect, lanceolate, ciliated. \( \delta \). S. Native of Guinea, on the Gambia at Alfreda, where it was collected by Leprieur and Perrotten. Flowers black, in the dried state, but probably white when recent, \( \frac{1}{2} \) inch long. Style much exerted; stigma thick, bipartite. Fruit nearly globose, about an inch in diameter. Seeds compressed, separated by glutinous partitions.

Long-styled Randia. Shrub 5 to 6 feet.

35. R. MADAGASCARE'NIS (D.C. prod. 4. p. 389.) shrub, unarmed; leaves ovate, acute, on short petioles, glabrous, coriaceous; flowers axillary, sessile, bibracteate at the base; limb of calyx 5-lobed, obtuse; corolla vellutty outside from tomentum, with a terete tube, and 5 oblong obtuse lobes; genitals inclosed. \( \delta \). S. Native of Madagascar. Gardénia Madagascaiensis. Lam. dict. 2. p. 608. Flowers about 3 inches long. (ex Lam.) Tube of corolla 15 lines long. (ex D.C.)

Madagascar Randia. Shrub 5 to 18 feet.

36. R. genéPEHLO'RA (D.C. l. c.) shrub, unarmed; leaves oval-oblong, acuminated at both ends, coriaceous, glabrous, on short petioles; stipules lanceolate; peduncles axillary, very short, divided at top into many 1-flowered pedicles, which are disposed in a corystome; limb of calyx tubular, permanent, 5-toothed, a little shorter than the corolla. \( \delta \). S. Native of Sierra Leone, where it was collected by Smeathmann. Tube of corolla cylindrical, hardly longer than its lobes. Anthers long, linear. Stigmas 2, slender, acute. Berry dry, 2-celled, crowned by the tubular limb of the calyx; placentas scarcely exerted. Seeds horizontal.

Genipa-flowered Randia. Shrub 5 to 8 feet.

37. R. TALANGNINIA (D.C. l. c.) leaves oval-oblong, acute at the base, obtuse at the apex, coriaceous, glabrous; stipules short, undivided; flowers axillary, solitary, a little shorter than the leaves; calyx long and tubular beyond the ovarium, with 5 short, acute teeth at the apex; corolla with a long terete tube, and as is as well the segments clothed with velvety hairs on the outside. \( \delta \). S. Native of Madagascar, on the east coast, where it was collected by Chapelier, and called by him Talangninia. Berry dry, ovate, rather acuminated.

Talagnniana's Randia. Shrub.

† Doubtful species.

38. R. t. drupa'CEA (D.C. l. c.) berry ovate, drupaceous, containing a bony putamen. \( \delta \). S. Native of Java. Posoquária drupácæ, Gaertn. fil. carp. 3. p. 77. t. 195. f. 1. The rest unknown.

Drupaceous-fruited Randia. Tree or shrub.

39. R. t. POLYSPE'RA (Roxb. fl. ind. 2. p. 146.) shrub bushy and much branched; leaves oblong, acuminated, smooth; stipules subulate; spikes panicked, axillary. \( \delta \). S. Native of the East Indies, about Chittagong.

Many-seeded Randia. Shrub 5 to 6 feet.

Cult. For culture and propagation see Gardénia, p. 499. All the species being very showy, usually bearing large, white, fragrant flowers, are therefore worth cultivating in every collection of stove plants.

Lin. syst. Penétária, Monogynia. Calyx with a 5-parted limb, and erect, acute, permanent lobes. Corolla with a slender tube and a 5-parted limb; rather oblique, spreading, lanceolate, acute segments, and a villous throat. Stamens 5, almost sessile, inclosed, inserted in the middle of the tube. Style short, inclosed; stigma oblong, bipartite, with the lobes approximate. Fruit egg-shaped, fleshy, coriaceous, 2-celled, crowned by the large erect limb of the calyx; cells many-seeded. Seeds distinct, many-sided, of a golden yellow colour, and clothed with adpressed, silky down. Embryo linear, terete, in the center of a horny albumen.—A shrub. Leaves opposite, coriaceous, elliptic, acute, quite glabrous. Stipulas entire, caducous, interpetiolar. Flowers on short pedicels, crowded in the axils of the leaves. Habit almost of an apocynous plant.

1 C. MADAGASCARE'NIS (A. Rich. l. c.). \( \delta \). S. Native of Madagascar.

Madagascar Chapelieria. Shrub 2 to 4 feet.

Cult. For culture and propagation see Gardénia, p. 499.

XXXIX. HEIN'SIA (named in memory of the famous philologist Heinsius, the translator of Theophrastus's works). D. C. prod. 4. p. 390.

Lin. syst. Penétária, Monogynia. Calyx with an obovate limb and a 5-parted limb; and oblong, foliaceous, permanent lobes. Corolla salver-shaped, with a terete tube, which is longer than the calycine lobes, very hairy inside in the upper part, and 5, oval, acute undulata lobes. Anthers 5, linear, acute, sessile towards the top of the tube, inclosed and hidden among the hairs. Style filiform, shorter than the tube of the corolla; stigmas 2, linear. Fruit globose, crowned by the calyx, dry, hard, indehiscent, 2-celled; placenta 2, thick, adnate to the
dissempment. Seeds numerous, wingless, nesting on the super-

ficies of the placentas.—A much-branched, unarmed, glabrous
shrub or small tree, but there are small permanent spurs, which look like spines. Leaves opposite, oval-oblong or ovate,
acuminated, on short petioles. Stipulas twin on each side, small,
acute. Flowers 3-4 together at the tops of the branches, ped-
dicellate, and disposed in something like racemes, white, about
the size of those of Vinca rosea, and very similar to those of
Gardénia and Rândia.

1 H. JASMINIFLOURA (D. C. prod. 4. p. 390.), t. Native of
Sierra Leone, where it was collected by Smeathmann, Afzel-
lius, and G. Don. The plant we have seen at Sierra Leone has
numerous 1-flowered, terminal, and axillary pedicels; the tube
of the corolla clothed with yellow hairs; and the segments of
the corolla hispid. The shrub bears nothing like spurs or spines
that we recollect.

Jasmine-flowered Heinsia. Fl. Feb. Cti. 1824. Sh. 5 to 8 ft.
Cult. See Gardénia, p. 499. for culture and propagation.
A beautiful shrub, clothed with numerous white flowers.

XL. MENENSTORIA (Menestor was a physiologist cited by

Lin. syst. Pentándria, Monogyaina. Calyx with a globose
tube, a 5-parted limb; and linear, almost subulate, acute, distant
segments. Corolla with a long terete tube, 5 oval acute short
lobes, and an almost naked throat. Anthers 5, oblong, sessile
within the tube of the corolla. Style filiform; stigma bifid,
icnosed; lobes linear. Ovarium 2-celled; placentas many-
seeded, adnate to the dissemination. Fruit baccate, almost dry,
arculate at the apex, never crowned, from the lobes of the calyx
being deciduous. Seeds very small, wingless.—Unarmed shrubs,
natives of Nipaul. Leaves opposite. Stipulas solitary on each
side, at length deciduous. Corymb of flowers terminal. This
is rather a doubtful genus, differing from Mussæn’dna in the tube
of the calyx or ovary being globose, not turbinate, and in the
stipulas being solitary on each side, not twin; and from Tocoyéna
in the limb of the calyx being parted to the base.

1 M. TOCOVÉNE (D. C. prod. 4. p. 390.) leaves obovate,
obtuse, cucurate at the base, almost sessile, glabrous above, pale
beneath, and beset with adpressed villi along the nerves. t. G.
Native of Nipaul. Branches terete. Stipulas broad, short,
very blunt, membranous. Corymb terminal, trichotomous, on
short peduncles; pedicels puberulous. Corolla 15 lines long,
puberulous on the outside; segments ciliated, apiculate, clothed
with adpressed down on the outside, as well as the tube. Style
about equal in length to the tube of the corolla; stigmas 2,
linear, applied to each other in the dried state.

Tocoyéna-like Menestoria. Shrub 5 to 6 feet.

2 M. HAMÉLIE (D. C. l. c.) leaves oval, acuminate at
both ends, on long petioles, rather scabrous from scattered hairs
above, and along the nerves underneath. t. G. Native of
Nipaul. Branchlets compressed. Leaves along with the
petioles an inch and more in length. Stipulas ovate, broad, short,
acute. Peduncles numerous, spreading, disposed in loose
cymes, rising from the top of the stem and forks of the branches.
Corolla 6 lines long, scarcely puberulous. Style very short,
icnosed, hardly attaining the height of the anthers.

Hamellia-like Menestoria. Shrub 5 to 6 feet.

3 M. MUSSÉNĐÉ (D. C. l. c.) leaves ovate, acute, on short
petioles, pale beneath, and downy on both surfaces; petioles,
stipula and middle nerve of the leaves clothed with rusful
hairs. t. G. Native of Nipaul. Branches rather hispid
and rufous. Stipulas ovate. Corymb dichotomous, with some of
the flowers sessile and solitary in the forks, and others terminal.
Calyx hispid; lobes deciduous. Berry ovate-globose, smoothish.
Mussénda-like Menestoria. Shrub 5 to 6 feet.

4 M. RIGIDÁ (D. C. l. c.) leaves cuneate, retuse, and mu-
cronulate, glabrous; stipulas ovate, acute. t. G. Native of
Nipaul, at Suembu. Gardénia rigidá, Hamilt. ex D. Don, prod.
Sement of the calyx subulate. Limb of corolla 5-lobed; lobes
attenuated at the apex.

Stiff Menestoria. Shrub 5 to 4 feet.
Cult. For culture and propagation see Gardénia, p. 499.

XLI. HELÓSPORA (from helos, helios, the sun, and stépore,
spora, a seed; in reference to the disposition of the seeds).
p. 391.

Lin. syst. Tetrándria, Monogyaina. Calyx with a globose
tetragonal tube, and a somewhat campanulate 4-toothed, erect,
permanent limb. Corolla tubular, much longer than the calycine
limb, with a naked throat, and 4 oblong spreading lobes, which
are valvate in aestivation. Anthers 4, linear, incnosed. Style
4-furrowed, and 4-cleft at the apex; stigmas short, spreading.
Berry crowned by the calyx, tetragonal, not divided into cells
inside, but bearing the seeds disposed crosswise, in 4 double
series, immersed in pulp. Seeds linear, curved a little.—A
smoothish shrub. Leaves opposite, on short petioles, ovate-
lanceolate. Stipulas deciduous, bearing a row of cells inside.
Peduncles axillary, 1-flowered, shorter than the leaves. Brac-
teeles 2, under each ovary.—This genus is perhaps allied
to Guttárdia or Gardénia.

1 H. FLAVESCENS (Jack, l. c.). G. Native of Sumatra.
Leaves 3-5 inches long. Corolla yellowish, 4-8 lines long.
Yellowish-flowered Helospora. Tree small.
Cult. For culture and propagation see Gardénia, p. 499.

XLII. HIPPÓTIS (from ἵππος, hippos, a horse, and ὀφως,
ous otos, an ear; the form of the calyx has been compared to
hist. nat. par. 5. p. 255.

Lin. syst. Pentándria, Monogyaina. Calyx with an obovate
tube and a spath-formd limb, which is cleft on one side, and
drawn out into a mucronate auricle on the other. Corolla a little
longer than the calyx, funnel-shaped, with a somewhat incurved
tube, and a bluntly 5-lobed limb. Stamens 5, inserted in the middle
of the tube; anthers ovate, incnosed. Urecolus 5-crated, seated
on the ovary. Stigma of 2 adpressed lobes. Berry ovate,
crowned by the calyx, 2-celled. Seeds numerous, minute.—
An unarmed villous shrub. Leaves obovate-oblong, acuminated,
petiolate. Stipulas ovate, acute, caducous, villous on the
outside and solitary on each side. Peduncles axillary, hardly one
half shorter than the leaves, 5-flowered at the apex. Corolla
and berries villous, purplish red.

1 H. TRÍFLÓRA (Ruiz et Páv. l. c.). G. Native of Peru,
in forests about Cuchero, Macorà, and Marimarchalma. Pe-
duncles furnished with small, subulate, deciduous bracteas.
Calyx reddish purple. Corolla crimson, greenish at the base:
having the tube yellowish inside.

Three-flowered Hippotis. Shrub 10 to 12 feet.
Cult. For culture and propagation see Gardénia, p. 499.

XLIII. POMATIUM (from pomeum, an apple; shape of
p. 391.

Lin. syst. Pentándria, Monogyaina. Calyx with a sub-
globose tube, and a 5-toothed limb; teeth short, obtuse, deci-
duous, leaving only a membranous circle behind. Corolla small,
with a terete tube and a 5-parted limb. Anthers ovate, sessile
in the throat of the corolla, incnosed. Stigma bifid, with oblong
lobes. Berry almost dry, globose, somewhat didymous, crowned by an areola formed by the falling of the calyx, 2-celled, many-seeded. Placentas rather thick. Seeds angular. Embryo straight, in fleshy albumen, with a centripetal radicle, and flat ovalate-roundish cotyledons.—African shrub. Branches terete, hispid in the young state, and glabrous in the adult state. Leaves opposite, almost sessile, oblong-lanceolate, acuminate. Stipulas foliaceous, solitary on each side, oblong, acuminate, almost an inch long. Thyrsoid spike-formed, terminal.—Habit of Bertiera.

1 P. spicatum (Gaertn. l. c. D. C. diss. ined. with a figure). \S. Native of Sierra Leone, where it was collected by Smeathmann and G. Don; and in the woods of Casamance at l'ouo by Perrottet and Leprieur. Genaiba labiata, Smeathm. in herb. Lher. Flowers small, white. Spicate-flowered Pomatium. Shrub 6 to 8 feet.

2 P. de'gium; leaves broad-lanceolate, long-acuminate, rather cordate at the base, sessile; flowers panicled, axillary, and terminal. \S. Native of Sierra Leone, on the mountains, in woods. Flowers small, white. Doubtful Pomatium. Shrub 6 to 8 feet.

Lin. syst. Pentändria, Monogynia. Calyx with a sub-globose tube, and a very short permanent 5-toothed limb. Corolla funnel-shaped, with a terete tube, and a 5-parted spreading limb; segments oval, very acute. Anthers 5, sessile within the throat of the corolla. Stigma bifid; the lobes acute. Berry almost dry, crowned by the calyx, umbilicate, roundish, 2-celled, many-seeded. Seeds fixed to the central placentas, angular, muricate.—Shrubs. Leaves oval-oblong, acuminate, petiolate, villous. Stipulas solitary on both sides, combined at the base, acuminate. Thyrsoid terminal, racemously peduncled, bracteolate. Flowers small, white, and sometimes red.—Habit of Logfistum, but differs in the flowers being 5-parted.—This genus is probably divisible into several.

Sect. 1. Bertiera (see genus for derivation). D. C. prod. 4. p. 802.—Bertiera, Aubl. Fruit usually striated, crowned by the calycine teeth, which are erectly connivent and subulate. Inflorescence terminal.

1 B. guianensis (Aubl. guian. 1. p. 180. t. 69.) leaves ovate-oblong or elliptic, acute, with distant villous nerves; stipulas undivided on both sides, acuminate; flowers disposed in a racemose thyrsus; fruit sessile, striated, hairy, disposed along the branches of the panicle, crowned by the erect subulate calycine teeth. \S. Native of French Guiana, in woods; and of Cayenne. Vahl, symb. 3. p. 35. Lam. ill. t. 165. Spreng. syst. 1. p. 708. exclusive of some synonyms. Branches villous. Stipulas broad at the base, and rather connate. Leaves 3-4 inches long. Flowers small, white. Guiana Bertiera. Shrub 6 to 7 feet.

2 B. mucronata (Gaertn. fil. carp. 3. p. 74. t. 192. f. 7.) leaves and flowers unknown; fruit striated, crowned by the erectly connivent calycine teeth, pedicellate, disposed along the branches of the panicle. \S. Native country unknown. Perhaps the same as B. Guianensis.

Mucronate Bertiera. Shrub.

3 B. palustris (A. Rich. in mem. soc. hist. nat. par. 5. p. 245.) leaves elliptic-oblong, acute, hairy, with approximate nerves; stipulas bifid on both sides; flowers almost cymose; fruit not striated, hairy, crowned by the subulate teeth of the calyx. \S. Native of Guiana, in marshy parts of woods. A small sub-herbaceous erect shrub, clothed with rusty down. Leaves soft, usually tapering gradually to the base. Marsh Bertiera. Shrub 1 to 2 feet.

Sect. II. Zaluza (altered from Zaluzianski, an obscure Polish botanist). D. C. prod. 4. p. 392.—Zaluza, Comm. miss. Fruit smooth, crowned by the calycine teeth, which are spreading or erect, but not connivent. Embryo transverse, ovate-cylindrical, in the albumen.—Inflorescence terminal, racemose thyrsoid.

4 B. borbonica (A. Rich. l. c.) smoothish; leaves elliptic-lanceolate, acuminate, petiolate; stipulas undivided, drawn out into a setaceous point each, length of petioles; racemes thyrsoid, terminal; fruit glabrous, not striated, crowned by the teeth of the calyx, which are permanent, acute, and straight, but not connivent. \S. Native of the Island of Bourbon. Peduncles angular. Bracteas subulate. Bourbon Bertiera. Shrub 3 to 4 feet.

5 B. Rubra (A. Rich. l. c.) leaves elliptic, acute, on very short petioles, clothed with rufous silky down; stipulas broad, connate, acute, silky inside, and smoothish on the outside; racemes elongated; pedicels silky; fruit glabrous and villous, crowned by the erect calycine teeth. \S. Native of the Island of Bourbon. Rufous Bertiera. Shrub.

6 B. Zaluza (Gaertn. fil. carp. 3. p. 74. t. 192.) smoothish; leaves rather coriaceous, lanceolate-elliptic, acuminate, on short petioles, ciliated on the edges; stipulas undivided, drawn out into an acumen, length of petioles; racemes thyrsoid, terminal, and are as well as the flowers downy; branches of racemes dichotomous, with a sessile flower in each fork; fruit crowned by the limb of the calyx, which is hardly toothed; teeth spreading. \S. Native of the Mauritius. Musaenda racemosa, Sieb. fl. maur. 3. no. 303. Stipulas short, broad, conic, Racemes apparently drooping. Bracteae small, acute. Flowers sessile. Anthers mucronate. Calyx truncate. Corolla widening from the base, with acute segments. Zaluza Bertiera. Shrub 3 to 4 feet.

Sect. III. Mycet (apparently after some botanist of the name of Mycet). Reinwardt. miss. D. C. prod. 4. p. 892.—Bertiera, Blum. bijdr. p. 987. Tube of calyx ovate or turbinate. Berry crustaceous inside, crowned by the calycine teeth, which are spreading. Racemules axillary, somewhat corymbose.

7 B. Java (Blum. bijdr. p. 987.) stem simple; leaves petiolate, cuneate-oblong, acuminate, with a few scattered hairs above, and more so on the nerves beneath; coryms divaricate, axillary, and terminal, trichotomous, solitary, drooping; tube of corolla short. \S. Native of Java, in shady parts of woods.

Java Bertiera. Shrub 2 to 3 feet.

8 B. fasciculata (Blum. bijdr. p. 987.) stem a little branched; leaves cuneate-oblong, acuminate, glabrous above, but somewhat stigose on the veins beneath; coryms short, axillary, trichotomous, erect; pedicels in fascicles; tube of corolla elongated. \S. Native of Java, on Mount Salak, in humid places. Coryms often lateral, hardly longer than the pedicels. Throat of corolla velvety. Var. \beta. macrophylla (Blum. l. c.) leaves obovate, acute. \S. Native of Java, on Mount Bonok, in the province of Bantam. Fascicled-pedicelled Bertiera. Shrub. 3 T.
XLV. POUCEHTIA. Shrub rambling.

Cult. See Musce'nda, p. 492. for culture and propagation.

LIN. SYST. Pentàndria, Monogygni. Calyx with a turbinate tube, and a 5-parted limb; lobes erect, acute, permanent. Corolla funnel shaped, with a terete tube, which is longer than the calyx, a gradually widened throat, and a 5-parted limb; segments ovate-oblong, recurved. Filaments very short. Anthers oblong, dehiscing at the side in the upper part of the cells. Style clavate, 10-angled or 2-lobed. Berry globose, crowned by the calyx, 2-celled. Placentas spongy, central. Seeds wrinkled at the hilum. Albumen cheesy. Embryo centripetal. - Asiatic glabrous shrubs. Leaves oblong-lanceolate. Stipulas intrafoliaceous, broad, ending each in a short acumen. Corymb or panicles trichotomous, terminal, axillary, or opposite the leaves. Flowers white, fragrant.

§ 1. Stigma undetermined.

1 C. corymbosa (D. C. prod. 4. p. 394.) shrubby; leaves lanceolate-oblong, with revolute margins, shining; corollas terminal; lobes of calyx 5, about equal in length to the tube of the corolla; mature capsule 4-seeded. S. Native of the coast of Coromandel, frequent; Malabar; Pulo Penang, on hills; Ceylon, China, &c. Cùpì, Rheed. mal. 2. p. 37. t. 23. - Rendelèttia Asiatica, Lin. spec. 244. Weberà corymbosa, Wildl. spec. 1. p. 1224. Ker. bot. reg. t. 126. Cãntiñà corymbosum, Pers. ench. 1. p. 200. Roxb. fl. ind. 2. p. 533. Stylocorynia Weberà, A. Rich. mem. soc. hist. nat. par. 5. p. 248. Leaves 6-7 inches long and 2½ broad; having hairy glands in the axis of the large veins. Corollas terminal. Flowers small, very numerous, at first white, but finally yellowish, faintly fragrant. Berry size of a large pea, black when ripe. Seeds 4-8 in each cell. The extremities of the young shoots are often found covered with a white resinous matter, like that on the germs of most species of Gaertnèra.

Corymbose-flowered Cupia. Cct. 1759. Shr. 5 to 6 ft.

2 C. macrophylla (D. C. prod. 4. p. 394.) leaves broad-lanceolate, acuminate: panicule terminal, villous; tube of corolla long, slender, villous; berries 5-12-seeded. S. Native of the Prince of Wales Island. Weberà macrophylla, Wall. in Roxb. fl. ind. 2. p. 534. Young shoots villous. Leaves 6-8 inches long, and from 4-5 broad. Panicle large. Flowers large, white. Anthers long as the segments of the corolla.

Long-leaved Cupia. Shrub.

3 C. densiflora (D. C. prod. 1. c.) sub-arborescent; leaves oblong-lanceolate, acute at the base; panicule rounded, lateral, almost sessile, occupying the place of a leaf or branch, trichotomous, dense-flowered; throat of corolla bearded; ovary many-seeded. S. Native of Pulo Penang, on hills. Weberà densiflora, Wall. in Roxb. fl. ind. 2. p. 636. Leaves coriaceous, acuminate, shining above, 5-6 inches long. Flowers numerous, by threes, white. Bracteas lanceolate, ciliate. Anthers very long.

Dense-flowered Cupia. Shrub large.

4 C. mollissima (Hook. et Arn. in Bech. bot. p. 192.) leaves lanceolate, clothed with soft dense hairs on both surfaces; lobes of calyx short, very blunt; fruit pubescent, many-seeded. S. Native of China. The leaves, which clothe every part of the plant are of a rusty colour. Stigma unknown.

Very-soft Cupia. Shrub.

5 C. oppositifolia (D. C. l. c.) shrubby; leaves lanceolate-oblong, firm, and glossy; panicles opposite the leaves, composed of a few stiff, jointed, sub-recurved spikes; corolla with a short tube and a woolly throat; stigma clavate. S. Native of Chittagong. Weberà oppositifolia, Roxb. fl. ind. 2. p. 553. Flowers white.

Opposite-leaved Cupia. Shrub.

XIV. POUCEHTIA. XLVI. CUPIA.
6 C. ODORA'TA (D. C. l. c.) shrubby; leaves lanceolate, acuminate, polished; corymb terminal, and are as well as the bracteas villous; calyx 5-toothed; teeth one half shorter than the tube of the corolla; cells of berries 3-4-seeded. \(\gamma\). S. Native of Silhet, where it is called Patugrooa. Webbera odorata, Roxb. fl. ind. 2. p. 535. Leaves 4-6 inches long and 1-2 broad. Stipulas triangular. Flowers numerous, middle-sized, white, very fragrant. Anthers about as long as the segments of the corolla. 

**Sweet-scented-flowered Cupia.** Shrub large.

§ 2. **Stigma 2-lobed.**

7 C. AURICULATA (D. C. l. c.) arboreal, smooth; leaves ovate-oblong, emarginate, and unequally 2-lobed at the base, acuminate, almost sessile, the axils of the veins glanular beneath; panicles terminal and lateral, bracteate, on flattened peduncles; throat of corolla swollen, elevated, and bearded; ovary many-seeded. \(\gamma\). S. Native of Pulo-Penang. Webbera auriculata, Wall. in Roxb. fl. ind. 2. p. 537. Leaves contracted towards the cordate base, 7 inches long. Flowers white, fragrant. 

**Auricled-leaved Cupia.** Shrub large.

8 C. TRUNCATA (D. C. l. c.) shrub twining; leaves ovate, acute; panicles terminal, on flattened peduncles: corolla with a naked throat; ovary 4-ovulate. \(\gamma\). C. S. Native of Pulo-Penang, on hills. Webbera truncata, Wall. in Roxb. fl. ind. 2. p. 538. Leaves 3-4 inches long, acute at the base, dark and shining above, coriaceous. Bracteas lanceolate, deciduous. Flowers white, fragrant, on short pedicles by threes, or in fascicles. Anthers very long. 

**Truncate Cupia.** Shrub tw. 

9 C. SCANDENS (D. C. l. c.) shrubby, scandent, glossy; leaves oblong, acuminate; cymes axillary; stigma of 2 oval plates. \(\gamma\). C. S. Native of Silhet, where it is called Gujer-kota by the natives. Webbera scandens, Roxb. fl. ind. 2. p. 534. Leaves 5 inches long and 2-3 inches broad. Divisions of cymes generally alternate. Flowers large, funnel-shaped, fragrant when they first open, white, but like Gardenias become yellow by the second day. Anthers linear, sessile. 

**Climbing Cupia.** Shrub cl.

† **Species not sufficiently known.**

10 C. CYMOSA (D. C. l. c.) arboreous; branches pubescent; leaves ovate, acute, shining; cymes axillary, pedunculate, many-flowered; stigma capitate, 2-lobed. \(\gamma\). S. Native of the East Indies. Webbera cymosa, Wildl. spec. 1. p. 1234. Rondeletia cymosa, Poiret. dict. 6. p. 236. Cântium cymosum, Pers. ench. 1. p. 200. Flowers white, fragrant. Berries about the size of juniper berries, but their internal structure has not been noticed. 

**Cymose-flowered Cupia.** Clt. 1811. Tree.

11 C. THYRSOIDEA (D. C. l. c.) branches woody, clothed with brown pubescence; leaves oblong-obovate, acuminate at both ends; thryse dense, terminal; corolla glabrous outside and pilose inside; stigma bifid. \(\gamma\). S. Native of the East Indies. Webbera thyrsoida, Roth. nov. spec. p. 149. Cântium thyrsoides, Rœem. et Schultes, syst. 6. p. 207. Flowers white. Fruit unknown. 

**Thryse-flowered Cupia.** Shrub. 

Cult. For culture and propagation see Rondeletia, p. 517. All the species are very elegant when in blossom, and the flowers are very fragrant.

**XLVII. TARE'NNA (Tarenna is the Ceylonese name of the shrub), Gaertn. fruct. 1. p. 139. 28. f. 3. D. C. prod. 4. p. 395.**

**Lin. syst. Pentandria, Monogynia.** Calyx with a globose tube, and a 5-parted limb; lobes linear-oblong, reflexed, permanent. Corolla, stamens, and stigma unknown. Berry globose, with 8 stripes, crowned by the limb of the calyx, 2-celled; pulp thin. Placentas central, spongy. Seeds 4-6 in each cell, horizontal, semi-lunate, cuneated, compressed, wrinkled. Alumen fleshy. Embryo dorsal, with the radicle directed to the periphery, and foliaceous cotyledons. This genus appears to be allied to Cupia, but the flowers and all other particulars besides those mentioned are unknown.

1 T. zeylanica (Gaertn. l. c.). \(\gamma\). S. Native of Ceylon. Ceylon Tarenna. Tree or shrub. 

Cult. For culture and propagation, see Rondeletia, p. 517.

**Lin. syst. Tetra-Pentandria, Monogynia.** Calyx with a roundish tube, and a short, 4-5-toothed limb. Corolla funnelformed, with an equal 4-5-cleft limb. Stamens 4-5, within the tube. Berry almost globose, naked at the apex, 2-celled, many-seeded. Seeds numerous, rather angular, crustaceous—Trees and shrubs. Leaves opposite, or 3 in a whorl, on short petioles, often coriaceous. Stipulas intrapetiolar, undivided, solitary, on both sides. Peduncles axillary, shorter than the leaves, bearing each a few flowered corymb or cyme; rarely terminal, except in the more doubtful species.—Petesia of Gaertn. is Eumachia, D. C. a genus among the tribe Cooffeeceae. The character given by P. Browne agrees with this genus, but the species given are probably true species of Rondeletia. Petesia of Jacq. and Swartz is very doubtful, and will probably constitute a new genus, according to Bartling.

* Flowers axillary.

1 P. gra'ndis (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 395.) leaves opposite, rhomboid-ovate, acuminate at both ends, villous on both surfaces while young, but in the adult state they are beset with a little scattered down above, and rather villous on the nerve and veins beneath, reticulate and radiately striated between the veins; corymb few-flowered. \(\gamma\). S. Native of Mexico. Limb of calyx 5-cleft, deciduous. Seeds scrobiculate. 

**Great Petesia.** Tree.

2 P. nitrata (Bartl. in herb. Hænke, ex D. C. l. c.) leaves opposite, oblong, attenuated at both ends, glabrous, reticulately veined beneath, and radiately striated between the veins; peduncles axillary, 3-5-flowered, but only bearing one fruit each. \(\gamma\). S. Native of the Philippine Islands and Marian Island. Calyx sinuate 4-toothed. Corolla tomentose, small. Berry globose, hardly the size of a pea. Seed sub-cylindrical. The leaves are striated, almost like those of the first species.

**Shining-leaved Petesia.** Tree.

3 P. terrinolia (Bartl. in herb. Hænke, ex D. C. l. c.) leaves 3 in a whorl, obovate-oblong and oblong, acute at both ends; peduncles axillary, bifid, 5-7-flowered, but bearing only 1 fruit each. \(\gamma\). S. Native of the Island of Luzon. 

**Three-leaved Petesia.** Tree.

4 P. carnosa (Hook et Arn. in Beech, voy. pt. bot. p. 64.) leaves opposite, oblong-obovate, obtuse, attenuated at the base, glabrous, fleshy; peduncles axillary, 1-flowered. \(\gamma\). S. Native of the Society Islands. Corolla funnelflaped, 4-lobed: having the anthers sessile in the throat. It differs from most Rutaceous plants in the fleshy leaves.

**Fleshy-leaved Petesia.** Tree or shrub. 

3 T 2
**Flowers terminal.**

5 P. ? Hí'spida (Bartl. in herb. Hænke. ex D. C. l. c.) leaves opposite, membranous, obovate-oblong, acuminate at both ends, leaving the middle nerve on both surfaces, and the veins beneath hiuspid from bristles; corymbs terminal, short. h. S. Native of the island of Luzon.

Hispid-leaved Petesia. Tree or shrub.

6 P. ? Toméntosa (Jacq. amer. p. 18.) leaves oblong, attenuated at both ends, very soft on both surfaces from hardly conspicuous tomentum; corymbs lateral and terminal. h. S. Native of New Spain, in woods about Cartagena. Flowers tetramerous. Fruit unknown. Perhaps a species of Rondelétia.

Toméntose Petesia. Tree.

7 P. ? Spicata (Swartz. fl. ind. occ. 3. p. 1945.) leaves elliptic, attenuated, glabrous, pubescent on the nerves beneath; petioles hairy; racemes terminal, spicate. h. S. Native of the southern part of Jamaica, among bushes. Flowers small, white, 4-parted. Berry crowned by the very minute calyx.

Spicate-flowered Petesia. Shrub 5 to 6 feet.

8 P. ? Siniplicissima (Lour. coeh. p. 77.) stem herbaceous, quite simple, tetragonal; leaves lanceolate-linear, glabrous; racemes erect, almost terminal; calyx 5-toothed. 2. G. Native of Cochinchina. The fruit is said to be baccate, 2-celled, and many seeded. Flowers white.

Quite-simple-stemmed Petesia. Pl. 1 foot.

9 P. ? Terminais (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) leaves oblong, obtuse at the base, acutish at the apex, membranous, glabrous; panicles terminal, racemose, one-half shorter than the leaves; corolla salver-shaped, having the lobes shorter than the tube. h. S. Native of the Sandwich Islands. Stem dichotomously branched. Leaves 4 inches long, and 1½ inch broad. Corolla funnel-shaped, 4-lobed, inclosing the anthers. Much the habit of Stylocoryna racemosa, Cav.

Terminal-flowered Petesia. Tree or shrub.

10 P. ? Coriacea (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) leaves oblong, acute at the base, and obtuse at the apex, coriaceous, glabrous; corymbs terminal, dense, few-flowered, much shorter than the leaves. h. S. Native of the Sandwich Islands.

Coriaceous-leaved Petesia. Tree or shrub.

**Cult.** For culture and propagation see Rondelétia, p. 517.

JAN. SYST. Tetraphyllum, Monogynía. Calyx with an ovate tube, and a 4-parted permanent limb (f. 94. a.); lobes narrow. Corolla funnel-shaped (f. 94. b.), with a 4-parted limb (f. 94. b.), and a glabrous throat. Stamens 4, inserted in the tube of the corolla, inclosed (f. 94. b.); anthers oblong-heart-shaped. Stigma bifid. Berry ovate, crowned (f. 94. d. e.), 2-celled (f. 94. c.); cells many-seeded. Seeds lenticularly angular, wingless.—Creeping herbs. Leaves opposite, on short petioles. Stipulae subulate, solitary on both sides. Peduncles axillary, solitary, and in the alternate axils, bearing each a few-flowered head, surrounded by a short involucrem. Corollas and berries blue or purple.

1 C. repens (Swartz. fl. ind. occ. 1. p. 245.) plant prostrate, creeping; leaves ovate, pubescent on both surfaces; peduncels very short while bearing the flowers, but afterwards become more elongated; heads few-flowered; bracteas subulate. h. S. Native of Jamaica and St. Domingo, in temperate parts on the mountains. Brown, jam. 144. t. 6. f. 2. C. herbaceum, Lam. dict. 2. p. 56. ill. t. 64. Flowers almost sessile, collected in the axis of the leaves, blue. Fruit seated on peduncles, 4-5 lines long, blue, inflated. (f. 94.)

Umellaté-flowered Coccocypselum. Pl. creeping.

3 C. ovatum (Cham. et Schlecht. in Linnaea. 4. p. 141.) plant ascending, rooting at the base; leaves ovate, very blunt at the base, and acute at the apex, beset with minute adpressed pubescence; peduncels alternate, shorter than the leaves, clothed with strigose hairs; heads 8-10-flowered. h. S. Native of Brazil. Allied to C. umellatum and C. lancéolatéum.

Ovate-leaved Coccocypselum. Pl. cr.

4 C. lancéolatéum (Pers. ench. 1. p. 132.) plant densely clothed with down; leaves lanceolate, acute; heads many-flowered, pedunculate; bracteas lanceolate; berries ovate-oblong. h. S. Native of Peru, in shady groves at Cuchero and Chinchao, ex Ruiz et Pav.; and on the mountains about the Oriñoco, ex Hænke; and at Caraceas, ex Vargas. Condália lancéolata, Ruiz et Pav. fl. per. 1. p. 54. Corolla of a pale violaceous colour. Berries blue.

Lancéolate-leaved Coccocypselum. Pl. cr.

5 C. hissíhum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 396.) plant ascending, very hairy in every part; leaves broad; ovate, acute; heads axillary when in flower, almost sessile; peduncles a little elongated when in fruit, and recurved. 2. S. Native country unknown.

Hairy Coccocypselum. Pl. ascending.

6 C. canescens (Willd. herb. ex Cham. et Schlecht. in Linnaea. 4. p. 139.) plant prostrate, creeping; leaves ovate, clothed with silky yellow down on both surfaces; heads axillary, and almost terminal, on long peduncles; bracteas of heads 5-6, oblong, acute. h. S. Native of South America, in temperate shady places, near Buenos-Viata, Caraceas, Popyan, and of tropical and extratropical Brazil. C. repens, H. B. et Kuntb. nov. gen. amer. 3. p. 405. exclusive of the synonyms. Schwefélidía áspera, Spreng. neu. entd. 1. p. 280. not of Willd. Bellárdia mollis, Willd. herb. ex Cham. et Schlecht. in Linnaea. vol. 4. Corolla blue or red. Berries blue.

Canèscens Coccocypselum. Pl. cr.

7 C. aëreum (Cham. et Schlecht. in Linnaea. 4. p. 139.) leaves ovate, acute, with parallel veins, clothed with golden silky down; heads axillary, sessile, few-flowered; bracteas 4-5, narrow, acute. h. S. Native of tropical Brazil. Schwefélidía aèrea, Spreng. neu. entd. 1. p. 280. syst. 1. p. 764.
Allied to *C. canescens*, but differs in the above characters, and in the flowers being larger and slenderer, and more hairy; and in the leaves being more acute and longer.

**Goldil Cococcyspellum.** Pl. cr.

8 C. *nummulariifolium* (Cham. et Schlecht. in Linnaea. 4. p. 397.) plant very hairy, prostrate, creeping; leaves ovate-roundish, very blunt at the base, obtuse at the apex, and somewhat mucronulate; heads on short peduncles; bracteas linear. z. S. Native of equinozial Brazil. Corolla violaceous, beset with spreading pili at the tops of the lobes. Allied to *C. campanuliflorum* and *C. cordifolium*.

**Money-wort-leaved Cococcyspellum.** Pl. cr.

9 C. *cordifolium* (Nees et Mart. in nov. act. bonn. 12. p. 14.) plant creeping; leaves cordate, obtuse, hairy; peduncles at length equal in length to the petioles; heads of flowers almost globose; calyces and petals very villous. z. S. Native of Brazil, on the road to Fellisbert and of St. Catharine. Corolla white, palescent. Berries globose, blue. Habit of *Geïopha*.

**Heart-leaved Cococcyspellum.** Pl. cr.

10 C. *erythrocycliifolium* (Cham. et Schlecht. in Linnaea. 4. p. 144.) branches or stems simple, hairy; leaves ovate, acute, at the base, hairy on both surfaces, often purplish beneath; heads on short peduncles, beset with purplish hairs. z. S. Native of equinozial Brazil. Flowers and fruit unknown.

**Red-headed Cococcyspellum.** Pl. cr.

11 C. *pedunculare* (Cham. et Schlecht. in Linnaea. 4. p. 145.) plant ascending, clothed with adpressed stigrose hairs; leaves lanceolate-oblong, with revolute edges; peduncles alternate, longer than the leaves, usually reflexed after flowering; heads 10-12-flowered. z. S. Native of equinozial Brazil.

**Pedunculare Cococcyspellum.** Pl. cr.

**Tontanea Cococcyspellum.** Pl. cr.

13 C. *glabrum* (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 397.) plant creeping, quite glabrous; leaves ovate, subcordate, acutish; heads few-flowered, axillary, when bearing the fruit on longer peduncles, which are deflexed. z. S. Native of Panama. Very nearly allied to C. *Tontanea*, and probably only a glabrous variety of that species, but the flowers are unknown.

**Glabrous Cococcyspellum.** Pl. cr.

14 C. *cilium* (Cham. et Schlecht, in Linnaea. 6. p. 414.) leaves roundish-ovate, ciliated, as well as the petioles, having the nerves furnished with long hairs on the upper surface; heads of flowers equal to about half the length of the leaves. z. S. Native of Mexico, between Huimalamo and Cuapa. Very like C. *umbellata*. Leaves an inch and a half long and 14 lines broad. Ciliated Cococcyspellum. Pl. creeping.

† The generic character of the two following species is doubtful, and according to Kunth, syn. should probably be excluded from the present genus. —Erect suffruticose glabrous plants.

**Obovate-leaved Cococcyspellum.** Shrub 3 feet. 16 C. *sessile* (Pers. l. c.) stem erect, suffruticose; leaves oblong, acute; flowers sessile, crowded, axillary. z. S. Native of Peru, on the mountains about Chincho. Condalia sessilis, Ruiz et Pav. fl. per. 1. p. 54. Corolla purplish. Berries ovate, purplish.

**Sessile-flowered Cococcyspellum.** Shrub 2 to 3 feet. Cult. A mixture of peat and sand is the best soil for the species; and they will be easily increased by separating the creeping stems from the main plant.

**Lin. syst. Tetradnirida, Monogynia.** Calyx with an obovate tube, and a 4-cleft limby; lobes subulate at the apex. Corolla small, with a short tube, and a 4-lobed spreading limb. Stamens 4, inserted in the tube of the corolla, inclosed, or a little exserted. Stigma bident. Berry crowned by the limb of the calyx, 2-celled, having the dissepiment incomplete and semilunar, and elliptic. Seeds numerous, somewhat compressed. Albens cartilaginous. Embryo almost doral, with a centripetal radicle, and flat roundish cotyledons. —Small glabrous branched trees, having much the habit of box. Leaves obovate, stitif. Stipulas short, acute, solitary on each side. Pedicels axillary, very short, bracteolate, 1-flowered.

1 F. *buxifolia* (Lam. ill. no. 1478, but not of Gaertn.) lobes of corolla obtuse; berry obovate, crowned by the subulate lobes of the calyx. z. S. Native of the Mauritius, where it is called *bois de buis*. F. obovata, Gaertn. fil. carp. 3. p. 62. t. 191. but not of Lam. Cococcyspellum buxifolium, Spreng. syst. 1. p. 416. Leaves 5-6 lines long, and 3-4 broad.

**Box-leaved Fernelia.** Clt. 1816. Shrub.

2 F. *obovata* (Lam. ill. t. 67. f. 1.) lobes of corolla acuminate; berries nearly globose, crowned by the lobes of the calyx, which are bluntish and velvety inside. z. S. Native of the Mauritius, where it is called *bois Malabar* and *bois de rogne*. F. buxifolia, Gaertn. fil. carp. 3. p. 63. t. 197. f. 6. Cococcyspellum uniflorum, Willd. spec. 1. p. 618. Siebl. fl. maurl. exsic. 2. no. 100. Leaves 8-10 lines long, and 6-7 broad.

**Box-leaved Fernelia.** Clt. 1816. Shrub.

3 F. *pedunculata* (Gaertn. fil. carp. 3. p. 191. f. 3.) lobes of corolla unknown; berry obovate, tapering a long way into the stipe at the base, crowned by the lobes of the calyx, which are bluntish. z. S. Native of the Mauritius. Shrub and flowers unknown.

**Pedunculate-fruited Fernelia.** Shrub. Cult. For culture and propagation, see Rondeléïa, p. 517.

L. I. PETUNGA (Peetunga is the name of *P. Rozbarghii* in the Bengalee language). D. C. prod. 4. p. 398.—Rândia species, Roxb.—Higginsia, Blum. bijdr. p. 988. but not of Pers.

**Lin. syst. Tetradnirida, Monogynia.** Calyx with an obovate tube, and a permanent 4-toothed limb. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a very villous throat. Stamens 4; anthers a little exserted. Style filiform, villous: stigma bidentate, a little exserted. Berry globose, depressed and umbilicate at the apex, 2-celled. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb., scale-formed, and imbricated downwards, ex Blum. Albumen cartilaginous. Embryo inverted, with linear cotyledons. —Unarmed erect glabrous shrubs, with decussate horizontal branches. Leaves opposite, oblong, attenuated at both ends. Stipulas long-acuminated, deciduous. Stipules axillary, solitary or twin,
simple, many flowered, 3 times shorter than the leaves. Bracteae short, 1-flowered. Flowers disposed in 2 or 4 rows, sessile along the rachis of the spike, small, greenish white. This genus differs from *Rândia* in the flowers being tetramerous, and very much bearded in the throat, and in the spicate inflorescence and whole habit; and from *Higginsia* in the throat of the corolla being bearded, in the genitals being a little exserted, and in the globose depressed fruit, &c.

1. P. **Roxb**.'s *Petunga* (D. C. prod. 4. p. 399.) leaves elliptic-oblong, glabrous, acuminated at both ends; spikes axillary; bracteae and calyces glabrous. S. Native of the East Indies, about Luksmeeapoora, where it is called *Petunga* by the natives. Rândia racemosa, Roxb. fl. ind. 2. p. 144. Branches almost horizontal. Leaves drooping, 3-4 inches long, and about 1 broad. Stipulas large, caducous. Spikes about one-half or one-third shorter than the leaves. Flowers small, pale, greenish white. Berries round, smooth, shining, straw coloured, size of a pea.

*Petunga's* Petunga. Clt. 1820. Shrub 3 to 4 feet.

2. P. **longifolía** (D. C. l. c.) leaves elliptic-oblong, acuminated at both ends; branches terete; bracteae and calyces downy. S. Native of Java. Higginsia longifolia, Blum. bijdr. p. 988. Leaves 6-7 inches long, and 2 broad. Spikes about 2 inches long. Flowers small, greenish white.

**Long-leaved Petunga.** Shrub 3 to 4 feet.

3. P. **microcarpa** (D. C. l. c.) leaves oblong-lanceolate, acuminated, finely veined; spikes short, quadrifidi, imbricated; tube of corolla very short. S. Native of Java, where it is called *Ki-Ajiet* by the natives. Higginsia microcarpa, Blum. bijdr. p. 988. Leaves 3 inches long, and 9 lines broad. Spikes 4 or 5 lines long. Flowers small, greenish white.

**Small-fruited Petunga.** Shrub 3 to 4 feet.

4. P. **glomerulata** (D. C. prod. 4. p. 399.) leaves oblong-lanceolate, veiny; spikes densely glomerulat. S. Native of Java, on mount Salak, and in woods on the island of Nusa-Kambanga.

**Gloomerulated-spiked Petunga.** Shrub.

_Cult._ For culture and propagation see *Catesbeya*, p. 511.

_LIN. SIST._ Tetradria, Monogynia. Calyx with a short ob- ovate tube, and a permanent limb, which is 4-toothed to the base. Corolla funnel-shaped, and somewhat campanulate, with a short tube, a 4-parted spreading limb, and a naked throat. Stamens inserted into the middle of the tube; filaments short; anthers ovate, inclosed. *Stigmas* 2, exserted. Berry oblong, somewhat tetragonal, bisulate, 2-celled, crowned by the calyx. Placentas adnate to the dissemination. Seeds many in each cell, small, wingless.—_Shrubs about 3 or 4 feet high, with bluntly tetragonal branches. Leaves opposite or in whorls, obovate or oblong, acute. Stipulas solitary on both sides, small, acute, deciduous. Peduncles axillary, racemose, bearing short unilaterial pedicels. _Corollas reddish._

1. **H. verticillata** (Pers. ench. 1. p. 133.) leaves 3 in a whorl, lanceolate, downy beneath; peduncles solitary, dependent, bearing about 4 flowers. S. Native of Peru, at Muna, where it is called *Carpales*. O-Higginsia verticillata, Ruiz et Pav. fl. per. 1. p. 55. t. 85. f. a. *Evémosia* verticillata, Spreng. **Corolla scarlet. Berries purplish white.**

**Whorled-leaved Higginsia.** Shrub 3 to 4 feet.

2. **H. angustifolia** (Bartl. in herb. Henke, ex D. C. prod. 4. p. 399.) leaves opposite, narrow-oblong-lanceolate, glabrous, tapering much at both ends; fruit axillary, usually twin, oblong, opposite, on short pedicels. S. Native of Peru, on mountains about the Guanooco. Flowers red.

**Narrow-leaved Higginsia.** Shrub 3 to 4 feet.

3. H. *latifolia* (Bartl. in herb. Henke, ex D. C. prod. 4. p. 399.) leaves opposite, obovate, acuminated, attenuately cuneated at the base, glabrous, having the nerves and veins clothed with rusty tomentum beneath; flowers axillary, in fascicles, pedicellate, nutans. S. Native of Peru, on mountains about the Guanooco. Fruit membranous, somewhat tetragonal.

**Broad-leaved Higginsia.** Shrub 3 to 4 feet.

**Obovate-leaved Higginsia.** Shrub 3 to 4 feet.

_Cult._ See *Catesbeya*, p. 511. for culture and propagation.

_LIN. SIST._ Tetradria, Monogynia. Calyx with an oblong somewhat tetragonal tube, and a 4-toothed limb: teeth erect, acute. Corolla salver-shaped, with a very short tube, and a 4-parted spreading limb; segments lanceolate. Anthers 4, sessile upon the tube, erectly connivent, linear, acute. *Stigma* obtuse, hardly emarginate. Capsule baccate, indinforest, crowned by the calyx, 2-celled, slightly tetragonal. Placentas ovate, distinct in the cells of the fruit. Seeds numerous, minute, roundish.—A herb, which is suffruticos, and branched at the base, having the branches hairy. Leaves ovate, acuminate, rough from dots above, and hairy beneath. Stipulas very short, acute. Peduncles axillary, longer than the petioles, many flowered.

1. **H. pedunculata** (Swartz, l. c.) S. Native of the higher mountains of Jamaica, in rather humid shady places. H. Jamaicensis, Spreng. syst. 1. p. 416. *Corolla* with a red tube, and the segments of the limb striped with blood-colour at the base, but they are yellow at the apex. Berries scarlet.

**Pedunculate Hoffmannia.** Shrub 2 to 3 feet.

_Cult._ See *Catesbeya*, p. 511. for culture and propagation.

_LIN. SIST._ Tetradria, Monogynia. Calyx with an obvate tube, and a 4-toothed or 4-parted limb. *Corolla* funnel-shaped, with a very long tube, gradually widening and dilated to the throat, and a 4-parted limb. Stamens 4; filaments inserted at the base of the tube of the corolla; anthers linear, exserted. *Stigma* bidentate, from the lamellae being combined. Berry globose or oblong, 2-celled, crowned by the limb of the calyx; having the dissemination perforated according to Jussieu, but according to Gartntr, it is entire. Placentas spongy, fixed to the upper part of the dissemination on both sides. Seeds numerous, scale-formed, inverted, imbricated downwards, collected in 2 bundles in each cell. Albumen fleshy. Embryo minute, inverted.—Glabrous shurs, bearing supra-axillary simple spines. Leaves small, oval, usually in fascicles. Stipulas solitary on each side, deciduous. Pedicels axillary. Flowers whitish, elongated.
bractless.—This genus comes very near to *Scolosanthis*, but differs in the cells of the fruit being many seeded.

1 C. latifolia (Lindl. bot. reg. 858.) leaves obovate, shining, convex, rather shorter than the spines; teeth of calyx subulate; tube of corolla very long, obconical at the apex. Ș. Native of the West Indies, particularly in Cuba near the Havana. Corolla pale yellow, 4-6 inches long. Fruit ovate, crowned by the 4 subulate calycine teeth.

2 C. spinosa (Lin. spec. p. 159.) leaves ovate, acutish at both ends, rather longer than the spines; teeth of calyx short, acute; berry oval; tube of corolla very long, cylindrical, widening at the ends. Ș. Native of the Bahamas Islands, but particularly of Providence, near Nasma. Lam. ill. 67 f. 1. Curt. bot. mag. t. 131. Tratt. tab. t. 259. C. longiflora, Swartz, prod. p. 30.—Catesb. car. t. 100. Corolla pale yellow, 3-6 inches long. Leaves like those of box, roundish, rising in fascicles. Berry about the size of a middling plum, yellowish, with rather tart pulp.

**Spinose Lily-thorn.** Fl. May, Sept. *Ct.* 1726. Shrub 10 to 14 feet.

3 C. ? Vavassorii (Spreng. syst. 1. p. 416.) leaves elliptic-oblong, obtuse, shining above, and are, as well as the branches specked, glabrous; pedicels 1-flowered. Ș. Native of St. Domingo. Cinchona spinosa, Vavass. journ. phys. oct. 1790. p. 245. t. 2. Lamb. cinch. p. 38. t. 13. C. elliptica, Spreng. in litt. The fruit is said to be capsular and dehiscent at the apex, and the seeds are said to be edged with a wing, but should this be the case it is certainly not a species of *Catesbaea*.

**Vavassor's Lily-thorn.** Shrub 4 to 6 feet.

§ 2. **Erectiflora** (from erectus, erect, and flos, a flower; the flowers are erect, not drooping as in the first section). *D. C. prod.* 4. p. 401. Pedicels axillary, 1-flowered. Flowers erect, glabrous. Stamens inclosed.—Perhaps all are species of the genus Rândia.

4 C. parviflora (Swartz, prod. 30. fl. ind. occ. 1. p. 236.) leaves ovate, stiff, with revolute margins, mucronate, and are, as well as the branches, glabrous; teeth of calyx short, acute; flowers sessile among the leaves; tube of corolla short, tetragonal; berries roundish. Ș. Native of the north of Jamaica, among bushes by the sea side. Vahl, symb. 2. p. 31. eclog. 1. p. 12. t. 10. f. 1. but not of Lam. Gertr. fil. carp. t. 192. f. 3. C. parviflora, ex Jamaica, Spreng. syst. 1. p. 416. exclusive of the diagnosis and synononyms.—Sloan. hist. t. 207. f. 1. Corolla white, with a tetragonal tube, about 4 lines long.

**Small-flowered Lily-thorn.** Fl. June, July. *Ct.* 1810. Shrub 4 to 5 feet.

5 C. campanulata (La Sagra, in litt. ex D. C. prod. 4. p. 401.) leaves ovate-roundish, coriaceous, and are, as well as the branchlets, quite glabrous; spines opposite, longer than the leaves; flowers erect, short, sessile in the axis of the leaves. Ș. Native of Cuba, near the Havana, where it was collected by Ramon de La Sagra. Perhaps sufficiently distinct from *C. pareiflora*.

**Campanulate-flowered Lily-thorn.** Shrub 4 to 5 feet.

6 C. parviflora (D. C. prod. 4. p. 401.) leaves ovate-roundish, mucronate, glabrous; spines axillary, subulate, a little longer than the leaves; branchlets hairy; flowers short, usually twin, axillary, on very short pedicels. Ș. Native of St. Domingo. Catesbaea parviflora var. Domingensis, Spreng. syst. 1. p. 416. Gardénia parviflora, Dietr. suppl. gart. lex. 3. p. 441. ex Röem. et Schultes, syst. 5. p. 247. Rândia parviflora, Lam. dict. 3. p. 25. (exclusive of the syn. of Slaone,) ill. t. 156. f. 2. but the flowers in the figure are drawn 5-eleft. Spines opposite, straight, about 5 lines long. Leaves like those of box, in fascicles. Berries globose, almost sessile. Flowers white, changing to yellowish.

7 C. erecta (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 401.) leaves ovate-oblong, acute; branchlets opposite, spreading, unarmed; flowers almost terminal, nearly sessile, solitary, erect; tube of corolla very long. Ș. Native of Mexico. Flowers white, almost like those of *C. spinosa*, but erect. Spurs none in the figure given.

**Erect Lily-thorn.** Shrub 4 to 5 feet.

Cult. All the species of *Catesbaea* are very ornamental while in bloom. They grow best in a mixture of light turfy loam and peat; and cuttings will root if planted in sand plunged in heat, with a bell-glass placed over them. The plants being apt to be infested with insects, they should be kept clean or they will not thrive.

**Tribe III.**

**HEDYOTIDEÆ** (this tribe contains plants agreeing with the genus *Hedyotis* in particular characters). Cham. et Schlect. in Linneae, 4. p. 150. *D. C. prod.* 4. p. 401. Fruit capsular, 2-celled, dehiscing in the middle of the cells: or rather membranous and indescent; cells many seeded. Seeds not winged. Alumen fleshy.—Shrubs and herbs, with opposite leaves, and interpetiolar stipules.

**Sub-tribe I. RONDELIEÆ** (plants agreeing with the genus *Rondeliea* in important characters). *D. C. prod.* 4. p. 401. Stipulas twin on both sides, combined or distinct, neither sheathed nor ending in bristles.

**LV. CONDAMINEÆ** (in honour of — La Condamine, a famous astronomer, and traveller in South America, and who was the first who described and figured Cinchôna lanceolata). *D. C. prod.* 4. p. 402.—Macroémum, Ruiz et Pav. fl. per. 2. p. 48. but not of Browne.—Macroémum, sect. 2. Kunth, and A. Rich.

**LIN. SYST. PENTANDRIA, MONOGYNIA.** Calyx with a cup-shaped tube, and a 5-crenated or 5-toothed limb (f. 95. a.), which at length becomes circumcised at the base, and falls off. Corolla funnel-shaped, with a somewhat curved tube (f. 95. b.), which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. c.); the segments ovate, acute, spreading, and thickened at the apex (f. 95. c.). Stamens 5, inserted above the middle of the corolline tube (f. 95. b.), or near its throat; filaments shorter than the corolla; anthers oblong-linear, bifid at the base, length of corolla. Stigma 2-lobed (f. 95. f.). Capsule turbinate (f. 95. g.), rather compressed, truncate, umbiliate, 2-celled, dehiscing in the middle of the cells (f. 95. k.). Seeds small, numerous, cuneiform, not winged.—South American shrubs. Leaves large, opposite, on short petioles. Stipulas intrafoliosae, bipartite, acuminate, adpressed, usually connate. Corymbbs or racemes terminal, many flowered.—This genus differs from *Macroémum* in the form of the calyx, in the stamens being inserted above the middle of the corolline tube, not at its base, as in that genus, and in the seeds being wingless; and from *Siekíngia* in the stigma being double, not simple, and in the seeds not being winged, &c.

1 C. cortihoda (D. C. prod. 4. p. 402.) leaves ovate-oblong,
acuminated, cordate at the base, sessile, plicate, coriaceous; coryombs large, brachiately, trichotomous; teeth of calyx broad, short, blunt. \( \frac{a}{b} \). S. Native of Peru, on hills towards Chimacoa, Acomayo, Padilla, and Muna, &c., ex Ruiz et Pav.; and on mountains about the Guanooco river, ex Huenke; as well as of New Granada about Mariquita, and Santa Anna, ex H. B. et Kunth. Macrocœnum corymbosum, Ruiz et Pav. fl. per. 2. p. 48. t. 189. H. B. et Kunth, nov. gen. amer. 3. p. 399. Leaves a foot long. Calyx purplish, fleshy. Corolla white inside and purplish on the outside, with a naked throat. Capsule at first purplish, but at length almost black. Seeds yellow.

*Corymbose-flowered Condamine.* Tree 40 to 50 feet.

2 C. tinctoria (D. C. prod. 4. p. 402.) leaves elliptic-oblong, acute, rounded at the base, petiolate, glabrous on both surfaces; coryombs sessile, triplicate; flowers crowded into heads; segments of corolla acute. \( \frac{a}{b} \). S. Native of South America, at the Missions of the Orinoco, between Encaramada and Carichana. Macrocœnum tinctorium, H. B. et Kunth, nov. gen. amer. 3. p. 399. Willd. rel. in Rom. et Schultes. syst. 5. p. 6. Corolla white, Coryombs terminal.

3 C. microcarpa (D. C. prod. 4. p. 402.) leaves oblong, bluntly acuminate, pubescent beneath; racemes terminal; flowers crowded, sessile; teeth of calyx minute. \( \frac{a}{b} \). S. Native of Peru, in hot shady forests near Chimacoa and Cuchero. Macrocœnum microcarpum, Ruiz et Pav. fl. per. 2. p. 48. t. 188. f. a. Leaves shining above. Racemes 3-9 inches long. Corolla white, with reflexed segments, 4 times longer than the calyx. Capsule small, turbinate. Seeds yellow.

*Small-fruited Condamine.* Tree 25 feet.

4 C. venosa (D. C. l. c.) leaves oval-oblong, acuminate, lined with numerous veins; the nerves and veins downy; stigmas connate, with the lobes acuminate; racemes terminal; flowers sessile; teeth of calyx minute. \( \frac{a}{b} \). S. Native of Peru, in groves in hot places towards Acomayo and Pati. Macrocœnum venosum, Ruiz et Pav. fl. per. 2. p. 49. t. 190. f. b. Branches tetragonal. Leaves 9 inches long. Stipulas reddish. Racemes downy. Flowers small, white.

*Vinca-leaved Condamine.* Shrub 10 feet.

5 C. glabrata (D. C. l. c.) leaves obovate, short-acuminated, attenuately cuneate at the base, quite glabrous, lined with the veins; stigmas 2-lobed, shorter than the petioles; lobes rounded, panicle terminal, glabrous; flowers glomerate; teeth of calyx minute. \( \frac{a}{b} \). S. Native of Peru, on mountains about Huanooco. Macrocœnum glabratum, Bartl. in herb. Huenke. Very like C. venosa, but differs in the smoothness and shape of the leaves.

*Glabrous Condamine.* Shrub 10 feet?

*Cult.* See *Catesbaea*, p. 511. for culture and propagation.

*Linn. syst.* Pentändria, Monogynia. Limb of calyx superior, 5-parted. Corolla cup-shaped, with a 5-parted limb, and a bearded throat. Stamens 5, almost distinct to the base of the corolla, exserted. Stigma parted. Ovarium 2-celled, many-ovulate.—A middle-sized tree. Leaves oblong, acuminate, rather pilose on both surfaces. Spikes branched, terminal. Flowers small, cream-coloured.—This genus is allied to *Macroœnum* and *Machionia* according to the author.

A. *TUBULARIA* (Schott, l. c.) \( \frac{a}{b} \). S. Native of Brazil, in groves.

*Bundle-flowered Alseis.* Tree.

*Cult.* For culture and propagation see *Rondeletia*, p. 517.

Linn. syst. Pentändria, Monogynia. Calyx with a turbinate tube, and a small 5-toothed persistent limb. Corolla tubular, with a wide throat; the tube pentagonal before expansion; and the segments 5, acute, and eretice-b. Stamens 5, almost free from the corolla, but sometimes adnate to the base of the tube; filaments very hairy above the middle; anthers oblong, inclosed. Style length of the stamens; stigma obtuse, 2-lobed. Capsule 2-celled, 2-valved; valves desiclsing at the sides (ex Swartz). Seeds numerous, imbricated, acute.—Small glabrous trees. Leaves approximate, oblong, short-acuminated. Stipulas solitary on both sides. Peduncles terminal and subaxillary, solitary, trichotomously corymbose above. Flowers rather large, yellowish green.

1 M. JAMAICÆNSE (Lin. amoen. 5. p. 413.) arboreous; leaves oblong-obovate, petiolate, polished; stipulas ovate-triangular, much shorter than the petioles; coryombs on long peduncles. \( \frac{a}{b} \). S. Native of the south of Jamaica, in shady places on the banks of rivulets. Swartz, obs. p. 68. t. 3. f. 1. Lam. dict. 3. p. 670.; and of Guadaloupe at a place called Grand Brandau, where it was collected by L’Hermier. Branches warty. Corollas rather large, of a yellowish green colour.

Jamaica Macroœnum. Clt. 1806. Tree 12 to 14 feet.

† Species not sufficiently known, and do not probably belong to the present genus.

2 M. ? *STIPAœCEUM* (Roxb. fl. ind. 2. p. 144.) leaves almost sessile, lanceolate, smooth; stipulas oblong, very large; coryombs terminal, supraduplicate. \( \frac{a}{b} \). S. Native of the Moluccas. The mouth of the corolla is uncommonly woolly, almost hiding the stamens.

*Stipulaceous Macroœnum.* Tree.

3 M. ? *PARVIFLORUM* (Roxb. fl. ind. 2. p. 144.) shrubby; leaves on short petioles, lanceolate, entire, smooth; stipulas anular, truncate; peduncles axillary, many-flowered; corolla acutabelliform. \( \frac{a}{b} \). S. Native of the Moluccas.

*Macroœnum.* Tree or shrub.

4 M. ? *TETRANDRIUM* (A. Rich. mem. soc. hist. nat. Par. 5. p. 279.) leaves elliptic-lanceolate, acute at both ends, discoloured, tomentose beneath; flowers subracemose, terminal, small, tetramerous; calyx woolly; corolla short; stamens exserted; capsule desiclsing at the dissepiment. \( \frac{a}{b} \). S. Native of Brazil.

*Tetrandrous Macroœnum.* Shrub or tree.

5 M. ? *TUBULARIUM* (A. Rich. l. c.) leaves broad-ovate, acuminate at the apex, dimidiate at the base, petiolate, downy; flowers subascenose, terminal; one of the teeth of the calyx is expanded into a large, broad, somewhat heart-shaped petiolar leaf; corolla with a long tube, and a 5-lobed limb; stamens exserted; capsule desiclsing in the middle of the cells. \( \frac{a}{b} \). S. Native of Brazil. This is probably a species of Calycophyllum.

*Tube-flowered Macroœnum.* Tree or shrub.

*Cult.* For culture and propagation see *Catesbaea*, p. 511.

LIN. SYST. Pentândria, Monogy'nia. Calyx with an obovate or turbinate tube, and an almost obsolete entire limb. Corolla with a short tube, and a 5-cleft spreading limb; segments hairy in the middle outside. Stamens 5, inserted in the upper part of the corolline tube; filaments hairy at the base; anthers oval. Capsule obovate or turbinato, ligneous, coriaceous, crowned by the marginal limb of the calyx, 2-celled; cells deshiscing from the apex to the base, ex Jacquin, 1-seeded, ex A. Richard, many-seeded; valves semibifid. Seeds pendulous.—American glabrous trees. Leaves opposite, on short petioles. Stipulas interpetiolar, solitary on both sides. Corymbs or cymes terminal. Flowers white.—This genus is nearly allied to Machaonia.

1 C. cymosâ (Jacq. amer. p. 61.) leaves ovate, acuminate at both ends; branches of corymb alternate; capsules obovate, very short. Ψ. S. Native of Martinico, along the sides of mountain streams or torrents, where it is commonly called le Champs de rivière, or river wood. Macrocennum longifolium, A. Rich. mem. soc. hist. nat. Par. 5. p. 279. A lofty tree, with a handsome head. Leaves a foot long, shining, commonly 8 or 10 at the top of each branch. Flowers small, disposed in racemose corymbs, white. Capsules small. The wood is white, and used for beams and rafters.

Cymose-flowered River-wood. Tree lofty.

2 C. TURRIBÂ'ATA (D. C. prod. 4. p. 404.) leaves oval, obtuse at the apex, and acute at the base; branches of corymb opposite; capsules turbinato. Ψ. S. Native of Cayenne, where it was collected by Patris. Upper leaves 3 inches long and ½ broad, on short petioles. Stipulas triangular, acuminate. Peduncles and capsules downy.

Turbinato-flowered River-wood. Tree.

Cult. For culture and propagation see Rendeëlia, p. 517.

LIX. AUGUSTEA (named in compliment to the present empress of Austria, princess Caroline Augusta of Bavaria). D. C. prod. 4. p. 404.—Augusta, Pohl, fl. bras. 2. p. 1. but not of Leand.

LIN. SYST. Pentândria, Monogy'nia. Calyx 5-cleft, with foliaceous permanent segments. Corolla very long, tubular, incurved, 10-striated, with a spreading limb, which is valvate in asistence. Anthers sessile, exserted. Stigma cloven. Capsule 2-celled, dehiscing at the apex, 4-cleft. Seeds angular, margi- nated, truncate at the apex, fixed to a transverse receptacle.—Middle-sized trees. Leaves on short petioles, simple, decussate, entire, oblong, stipulate. Flowers showy, bracteate, in terminal fasicles, deep red or crimson. This genus differs from Exostémma by the funneled-shaped corolla, with broad short segments, by the foliaceous calycine lobes, and by the angular seeds.

1 A. LANCEOLÂ'TA (Pohl, fl. bras. 2. p. 2. t. 101.) leaves lanceolate, and are, as well as the stipulas, glabrous; flowers terminal, 3 in a fascicle; bracteas lanceolate, flat, ciliated. Ψ. S. Native of Brazil, in the province of Goyaz, in shady places, on the banks of rivers and ditches, in Serra de Cristaes. Flowers crimson or deep red. Stem bluish red.

Lanceolate-leaved Augusta. Shrub.

2 A. PARVIFOLIA (Pohl, fl. bras. 2. p. 3. t. 102.) leaves lanceolate, equal at the base and apex, acute; stipulas and bracteas glabrous; flowers terminal, twin; calycine segments oblong, bluish, retuse at the base, and pilose inside. Ψ. S. Native of Brazil, in the province of Rio Janeiro, in shady places on the banks of rivers and rivulets on the road from Engenho da Vargue to Agoa de Serra. Stem of a greyish brown colour. Flowers bluish red.

Small-leaved Augusta. Shrub.

1 P. GRANDIFLORA (Lin. spec. 244.) leaves elliptic-lanceolate; flowers axillary, pedicellate, solitary, 4 times the length of the breadth. Ψ. S. Native of Jamaica, St. Thomas, &c. among rocks at the foot of the mountains. Smith, icon. pict. 1. t. 6. Curt. bot. mag. 286. Jacq. amer. t. 44. pict. t. 64. Flowers almost like those of Brugmansia arborea, white, reddish inside at the throat, 5 inches long and 1½ broad, very fragrant at night; but in the bud state they are yellowish, tipped with red. Tube with 5 hairy angles.

Var. β; leaves ovate, acute. Ψ. S. Growing along with the species.

2 P. coCCINEA (Swartz, fl. ind. occ. 1. p. 384.) leaves ovate-roundish, coriaceous; flowers axillary, pedicellate, solitary, hardly twice the length of the breadth. Ψ. S. Native of the west of Jamaica, on the precipes of mountains, but rare. P. 3 U.

Scarlet-flowered Portländia. Clt. 1812. Shrub 2 to 3 feet.

† A species hardly known.

3 P. acuminata (Willd. rel. in Ramm. et Schultes, syst. p. 5. p. 23.) leaves ovate, acuminate. ñ. S. Native of New Spain, at Caraccas. Perhaps the same as P. grandiflora ß.

Acuminated-leaved Portländia. Shrub.

Cult. The species of Portländia are deserving of a place in every collection of stov plants, for their large showy flowers. They thrive best in a mixture of sandy loam and peat; and cuttings, not having their leaves shortened, will root freely if planted in a pot of sand, plunged in heat, with a hand-glass over them. A strong heat is necessary for flowering the species, and without it they will not even grow freely.

Lin. syst. Tetrandría, Monogýnia. Calyx with a turbinately oblong tube, which is angular from 8 filiform ribs, 4 of which are carinal, and 4 sutilar: a 4-parted limb; lobes linear-lanceolate. Corolla clavate, tetragonal, with a 4-parted limb. Anthers 4, linear, not exceeding the limb of the corolla. Stigma unknown. Capsule ovate, dehiscing at the apex, separable from the calyx, and therefore at length becoming naked, 2-celled, but almost 4-celled from the margins of the valves being involute; valves bifid at the apex. Placentas narrow, rather prominent. Seeds innumerable, small, compressed, not winged, but dilated along the margins from membranous crests. Albumen fleshy.—A globular shrub. Leaves opposite, obovate, bluish, cuneated at the base, petiole, veinless, with the exception of the middle nerve. Stipulas short, truncate, combined. Pedicels axillary, solitary, 1-flowered, naked. Flowers white.

Var. ß. Commersoniana. ñ. S. Native at Port Praslin. Leaves broad-obovate, very blunt, hardly coriaceous, cuneated at the base, on short petioles, 3-4 inches long and 2 or more broad. Corolla more than 2 inches long, with an obconical tube, and ovate lobes, which are apiculate by a mucrone at the apex. Anthers shorter than the lobes of the corolla.

Var. γ. Gauichaudiana. ñ. S. Native of the Island of Rawak. Intermediate between the two preceding varieties. Lobes of corolla triangular, acute, with the recesses broad and obtuse. Anthers equal in length to the corolla. Southern Bikkia. Tree or shrub.

Cult. For culture and propagation see Portländia above.

LXII. ISIDOREA (isidos is the Latin name of a shrub like coral; the name has been applied to this genus because it is stiff and dry, and grows by the sea side). A. Rich. in mem. soc. hist. nat. par. 5. p. 284. t. 25. f. 1. D. C. prod. 4. p. 405.

Lin. syst. Pentandría, Monogýnia. Calyx with a turbinate pentagonal tube, and a 5-parted limb; lobes erect, keeled, lanceolate-subulate. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb; segments triangular, acute, short. Stamens inserted in the bottom of the tube of the corolla, and about its length; filaments capillary, villous at the base, and combined together in a monadelphous manner; anthers oblong; obtuse at the apex. Style slender, length of corolla; stigma bilabellate; lamellose, obtuse. Capsule almost globose, pentagonal, truncate at the apex, crowned by the segments of the calyx, 2-celled; cells deshissent, many-seeded. Seed angled, from being pressed against each other, girded by a cup-shaped membrane at the base.—A stiff shrub, with the habit of Ernóde. Leaves opposite, linear, stiff, with revolute margins. Stipulas on the younger branches entire and subulate, but those on the older branches are bipartite. Flowers almost terminal, solitary, nearly sessile, often hexamerous.

Pleasant Isidorea. Shrub.

Cult. See Rondlelétia, p. 517. for culture and propagation.

LXIII. SPALLANZANIA (named in honour of Abbé Spallanzani, an Italian celebrated for his researches in natural history, particularly in zoology). D. C. prod. 4. p. 406. but not of Neck, nor Pall.

Lin. syst. Pentandría, Monogýnia. Calyx with an obversely pyramidal tube, a 5-parted limb, and foliaceous, linear, distant, acute, erect, permanent lobes, which are longer than the tube. Corolla with a slender, terete tube, which is longer than the segments of the limb, a naked throat, and 5 oval spreading segments. Stamens 5; filaments free from the throat, exserted; anthers oblong. Style filiform; stigmas 2, slender, elongated. Capsule ovate-globose, ribbed by nerves, and crowned by the calycine lobes, 2-celled; obscurely deshissent: having semi-bifid carpels. Placentas adnate to the dissemination. Seeds ovate, tubercular.—A smooth shrub. Branches terete, but compressed at the apex. Leaves obovate or oval, rather coriaceous. Stipulas solitary on both sides, ovate, bifid at the apex. Caryms terminal, many-flowered, with angular branches, which are branched at the base.—Very nearly allied to Lándia a section of Musscënda.

1 S. corymbosa (D. C. l. c.). ñ. S. Native of Madagascar, where it is called Tabamaracha by the natives.

Corymbose-flowered Spallanzania. Shrub.

Cult. For culture and propagation see Rondlelétia, p. 517.

Lin. syst. Tetra-Pentandría, Monogýnia. Calyx with a subglobose tube, and a 4-5-parted limb; lobes oblong-linear, acute, permanent. Corolla with a cylindrical tube, which is hardly ventricose at the apex, and a 4-5-lobed spreading limb; lobes roundish. Anthers 4-5, sessile at the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned by the calyx, 2-celled, dehiscing from the apex into 2 valves, which
are usually cleft at the apex, whence it sometimes appears 4-valved; but usually dehiscing at the cells, rarely at the dissepiment. Placentas central. Seeds numerous, small, ovate, angular, usually only 2 in each cell at maturity. —Small trees or shrubs, mostly natives of America. Leaves almost sessile, or more or less petiolate. Stipulas deltoid, or linear-lanceolate, solitary on both sides, undivided, sometimes hairy inside. Peduncles axillary, usually trichotomous, sometimes disposed in a terminal corystose panicule, rarely 3 or 1-flowered. —All the Asiatic plants referred to this genus are species of Wendlandia.

* Tube of corolla hardly longer than the calyx.

1 R. laurifolii (Swartz, fl. ind. occ. p. 363.) leaves lanceolate-oblong, acute, glabrous on both surfaces; stipulas deltoid, glabrous on the outside, with ciliated margins, and villous at top; racemes compound, axillary, erect; tube of corolla very short, clothed with adpressed villi. ingleton S. Native of Jamaica and Guadeloupe, among bushes. Petesia, no. 2. P. Browne, jami. p. 143. t. 2. f. 2. Tube of calyx turbinated, clothed with adpressed down; limb 5-parted, smoothish; lobes acute, about equal in length to the tube of the corolla. Flowers small, dusky yellow. Capsules about the size of hemp-seed. Leaves 3-4 inches long, on petioles about an inch long.

2 R. racemosa (Swartz, fl. ind. occ. p. 360.) leaves lanceolate-ovate, acuminate, petiolate, glabrous on both surfaces; stipulas almost deltoid, with somewhat ciliated margins; racemes axillary, trichotomous, spreading. ingleton S. Native of Jamaica, in woods on the mountains. Petesia, P. Browne, jami. p. 143. t. 2. f. 3. Leaves opposite and 3 in a whorl. Tube of corolla short, clothed with silky hairy down on the outside, a little longer than the calycine teeth, which are very short. Very nearly allied to R. laurifolia, but the petioles are longer, the racemes shorter, the calycine teeth shorter, and probably the stigma is undivided, as mentioned by Swartz. Branches covered with hoary bark; branchlets tetragonal. Corolla hoary.

** Tube of corolla cylindricall, 2-3 or 4 times longer than the calycine lobes.

3 R. thyrsoides (Swartz, prod. p. 41. fl. ind. occ. 1. p. 358.) leaves oblong, acute, petiolate, membranous, glabrous on the upper surface as well as the branches, but downy beneath; stipulas broad ovate, acute, glabrous, stiff; thyrses axillary, shorter than the leaves. ingleton S. Native of Jamaica, on the driest hills in the western parts of the island. Branches bluntly tetragonal. Leaves 3 inches long. Calyx minute, 5-toothed. Flowers small, dull whitish yellow or rust-coloured, with an elongated tube, which swells below the limb, and clothed with silky pubescence on the outside. Capsules roundish, size of coriander seeds. Seeds 2 in each cell at maturity.

4 R. umbellulata (Swartz, prod. p. 41. fl. ind. occ. 1. p. 367.) leaves lanceolate-ovate, acute, rather hairy, petiolate; stipulas hairy, ending each in a bristly acum; peduncles axillary, trichotomous at the apex, somewhat umbelliferous, shorter than the leaves. ingleton S. Native of Jamaica, on rocks near streams. Petesia, no. 3. P. Browne, jami. p. 144. 7 and there-

fore Petesia villosa, Smith, in Rees’s cyc.l. no. 4. Calyx very villous, with linear teeth. Corolla larger than in the rest of the species, downy, of a dusky yellow colour; tube elongated. Capsule roundish: having 2 seeds in each cell at maturity.

Umbellate-flowered Rondeletia. Shrub 2 feet.

5 R. tomentosa (Swartz, prod. p. 41. fl. ind. occ. 1. p. 365.) leaves ovate, acuminate, petiolate, membranous, hairy above, but clothed with hoary villous tomentum beneath; peduncles axillary, tripartite, short. ingleton S. Native of Jamaica, near Spanish Town, on rocky hills. Petesia stipulata, Linn. spec. p. 360. 7 ex Swartz. Stipulas ovate, downy, with a short point. Branchlets villous at the ends. Flowers small, whitish, or dusky yellow, villous outside. Capsules roundish, size of coriander seeds, containing 1 seed in each cell at maturity.

Var. ingleton, Domingensis (D. C. prod. 4. p. 407.) leaves oval-oblong, cuneated at the base, downy or villous above, but clothed with soft hoary tomentum beneath. ingleton S. Native of St. Domingo, where it was collected by Bertero. R. tomentosa, ex Hispaniola, Spreng. syst. 1. p. 708. This plant is probably referrible to Petesia tomentosa.

Hoary Rondeletia. Shrub 2 to 3 feet.

Var. ingleton, Aitomipes (D. C. prod. 4. p. 408.) leaves ovate-oblong, acute, pilose; capsules many-seeded. ingleton S. Native of Jamaica. Rondeletia hirta, Ait. hort. kew. 1. p. 227. This differs from the plant of Swartz, in the leaves being shorter, broader, and less acuminate, and in the fruit being dehiscent, and containing a great number of small seeds.

8 R. Panamensis (D. C. prod. 4. p. 408.) leaves oval-oblong, acuminated at both ends, glabrous above, white beneath, and villous on the nerves and veins; stipulas triangular, acute, villous outside; peduncles axillary, opposite, shorter than the leaves, trifid and densely corymbose at the apex: ultimate ones collected into a short thyrs; calyx villous, with lanceolate segments. ingleton S. Native of Panama. R. hirta, Bartl. in herb. Huenke. Tube of corolla villous; limb of 5 roundish lobes. Capsules almost globose. Seeds numerous, and of 2 forms, appendiculate.

Panama Rondeletia. Shrub 5 to 6 feet.

9 R. hirsuta (Swartz, prod. p. 41. fl. ind. occ. 1. p. 371.) leaves oblong, acuminate, hairy on both surfaces, pale beneath, on short petioles; stipulas ovate-lanceolate, hairy; branchlets peduncles, and flowers hairy; peduncles axillary, trichotomous. Loose, about the length of the leaves. ingleton S. Native of the south of Jamaica, among bushes on the mountains near Bath.

3 v 2
Petioles clothed with rufescent villi. Calyx villos. Corolla yellowish, tomentose outside, with a narrow throat. Seeds girded by a wing, according to A. Rich: if this be the case, it is referable to the genus Bouvardia.

10. *R. trifoliata* (Jacq. amer. p. 60. t. 43. pict. t. 82.) leaves oblong-lanceolate, 3 in a whorl, on short petioles, glabrous above but tomentose beneath; petioles and branches hairy; panicles axillary, shorter than the leaves. ℃ S. Native of Jamaica, at the foot of the mountains. Flowers reddish, small. Leaves 3 inches long. Teeth of calyx acuminate. Corolla with a very long tube. Capsule many-seeded.

**Trifoliata** Rondeletia. Tree 12 to 14 feet.

11. *R. levinga* (Ait. hort. kew. ed. 2. vol. 1. p. 366.) leaves oblong or elliptic, acuminate at both ends, glabrous, paler beneath, petiolate; stipulas deltoid, glabrous on the outside, but bearded inside; peduncles axillary, trichotomous, rather panicled, 3 times longer than the petioles, but one half shorter than the leaves. ℃ S. Native of Cuba, about the Havana; and of Trinidad. Anonyma, Sieb. fl. trin. no. 574. Tube of calyx downy; limb of 3-5 linear lobes, which are 5-times shorter than the tube of the corolla. Capsule downy, smaller than a pea.

12. *R. Americana* (Lin. spec. 245.) leaves lanceolate or elliptic, acuminate at both ends, glabrous, hardly petiolate, paler beneath; stipulas deltoid, downy outside; peduncles opposite, axillary, a little longer than the leaves, dichotomously cymose at the apex. ℃ S. Native of Cuba, near the Havana; Jamaica, and many other West India islands, ex. Plum. ed. Burm. t. 242. f. 1. Flowers white, bibracteolate, with a little scent. Tube of calyx clothed with adpressed villi; lobes of limb oblong-linear, 4 times shorter than the tube of the corolla. Capsule many-seeded.

**Cumana** Rondeletia. Shrub 8 to 10 feet.

14. *R. richardii* (D. C. prod. 4. p. 408.) glabrous; leaves oval or oblong, acute at both ends, on very short petioles; stipulas bipartite, obtuse, permanent; corollas pedunculate, rising from the forks of the branches; calyx truncate, with 5 very short teeth. ℃ S. Native of Cuba, about the Havana, where it was collected by De la Osa. Flowers white in the dried state, form of those of the other pantropical species of *Rondeletia*, but the calyx is hardly 5-toothed.

**Small-toothed-calyx** Rondeletia. Shrub.

15. *R. odorata* (Jacq. amer. p. 59. t. 42. pict. t. 61.) leaves hardly petiolate, ovate, or subcordate, acutish, scabrous above, paler beneath and rather scabrous on the nerves; corollas terminal. ℃ S. Native of Cuba, on rocks by the sea-side, at the Havana; and of Mexico. Lin. spec. 1671. H. B. et Kunth, nov. gen. amer. 3. p. 394. R. coccinea, Moc. et Sesse, fl. mex. icon. ined. R. obovata, Lin. syst. veg. Branchlets villous. Stipulas wide, acute. Peduncles trichotomous. Flowers handsome scarlet, with the projecting ring of the tube orange-coloured, having the scent of violets, downy on the outside, either pentameres or hexameres. Lobes of calyx linear, erect, one half shorter than the tube of the corolla. Capsule containing many angular seeds.

**Sweet-scented** Rondeletia. Shrub 5 to 6 feet.

---

16. *R. ferrifera* (Afo.) leaves oval coriaceous, deep green, glabrous, petiolate; corollas terminal. ℃ S. Native of Sierra Leone, in the low lands about Freetown. A branched spreading shrub, with the habit of *Laurustinus*. Flowers pale red. Stamens 5, a little longer than the tube of the corolla. Calyx 5-cleft.

**Ferrifera** Rondeletia. Shrub 4 to 5 feet.

17. *R. floribunda*; leaves ovate, acuminate, membranous, petiolate; corollas lateral and terminal, numerous; stamens 5, exerted. ℃ S. Native of Sierra Leone, in woods on the mountains. Corolla tubular, 5-cleft, white. Calyx 5-cleft.

**Bundle-flowered** Rondeletia. Shrub 5 to 6 feet.

18. *R. loniceroides*; leaves roundish, ovate, coriaceous, glabrous, petiolate; corollas campanulate; corolla with a long tube and a 5-cleft border; stamens 5, longer than the tube. ℃ S. Native of Sierra Leone, among bushes in the low lands. A branched twining shrub.

**Honeysuckle-like** Rondeletia. Shrub tw.

---

* Unarmed. *Panicles terminal.*

**Twiggy** Rondeletia. Shrub 6 to 5 feet.

**Discoloured-leaved** Rondeletia. Shrub 6 to 6 feet.

21. *R. tuba-cantans* (H. B. et Kunth, nov. gen. amer. 3. p. 396. t. 291.) leaves oblong, acute, petiole, clothed with fine down above, and with canescent pubescence beneath, as well as on the branches; stipulas lanceolate-subulate; panicles terminal, sessile, tripartite. ℃ S. Native of New Granada, between Maracaiba and Honda. Lobes of calyx lanceolate, 5-times shorter than the tube of the corolla. Corolla tomentose, outside. Fruit unknown.

**Downy** Rondeletia. Shrub 4 to 6 feet.

22. *R. elongata* (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 409.) leaves elliptic-oblong, acuminate at both ends, pubescent above, but clothed with white tomentum beneath, but they at length become glabrous from the down being deciduous; stipulas lanceolate, equal in length to the petioles; panicles terminal, on long peduncles; flowers crowded; lobes of calyx linear, 3 times shorter than the tube of the corolla. ℃ S. Native of Mexico, about Acapulco. An intermediate species, between *R. tuba-cantans* and *R. leucophyllum*.

**Elongated** Rondeletia. Shrub.

23. *R. leucophyllum* (H. B. et Kunth, nov. gen. amer. 3.
24. **Rondeletia** (D. C. prod. 4. p. 409.) leaves oval, acute, somewhat cuneated at the base, petiolate, clothed with villous pubescence above, but hoary from soft villous tomentum beneath; branches clothed with velvety tomentum; stipulas lanceolate, acuminate, villous; racemes axillary, shorter than the leaves, many-flowered. " S. Native of St. Domingo, where it was collected by Bertero. R. hisrita, Spreng. in herb. Balb. but not of Swartz. Calyx villous; lobes linear, 3 times shorter than the tube of the corolla. Peduncles semi-orbicular, 3-seeded. Capsule glabrous, villous outside. " S. Native of the West India islands, in Santa Cruz, Montserrat, and Martinico. R. triflora, Vahl, symb. 3. p. 34. t. 54. Oldenlandia longiflora, Lam. dict. 4. p. 534. *Hedyotis* longiflora, Spreng. pug. 2. p. 27. Branches hairy towards the top, terete or tetragonal. Leaves 2-5 inches long. Lobes of calyx length of the tube of the corolla. Capsule many-seeded. Tube of corolla silky outside.

**Pilose Rondeletia.** Shrub 4 to 6 feet.

**Box-leaved Rondeletia.** Shrub 2 to 3 feet.

27. **R. bovyana** (D. C. prod. 4. p. 410.) leaves obovate-oblong, obtuse, on very short petioles, somewhat mucronate, hoary on both surfaces from short down; stipulas lanceolate, acute; pedicels axillary, very short, 1-flowered. " S. Native of St. Domingo, where it was collected by Bertero. R. incana, ex Hispaniola, Spreng. syst. 1. p. 707. ex herb. Balb. Allied to *R. buxifolia*, but quite distinct from *R. incana*.

**Rogena-leaved Rondeletia.** Shrub.

28. **R. leptaca** (D. C. prod. 4. p. 410.) spines opposite; leaves broad-oval, acutish, glabrous on both surfaces, but rather pilose when young as well as the branches; pedicelles slender, equal in length to the leaves, or longer than them, bearing 3-5 flowers at the apex. " S. Native of Cuba, about the Havana, where it was collected by De la Ossa. Branches slender, glabrous. Spines axillary, long, bearing rudiments of leaves on one side. Peduncles an inch long. Segments of the calyx subulate. Corolla 5 lines long.

**Slender-spined Rondeletia.** Shrub.

29. **Brachycarya** (D. C. l. c.) spines opposite; leaves elliptic-oblong, acute at the base, and acuminate at the apex, glabrous above, but villous beneath, as well as the branchlets, pedicelles, and flowers; pedicelles one half shorter than the leaves, 3-4-flowered at the apex. " S. Native of Brazil. Branches dotted by linear-oblong crowded warts. Spines conical, stiff, forming a straight angle, spreading, 4-5 lines long. Segments of the calyx subulate. Anthers inserted at the throat.

**Short-spined Rondeletia.** Shrub.

† **Species not sufficiently known.**

**Small-flowered Rondeletia.** Shrub.

31. **R. rhyhchospora** (H. B. et Kunth, nov. gen. amer. 3. p. 306.) leaves oblong-elliptic, acute, on short petioles, pubescent above and on the branches, but clothed with canescence tomentum beneath; panicles terminal; seeds beaked at both ends. " S. Native of New Granada, near Honda. The flowers are unknown.

**Beaked-seeded Rondeletia.** Shrub 4 to 6 feet.

32. **R. dispersa** (Jacq. amer. p. 59.) leaves oval, obtuse, petiolate, glabros; racemes axillary, compound, loose, trifid; fruit somewhat baccate, 2-seeded. " S. Native of South America, in the woods of Carthagena, in rocky places; very frequent in the islands of Baru and Tierra Bomba. This plant should probably be removed from the genus as well as from the present tribe. Flowers sweet-scented, purplish white. Perhaps a species of Caithium.

**Two-seeded Rondeletia.** Tree 15 feet.

33. **R. coriacea** (Spreng. syst. 1. p. 707. but not of Wall.) leaves oval-oblong, coriaceous, shining above, but clothed with very short velvety down beneath as well as on the branchlets; stipulas semi-oiricular, furnished with a pungent tooth in the middle; cymes terminal; calyxes and corollas 5-parted, rather hispid; stamens exerted. " S. Native of equinoical Brazil. Mussaenda coriacea, Spreng. neu. entr. 2. p. 145. It is probable that the plant is neither a *Mussaenda* nor a *Rondeletia*, according to Cham. et Schlecht. in Linnaea. vol. 4. p. 165., but the structure of the fruit is entirely unknown.

**Coriaceous-leaved Rondeletia.** Shrub.

**Cult.** The species thrive well in a mixture of sand, loam, and peat; and cuttings of them are easily rooted if planted in a pot of sand, plunged in heat under a hand-glass. All are shrubs of very little beauty or interest.

**LXV. WENDLANDIA** (Henry Ludov. Wendland, Curator of the botanical garden at Hanover, and author of Commentatio de Acaecis Aphyllis). Bartl. med. ex D. C. prod. 4. p. 111. but
not of Wild. Rondeletia, Roxb. and Wall. fl. ind. 2. p. 133.
but not of Plumier.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an
almost globose tube, which is often striated, and a very short
permanent limb, which is 4-5-toothed to the base. Corolla
with a terete tube, which is longer than the calyx, and a spreading
4-5-lobed limb; lobes ovate, acutish. Stamens 4-5; filaments
rising from the top of the tube; anthers oblong, exserted.
Style exserted; stigma biform, with the lobes thickish. Capsule
ovate-globose, 2-celled, crowned by the calyx, dislocating at the
seeds into 2 valves at the apex. Seeds small, numerous in each
—Trees and shrubs, all natives of the East Indies. Leaves
opposite, coriaceous, oval, petiolate. Stipulas broad at the base,
acuminated. Panicles axillary and terminal, many-flowered.
Flowers small.—This genus differs from Rondeletia as Eros-
témma does from Cinchona.

§ 1. Pentàmera (from πέντε, pente, five, and μέγας, meris, a
part; in allusion to the flowers being pentameres). D. C.
prod. 4. p. 411. Calyx and corolla with 5-lobed limbs. Sta-
mens 5.

* Indian species.

1 W. panículata (D. C. prod. 4. p. 411.) arboreous; leaves
almost sessile, oval-oblong, acuminate, smooth; stipulas reni-
form, sometimes apiculate, at length recurved; panicles ter-
minal and sub-axillary. τ. S. Native of the Malay islands.
Rondeletia paniculata, Roxb. fl. ind. 2. p. 133. Flowers small,
white, very numerous. Bracteas of various forms and sizes, all
hair. Calyx villous. Corolla glabrous, with revolute segments.
Tetra-Pentámera (D. C. l. c.) arboreous; leaves petiolate,
oblanceolate, smooth above, pubescent on the nerves beneath,
as well as on the branches, pedicels, peduncles, and calyxes;
stipulas triangular, cuspidate; panicles terminal, dec-
cussate; flowers by threes. τ. S. Native of Bengal, about
Burdwan and Midnapoor. Rondeletia tinctóri, Roxb. fl. ind. 2.
p. 134. Leaves 4-6 inches long and 1-2 broad. Branches of
panicle 4-sided, hairy. Bracteas numerous, hairy, those of the
ultimate divisions of the panicle ensiform, with a hastate base.
Flowers numerous, small, white, almost sessile, fascicled. Seg-
ments of corolla spreading. The bark is employed as a mod-
dant by the natives in some of their dyes, and is called by them
Tula-loth.

Dyer's Wendlandia. Tree.

3 W. Notónia (Wall. cat. no. 2673.) shrub in every
part, except the corollas; leaves elliptic or obovate-ob-
long, acuminate, pale beneath; peduncles axillary and
terminal, disposed in terminal racemose thyrsoid panicles; corolla
with a slender tube, much longer than the calyx, which is woolly;
stipulas broad, rounded at the apex. τ. S. Native of the
East Indies, in the Nilgherry mountains, where it was collected
by Noton. 1xora congésa, Roxb. Flowers white, in clusters?
Leaves usually 3 in a whorl.

Norton's Wendlandia. Shrub or tree.

4 W. glabra (D. C. l. c.) arboreous; leaves petiolate,
oblong lanceolate, glabrous on both surfaces, as well as the peti-
oles, branchlets, peduncles, and calyxes; stipulas triangular,
cuspidate; panicles terminal, decussate; flowers by threes.
τ. S. Native of Java, on the mountains in woods. Ronde-
letia tinctória, Blum. bijdr. p. 974. but differs from the plant
under the same name by Roxburgh, in its smoothness, and by the
flowers being distinctly pedicellate.

Glabrous Wendlandia. Tree.

5 W. níz (Wall. cat. no. 6271.) branchlets downy; leaves
glabrous, elliptic lanceolate, tapering to both ends, pale beneath;
stipulas broad at the base, and cuspidate at the apex; panicles
terminal, downy; flowers almost sessile, in fascicles. τ. S.
Native of Martaban, on the banks of the Ayram. Flowers very
small.

Shining Wendlandia. Shrub or tree.

6 W. exserèta (D. C. prod. 4. p. 411.) arboreous; leaves
petiolate, broad lanceolate, glabrous or downy above, pubes-
cent, or tomentose beneath; stipulas semi-lunate, reflexed;
panicles terminal, with spreading downy branches; corolla sub-
campanulate. τ. S. Native of the interior parts of Bengal,
and particularly over the ruins of the ancient city of Gour; and
nyílófora, Roth. nov. spec. 141. Ronb. Hévény, Rem. et
Schultes, syst. 5. p. 234, and Ronb. Oryssén, Roth. nov. spec.
p. 142. ex Wall. fl. ind. 2. p. 135. Branchlets villous. Leaves
4-6 inches long. Bracteas somewhat ensiform, varying much in
size. Flowers numerous, small, pure white, fragrant. Calyx
hoary. Segments of corolla recurved.

Exserèted-stamened Wendlandia. Tree 20 to 30 feet.

7 W. próxima (D. C. l. c.) arboreous; leaves elliptic,
acuminated, clothed with tomentum beneath, as well as on the
branchlets; panicles very hairy; flowers very much crowded;
limb of corolla one half shorter than the tube; calycine teeth
obtuse, pilose. τ. S. Native of the east of Bengal, in Silhet.
Rondeletia próxima, D. Don, prod. fl. nep. p. 139. Nearly
related to W. exsérèta, but in that species the leaves are silky
beneath, and the branchlets are more crenate; the limb of the
corolla is about equal in length to the tube; the stigma is
bipartite, and the calycine teeth are ovate and acute.

Allied Wendlandia. Tree.

8 W. leuóstríka (Wall. cat. no. 6721.) shrub glabrous in
every part; leaves elliptic, tapering to both ends, shining above;
stipulas broad at the base, and cuspidate at the apex; teeth of
calyx subulate, much shorter than the tube, which is terete and
slender; bracteas to the flowers linear. τ. S. Native of the
Burmese empire, on Mount Taon-Dong. Flowers pedicellate,
white, dispersed in terminal racemose panicles; pedicels solitary.
Capsules hardly the size of coriander seeds.

Privet-like Wendlandia. Tree.

9 W. dentíflóra (D. C. prod. 4. p. 412.) arboreous; leaves
petiolate, obovate-oblong, acuminate, acutish at the base, cori-
ceous, pubescent on the veins beneath; panicle terminal, decus-
sate, densely clothed with tomentum; flowers much crowded.
τ. S. Native of Java, in the province of Cheribon, in woods
on the mountains of Tjeri, where it is called Kissamang-

Tooth-flowed Wendlandia. Tree.

10 W. cine’rea (D. C. prod. 4. p. 412.) arboreous; the
upper parts clothed with ash-coloured dense tomentum; leaves
lanceolate, petiolate, villous above and tomentose beneath;
stipulas recurved at the apex; panicles terminal, much branched,
tomentose; flowers in dense fascicles; corolla with a very short
tube. τ. S. Native of the valley of Nipal, at Bunipa, and
at Bheempedi; as also from Noakote and Shrengaur; and it
is called in the Newar language Gokhina. Rondeletia cine’
èra, Wall. in Roxb. fl. ind. 2. p. 141. Branches quadrangular,
with rounded corners. Leaves 4-6 inches long, smooth above,
glau
cous beneath. Stipulas reniform, emarginate. Bracteas oblong,
caducous, sometimes lobed or sub-hastate at the base. the
lowermost ones very long, linear. Flowers numerous, small,
white. Teeth of calyx small, triangular. Segments of corolla
spreading; throat furnished with 5 tubeckes. Capsule glo-
bulous, villous. The wood is brownish, close-grained, and seems
well adapted for furniture.

Grey Wendlandia. Tree. 12 to 14 feet.

11 W. luzónie’nsis (D. C. l. c.) branches, pedi
eto
nerves of leaves hairy; leaves oval-oblong, acuminate at both ends; stipulas semi-orbicular, obtuse, permanent, coriaceous; panicle much branched, many-flowered, rather villous; anthers hardly exerted; stigma bifid. S. Native of the island of Luzon. Wendlandîa multiflora, Bartl. in herb. Hænke. Allied to R. pubêrula. Fruit hardly larger than turnip seed. Flowers small, white.

Luzon Wendlandia. Tree.
12 W. coriaceâ (D. C. l. c.) arboreous, smooth in every part; leaves oblong-lanceolate, acuminate, tapering at the base, petiolar, coriaceous, shining; stipulas broad, short, rounded, ending each in a cuspitate point; panicles dense, terminal, many-flowered; flowers opposite, very numerous. S. Native of Nipaul, in the valley, very common in the forest of Thoka, and other places; and from Nombok. The tree is called Kōngéa in the Parbutteyan language, and Julū in that of Newar. Rondélâta coriaceà, Wall. in Roxb. fl. ind. 2. p. 142. C. Don, fl. nep. p. 138. Leaves 5-7 inches long. Flowers white, fragrant. Bracteas lanceolate, coriaceous, those of the flowers capillary. Corolla with a cylindrical tube, and a spreading border. The inhabitants of Nipaul use the wood of this tree for various purposes, such as rafters, tools, &c.: it is close-grained, and becomes of a brownish colour soon after being cut, not unlike mahogany. A red dye is likewise prepared from it. The leaves and flowers attain sometimes a bluish colour on being dried.

Coriaceous-leaved Wendlandia. Tree 10 to 12 feet.
13 W. purêrea (D. C. l. c.) branches, petioles, nerves of leaves underinch, and panicles hairy; leaves petiolar, oval-oblong, acute at both ends, glabrous above; stipulas adpressed, broad at the base, cuspitate at the apex; panicle terminal, branched, many-flowered; corollas glabrous; stigma clavate. S. Native of Nipaul. Allied to W. pändula, but differs in the stipules being 4 times shorter, in the corolla being glabrous, &c.

Puberulous Wendlandia. Tree.
14 W. pändula (D. C. l. c.) fruticos; branches pendulous; leaves lanceolate-ovate, acuminate, smooth above and rough underinch; stipulas lanceolate, adpressed, deciduous, rather shorter than the petioles; corysts terminal, oblong, pinnate; tube of corolla filiform, smooth, without and pubescent within; segments of corolla recurved. S. Native of Nipaul, between Hetaunra and Rheempe, also on Sheepope. Rondélâta pändula, Wall. in Roxb. fl. ind. 2. p. 140. A very elegant shrub. Branches obscurely quadrangular; new shoots downy. Leaves 3-5 inches long, and disposed 3 in a whorl on the robust shoots. Peduncles villous. Flowers fuscicled, green, fragrant. Stigma clavate.

Pendulous-branched Wendlandia. Shrub 5 to 6 feet.
15 W. malaya'na; branches somewhat tetragonal; leaves elliptic-lanceolate, acuminate, downy on the nerves, tapering to the base, membranous; stipulas broad; calyx with a roundish tube and a 5-cleft border; corolla with a very slender tube, and a spreading border; panicles terminal, coriaceous, hardly longer than the petioles. S. Native of the Malay islands. Anderósââmne Malayâna, Wall. cat. no. 6282.

Malay Wendlandia. Shrub or tree.
16 W. longi'otia (D. C. l. c.) fruticos; epidermis falling from the branches; leaves elliptic-oblong, acuminate, tapering at the base, villous underinch; stipulas lanceolate, erect, acute, often bidentate, furnished within their broad base with a series of subulate glands; panicle many times trichotomous, downy; calyx downy, with a yellow gland on each margin of the segments, and sometimes at the points; bracteas villous, glandular. S. Native of Silhet; and of Nipaul, on Chundagir, Nogurjoon, and at the foot of Sheepore near Thoka. The Bengalee name of the plant is Soopari. Rondéâlêta longifólia Wall. in Roxb. fl. ind. 2. p. 137. D. Don, prod. fl. nep. p. 138. Anderósââmne longifólia, Wall. cat. no. 6280. Leaves 6-14 inches long, dark green above. Bracteas with an entire or 3-lobed base, their margins marked with yellow subulate fleshy glands. Flowers large, fleshy, yellow, scentless, with a valvate aestivation. Segments of corolla spreading. Stamens inserted in the bottom of the tube. Capsules round, smooth. All the species of this genus vary considerably in the size of the leaves, the degree of their pubescence, and in their inftorescence, which renders their specific discrimination difficult.

Long-leaved Wendlandia. Shrub.

** ** African species, not sufficiently known.
17 W. sulca'na; leaves oblong-lanceolate, acuminate, glabrous, on short petioles; stipulas sheath-formed, supra-follicose; racemes panicked, terminal; capsule round, sulate. S. Native of Sierra Leone, in woods on the margins of rivers. Shrub branched.

Furrowed-fruited Wendlandia. Shrub 5 to 6 feet.
18 W. fiolo'sa; leaves broad, ovate-lanceolate, acuminate, coriaceous, of the base, almost sessile; stipulas large, sheath-formed, supra-follicose, and as are well as the leaves pilose; racemes panicked, terminal; capsules ovate. S. Native of Sierra Leone, in woods on the banks of rivulets.

Hairy Wendlandia. Shrub 5 to 6 feet.
19 W. racemo'ssa; glabrous in every part; leaves elliptic, very long, acuminate, coriaceous, on short petioles; stipulas large, sheath-formed, supra-follicose; racemes panicked, terminal; capsules ovate. S. Native of Sierra Leone, on the edges of woods. A branched twiggy shrub. Stamens 5, longer than the corolla. Capsule 1-celled, many-seeded. Corolla funnel-shaped.

Twiggey Wendlandia. Shrub.

§ 2. Tetramére (from tetra, tetras, by fours, and meris, a part; in reference to the flowers being tetramerous). D. C. prod. 4. p. 412. Limb of calyx and corolla 4-lobed. Stamens 4.—Doubtful species.

21 W. spica'na (D. C. prod. 4. p. 419.) leaves elliptic, tapering downwards, villous, as well as the panicle; stipulas oblong, acute, smooth, except the elevated rib, which is villous; panicle large, terminal, almost sessile, with opposite compressed peduncles: the secondary divisions of the peduncle dichotomous, terminating in cylindrical slender, twin, or ternate spikes, which are 2 inches long; flowers disposed in one row along one side of the rachis of the spike; corolla pubescent, with a slender tube, widening at the apex; stigma of 2 recurved lobes. S. Native of Pulo-Penang. Rondélâta spicà, Wall. in Roxb. fl. ind. 2. p. 139. Leaves 6-12 inches long. Bracteas lanceolate, sub-bastate, acute. Flowers small. Capsule small, round, villous. Seeds angular. Inflorescence like that of Tournefôrîé. Perhaps a proper genus.

Spicate-flowered Wendlandia. Shrub or tree.

Tetrandrous-flowered Wendlandia. Shrub.
Rubiaceae. LXV. Wendlandia. LXVI. Xanthophyllum. LXVII. Carphæa. LXVIII. Sipanea.

23 W. ? corymbosa (D. C. prod. 4, p. 413.) leaves obovate-lanceolate; peduncles for the most part terminal, dichotomously corymbose; flowers unilateral, tetrandrous. S. Native of Pulo-Penang. Rondelétia corymbosa, Jack, in mal. misc. 1. no. 1. p. 4. Corolla white, tinged with red. Perhaps a separate genus.

Corymbosa-flowered Wendlandia. Tree.

24 W. Wrightiana (Wall. cat. no. 6277.) young branches downy; leaves obovate-oblong, rather acuminate at the apex, tapering much to the base, glabrous; panicles trichotomous; flowers small, sessile, tetrandrous, disposed in a single row, on the upper side of the branches of the panicle. S. Native of the East Indies. Tournefortia, herb. Wight. Leaves 1 to 1½ foot long. Stipulas broad, membranous. Very like W. corymbosa.

Wright's Wendlandia. Shrub or tree.

25 W. ? Lawsoniæ (D. C. l. c.) sub-arborescent; branchlets quadrangular; leaves lanceolate, acuminate, glabrous; corymb terminal, trichotomous; fruit oblong. S. Native of Malabar. Poutelaetsje, Rhed. mal. 4. t. 57. Petèòsia species, ex Juss. Ligtstrum species, ex Comm. Lawsonis purpurea, Lam. dict. 3. p. 197. Barsoti, ancre encyl., where the fruit is said to be baccate, but in the figure the fruit is drawn capsular and many-seeded, it is therefore more likely to be a species of Wendlandia than Petèòsia.

Lawson's Wendlandia. Tree.

† A species hardly known.

26 W. ? scædens: shrubby, scandent, smooth; leaves opposite, petiolate, oblong, entire; panicles axillary, small, branched; capsules globular; seeds small, numerous. S. Native of the Mauritius. Rondelétia scædens, Roxb. fl. ind. 2. p. 187.

LXV. XANTHOPHYLLUM (from xanthos, xanthos, yellow, and phos, phytos, a plant; so called from the first species being clothed with rufous villi). Blum. bijdr. p. 989. A. Rich. mem. soc. hist. nat. par. 5. p. 275. D. C. prod. 4. p. 413.

Lin. syst. Tetra-Pentandria, Monegogia. Calyx with an ovate tube and a 4-5-cleft limb. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft limb. Stamens 4-5, exerted; filaments inserted in the throat, connivent. Style sub-clavate, perforating the disk of the ovarium; stigma thick, 2-lobed, in the throat. Drupe dideymous, crowned by the calyx, divisible into 2 many-seeded parts or cells. Placentae prominent, fixed to the middle dissepiment on both sides. Seeds minute, angular, wingless.—This genus is nearly allied to Wendlandia, but differs in the fruit not being dehiscence.

1 X. fruticulosem (Reinw. in Blum. bijdr. p. 989.) suffruticose, clothed with rufous villi; leaves oblong-lanceolate; stipules bifid; peduncles axillary, trichotomous, many-flowered. S. Native of the islands of Java and Nusa-Kambanga, on the mountains, among bushes. Branches, peduncles, calyces, and lower surfaces of leaves clothed with adpressed rufous silky villi. Stipulas large, deciduous.

Shrubby Xanthophyllum. Shrub.

2 X. spicatum (Blum. in litt ex D. C. prod. 4. p. 413.) suffruticose, glabrous, erect; leaves oblong, acuminated at both ends; spikes axillary and terminal, nutant; flowers in heaps. S. Native of Java, especially on calcareous mountains. Chicoceca spicata, Blum. bijdr. p. 958. Berries small, indehiscent, dry, didymous, striated. Seeds small, not winged. Stipulas twin on both sides, subulate at the apex, combined into a short sheath at the base. Spikes slender, elongated.

Spicate-flowered Xanthophyllum. Shrub.

Cult. For culture and propagation see Rondelétia, p. 517.

Lin. syst. Tetrandria, Monogynia. Calyx with a turbinate tube, and a 4-parted limb; lobes large, ovate-oblong, rather spatulate, scarious, permanent. Corolla with a long filiform tube, a ventricose throat, which is hairy inside, and a 4-parted limb; lobes oblong, acute. Anthers almost sessile, inclosed, oblong. Stigma 1 (ex Juss.), but slender and bifid according to Lamark's figure. Capsule crowned by the calyx, 2-celled, dehiscing at the cells: valves semi-septiferous. Seeds many in each cell.—A dry stiff shrub, with the habit of Serissa, and leaves like those of hyssop. Leaves sessile, linear, acute. Stipulas unknown. Flowers terminal (ex Lam.) capitate (ex Juss.); corymbose.—It is doubtful which place this genus should occupy in the order, both the seeds and stipulas being unknown.

Madagascar Carphæa. Shrub.

Cult. For culture and propagation see Rondelétia, p. 517.

Lin. syst. Pentandria, Monogynia. Calyx with a turbinate tube, and a 5-parted limb; lobes lanceolate-subulate, permanent. Corolla with a terete tube, about 3 times longer than the lobes of the calyx, a bearded throat, and a 5-parted limb; segments ovate. Anthers 5, sessile, inclosed. Stigma bifid, acute. Capsule almost glabrous, crowned by the calyx, 2-celled, dehiscing at the cells into 2 valves. Placentas central, rather fleshy. Seeds very numerous, wingless, very minutely tuberculated.—Annual green herbs. Leaves ovate. Stipulas linear, acuminate, solitary on both sides. Flowers axillary and terminal.—This genus is nearly allied to Rondelétia.

1 S. fraterennis (Aubl. guian. 1. p. 147. t. 56.) stems creeping at the base; leaves ovate-lanceolate, rather scabrous, ciliated at the base; flowers sessile, almost terminal, sub-corymbose. S. Native of Cayenne. Poir. dict. 7. p. 199. Cham. et Schlcht. ex Linn. 4. p. 166. with a good description. Viréta fraterennis, Vahl. elog. amer. 2. p. 11. Corolla rose-coloured, with a bearded throat. Stem rather villous. The plant is used in Guiana in astringent ptisans, and in the cure of gonorrhoea; and a decoction of it is used to wash ulcers and other sores.

Field Sipanea. Pl. creeping, 2 feet.

2 S. dichotomata (H. B. et Kunth, nov. gen. amer. 3. p. 397.) stem tetragonal; leaves lanceolate, clothed with silky villi on both surfaces; panicle terminal, dichotomous. S. Native of South America, in humid places near Atures, at the cataract of the Orinoco. Corolla rose coloured, pilose on the outside, with a bearded throat. Viréta dichotomata, Spreng. syst. 1. p. 702. Pycnochēa dichotomata. Wildl. harb. ex Cham. et Schlcht. in Linneæa. 4. p. 166. Stem villous, branched.

Dichotomous Sipanea. Pl. 2 to 3 feet.
LXIX. VirecTa (from viréctum, a green place; from the agreeable greenness of the leaves). D. C. prod. 4. p. 414.—VirecTa species, Smith, but not of Lin. fil.—Sipánea species, A. Rich.?—Phyteumoides, Smeathm., in herb. L’Her.

Lin. syst. Pentandria, Monogyúnia. Calyx with an ovate short tube, and 5 linear-setaceous lobes. Corolla funnel-shaped, with an obconical tube, about equal in length to the lobes of the calyx, a naked throat, and 5 linear-oblong ciliated lobes. Stamens 5: having the filaments much exserted beyond the throat; anthers linear, oscillatory, bifid at the base. Style filiform, equal in length to the stamens. Stigma hardly thickened, undivided. Capsule globose, crowned by the calyceal lobes in the young state, but almost naked in the adult state, 2-celled, and at length dehiscing at the cells. Seeds innumerable, 4-5-sided, and a little muricate.—Hairv hairs, with opposite branches. Leaflets opposite, ovate-oblong. Stipulas twin on each side, lanceolate. Flowers white or yellow, disposed in dense cymose corymb.—Branchlets of cyme elongated after flowering.—This genus is nearly allied to Sipánea, but differs in the genitals being exserted; it differs also from Hydrópis in the quinary number of the floral parts, and in the exserted stamens, &c.

1 V. múlsfíora (Smith, in Rees’s cycl. no. 4.) stem erect; leaves ovate-lanceolate, almost sessile.—Native of Sierra Leone, where it was collected by Smeathm. Phyteumoides hirsutum, Smeathm. in herb. L’Her. Perhaps Sipánea angustífolia, A. Rich. mem. soc. hist. nat. par. 5. p. 276. is the same as the present plant. Flowers white.

Many-flowered VirecTa. Pl. 2 to 3 feet.

2 V. procúmbens (Smith, 1. c. no. 2.) stem procumbent; leaves ovate, 3 times longer than the petioles. ¼ S. Native of Sierra Leone.

Procumbent VirecTa. Pl. procumbent.

3 V. lu’trea; leaves ovate-lanceolate, acuminate, hairy; pedicles aggregate, axillary; calyx-5-toothed; corolla tubular, 5-cleft, hairy. ½ S. Native of Sierra Leone, in cultivated places. Flowers yellow. Habit of Lithospermum. Perhaps the same as V. procúmbens.

Yellow-flowered VirecTa. Pl. rambling.

4 V. elátior (D. C. prod. 4. p. 415.) leaves oval-lanceolate, rounded at the base and abruptly petiolate, acute at the apex, smoothish; flowers terminal, almost aggregate; calyce segments very unequal, smoothish; tube of corolla very long. ¼ S. Native of Angola, in south-western Africa. Sipánea elátrí, A. Rich. mem. soc. hist. nat. par. 5. p. 276.

Taller VirecTa. Pl.

5 V. pánícula; suffrúticose, branched, clothed with brown or copper-coloured hairs; leaves ovate-lanceolate; corymb pinnate, axillary, and terminal. ½ S. Native of Sierra Leone, on the mountains. Flowers small, greenish. Pánicled-flowered VirecTa. Shrub.

Cult. For culture and propagation see Sipánea above.

Lin. syst. Pentandría, Monogyúnia. Calyx with a short turbinate tube, which is adnate to the ovary at the base, and a 5-cleft permanent limb. Corolla tubularly funnel-shaped, 3-times longer than the limb of the calyx, hairy inside; with 5 ovate segments. Stamens 5, inclosed. Style filiform, girded by an urceolus at the base; stigma 2-lobed, shorter than the corolla. Capsule broad, compressed, 2-lobed, almost mitre-formed, crowned by the calyceal teeth, internally divided into 2 cells by a transverse partition, opening between the remains of the 2 fleshly nectareal lips, or by a transverse chink round the apex. Seeds numerous, small, hexagonal. Embryo straight, slender, in fleshy or rather horny albumen.—Dwarf perennial herbs, natives of the East Indies. Leaves opposite, petiolate, membranous, those opposite each other often unequal in size. Stipulas twin on each side, small. Peduncles axillary and terminal, solitary, cymose at the apex, with sub-umbellate branches. Flowers disposed along the branches of the peduncles in a single unilateral row.

1 O. múnógos (Lin. amen. 2. p. 117. spec. 213. mat. med. 27. with a bad figure, but not of Burm.) suffrúticose; leaves elliptic-lanceolate, acuminate at both ends, glabrous, papery; stipulas small, truncate; cymes pedunculate, terminal, branched; tube of corolla short, funnel-shaped. 2 S. Native of Java, Ceylon, Sumatra, Pulo Penang, &c. Blum. bijdr. p. 976. Roxb. fl. ind. 2. p. 544. Gaertn. fr. 1. t. 55. A. Rich. l. c. t. 2. Radix. Mungo. Kempf. amen. 573 and 577. Stipulas a slight connecting membrane. Nectary a 2-lobed terminal body, surrounding the base of the style. Flowers white. The root is very bitter, and is celebrated as an alyxeteric, the trunk of which is horizontal, and the fibres perpendicular. The plant is called in Ceylon Ekanwerya and Naghavanáli, from nagha, the ribbon-snake, for the bite of which it is accounted a specific.

2 O. brácteolá (Wall. cat. no. 6228.) stem ascending, villous above, simple, or a little branched; leaves unequal in size in each pair, as is the case in most of the species; stipulas ensiform, pubescent; common peduncles slender, villous, from 3-5 inches long. ½ S. Native of the valley of Nipaí, in dark moist situations.

Brácteolate Snake-root. Pl. 1 foot.

3 O. oblóntifóllia (D. C. prod. 4. p. 415.) suffrúticose, downy at the apex as well as on the peduncles; leaves oblong, bluntish, attenuated at the base, glabrous above, pale and rather velvety beneath; stipulas small, triangular, acute; cymes pedunculate, branched; tube of corolla short. ½ ?. 2 ?. S.
Native of the Island of Luzon, one of the Philippines. O. Mungos, Barth. in herb. Häkne. Herb hardly a hand high, erect, suffruticose at the base, and throwing out a few roots from the lower part.

Oblong-leaved Snake-root. Shrub 1/2 foot.

4 O. villosa (Roxb. fl. ind. 2. p. 546.) stem suffruticose; erect, villous; leaves ovate-oblong or lanceolate, villous on the veins beneath; stipulas ensiform, villous; cymes or corylombs terminal, on long peduncles, villous; corolla funnel-shaped. 2. S. Native of Chittagong and Silhet, on the hills in shaded moist places. O. Mungos, Gaertn. fruc. 1. p. 264. t. 55.? ex Roxb. Corollas almost globular, with numerous white almost sessile flowers, and recurved branches. Urceolus bilabiate, surrounding the base of the style. Capsule opening round the apex.

Villos Snake-root. Pl. 3/4 foot.

5 O. argentea (Wall. cat. no. 6229.) suffruticose; stem hispid; leaves ovate, acuminate, tapering at the base, glabrous, green above and white beneath; peduncles axillary and terminal, trichomatous at the apex; tube of corolla longer than in O. villosa. 2. S. Native of Java, and Mount Tjerimai. Allied to O. Mungos, but differs in the flowers being larger and in the stipulas being subulate at the apex.

Marginate-leaved Snake-root. Pl. 1/2 to 1 foot.

6 O. marginita (Blum. bijdr. p. 976.) stem suffruticose, erect; leaves lanceolate, acuminate at both ends, glabrous, except the margins, which are scabrous; stipulas semi-lanceolate, small, acuminate; cymes or corylombs pedunculate, terminal, almost trifid; corolla funnel-shaped, with an angular tube. 2. S. Native of Java, on Mount Tjerimai. Allied to O. Mungos, but differs in the flowers being larger and in the stipulas being subulate at the apex.

Fasciculate-leaved Snake-root. Pl. 1/2 to 1 foot.

7 O. fasciculata (D. Don, prod. fl. nep. p. 136.) stem suffruticose, erect; leaves elliptic, acuminate, glabrous above and downy beneath; flowers in terminal fascicles; calyce segments ovate, acute. 2. S. Native of Nipal, in moist shaded places, near Suembo. Virécta fasciculata, and O. suffruticosa, Hamilt. mss. Differs from O. Mungos in the leaves being downy beneath, and in the flowers being in terminal fascicles.

Fasciculated-flowered Snake-root. Pl. 1/2 foot.

8 O. rugosa (Wall. in Roxb. fl. ind. 2. p. 547.) stems herbaceous, creeping at the base, and ascending at the apex, villous; leaves elliptic-lanceolate, attenuated at both ends, shining, rugose and rather scabrous above, paler beneath and rather downy along the veins; stipulas semi-lanceolate, acuminate; cymes or terminal corylombs pedunculate, bipid or trifid, equaling the uppermost pair of leaves. 2. S. Native of Nipal, in forests, on Shivaapoor and other high mountains near the valley; and of Java, on Mount Gede in woods. Blum. bijdr. p. 976. Root consisting of a number of long pink-coloured fibres. Petioles villous. Peduncles furnished with 2 subulate bracteas about the middle, villous. Flowers white, downy; twin, one sessile, and the other pedicellate. Urceolus 2-lobed.

Wrinkled-leaved Ophiorhiza. Pl. 1/2 to 2 feet.

9 O. discolor (R. Br. in Wall. cat. no. 6223.) leaves elliptic-oblong, much acuminate, tapering to the base, glabrous, green above, and reddish beneath; stems and peduncles downy; peduncles terminal, corylombose, trichomatously branched. 2. S. Native of Penang. O. Mungos, Wall. in Roxb. fl. ind. 2. p. 547. O. ourybiosa, Hamilt. herb.

Discoloured-leaved Snake-root. Shrub 1 to 2 feet.

10 O. canescens (Blum. bijdr. p. 977.) stems herbaceous; leaves orbicular-lanceolate, attenuated at both ends, whitish beneath, and rather downy along the veins; stipulas broad, short, subulate at the apex; cymes on short peduncles, terminal, and axillary, naked, usually quadridif; stamens about equal in length to the tube of the corolla. 2. S. Native of Java, on the mountains of Seribu, in shady places. Allied to O. rugosa, but is distinguished from it in the cymes being naked.

Canescens Snake-root. Pl. 1/2 to 1 foot.

11 O. trichocarpa (Blum. bijdr. p. 977.) stems herbaceous, tomentose; leaves on short petioles, ovate-lanceolate, acute, rather downy on the veins beneath; peduncles downy; stipulas subulate; cymes pedunculate, axillary, and terminal, dichotomous. 2. H. Native of the islands of Java and Nusa-Kambanga. Said to be nearly allied to O. villosa.

Hairy-fruited Snake-root. Pl. 3/4 to 1 foot.

12 O. longiflora (Blum. bijdr. p. 977.) stem suffruticose; leaves orbicular-lanceolate, acuminate at both ends, hairy beneath; stipulas semi-lanceolate, acuminate; cymes pedunculate, terminal, loose-flowered; tube of corolla very long, velvety. 2. S. Native of Java, on Mount Gede, in woods near the top.

Long-flowered Snake-root. Shrub 1/2 to 1 foot.

13 O. sanguinea (Blum. bijdr. p. 977.) stems herbaceous; leaves ovate or elliptic-lanceolate, acuminate, rather oblique at the base, glabrous; stipulas foliaceous, ovate-oblong, bifid; cymes pedunculate, terminal. 2. S. Native of Java, on the mountains in shady places. Leaves reticulately veined in the dry state; the veins blood-coloured.

Bilaceous leaved Snake-root. Pl. 1/2 to 1 foot.

14 O. neglecta (Blum. herb. ex D. C. prod. 4. p. 416.) stems herbaceous, erect, dark purple, glabrous; leaves orbicular-lanceolate, acuminate, pale beneath; peduncles axillary, clothed with rusty down; cymes bifid or quadridif, having the branches elongated. 2. S. Native of Java. Nerves of leaves puberulous beneath. Stipulas deciduous.

Neglected Snake-root. Pl. 1/2 to 1 foot.

15 O. quadrifida (Blum. bijdr. p. 977.) stems herbaceous; leaves ovate or oblong, acute at both ends, smooth, with simple veins; stipulas linear, obtuse; cymes pedunculate, axillary, and terminal, usually quadridif. 2. S. Native of Java, in shady mountain woods.

Quadridif-cymed Snake-root. Pl. 1/2 to 1 foot.

16 O. japonica (Blum. bijdr. p. 977.) stems herbaceous, radiate, leaves ovate or orbicular-lanceolate, roughish above, and downy on the veins beneath; cymes terminal, pedunculate, dichotomous; corolla funnel-shaped, with a very long tube, and having the segments hairy inside. 2. G. Native of Japan, where it was collected by Siebold.

Japan Snake-root. Pl. 3/4 foot.

17 O. prostrata (D. Don, prod. fl. nep. p. 136.) stems prostrate, radiate, downy; leaves ovate or elliptic, rough above, and downy beneath; calyce segments oblong. 2. G. Native of Nipal, at Narainhetty. Virécta prostrata, Hamilt. mss. Differs from O. Mungo in the plant being smaller, and more pubescent, and in the stems being radiant.

Prostrate Snake-root. Pl. prostrate.

18 O. tomentosa (Jack, in Roxb. fl. ind. 2. p. 546.) the whole plant is clothed with very soft villi; stem herbaceous, erect, branched; leaves lanceolate-oblong, finely acuminate, on longish petioles, villous and hoary underneath, with reddish veins; stipulas subulate; cymes pedunculate, terminal. 2. S. Native of the islands of Pulo-Penang and Sumatra, on the hills. Stem reddish. Petioles villous. Flowers almost sessile. Peduncles and cymes tomentose. Corollas white. Urceolus bilabiate, glandular. Very like O. bracteolata.

Tomentos Snake-root. Pl. 1 foot.

19 O. erubescens (Wall. cat. no. 6223.) stems clothed with rusty down at the top; leaves elliptic-lanceolate, acuminate, tapering at the base, glabrous above, and downy beneath; stipulas broad at the base, and cuspidate at the apex; flowers ter-
minal, coriodybose. ½ S. Native of the East Indies, at Cheppadong.

Reddish Snake-root. Shrub 1 foot.

20 O. hispidula (Wall. cat. no. 6234,) stem and pedioles downy; leaves elliptic, tapering to both ends; peduncles terminal, downy, coriodybose, dichotomously branched; capsules downy. ½ S. Native of the East Indies, at Tavoy.

Hispid Snake-root. Shrub ½ to ¾ foot.

21 O. heterophylla (Jack, mal. misc. 2. no. 7. p. 85. Wall. in Roxb. fl. ind. 2. p. 547.) stem erect, tomentose; leaves roundish-ovate, those opposite each other very unequal in size; cymes small, terminal. ½ S. Native of Sumatra, in the interior of the island. Leaves with a bluish acumen, smooth, pale, and whitish beneath. Capsules compressed, obcordate.

Variable-leaved Snake-root. Pl. ½ to 1 foot.

22 O. acuminata (D. C. prod. 4. p. 416.) stem suffruticose, clothed with rufulus velvety down above, as well as the pedioles; leaves lanceolate, acuminate, glabrous, velvety on the nerves beneath; stipulas broad at the base, and armed by a bristle at the apex; cymes pedunculate, of 5 velvety branches. ½ S. Native of the island of Luzon, at Sorzagon. O. subumbellata, Bartl. in herb. Haenke. Perhaps the same as O. subumbellata, Forst.

Aecinated-leaved Snake-root. Shrub.

23 O. Richardsonii (Gaud. in Freyc. voy. p. 473. t. 97.) plant suffruticose, quite glabrous; leaves oblong, much acuminate at both ends, petiolate, with smooth margins; cyme terminal, on short peduncles, trifid or quadridif; tube of corolla short; calyce teeth very short. ½ S. Native of the Moluccas.

Richard's Snake-root. Shrub ½ to 3 feet.

24 O. perpusilla (Blum. herb. ex D. C. prod. 4. p. 417.) stem erect, dwarf, simple; leaves elliptic, glabrous; flower terminal, solitary, nutant, on a short pedicel; corolla funnel-shaped, glabrous; calyce teeth obtuse. ½ S. Native of Java. Herb hardly an inch long. Fruit unknown.

Smallest Snake-root. Pl. 1 inch.

25 O. Harrisii (Heyne, ex Wall. cat. no. 6236.) stem, petioles, peduncles, and nerves of leaves on the under side downy; leaves ovate or roundish-ovate, acutish, glabrous and green above, and pale beneath; peduncles terminal, coriodybose, and dichotomously branched at the apex. ½ S. Native of the East Indies. Root creeping much.

Harrison's Snake-root. Pl. ½ to 1 foot.

26 O. ? geminata (Wall. cat. no. 6237.) stem, petioles, peduncles, and nerves of leaves on the under surface of the leaves, downy; leaves large, obovate-oblong, tapering much at the base, and running down the petioles, and acute at the apex, glabrous and green above, but pale or reddish beneath; peduncles long, terminal, racemose. ½ S. Native of the East Indies, in Silhet and Gualpara. Dentella geminata, Herb. Ham. Root creeping. Stem dwarf. Racemes numerous, crowded, secund, alternate, short, recurved on each peduncle. Perhaps a proper genus.

Twin Snake-root. Pl. ½ to 1 foot.

+ A doubtful species.

27 O. ? subumbellata (Forst. prod. no. 66.) stem shrubby; leaves lanceolate, acute; umbels axillary, trifid. ½ S. Native of the island of Otahibi.

Subumbellata-flowered Snake-root. Shrub.

Cult. The species of Snake-root will grow in a mixture of loam, sand, and peat; and they may either be increased by cuttings under a hand-glass in heat, or by seeds.

LXXI. ARGOSTEMMA (from argos, white, and στεμμα, stemma, a crown; in reference to the terminal racemes or umbels of snow white flowers). Wall. in Roxb. fl. ind. 2. p. 324. Blum. mss. ex D. C. prod. 4. p. 417. — Pomångium, Reinw. ex Blum.

Linc. syst. Tri-Pentándria, Monogónia. Calyx with a short obconical tube, and a 3-4-5-cleft limb: lobes acute, valvate in aestivation. Corolla rotate, spreading, with a 5-5, rarely with a 3-4-parted limb. Stamens alternating with the lobes of the corolla. Anthers large, exserted, cohering at the apex. Style perforating a flabby disk; stigma globosa. Capsule crowned by the calyx and an opercular disk, 2-celled, dehiscing in a radiant manner at the apex; receptacles convex, adnate to the dissepiment. Seeds numerous, angular. — Herbs, for the most part hairy from short down. Leaves quite entire, opposite, one usually smaller than the other, rarely verticillate. Stipulas foliaceous, ovate, solitary on both sides. Peduncles terminal, and almost axillary, bearing fascicled umbels of flowers at the apex, very rarely only one flower. Flowers white. The species of this genus have the habit of those of Ophiorhiza.

1 A. sarmentoso-sum (Wall. in Roxb. fl. ind. 2. p. 324.) plant rather villous, creeping at the base, and atolloniferous, the upper part of the stem erect; leaves ovate, obtuse, almost sessile, downy above, and villous on the nerves beneath, in two approximate pairs; flowers 3 or 4-parted, disposed in a terminal umbel or corymb-formed raceme. ½ S. Native of the East Indies, on rocks on the hills at Schukragiri, near Rujmahal; and of Nipal, on the mountains to the northward of the valley on the route to Gosaingstlan. Stem and leaves rather pubescent. Snow white flower. Corolla 5 times longer than the calyx. Leaves at end of stem.

Sarmentoso Argostemma. Pl. ½ foot.

2 A. verticillatum (Wall. l. c. p. 325.) plant erect, downy, and tufted; leaves 4 in a whorl, linear-lanceolate, rather falcate; peduncles 2-3, rarely solitary, bearing a few umbelate flowers each; flowers 4-5-parted. ½ S. Native of Nipal, on rocks at Moreko in the valley. Root fleshy, and almost tuberous. Stems furnished with a pair or two of lanceolate connate scales. Leaves ciliolate. Flowers snow white, rather smaller than those of the preceding species. The mouth of the corolla is marked with 10 minute tubercles, alternately receiving the basis of the filaments. Ovarium smooth. Wall. pl. rar. asiat. 2. p. 80. t. 185.

Whorled-leaved Argostemma. Pl. 4 inches.

3 A. rostratum (Wall. l. c. p. 326.) plant erect, smooth; leaves in 2-4 approximate pairs, narrow-lanceolate, acuminate, petiolate; stipulas ovate, recurved, permanent; umbels pedunculate, terminal, many flowered; segments of corolla and tube of the anthers acuminate. ½ S. Native of the East Indies, on the Pundua mountains near Silhet. Stem furnished with several remote pairs of lanceolate-ciliated stipulas: the upper ones becoming enlarged and foliaceous. Pedicles an inch long, clavate, a little ventricose above the middle. Corollas white, nearly an inch in diameter. Habit of Trientalis Europae'a.

Beaked-anthered Argostemma. Pl. ½ to ¾ foot.

4 A. frutetum (Wall. l. c. p. 327.) plant glabrous; stem short; leaves smooth, ovate, subcordate, painted with reticulated white nerves, on very short petioles; umbels terminal, pedunculate, many flowered; flowers pentandrous. ½ S. Native of Pulo-Penang, growing on rocks near the water-fall. Leaves only 2, or in 2 remote pairs, slightly ciliolate. Peduncle simple, or having 2 opposite branches, each bearing a round umbel of many small flowers. Unripe berry as large as a coriander seed, smooth.

Painted-leaved Argostemma. Pl. 1 to 2 inches.

5 A. borraginæum (Blum. mss. ex D. C. prod. 4. p. 417.) stem creeping at the base, but erect above, and sebaceous at the apex; leaves elliptic, acute at both ends, petiolate, with a few 3 x 2
scattered hairs above, but more crowded on the nerves beneath, and on the petioles; umbels pedunculate, terminal, subtrifid; flowers pentameric, at length secund. 0. S. Native of Java, in mountain woods in humid places. Stem 4-6 inches long. Leaves 4-6 long along each stem.

Borrago-like Argostemma. Pl. ½ foot.

6. A. mantaum (Blum. ms. ex D. C. prod. 4. p. 418.) stem torpently hairy, ascending; leaves ovate, acuminate, ciliated, petiolate, and with scattered hairs above, and with bristle-like hairs on the nerves beneath; umbel terminal, pedunculate, bracteate, 5-6-flowered.—Native of Java. Pomáigüion mantaum, Blum. ms. Stem branched a little, 3-4 inches long. Leaves 10-12 on each stem, disposed in nearly equal distant pairs. Peduncles hardly longer than the leaves.

Mountain Argostemma. Pl. ½ foot.

7. A. synfolium (Blum. ms. ex D. C. prod. 4. p. 418.) stem creeping at the bottom, but branched, and rather scabrous above; leaves petiolate, ovate, acute, tapering a little at the base, hairy; umbels pedunculate, shorter than the leaves, terminal, subtrifid, few-flowered. ½. S. Native of Java, on Mount Salak in shady places. Leaves 16-20 on each plant, membranous, pale beneath. Flowers white, smaller than those of the preceding species.

Few-flowered Argostemma. Pl. ½ foot.

8. A. unifolium (Blum. ms. ex D. C. prod. 4. p. 418.) stem creeping below, clothed with hairy pubescence; leaves opposite, very unequal, one of which in each pair hardly exceeds a stipula in size, the other is lanceolate, with an unequal base, rather pilose; peduncle terminal, 1-flowered. 0. S. Native of Java, in woods on the higher mountains.

One-flowered Argostemma. Pl. creeping.

Cult. For culture and propagation, see Ophiophora, p. 523.

The species are all remarkable in their appearance.

LXXII. SPIRADICLUS (from σπείρα, speira, a spire, and δυλικός, diclis, valves with folding doors; in allusion to the valves being divided into 2 parts, and also twisted at the apex). Blum. bijdr. p. 975. D. C. prod. 4. p. 418.

Lin. syst. Pentändria, Monogynia. Calyx with an oblong tubinate tube, and a 5-toothed limb. Corolla with a short tube, and a 5-parted spreading limb. Stamens 5, inclosed. Style girded by 4 glands; stigma 2 lobed in the throat. Capsule oblong, crowned by the calyx, 2-celled, 2-valved; valves bipartite, at length twisted. Seeds numerous, angular.—This genus is nearly allied to Tula, with the tufted habit of Nertèra. Leaves opposite, ovate, rather undulated, glabrous. Spikes terminal and lateral, 1-flowered. Flowers small, second, each furnished with one bracteate.

1. S. cespitosâ (Blum. 1. c.)—Native of Java, at the foot of Mount Salak in humid places.

Tufted Spiradclus. Pl. tufted.

Cult. For culture and propagation see Tula below.

—A small procumbent branched tufted herb. Leaves reniform, petiolate. Pedicels axillary, short, 1-flowered. This genus was alone known to Feuillé, and is therefore very doubtful. Habit of Nertèra, but differing in the flowers being pentameric, and in the cells of the fruit being many seeded; it is perhaps, however, only that genus badly described.

1 T. adansonii (Rom. et Schultes, syst. 4. p. 385.) 0. G. Native of Peru, on rocks by the sea-side. Soldanella facie, Feuill. obs. 3. pt. 2. p. 63. t. 44.

Adanson's Tula. Pl. tufted.

Cult. A mixture of loam, peat, and sand will be a good soil for this little plant; and it may either be increased by cuttings planted in sand under a hand-glass, or by seeds. The pot in which it is grown should be half filled with sherd.

1. D. repens (Forst. l. c.) 0. F. Native of the East Indies, as in Java, Coronadel, Timor, Luconia, New Caledonia, &c., in humid shady places along the banks of rivers, and on the margins of rice fields. Blum. bijdr. p. 990. Roth. nov. spec. 139. Roxb. fl. ind. 2. p. 159. Cham. et Schlecht. in Linn. 4. p. 150. Hedyotis repens, Lam. ill. no. 1424. Oldenlandia repens, Lam. m. t. 40. but O. repens of Bum. fl. ind. according to his herbarium is nothing but Pélipis Pörtula.—Rumph. amb. 6. t. 170. f. 4. Flowers small, in the divisions of the branchlets.

Cult. The seeds require to be sown on a gentle hot-bed in spring; and the plants when of sufficient size may be planted out into a moist shady situation in the open ground.

LXXV. DEPEEA (named after M. Deppe, who has collected and sent home many plants from México). Cham. et Schlecht. in Linn. 5. p. 167. D. C. prod. 4. p. 618.

Lin. syst. Tetrandria, Monogynia. Teeth of calyx 4, triangular. Corolla somewhat rotate, quite glabrous; lobes elliptic. Anthers 4, linear, exerted; filaments very short. Style longer than the stamens; stigma thicker than the style. Capsule membraneous, elliptic, crowned by the calyceine teeth beneath the vertex, 2-celled; cells 1-seeded, with a loculicidal dehiscence. Seeds fixed to the middle dissepiment.—A small shrubby plant, with a woody root, and reddish inner bark. Leaves petiolate, elliptic, acuminate at both ends, rather pilose above and on the margins. Stipulas triangular, deciduous. Gyms terminal and axillary, pedunculate, of 3 or 4 branches. Flowers yellow. Habit, fruit, and capsule of Hedyotis, but the cells are 1-seeded as in the tribe Spermacoceae.

Red-rooted Depeea. Shrubs 1 to 2 feet.

Cult. For culture and propagation see Dentella above.

SUBTRIBE II. HEDYOTEÆ (this tribe contains plants agreeing with Hedyotis in important characters). D. C. prod. 4. p. 419. Stipulas resembling a sheath on both sides, and ending in many bristles at the apex.

LXXVI. HEDYOTIS (from ἱέυς, hedy, sweet, and οὖς, ous, an ear; the leaves are oval, soft, and firm, from
which circumstance they have been compared to ears). Roxb. fl. ind. 1. p. 368. Cham. et Schlecht. in Linnaea. 4. p. 153. D. C. prod. 4. p. 419.—Hedyotis species of Lin. and all authors.

LIN. SYST. Tetrandria, Monogynia. Calyx with an ovate tube, and a 4-toothed limb: teeth erect, permanent, also separated on the fruit by acute narrow recesses. Corolla with a short tube, a bearded throat, and a 4-lobed limb. Stamens exerted a little; anthers ovate or roundish, small. Capsule ovate, somewhat attenuated at the apex, crowned by the calyceine teeth, which are connivent, but separate, 2-celled, and dehiscing in the middle of the cells. Seeds minute, angular, many in each cell.

—Herbs, sometimes suffruticosum at the base, with a habit like that of *Sperrmacese*. Stems tetragonal or nearly terete. Leaves opposite. Stipules adhering to the petioles on both sides, ending in many bristles. Flowers axillary, usually glomerate.—This genus differs from *Houtstoria*, to which St. Hil. pl. rem. bras. p. xxi. has joined it, in the calyx being adnate to the fruit the whole length. It differs from *Oldenlandia* in the teeth of the calyx being separated on the fruit by narrow recesses, not by broad ones.

*Pedicels axillary, 1-flowered, solitary, and sometimes twin.*

1 H. oqa'elis (D. C. prod. 4. p. 419.) plant decumbent and elongated, scabrous from hairs; leaves linear, acute; stipulas cleat into many bristles; pedicels axillary, 1-flowered, solitary, equal in length to the leaves; corolla hardly longer than the calyceine teeth.—Native of New Caledonia. Capsule downy, ovate, rather compressed: lobes of calyx lanceolate, separated by narrow recesses.

**Slender Hedyotis.** Pl. decumbent.

2 H. Asdce'snsionis (D. C. l. c.) stem suffruticosum, branched, glabrous; leaves linear, acute, with revolute margins, and are, as well as the calyces, the axillary bristles; pedicels axillary, solitary, 1-flowered, shorter than the flowers. ? S. Native of the island of Ascension, where it was collected by Lessen, G. Don, &c. Herb becoming black on drying. Capsule compressed. Seeds very minute. Corolla white. Lobes of calyx long, linear.

**Ascension Hedyotis.** Pl. ½ foot.

3 H. Paeceilbora (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 419.) plant suffruticosum, glabrous; branches tetragonal, smooth; leaves linear, very acute, with revolute margins; stipulas with many stiff erect bristles; flowers solitary, axillary, hardly pedicellate. ? S. Native of the island of Luzon, one of the Philippines. Leaves 1 or 1½ inch long, and a line broad. Fruit unknown, but the lobes of the calyx are separated by narrow recesses, indicating it to belong to this genus.

**Few-flowered Hedyotis.** Pl.

* * Flowers axillary, almost sessile, disposed in glomerose whorles.

4 H. Teneilfluora (Blum. bijdr. p. 971.) stems suffruticosum, kneeled, procumbent; leaves on short petioles, lanceolate, veinless beneath, with scabrous margins; bristles of stipulas long and setaceous; flowers usually twin, axillary, sessile. ? S. Native of the island of Nusa Kambanga, near Java.

**Slender-flowered Hedyotis.** Shrub procumbent.

5 H. Augustjolia (Cham. et Schlecht. in Linnaea. 4. p. 153.) stems branched a little, tetragonal, when young the angles are hairy; leaves linear, very narrow, acute, with revolute scabrous margins; stipulas hairy, membranaceous fringed; flowers 3-6-together, axillary, almost sessile, glomerate. ? F. Native of the island of Luzon, one of the Philippines.

**Narrow-leaved Hedyotis.** Pl. ½ foot.

6 H. Bocei (D. C. prod. 4. p. 420.) plant glabrous; stems herbaceous, ascending, branched, slender, tetragonal; leaves linear; bristles of stipulas shorter than the fruit; flowers few, axillary, somewhat verticillate; fruit ovate, crowned by the teeth of the calyx, which are acute. ? H. Native of Carolina, where it was collected by Bosc, and sent home under the name of *Didia*. Leaves almost an inch long, and a line broad. Seeds very minute.

**Bosc's Hedyotis.** Pl. ascending.

7 H. Auricula (Lin. spec. 147.) stem almost simple, tetragonal, rather hairy at the apex; leaves lanceolate-ovate, nervel; stipulas ciliated with bristles; flowers glomerate, axillary, somewhat verticillate. ? S. Native of Ceylon, Malabar, also of Silhet and Nipaul, ex Roxb. fl. ind. 1. p. 369. Rhed. mal. 10. t. 32.—Burn. fl. zeyl. t. 108. f. 1. H. nervosa, Lam. dict. 3. p. 79. ? Flowers white, sessile.

**Auricled Hedyotis.** Pl. ½ foot, procumbent.

8 H. genculata (Roxb. fl. ind. 1. p. 368.) plant weak, decumbent; stems nodose, terete, smooth; leaves almost sessile, lanceolate, smooth; flowers on short peduncles, disposed in whorles.—Native of the Malay Islands. The rest unknown.

**Kneed-stemmed Hedyotis.** Pl. decumbent.

9 H. Lapeyrrousii (D. C. prod. 4. p. 420.) stem erect, glabrous, terete, rather angular at the apex, and hardly branched; leaves oblong-lanceolate, acuminate at both ends, glabrous; stipulas of many bristles; flowers few, axillary, almost sessile, verticillate; capsules globose. ? F. Native of the island of Vanikoro, where it was collected by Lessen. Stem 1½ foot high. Leaves 4 inches long, and 8-10 lines broad, lined with 5-6 oblique nerves on each side.

**La Peyrous's Hedyotis.** Pl. 1½ foot.

10 H. crassifolia (Blum. bijdr. p. 971.) stems diffuse, rather hairy; leaves lanceolate, cuspidate, almost veinless, except the middle nerve, scabrous beneath and on the margins, on very short petioles; stipulas setigerous; flowers disposed in glomerate whorles.—Native of Ambayna, ex Rumph. amb. 6. p. 25. t. 10.; and of Java, ex Lin. not in Jamaica, as said by Rœm. et Schultes, syst. 3. p. 199. Oldenlandia verticillata, Lin. mant. 40.

**Thick-leaved Hedyotis.** Pl. 2 to 3 feet.

11 H. cratæganum (Spreng. pug. 2. p. 35.) stems terete, glabrous, articulated; leaves lanceolate, acuminate, veiny, scabrous; stipulas setaceous-jagged; flowers sessile, disposed in glomerate whorles.—Native of Amboyna, ex Rumph. amb. 6. p. 25. t. 10.; and of Java, ex Lin. not in Jamaica, as said by Rœm. et Schultes, syst. 3. p. 199. Oldenlandia verticillata, Lin. mant. 40.

**Strong-jointed Hedyotis.** Pl. 1 foot.

12 H. hispidula (Retz. obs. 4. p. 23. but not of Roth.) stems diffuse, branched, tetragonal, rooting at the nodi; leaves sessile, lanceolate, with hispid margins; stipulas with many bristles; flowers axillary, almost sessile, disposed in glomerate whorles; filaments inclosed.—Native of China, ex Retz; of the Moluccas, ex Roxb. fl. ind. 1. p. 368.; of Java, Blum. bijdr. p. 971. Oldenlandia hispida, Poir. dict. 4. p. 536. Stamens shorter than the style, which is clavate, ex Retz. Capsule hispid, ex Spreng. pug. 2. p. 32.

**Hispid Hedyotis.** Pl. ½ foot, decumbent.

13 H. uncælla (Hook. et Arn. in Beech. voy. pt. bot. p. 192.) plant suffruticosum, glabrous; branches simple; leaves petiolate, oblong-lanceolate, with almost simple longitudinal veins; flowers axillary and terminal, numerous, almost sessile, disposed in glomerate whorles; capsules turbinate, glabrous, crowned, bipartite at the dissepiment; tube of calyx contracted, and the lobes subulate and recurvedly uncinate, long, and ciliated. ? G. Native of China. This may be the type of a new genus, and is probably the H. cephalophora, R. Br. in Wall. cat. no. 842.

**Hooked-calycy Hedyotis.** Shrub.
Rubiaceæ. LXXVI. Hedyotis.

14 H. rotundifolia (Spreng. pug. 3. p. 197.) plant decumbent, branched a little; leaves petiolate, broad-ovate, somewhat 3-nerved; stipulas scarious, ciliate; flowers axillary, almost sessile, disposed in whorles; capsules hispid.—Native of the East Indies, in humid places. Oldenlandia trinervia, Reiz, obs. 4. p. 27.

Round-leaved Hedyotis. Pl. decumbent.

15 H. perpusilla (Hook. et Arn. in bot. misc. 3. p. 259.) glabrous; stems tufted, diffuse, branched, weak; leaves oblong; stipulas minute, not setigerous; pedicels terminal, and from the forks of the branches, 1-footed, about equal in length to the leaves; tube of calyx globose, hispid from bristles; teeth of calyx erect, ovate, obtuse.—Occasionally found in inundated places by the shores of La Plata, near Buenos Ayres. Stem 1 to 2 inches long, branched; the branches are furnished with several short lateral ramuli, from the axils of which springs a peduncle, which after flowering becomes reflexed. Very closely allied to H. umiflora, but seems to differ from the genus by the stipulas not being furnished with bristles.

Least Hedyotis. Pl. tufted.

16 H. nodiflora (Wall. cat. no. 855.) glabrous; stems quadrangular; petioles downy; leaves ovate-elliptic, acuminated, veined; flowers much crowded, axillary, subverticillate, sessile. 2. S. Native of the East Indies, in Tavoy.

Knot-flowered Hedyotis. Pl. 1 to 2 feet.

17 H. argentea (Wall. cat. no. 855.) glabrous; stems quadrangular; leaves broad-ovate, acuminated, whitish above, and rusty beneath; flowers in axillary heads. 2. S. Native of the Burmese Empire, on the banks of the Irrawaddy.

Silery Hedyotis. Pl. 2 to 3 feet.

18 H. costata (R. Br. in Wall. cat. no. 849.) stem downy, quadrangular; leaves lanceolate, tapering to both ends, glabrous, with many parallel veins; flowers disposed in crowded axillary heads, subverticillate; teeth of calyx separated by distant recesses. 2. S. Native of Pulo-Penang and Silhet.

Ribbed Hedyotis. Pl. 2 to 3 feet.

19 H. pinifolia (Wall. cat. no. 850.) plant much branched; branches quadrangular; leaves linear, with revolute edges; flowers disposed in axillary and terminal verticillate heads. 2. S. Native of Pulo-Penang, and of the Burmese Empire, at Prone and Amherst. Perhaps a species of Oldenlandia.

Fine-leaved Hedyotis. Pl. ½ to 1 foot.

20 H. congesta (R. Br. in Wall. cat. 844.) herboaceous, glabrous; stem and branches quadrangular; leaves ovate-lanceolate, acuminated, pale beneath; flowers crowded, axillary; stipulas somewhat pinna-tiulat; lobes of calyx rounded, separated by narrow blunt recesses. 2. F. Native of Pulo-Penang.

Crowded-flowered Hedyotis. Pl. 3 to 4 feet.

21 H. macrophylla (Wall. cat. no. 841.) stem and branches quadrangular; leaves large, roughish, veined, tapering to both ends; stipulas pinna-tiulat; flowers much crowded, axillary, forming glomerate whorls. 2. S. Native of Pulo-Penang. Calyx downy, with the lobes separated by narrow recesses.

Large-leaved Hedyotis. Pl. 2 to 3 feet.

** * Peduncles axillary, many-flowered: flowers crowded.

22 H. calvata (Lam. dict. 3. p. 80.) stem terete, almost simple, downy; leaves almost petiolate, ovate-lanceolate, acute, nervet, glabrous above, velvety on the nerves beneath; stipulas tetaceously jagged; peduncles axillary, solitary, much shorter than the leaves, bearing each a dense head of flowers.—Native of the East Indies, particularly in Java, in moist parts of mountains. Blum. biijdr, p. 973. Habit of euphorbia capitata.

Capitate-flowered Hedyotis. Pl. ½ foot.

23 H. lineata ( Roxb. fl. ind. 1. p. 369.) plant diffuse, plicate; leaves sessile, ovate-lanceolate, with longitudinal simple parallel veins; peduncles axillary, many flowered, rather long, 2-3-together; capsules round, pilose. 2. F. Native of the East Indies, in Chittagong. The rest unknown.

Linaced-leaved Hedyotis. Pl. diffuse.

24 H. umiflora (Wall. in Roxb. fl. ind. 1. p. 370.) plant ascending, clothed with soft hairs; leaves oval-lanceolate, acute, nerved, very villous on the nerves on both surfaces; stipulas cup-shaped, acuminated at both ends, joined to both sides of the petioles; peduncles axillary, much shorter than the leaves, bearing many subcorymbous flowers; flowers usually by threes; calyx villous, with acute lobes. 2. G. Native of Nipal. H. linata, D. Don, fl. nep. p. 134. but not of Roxb. Spermacoce lineata, Hamilt. miss. Stipulas coriaceous, acuminated in the middle. Stems many from the same root, woody, simple. Calycine segments lanceolate, spreading.

Elat-leaved Hedyotis. Pl. 1 to 2 feet.

25 H. vestita (R. Br. in Wall. cat. no. 847.) stems, peduncles, and petioles villous; stem quadrangular; leaves ovate-lanceolate, much acuminated, tapering at the base, downy, particularly on the veins beneath; stipulas villous, bearing 3 long bristles each; peduncles axillary, trichotomous, each division bearing a head of flowers. 2. S. Native of Pulo-Penang and Silhet. Leaves with parallel veins.

Clothed Hedyotis. Pl. 2 to 3 feet.

26 H. macrostemon (Hook. et Arn. in Beech. voy. pt. bot. p. 192.) plant suffruticose, branched; branches pubescent; leaves on short petioles, ovate-lanceolate, clothed with soft down beneath, rather scabrous and shining above, with longitudinal simple parallel veins; peduncles axillary, solitary, shorter than the leaves, many flowered; flowers capitate; stamens much exserted; capsules hairy, free at the apex. 2. G. Native of China. Closely allied to the two preceding species.

Long-stamened Hedyotis. Pl. ½ foot.

27 H. serpyllifolia (Poir. suppl. 3. p. 14.) stem herboaceous, branched, rather angular; leaves ovate, acuminately mucronate, somewhat ciliated; stipulas bipartite, acuminated; flowers 2-fé in each heap, axillary and terminal, on short peduncles; tube of calyx downy.—Native of the island of Bourbon, where it was collected by Bory de St. Vincent. Corolla white, shorter than the calyx. Seeds innumerable, very minute. Stem hispid.

Wild Thyme-leaved Hedyotis. Pl. ½ to 2 foot.

28 H. retenis; stem creeping, filiform, branched, rooting at every joint; leaves small, oval or obovate, linear-lanceolate, ex Lour, smooth; flowers axillary, solitary, on very short pedicles; capsule nearly globular, covered with hollow pellucid hairs. 2. S. Native of the East Indies and China. Oldenlandia repens, Burm. fl. ind. 38. t. 15. f. 2. Lour. coch. p. 78. Corolla bell-shaped, white.

Creeping Hedyotis. Pl. creeping.

29 H. uniflora (D. C. prod. 4. p. 421.) plant glabrous; stems creeping, branched, weak; leaves ovate-roundish, obtuse; stipulas small; pedicels terminal, 1-flowered, longer than the leaves; tube of calyx rather hispid. 2. F. Native of Chili, in sandy places along the banks of streams. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. Corolla with a broad tube, which is bearded inside. Lobes of calyx ovate, acutish.

One-flowered Hedyotis. Pl. creeping.

uniflora, Lam. ill. p. 271. H. Virgínica and H. glomeráta, Spreng. syst. 1. p. 412, 413. Lobes of calyx 4, ovate, acuminate. Corolla subrotate, shorter than the calyx; with the lobes rather spinose. Stamens short, opposite the lobes of the corolla, ex Torrey. Style almost wanting; stigma thick, undivided. Seeds innumerable, very minute, as in the genus Oldénlandia.

Goree-flowered Hedyotis. Pl. 1/4 creeping.

31. H. Góreënsis (D. C. prod. 4. p. 421.) plant diffuse, many stemmed; stems rather angular, glabrous, except at the nodi, where they are downy; leaves lanceolate, acute, glabrous; peduncles axillary and on the tops of the branches, disposed in umbellate heaps, a little shorter than the fruit; fruit downy, crowned by the calycine teeth, which are subulate, and somewhat involucitely incinate at the apex. Gen. F. Native of the coast of Africa, in the island of Goree. Habit of Chickweed. Leaves oval-oblong or lanceolate. Capsule desiccating but slowly. Seeds very minute. Corolla not seen.

Var. β, erecta (D. C. l. c.) stems erect, much shorter than those of the species; heads of flowers solitary, terminal, umbelicate. Gen. S. Native in humid parts of woods.

Goree Hedyotis. Pl. diffuse.

**** Panicles or coryms terminal, loose, rarely axillary. The species are very different from each other, and from the rest of the genus.

32. H.? Láxa (D. Don, prod. fl. nep. p. 155.) stem herbaceous, weak, dichotomously branched, angular, glabrous; leaves ovate, acute, rather hairy on both surfaces, ciliated; stipules divided into bristles; peduncles axillary, dichotomous; flowers usually by threes. Gen. G. Native of Nipaul. Habit of a species of Ophiórihiza. Anthers in some specimens examined exserted, and in others almost inclosed. Teeth of calyx acutely mucronate, 3 times shorter than the corolla. Capsule somewhat didymous, free at top, and desiccating in the middle of the cells. Seeds ovate-roundish.

Loose-flowered Hedyotis. Pl. 1/4 foot.

33. H. Polyca'pa (Wall. cat. 838.) branches tetragonal; leaves elliptic-lanceolate, acuminate, tapering to the base; stipules joined to the petioles, and forming a sheath with them, furnished with a tooth on each side; panicle terminal, corollary, bracteose, trichotomous; lobes of calyx separated by broad recesses. Gen. S. Native of Sílhet. Perhaps a species of Oldénlandia.

Many-fruited Hedyotis. Pl. 2 to 3 feet.

34. H. Móliis (Wall. cat. no. 839.) plant clothed with soft white down in every part, but particularly so on the under side of the leaves; peduncles axillary and terminal, panicked; pedicels corymbose; stipulas with 3 bristles. Gen. S. Native of Pólo-Penang.

Soft Hedyotis. Pl. 1 to 2 feet.

35. H. Vaginátta (Blum. herb. and mss. ex D. C. prod. 4. p. 421.) plant suffruticose, glabrous; leaves lanceolate, much acuminate, nerved; stipulas long, sheathing, drawn out on both sides into one puberulous bristle; corollary terminal, trichotomous; throat of corolla bearded; stamens exerted. Gen. S. Native of the island of Ternate, one of the Moluccas.

Sheathed-stipuled Hedyotis. Shrub.

36. H. Elongáta (R. Br. in Wall. cat. no. 865.) plant puberulous; leaves lanceolate or linear; stipulas jagged; peduncles terminal, elongated, dichotomously branched; flowers distinct on the branches of the peduncle, usually by twos, and one in each fork, almost sessile. Gen. S. Native of the East Indies. Perhaps a species of Oldénlandia.

Elongated-stipuled Hedyotis. Pl. 1 to 2 feet.

37. H.? Scándens (Roxb. fl. ind. 1. p. 369.) stem terete, scendent, glabrous; leaves on short petioles, broad-lanceolate, acuminate, glabrous, shining; stipulas entire, joined to the pedioles, furnished with a short mucron on both sides; coryms panicked, axillary, and terminal, with the branchlets rather villous; lobes of corolla and throat hairy inside; style villous at the apex; stigma bilamellate. Gen. S. Native of Nipaul and Silhet, where it is called Gújéc. Petésia Hita, Hamilt. mss. ex D. Don, fl. nep. p. 134.

Climbing Hedyotis. Pl. cl.

38. H. Cape'telláta (Wall. cat. 837.) glabrous; leaves elliptic, acuminate, tapering at the base; stipulas joined to the pedioles, furnished with a tooth on both sides; panicle terminal, composed of round heads of flowers. Gen. S. Native of Pólo-Penang, and Távov.

Headed-flowered Hedyotis. Shrub cl.

39. H.? Leschenau'ltii (D. C. prod. 4. p. 422.) suffruticose; branches glabrous, tetragonal at the apex; leaves lanceolate, pilose beneath; stipulas combined with the petioles, forming a kind of cupula, and furnished with 3 bristles on both sides; panicle terminal, with glabrous branches; limb of calyx with 4 short teeth; lobes of corolla hairy above; style shorter than the corolla. Gen. S. Native of the East Indies, on the Nellígherry mountains, where it was collected by Leschenault. Allied to H. scándens, and with it will probably form a distinct genus.

Var. β, Wallíchii (D. C. prod. 4. p. 422.) branches compressedly angular; leaves acuminate; limb of calyx 4-cleft to the middle; lobes oblong-linear; limb of corolla very hairy above. Gen. G. Native of Nipaul, at Katmandu. Perhaps the same as H. scándens, Roxb. ex Wall. fl. ind. 1. p. 369, but it does not exactly agree with the description given of that plant by Roxburgh.

Leschenaultii's Hedyotis. Shrub cl.?

40. H. Articuláris (R. Br. in Wall. cat. no. 854.) plant dense and dwarf; leaves much crowded, lanceolate, veiny; stipulas jagged; peduncles terminal and axillary, forming panicles. Gen. G. Native of the Nellígherry mountains.

Jointed Hedyotis. Pl. 1/2 foot.

41. H.? Arbórea (Roxb. in Beuts. voy. append. p. 310.) arboreous; leaves on short petioles, oblong, acuminate, shining, recurved at the apex; stipular sheath cylindrical, furnished with 1-3 unequal teeth; coryms terminal, brachiate, almost globular; capsules globose. Gen. S. Native of the island of St. Helena, in woods towards the tops of the mountains, where it is called dogwood by the inhabitants. Lobes of calyx oval. Corolla short, glabrous. Perhaps a proper genus.

Tree Hedyotis. Shrub.

42. H. Stylosá (R. Br. in Wall. cat. no. 853.) stems quadrangular; leaves glabrous, elliptic-lanceolate, tapering to both ends, coriaceous; stipulas pilose; peduncles axillary and terminal, trichotomous, forming panicked coryms; corolla very hairy inside. Gen. G. Native of the Nellígherry mountains.

Long-styled Hedyotis. Shrub 1 to 2 feet.

† Doubtful species.

43. H. Crassifólia and H. Ro'sea, Rafin. fl. lud. 77. are very doubtful plants, and are probably species of Anótis.

Cult. None of the species of this genus are worth cultivating except in botanic gardens. Any light soil will suit them; and cuttings of the shrubby and herbaceous perennial species will root in the same kind of soil, with a hand-glass over them, in a little heat. The annual kinds require the same treatment as other tender annuals. All are easily increased by seeds.

LXXXVII. Oldénlandi'ndia (named by Plummer in memory of Henry Bernh. Oldenland, a Dane, who collected plants at the Cape of Good Hope in 1695. They came into the possession of Burmann, and there is an account of them in the 6th volume of Linnaeus'ss Aménitates Académicae). Lin. gen. no. 154.
—Hedyotis species, Spreng. Smith, and Blume.—Hedyotis and Oldenlandia, Gaertn. fr. 1. t. 30.—Oldenlandia and Lístèria, Neck. elem. no. 345 and 346.—Lístèria, Rafn. ann. gen. sc. phys. 6. p. 81. but not of R. Br.

Lin. syst. Tetrindria, Monogynia. Calyx with a sub-globose tube, and 4 sub-approximate teeth, which remain on the fruit and are separated by very wide recesses. Corolla with a short tube, a 4-cleft limb, and a villous or glabrous throat. Stamens a little exerted; anthers ovate or orbicular. Stigma undivided or bifid. Capsule almost globose, crowned by the small distant teeth of the calyx, 2-celled, dehiscing at top by a loculacidal chink. Seed small, innumerable, fixed to sub-globose placertas, and as if they were half immersed in them.—Small, herbaceous, or suffruticose plants, with the habit of chickweed. Leaves opposite, with the stipulas adhering to both sides of the petioles. Peduncles axillary and terminal, bearing 1-2 or many flowers, usually elongated and slender. Flowers usually white. This genus hardly differs from Hedyotis, except in the teeth of calyx being separated by wide recesses on the fruit instead of narrow ones, which character we think would scarcely constitute a sectional distinction. The species, however, have a different habit, and are more readily distinguished by it, than by any other character.

* Pedicels axillary, 1-flowered, usually solitary, rarely by twos or threes.

1 O. brachi'yjoda (D. C. prod. 4. p. 424.) plant glabrous and decumbent; leaves linear; stipulas furnished with 2 bristles on both sides; pedicels axillary, 1-flowered, shorter than the flowers, solitary or in tufts; corolla tubular; anthers exerted to the length of the lobes of the corolla. O. F. Native of Java, Philippine Islands, and Nipal. Hedyotis herbácea, var. a. Blum. bijdr. p. 970. H. radicans, Batl. in herb. Henkee. Allied to O. herbácea but distinct, and it is probably the same as O. ramóssissima or O. diffla.

Short-pedicelled Oldenlandia. Pl. ½ foot.

2 O. ramóssissima (Fisch. ms. in Spreng. mant. 1. p. 35.) stems herbaceous, diffus; leaves lanceolate, bluish; stipulas toothed; fruit almost solitary, axillary, sessile. Y. F. Native country unknown. Hedyotis ramosissima, Spreng. pug. 2. p. 31. Flowers white. Probably distinct from O. brachi'yjoda.

3 O. sabulōsa (D. C. prod. 4. p. 424.) an herbaceous, tufted, diffuse, much-branched plant, which is roughish from short scattered hairs in every part; leaves linear, acute; stipulas membranous, furnished with many bristles; pedicels 2-3 together, axillary, 1-flowered, much shorter than the leaves, deflexed in the fructiferous state; corolla length of the lobes of the calyx. O. F. Native of Senegal, in sandy places at Walo, where it was collected by Perrottet and Leprêtre. Flowers white. Perhaps only a luxuriant variety of O. ripátria.

Sand Oldenlandia. Pl. ½ foot.

4 O. ripátria (D. C. prod. 4. p. 424.) stem branched, erectish, tetragonal, smoothish; leaves linear, acute, rather scabrous; pedicels axillary, 1-flowered, 2-3 times shorter than the leaves; corolla tubular, about the length of the calyx. O. F. Native of Senegal, in humid sandy places, on the banks of the river, where it was collected by Perrottet and Leprêtre. Very nearly allied to O. scabrida, but is easily distinguished from it in the pedicels being much shorter, and the lobes of the calyx being longer.

River-side Oldenlandia. Pl. ½ foot.

5 O. Cape'nxsis (Thunb. prod. p. 29. fl. cap. 1. p. 537.) stem decumbent, branched, villous; leaves linear, acute, glabrous; pedicels numerous, 1-flowered, shorter than the leaves; lobes of calyx ciliated; throat of corolla villous. O. F. Native of the Cape of Good Hope, in sandy places by the margins of rivers. Hedyotis Capénìs, Lam. ill. no. 1425. Stigma clavate (ex Thunb.). Capsule ovate, didymous.

Cape Oldenlandia. Pl. decumbent.

6 O. linea'ris (D. C. prod. 4. p. 425.) plant glabrous, erect, branched; stem tetragonal; leaves linear, acute; stipulas ciliated, furnished with many bristles; pedicels axillary, twin, 1-flowered, about the length of the leaves; but the uppermost ones are longer than them; capsule globose; teeth of calyx acute, very short. O. F. Native of Senegal, in sandy places, at St. Louis, where it was collected by Leprieur and Perrottet.

Linear-leaved Oldenlandia. Pl. ½ foot.

7 O. lanci'fölia (D. C. l. c.) stem simple, weak, somewhat dichotomous, creeping, glabrous; leaves linear-lanceolate, glabrous, with rather scabrous margins; bristles of the stipules distant; peduncles axillary, solitary, rarely twin. O. F. Native of Guinea. Hedyotis lancifólia, Schum. pl. guin. p. 72.

Lance-leaved Oldenlandia. Pl. ½ foot.

8 O. herba'cea (D. C. l. c.) plant glabrous, decumbent; leaves linear or linear-lanceolate; stipulas of many bristles; pedicels axillary, 1-flowered, solitary or twin, shorter than the leaves, but 2-3 times longer than the flowers; tube of corolla cylindrical; anthers hardly exserted from the throat. O. F. Native of the East Indies, Madagascar, Senegal, St. Domingo, Mexico, &c. O. Madagascariensis, Desf. cat. hort. par. 1815. —Rheed. mal. 10. t. 23. and 55. Hedyotis herba'cea, Lin. fl. zeal. p. 65. H. herbácea, var. Œ. Blum. bijdr. p. 970. Flowers white.

Herbacium Oldenlandia. Pl. Ju. Aug. Cilt 1819. Pl. ½ fl. O. tenui'fölia (Forst. prod. no. 57, but not of Burm. ex D. C. prod. 4. p. 425.) stem erect, tetragonal, branched; leaves linear, attenuated at both ends; stipulas ciliated a little, rather scarios; peduncles axillary, 1-flowered, shorter than the leaves, reflexed while in flower, and erect while bearing the fruit. O. F. Native of the Island of Tanna. Hedyotis tenuifólia, Smith, in Rees's cyc. 17. no. 19. Spreng. pug. 2. p. 30, where it is confused with O. Capénìs and O. herba'cea. O. tenui'fölia, Burm. fl. ind. 38. t. 14. f. 1 is probably distinct from this but is not sufficiently known. Flowers white.

Fine-leaved Oldenlandia. Pl. ½ foot.

10 O. scabri'da (D. C. prod. 4. p. 425.) stem erect, branched; tetragonal, scabrous along the angles; leaves linear, acute; pedicels axillary, 1-flowered, a little shorter than the leaves; corolla tubular, hardly longer than the calyx. O. F. Native of Nipal. Oldenlandia tenuifólia, Burm. fl. ind. t. 14. f. 1 is referrible to this species, as the figure given agrees very well with it.

Scabrous Oldenlandia. Pl. ½ foot.

12 O. grami'nîfölia (D. C. l. c.) plant decumbent, much branched, smoothish; leaves linear; stipulas of 5-8 setaceous divisions; pedicels axillary, 1-flowered, about equal in length to the leaves, twin or crowded; corolla hardly longer than the calyx. O. F. Native of the East Indies and Arabia. Hedyotis graminifólia, Lin. fl. suppl. p. 110. Vahl. symb. 2. p. 27. Spreng. pug. 2. p. 29. exclusive of the syn. of Pluk. which is referrible to Mallugo Cervæna. Hedyotis herbácea, Forsk. cat. arab. no. 88. Old. stricta, Lin. mant. 200. ex Vahl. Corolla and anthers blue.

Grass-leaved Oldenlandia. Pl. decumbent.

12 O. vu'îlîa (D. C. l. c.) stems decumbent, tetragonal, scabrous; leaves almost sessile, elliptic, acute at both ends, with scabrous margins; stipulas having 3–5 setaceous divisions; peduncles axillary, solitary, 1-flowered, about equal in length
to the leaves. O. F. Native of Tranquebar and Java. Hedyotis pumila, Lin. fil. suppl. 119. Spreng. pag. 2. p. 34. bidr. p. 971. Flowers white.

Dwarf Oldenlandia. Pl. deciduous.

13 O. linifolia (D. C. l. c.) leaves linear, attenuated at both ends; peduncles 1-flowered, longer than the leaves. O. F. Native of the East Indies. Hedyotis linifolia, Willd. mas. in Rœm. et Schultes, syst. S. p. 596. The rest unknown.

Flax-leaved Oldenlandia. Pl. deciduous.

14 O. virgata (D. C. l. c.) plant very slender, glabrous; stems tetragonal; leaves linear; stipules furnished with very short bristles, at length truncate; peduncles twin, 1-flowered, elongated. the ultimate ones disposed into a kind of terminal panicle; pedicels opposite, from the axils of the bracteas, longer than them, and about equal in length to the internodes. O. F. Native of Guinea (ex Willd.), in the rice-fields of Casamancia and Gambia (ex Perrottet and Leprieur), and Sierra Leone (ex Smeathmann). Hedyotis virgata, Willd. spec. 1. p. 167. Scler. pl. guin. p. 69? Flowers and fruit very small. Leaves 8-9 inches long. Stmiss a little exerted.

Tiggy Oldenlandia. Pl. foot.

15 O. asperula (D. C. l. c.) plant glabrous; stem erect, branched, tetragonal; leaves distant, linear, ciliated at the base; stipules entire, cupular, truncate; pedicels straight, 1-flowered, rising from the axils of the upper leaves, which are almost abortive. O. F. Native of Ceylon, where it was collected by Leschenault. Habit almost of the species of Aspéraula. Corolla greenish in the dried state, also glabrous in the throat, 4-cleft. Antlers pedicellate, shorter than the lobes of the corolla. Stigmas 2, elongated. Capsule oblong. Seeds minute. Lobes of calyx short, distant. Perhaps this plant ought to be removed from the genus.

Woodroof-like Oldenlandia. Pl. foot.

16 O. diffusa (Roxb. fl. ind. 1. p. 444.) stem tetere, flaccid, spreading, scabrous; leaves linear-lanceolate, acute, smooth; stipules at length many bristles; pedicels axillary, 1-flowered, 4-times shorter than the leaves. O. F. Native of the East Indies, at Bandra. Corolla smooth, white. Stigma profusely bifid. Capsule roundish. Perhaps only a variety of O. bifora.

** Peduncles 2-3 or many-flowered.

18 O. alsinifolia; glabrous; leaves membranous, lanceolate, tapering to both ends; peduncles axillary, few-flowered; stipulas bristly at top; teeth of calyx distant. O. F. Native of Pulu-Penang. Hedyotis alsinifolia, R. Br. in Wall. cat. no. 873. Plant diffuse.

Chickweed-leaved Oldenlandia. Pl. 1/4. to 1 foot.

19 O. brachyoda; plant glabrous, diffusely branched; leaves linear, with revolute edges; pedicels short, axillary, bearing at the top an umbel of short pedicellate flowers, or the vol. III.
white and tasteless; it is the bark only that is possessed of the colouring principle; when fresh it is orange-coloured, tinged the spittle yellow, and leaves a slight degree of acrimony on the point of the tongue, for some hours after chewing; to appearance it loses its yellow colour on drying, but still retains the above property on being chewed. It impregnates cold water or spirits with a straw-colour, and to boiling water it gives a brownish porter colour. The watery infusions and spirituous tinctures are changed into a bright and deep red by alkaline substances, and are rendered paler or nearly destroyed by acids.

The colouring powers of this root are said to improve by keeping 3 or 4 years. When the wild sort can be had in any quantity, it is esteemed one-third or fourth stronger, and yields a better colour; and when these roots can be had of two years' growth they are reckoned still better. This plant is the *Tseri-lc\* of the Telingas; and the *Sayae-ver or Imurel* of the Tamul. The Telinga physicians do not give any part of the plant a place in their Materia Medica; but the Malabar physicians say that the roots cure poisonous bites, colds, and cutaneous disorders, and warm the constitution.

**Umbe1-flowered Oldenlandia or Indian Madder.** Fl. July, Aug. Cl. 1792. Pl. 3 to 1 foot.

26 *O. pure\*; downy in every part; leaves linear-lanceolate, mucronate; pedicules axillary or from the forks of the stems, bearing each a simple umbel of flowers, or 3 pedunculate umbels of flowers, rising from 2 leaves. © H. Native of the East Indies. O. puberula, R. Br. in Wall. cat. no. 884.

27 *O. capillaris* (D. C. prod. 4. p. 426.) stem ascending, teretely tetragonal, and rather seaborous along the angles, much branched; leaves linear-lanceolate, rather scabrous; stipules small, with setaceous bristles; pedicules axillary and terminal, loosely pilose, longer than the leaves, very slender, 2-4-flowered; flowers opposite, on long pedicels. © F. Native of Madras. Corolla small, tubular. Capsule globose, glabrous.

28 *O. paniculata* (Lin. spec. p. 1667.) plant glabrous, erectish, branched; branches tetragonal; leaves ovate-lanceolate; stipules small, undivided; racemes axillary and terminal, almost naked; pedicels longer than the leaves; corolla with a gibbous tube and a villous throat. © S. Native of the East Indies, Moluccas, and Philippines.—Burm. fl. ind. 38. t. 15. f. 1. Hedyotis racemosa, Lam. dict. 3. p. 76. ill. 62. f. 2. Leaves smooth. Flowers small. Hedyotis dichotoma, Cav. icon. 6. p. 573. f. 2 and H. media, Cav. icon. 6. p. 574. f. 1. According to Bartling is probably distinct from this. Flowers small, red, on long pedicels.

27 *O. pentandra* (D. C. prod. 4. p. 427.) plant procumbent, glabrous; leaves lanceolate, cordate at the base, or ovate-oblong, sessile, discoloured; racemes axillary, naked; flowers pentamers.—Native of Guinea. Hedyotis pentandra, Schum. pl. guin. p. 71.

30 *O. multiflora* (Cav. icon. 6. p. 58. t. 574. f. 2.) glabrous; stem branched, furrowed, ascending; leaves sessile, ovate-oblong; stipules small, undivided; panicles axillary, opposite and terminal, many-flowered; pedicules 3-flowered, elongated.—Native of the Philippine Islands, about Manila, not of the Friendly Islands, as said by Poiret and Roemer. Very nearly allied to *O. paniculata*.

**Many-flowered Oldenlandia.** Pl. 1/2 foot.

31 *O. crassifolia* (Bart. in herb. Haenke, under *Hedyotis*) plant glabrous, surfruticosus, diffuse; branches tetragonal; leaves ovate or oblong, obtuse, fleshy; pedicules axillary and terminal, 3-flowered, usually shorter than the leaves; pedicels shorter than the flowers; segments of calyx lanceolate, short.

—Native of the Island of Luzon, one of the Philippines.

**Thick-leaved Oldenlandia.** Pl. diffuse.

32 *O. strigulosa* (Bartl. in herb. Haenke, under *Hedyotis*, ex D. C. l. c.) plant herbaceous, branched, erectish; leaves ovate-oblong, beset with very minute callous dots above, and with adpressed stigie beneath; stipulas undivided, linear-subulate; pedicules axillary and terminal, longer than the leaves, 3-flowered; pedicels hardly any; calycine segments ovate-triangular.—Native of the Island of Mariane.

**Strigulosa Oldenlandia.** Pl. 1/2 foot.

33 *O. latiflora* (Linn. in Roxb. fl. ind. 1. p. 442.) plant glabrous, erect; stem tetragonal, branched; leaves almost sessile, elliptic-oblong, smooth, rather fleshy; stipulas broad, eerosely toothed, obtuse; panicle terminal, leafe; corolla ventricose, with the throat closed by vilis; capsule somewhat compressed, furnished with a somewhat winged nerve on both sides. ©. F. Native of the East Indies, Java, Timor, &c. on the edges of rice-fields. Old. alata, Wall. in herb. Puer. Hedyotis ramosissima, Blum. bijdr. p. 972. but not of Fisch. Perhaps Hedyotis paniculata, Lam. ill. 1412. but the figure in Burm. ind. t. 71. f. 2. cited for this plant has 5-clft flowers, and is consequently not it. From the capsules being furnished with a somewhat winged nerve on each side, it comes very near to the genus *Gonotheca*. Flowers small, white.

34 *O. alata* (Koen. in Roxb. fl. ind. 1. p. 442.) plant glabrous, erect; stem tetragonal, branched; leaves almost sessile, elliptic-oblong, smooth, rather fleshy; stipulas broad, eerosely toothed, obtuse; panicle terminal, leafe; corolla ventricose, with the throat closed by vilis; capsule somewhat compressed, furnished with a somewhat winged nerve on both sides. ©. F. Native of the East Indies, Java, Timor, &c. on the edges of rice-fields. Old. alata, Wall. in herb. Puer. Hedyotis ramosissima, Blum. bijdr. p. 972. but not of Fisch. Perhaps Hedyotis paniculata, Lam. ill. 1412. but the figure in Burm. ind. t. 71. f. 2. cited for this plant has 5-clft flowers, and is consequently not it. From the capsules being furnished with a somewhat winged nerve on each side, it comes very near to the genus *Gonotheca*. Flowers small, white.

35 *O. macrophylla* (Linn. et Perr. ms. under *Hedyotis*, ex D. C. prod. 4. p. 427.) plant glabrous, erect; stem tetragonal, branched; leaves sessile, lanceolate, acuminate; stipulas undivided; pedicules axillary, racemose, longer than the leaves; pedicels in 4-5 opposite pairs.—Native of the Gambia, in rice-fields at Abreda, where it was collected by Leprieur and Perrotte. Allied to *O. alata*. Capsule somewhat turbinate, and probably furnished with a nervous wing on each side.

36 *O. lactea* (Cham. et Schlecht. in Linnaea. 4. p. 159. under Gerontoea) stem terete, pubescent; leaves linear-lanceolate, acute at both ends, flat; stipulas bidentate, scarious; pedicules terminal; corollas villous inside; anthers oblong, exserted. ©. F. Native of the East Indies. Hedyotis lactea, Will. enum. hort. berol. 1. p. 149. H. cymosa, Spreng. syst. 1. p. 413. © Flowers cream-coloured.

38 *O. microtheca* (Cham. et Schlecht. in Linnaea. 4. p. 169. under Gerontoea) plant herbaceous, erect, much branched;
leaves petiolate, ovate-lanceolate, acuminated, scabrous above; stipulas small, downy, dentately ciliated; flowers disposed in loose cymose terminal panicles. O. F. Native of Mexico, at Baranca de Tioselos, in shady places, where it was collected by Deppe and Schiede.—Chichia-tzonpatonic de Ocopetlayec. Hern. mex. p. 366. Corolla funnel-shaped, a line or more long. Capsules small. A larger variety of this is found about Tampico, ex Cham. et Schlecht. in Linnaea. 6. p. 414.

Small-sheathed Oldenlandia. Pl. 1 to ½ foot. 39. O. Deppeana (Cham. et Schlecht. in Linnaea. 5. p. 169. under Gerontogéa) plant shrubby, much branched, erect, glabrous; leaves petiolate, ovate-lanceolate, tapering into the petioles, firm, much acuminate, rather revolute, and scabrous on the margins; stipulas white, beset with glandular down, setosely jagged; the bristles thickened and glandular at the apex; flowers disposed in loose panicles at the ends of the branches. O. F. Native of Mexico, at San Andres, where it was collected by Schiede and Deppe. Gerontogéa Deppeana, Link and Otto, new abdibt. t. 86. Leaves large, but hardly an inch long. Corolla about 3 lines long. Anthers blueish. Flowers sometimes only 3-petalled.

Deppe's Oldenlandia. Shrub 1 foot. 40. O. Spergula Céa (D. C. prod. 4. p. 428.) plant erect, almost simple, hairy; leaves oval-oblong; stipulas cupulate, mucronate; peduncles almost terminal, elongated, many-flowered, naked; calyx glabrous; corolla tubular; anthers sessile; style at length bipartite to the base. O. H. Native of Nipal. Herb a finger in height, with the habit of Spérgula. Upper leaves usually 4 in a whorl. Peduncles glabrous. From the disbelieving of the capsule it agrees with O. conóstyla; but is very different in habit.

Spurrey-like Oldenlandia. Pl. ½ foot. 41. O. Rotundifolia (Ham. ex Wall. cat. no. 6190. under Hedyotis) leaves elliptic-ovate, rounded at the apex, downy, but most particularly so on the veins beneath, close together; peduncles long, axillary, and terminal, panicled. O. H. Native of the East Indies, at Goalpara. Hedyotis Scapigera, R. Br. in Wall. cat. no. 881.

Round-leaved Oldenlandia. Pl. ½ to ½ foot. 42. O. Marímta; plant glabrous; stems erect; leaves linear or lanceolate, acute, with revolute edges; panicles terminal; erect; peduncles swelling toward the top, angular, erect; teeth of calyx distant. 2. S. Native of the East Indies, by the sea-side. Hedyotis Marímta, Wall. cat. no. 6192. Old grammoníphila, Vahl. Old. stricta, herb. Russ.

Sea-side Oldenlandia. Pl. 1 foot. 43. O. Oxyphylílla; glabrous; leaves linear-lanceolate, tapering to both ends; peduncles terminal and axillary, dichotomous, panicked; pedicels short, bracteate; teeth of calyx distant. 2. S. Native of the mountains of Silhet. Hedyotis Oxyphylíllla, Wall. cat. no. 6193. Leaves like those of the weeping willow. Stipulas broad at the base, ending in 2 subulate points at the apex, and a small tooth on each side.

Sharp-leaved Oldenlandia. Pl. 2 to 3 feet. 44. O. Héyni; glabrous; leaves linear; stems diffusely branched, panicked; pedicels slender, 2-6 together; stipulas bident, short; teeth of calyx distant. O. F. Native of the East Indies. Hedyotis Héyni, R. Br. in Wall. cat. no. 867. Oldenlandia herbacea, Heyne and Roxb. but not of Lin. Flowers white.

Heyne's Oldenlandia. Pl. 1 foot, diffuse. 45. O. Tubulos;a; glabrous, erect; leaves ovate, acute; peduncles terminal and axillary, umbrallate or capitate; flowers crowded, almost sessile; tube of corolla long, slender. O. F. Native of the East Indies. Hedyotis Tubuláris, R. Br. in Wall. cat. no. 876. Hedyotis mínima, Heyne, in Wall. cat. no. 837.

Tubular-flowed Oldenlandia. Pl. ½ to ½ foot. 46. O. Mypseesis; downy; stems quadruangular; leaves ovate, acute, clothed with rusty down on the nerve and veins beneath, and on the petioles, ciliated on the margins; peduncles terminal and axillary, racemose, branched; flowers almost sessile. O. F. Native of Mysore. Hedyotis Mypséris, Heyne ex Wall. cat. no. 882.

Mysore Oldenlandia. Pl. 1 foot.

† Species not sufficiently known.

47. O. ? hispida (Roth. nov. spec. p. 95. under Hedyotis) the whole plant is hispid from bristles; stem ascending, dichotomous, terete; leaves petiolate, ovate-lanceolate; stipulas acutely toothed; peduncles axillary, bearing few-flowered umbels; corolla twice the length of the calyceal lobes.—Native of the East Indies. Anthers linear, length of corolla. Hedyotis Indica. Rom. et Schultes, syst. 3. p. 195.

Hispida Oldenlandia. Pl. ½ foot, procumbent. 48. O. Aspera (Roth, nov. spec. p. 94. under Hedyotis) the whole plant is rough from papillae; stem straight, filiform, terete; leaves linear-subulate; stipulas linear-subulate, a little toothed; raceme terminal, pedunculate, sub-fasciculate, naked; teeth of calyx linear, 4-times shorter than the tube of the corolla.—Native of the East Indies. Hedyotis hispida, Spreng. syst. 1. p. 415. The stamens being inclosed, it is very doubtful whether it belongs to this genus.

Rough Oldenlandia. Pl. ½ foot. 49. O. Affinis (Roem. et Schultes. syst. 3. p. 194. under Hedyotis) plant erect, much branched; branches rather tetragonal, scabrous at the angles; leaves linear, acuminate, finely ciliated; stipulas tridentate; peduncles disposed in a loose, divaricate, dichotomous panicle; corolla twice the length of the calyx.—Native of the East Indies. Hedyotis dichotoma, Roth. nov. spec. p. 93. but the Oldenlandia dichótoma of Spreng, now called Válhia dichótoma, is a very distinct plant. Corolla blue. Anthers inclosed, and therefore it ought to be excluded from the present genus, but it is said to be nearly allied to O. hispína and O. herbácea.

Allied Oldenlandia. Pl. ½ foot. 50. O. Hírúta (Lin. fil. suppl. p. 127.) stem herbaceous, diffuse, and are as well the calyces hispid; leaves ovate, acute, petiolate, vein; peduncles axillary, bearing few-flowered umbels.—Native of Java. Hedyotis hírúta, Spreng. pag. 2. p. 55.

Hairy Oldenlandia. Pl. diffuse. 51. O. Púllila (Roth, in Willd. act. amem. nat. cur. berol. 4. p. 216.) stem branched, tetragonal, rough; leaves linear, acuminate; racemes axillary, simple, few-flowered.—Native of the East Indies. Hedyotis attenuátá, Willd. l. c. Said to be allied to O. grámnófílla.

Small Oldenlandia. Pl. ½ foot. 52. O. DeBílis (Forst. prod. no. 56.) leaves ovate, sessile; umbels axillary, pedunculate, few-flowered.—Native of the Island of Tongatabu. The rest unknown.

Zanquebar Oldenlandia. Pl. ½ foot. 54. O. Depressá (Willd. spec. 1. p. 675.) stem diffuse; leaves elliptic, petiolate, glabrous; peduncles axillary, twin, 1-flowered.—Native of the East Indies. Hedyotis depressá,
RUBIACEÆ. LXXVIII. GONOTHECA. LXXIX. KOBAUTIA.

Roe. et Schultes, syst. 3. p. 200. A very obscure species, and syn. in Rheed. mal. 10. t. 31. cited for this species is referrible to Portulaca Meridiana.

Depressed Oldenlandia. Pl. prostrate.

N. B. Oldenlandia nudicaulis, Roth, nov. spec. p. 96. and Old. maritima, exclusive perhaps of the synonym of Lin., differs from this genus in the flowers being of 4 distinct petals, and in the want of stipulas; they therefore even do not belong to Rubiaceae, but are probably Caryophyllaceous plants.

Cult. The species are not worth cultivating, unless in botanic gardens. A very sandy soil suits them best, and in both cases of the shrubby kinds will root in sand, under a hand-glass, or by seeds. The annual kinds should be treated like other tender annuals, by being raised on a hot-bed, and afterwards planted out. All the species require a considerable degree of moisture.

LXXVIII. GONOTHECA (from γονή, genus, an angle, and θηκή, theke, a sheath; in reference to the capsule, which is furnished with a double wing on each side). Blum. mes. ex D. C. prod. 4. p. 429. but not of Rafin.—Hedyotia species, Blum. bijdr.

Lin. syst. Tetrádria, Monogynia. Calyx with a somewhat compressed tube, and a short truncate somewhat 4-toothed limb. Corolla having the tube inflated at the base, the throat villous, and the lobes keeled. Stamens inclosed. Style wanting: stigma 2, obtuse. Capsule compressed, margined by a double wing on both sides, which runs down the pedicel, crowned by the tube and short limb of the calyx, and dehiscing through the stigmas, membranous, 2-celled. Seeds numerous, ovate, small, scrobiculate.—A glabrous, erect herb, with the habit of Oldenlandia. Stem divaricate, quadrangular. Leaves lanceolate, almost sessile. Stipulas toothed. Gynes pedunculate, axillary, and terminal, few-flowered.

Blume's Gonotheca. Pl. ½ foot.

Cult. See Kâdus, p. 538. for culture and propagation.

LXXIX. KOBAUTIA (in memory of Francis Kohaut, who collected many plants and other objects of natural history in Senegal). Cham. et Schlecht. in Linnaea. 4. p. 156. D. C. prod. 4. p. 429.—Knóxia and Hedyotis species of authors.

Lin. syst. Tetrándria, Monogynia. Calyx with an obovate tube; teeth acute, separated by acute recesses while in flower, but at last by very broad ones. Corolla with a long terete tube, and oval-lanceolate lobes, which are usually cuspidate by a mucrone. Anthers sessile, within the tube, inclosed under the throat. Style shorter than the anthers, bifid at the apex. Capsule globose, membranous, crowned by the teeth of the calyx, 2-celled, dehiscing at the cells. Seeds innumerable, small, half immersed in pits on the placenta, which are globose and stand on short pedicels.—Erect, twiggly, glabrous, branched herbs, with the habit of Aspérula. Leaves opposite, linear, or linear-lanceolate. Stipulas joined to the petals, furnished with one or few bristles. Gynes terminal, corymbose, or loosely spicate.

1 K. grandiflóra (D. C. prod. 4. p. 430.) leaves linear, lower ones the broadest, and nearly lanceolate: uppermost ones very slender and subulate; stipulas membranous, connecting the petals: lower ones cuspidate in the middle, the rest furnished with 2 bristles on both sides; flowers trichotomously corymbose; lobes of corolla oval, mucronate. F. S. Native of Senegal, from which place it was sent by Becla, under the name of Hedyotis herbacea; and in sandy places at Kounnour, where it was collected by Perrottet and Leprieur. Tube of corolla 6 lines long, and the lobes 3 lines long and ¼ broad.

Great-flowered Kobautia. Shrub ½ to 1 foot.

2 K. senégálensis (Cham. et Schlecht. in Linnaea. 4. p. 156.) leaves linear; floral ones subulate; stipulas with very narrow margins, joining the petals, furnished with 2 bristles; flowers on short pedicels along the branches and at their tops, distant; lobes of corolla lanceolate. F. S. Native of Senegal. Knóxia Senegalensis, Reichb. in Sieb. fl. seneg. exsic. no. 9. Tube of corolla 4½ lines long; and the lobes 2½ lines long.

Senegal Kobautia. Shrub ½ to 1 foot.

3 K. stricta (D. C. prod. 4. p. 430.) leaves linear, with sub-revolute margins; stipulas joined to the petals by a very narrow margin, furnished each with 2 short bristles; flowers trichotomously corymbose; lobes of corolla oblong-linear. O. S. Native of Senegal at Walo and Lampsar, where it was collected by Leprieur and Perrottet; and at Sierra Leone by Azelius. Hedyotis stricta, Smith, in Rees's cyc. vol. 17. no. 21. but not of Wall. Root simple, perpendicular, white. Tube of corolla 3 lines long; and the lobes 2½ lines long and hardly a line broad.

Straight Kobautia. Pl. ½ foot.

4 K. longiflóra (D. C. prod. 4. p. 430.) leaves linear, hardly acute; stipulas short, with many bristles; bristles spreading little a length of membrane; flowers pedicellate along the branches on one side; corolla with a very long tube, and linear, hardly acute lobes. G. S. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 1987. Tube of corolla 7 lines long; and the lobes 3 lines long, and scarcely a line in breadth. Teeth of calyx short. Pedicels 2½ lines long.

Long-flowered Kobautia. Pl. ½ foot.

5 K. cynàchica (D. C. prod. 4. p. 430.) leaves linear, acute; stipulas membranous, joining the petals; bristles reflexed, twin on both sides, at last deciduous; corymbs few-flowered; lobes of corolla linear, hardly acute. F. G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 772. Capsule turbinate. Teeth of calyx short. Tube of corolla 3 lines long with the lobes a little shorter than the tube.

Cynanchica-like Kobautia. Shrub ½ to 1 foot.

7 K. setósá (D. C. prod. 4. p. 430.) leaves linear, cespitate, mucronate, with somewhat revolute edges; stipulas membranous, joining the petals, cleft into 4 spreading bristles on both sides, which are longer than the membrane; corymbs few-flowered; lobes of corolla short, oval. F. G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 2322. Plant hardly a hard hand. Bracteas stipulaceous, membranous, multifoil. Tube of corolla hardly 2 lines long.

Bristle-bearing Kobautia. Pl. ½ foot.

7 K. grácilis (D. C. l. c.) leaves linear; branches and peduncles compressed; stipulas truncate, fringed, at length naked; flowers on long pedicules, rising from the forks and from the tops of the branches; lobes of corolla linear-lanceolate, bluntish, a little shorter than the tube. O. F. Native of Nipaü. Hedyotis stricta, Wall. act. soc. asiat. 13. p. 369. but not of Smith. Hedyotis grácilis, Wall. in Roxb. fl. ind. 1. p. 577. Helenium fusca, Hamilt. ex D. Don, prod. fl. nep. p. 134. Tube of corolla 4 lines long; and the lobes 3 lines long, and hardly a line broad.

Slender Kobautia. Pl. ½ to 1 foot.

Cult. For culture and propagation see Oldenlandia above.

Lin. syst. Tetrandria, Monogynia. Calyx with a hemispherical tube, and a 4-cleft or 4-toothed limb. Corolla coriaceous, glabrous inside, salver-shaped: with a long tube and a 4-cleft limb. Genitalia inclosed. Anthers linear or oblong, almost sessile within the tube. Style filiform, thickest at the apex and bifid: lobes bearing papillae inside. Capsule globose or elliptic, 2-celled, half adnate to the calyx, which is sometimes dry and sometimes fleshy, usually crowned by the segments of the calyx, dehiscing at the cells at the apex. Seeds innumerable, small, angular, inserted in the placentas, which are spongy, and fixed to the middle dissepiment.—Smooth Australian subshrubs. Leaves opposite. Stipulas solitary on each side, acute, entire. Flowers in terminal cymes or solitary and axillary, pedunculate.

1 K. Cookiana (Cham. et Schlecht. in Linnaea. 4. p. 158.) branches opposite, terete; leaves linear, acute, with revolute margins; flowers few, terminal; capsule beaked at the apex. K. G. Native of the Island of O-Wahu. The beak of the capsule having both a loculecidal and septiclidal dehiscence at the same time, hence the capsule is at length apparently 4-beaked.

Cook's Kadua. Shrub ½ to 1 foot.

Cordate-leaved Kadua. Shrub ½ to 1 foot.

3 K. Glomerata (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) lower parts of branches almost terete, upper part compressed; leaves oblong-lanceolate, suddenly contracted at the base into a very short petiole; panicle terminal, with elongated opposite branches, bearing each 2 foliose bracteas at the apex, and glomerate flowers; calyx and corolla downy. K. G. Native of the Sandwich Islands. The flowers may be said to be axillary, pedunculate, capitulate, if the axes of the panicle may be considered as a continuation of the branch. Teeth of calyx linear, stiff.

Glomerated-flowered Kadua. Shrub ½ to 1 foot.

4 K. Anserina; plant erect, glabrous, branched; leaves oblong or ovate, short petioles; stipulas undivided, triangular; flowers disposed in fascicles in the axils of the superior leaves, the whole forming interrupted racemes; calyxes downy; tube of corolla very long, terete: lobes obtuse, revolute; style bipartite to the base. K. G. Native of the Sandwich Islands, where it is called by the natives Kioire. Hedyotis conostyla, Gaud. in Freyc. voy. pt. bot. p. 471. t. 91. Oldenlandia conostyla, D. C. prod. 4. p. 428. Nearly allied to the preceding species, according to Arnott.

Arnott's Kadua. Shrub ½ to 1 foot.

5 K. Menziesiana (Cham. et Schlecht. l. c. p. 160.) branches tetragonal; leaves elliptic, petiolate, bluntly acuminate, downy beneath at the base; stipulas glandular, truncate; cymes terminal, few-flowered; peduncles compressed, downy; drupe rather convex at the apex. K. G. Native of the Island of O-Wahu.

Menz's Kadua. Shrub ½ to 1 foot.

6 K. Smithii (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) branches terete, but compressed towards the tops; leaves coriaceous, ovate-elliptic, glabrous, petiolate; stipulas triangular, bluntly apiculate; panicle terminal, trichotomous, dense; calyxes and corollas downy. K. G. Native of the Sandwich Islands. Hedyotis coriacea, Smith, in Rees's cycl. vol. 17. no. 11. The tube of the corolla is long, and the segments of the limb are deflexed, with long-acuminate recurved points.

Smith's Kadua. Shrub ½ to 1 foot.

7 K. Centranthoides (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) branches terete at the base, and compressed at the apex; leaves coriaceous-lanceolate, almost sessile; panicle terminal, with short opposite branches, bearing naked heaps of flowers at their tops; calyx and corolla glabrous. K. G. Native of the Sandwich Islands.

Centranthus-like Kadua. Shrub ½ to 1 foot.

8 K. Romanzoffii (Cham. et Schlecht. in Linnaea. 4. p. 163.) branches tetragonal, densely leafy; leaves obovate, obtuse, or somewhat acuminate, on short petioles, rather coriaceous; stipulas furnished with a sub-glandular mucrone; flowers terminal, 1-3 together, pedicellate; drupe obovate. K. G. Native on the coral island, called Romanzoff's Island.

Romanzoff-island Kadua. Shrub ½ to 1 foot.

9 K. Acuminata (Cham. et Schlecht. l. c. p. 163.) branches terete, compressed towards the tops; leaves lanceolate, long-acuminate, distinctly petiolate, rather coriaceous; stipulas triangular, acuminate; flowers axillary, usually thin, pedicellate; teeth of calyx narrow-lanceolate, equal in length to the tube of the corolla; capsule globose. K. G. Native of the Sandwich islands, particularly of O-Wahu.

Acuminated-leaved Kadua. Shrub ½ to 1 foot.

10 K.? affinis (Cham. et Schlecht. l. c. p. 164.) branches tetragonal, wrinkled transversely; leaves elliptic-lanceolate, acute, obtuse at the base, on short petioles; stipulas membranous, deciduous, toothed a little on both sides; cyme thyrsoid, terminal; drupe nearly globose, crowned by the remaining part of the calyx, indehiscent. K. G. Native of the Island of O-Wahu. Flowers unknown.

Allied Kadua. Shrub ½ to 1 foot.

Cult. None of the species are worth cultivating, except in botanic gardens. They will grow in any light soil; and will be easily increased by cuttings planted under a hand-glass, or by seed, which latter mode will be preferable.

LXXXI. ANOTIS (from a priv. ovae wroc, ens otos, an ear; there are no accessory teeth to the calyx). D. C. prod. 4. p. 431.

—Hedyotis species, Ruiz et Pav. and Cav.—Houstonia species, Lin. and others.

Lin. syst. Tetrandria, Monogynia. Calyx with an obovate tube, and a 4-toothed limb (f. 96. a.); teeth acute, separated by acute recesses, with no accessory ones. Corolla salver-shaped (f. 96. b.), having the tube a little longer than the lobes; limb 4-cleft; throat almost glabrous. Anthers inclosed or a little exerted (f. 96. c). Stigma somewhat 2-lobed (f. 96. c.). Capsule ovate, crowned by the calyx, 2-celled, with a loculecidal dehiscence at the apex. Seeds 4-8 in each cell, ovate, and rather angular.—Subshrubs and herbs, natives of America. Leaves opposite, linear, mucronate or oval. Stipulas undivided or toothed. Flowers terminal, solitary or corymbose. This genus is nearly allied to Rischardtis, but differs from that genus in the want of accessory teeth to the calyx, whence the generic name. The genus probably contains the types of 3 different genera, which it may hereafter be necessary to separate.

Sect. I. Enicottis (this name has been given to this section on account of the plants contained in it having the habit of heaths). D. C. prod. 4. p. 431. Heath-like small shrubs, rarely herbs. Leaves linear, mucronate. Corolla salver-shaped, having the tube longer than the lobes (f. 96. d.) Tube of calyx almost adnate with the ovary to the apex.
1 A. filifórmis D. C. prod. 4. p. 431.) stems herbaceous, creeping, much branched, tetrahedral, glabrous; leaves sessile, linear, acutipetioled, rather ciliolate; stipules small, ciliate; flowers solitary, terminal, almost sessile; anthers exerted. 2. F. Native of Peru, on the Andes, in frigid places. Hedýyótis filiformis, Ruiz et Pavl. fl. per. 1. p. 67. t. 87. f. b. Habit of a species of Gálium. Corolla white; limb spreading at first, but reflexed at last. Lobes of calyx lanceolate, acute. Capsule ovate. (f. 96.)

Filiform Anotis. Pl. proc. 2 A. confértà (D. C. prod. 4. p. 431.) stem creeping, much branched; branches ascending, tetrahedral; leaves linear, acupetioled, flat, glabrous; stipulas subulate; flowers solitary, terminal; anthers at the throat. 3. F. Native of the province of Quito, in very cold places of the Andes, about Assayza. Houstónia bryoidea, Willd. herb. ex Kunth. Hedýyótis hypnoides, H. B. et Kunth, nov. gen. amer. 3. p. 389. Leaves hastily a line long. Corollas white. Capsule glabrous, emarginate.

Crowded Anotis. Pl. creeping. 3 A. hypnóides (D. C. prod. 4. p. 432.) stems suffruticose, creeping, tufted; branches tetrahedral; leaves sessile, linear-lanceolate, glabrous, piliferous at the apex; stipulas subulate at the apex; flowers terminal, sessile, anthers exerted. 4. F. Native of the province of Quito, in very cold places of the Andes, of Tarma and Cantua. Hedýyótis conferta, Ruiz et Pavl. fl. per. 1. p. 57. t. 87. f. a. Leaves 2-3 lines long. Corolla white.

Hypnum-like Anotis. Pl. creeping. 4 A. juniperifólia (D. C. prod. 4. p. 432.) plant suffruticosum, procumbent, much branched; branches tetrahedral; leaves linear, acupetioled, sessile, with revolute edges; stipulas ovate, acute; flowers terminal, tern, pedicellate. 5. F. Native of Peru, in high frigid places of the Andes, of Tarma, and Cantua. Hedýyótis juniperifolia, Ruiz et Pav. fl. per. 1. p. 57. t. 87. f. c. Corollas unknown.

Juniper-leaved Anotis. Pl. proc. 5 A. microphyllá (D. C. l. c.) stems suffruticosum, creeping; branchlets nearly terete; leaves oblong, glabrous on short petioles, piliferous at the apex; stipulas tridentate at the apex; flowers solitary, sessile, terminal, but at length lateral; anthers exerted; cells of capsule 4-5-seeded. 6. F. Native of Peru, near the mines of Guayacó, and the city of Mipecampa. Hedýyótis microphylla, H. B. et Kunth, nov. gen. amer. 3. p. 589. Willd. in Schultes, syst. 3. p. 526.

Cervantes's Anotis. Shrub diffusely tufted. 7 A. thyrsóide (D. C. l. c.) plant shrubby, erect, much branched; branchlets hairy; leaves sessile, linear, glabrous, with revolute margins; stipulas acutely bifid; corymbs terminal, trichotonous; cells of capsule 8-seeded. 8. F. Native of Peru, on high hills in the provinces of Tarma and Caxatambo. Hedýyótis thyrsóidea, Ruiz et Pav. 1. p. 56. t. 88. f. a. Leaves 5-6 lines long. Corollas white. Capsule obcordate. Branchlets subtergalional.

Var. γ, hyssopifólia (D. C. l. c.) plant suffruticosum; leaves an inch long; corymbs terminal, trichotonous. 10. F. Native of Chili, near Coquimbo; and of Peru, at Guamantagua and St. Bonaventura. Hedýyótis hyssopifólia, Cav. icon. 6. p. 54. t. 575. f. 2. Corolla as in var. β. Branchlets bluntly tetragonal. Seeds larger than in any of its congeners, and is perhaps a proper species.

Thyme-leaved Anotis. Shrub 1 to 2 feet. 8 A. lariçifólia (D. C. l. c.) plant suffruticosum, erect, branched, glabrous; leaves sessile, linear, acute, with hardly revolute margins; stipulas acute; peduncles 3-5-flowered, rising from the forks of the branch; anthers exerted. 11. F. Native of the Cordillera of Chili, on the highest mountains. Hedr. lariçifólia, Cav. icon. 6. p. 54. t. 575. f. 1. Corolla of a reddish brown colour, funnel-shaped. Capsule ovate, truncate.

Larch-leaved Anotis. Shrub ½ to 1 foot. 9 A. setósa (D. C. l. c.) plant shrubby, erect, much branched; leaves on short petioles, ovate, acute, ciliately serrulate, glabrous; stipulas conuate, ovate, furnished with many bristles at the apex; flowers terminal, usually by threes. 12. F. Native of Peru, on the Andes at Chupurallana and Huassa-Huassi. Hedr. setósa, Ruiz et Pav. fl. per. 1. p. 56. t. 88. f. a. Corolla large, purple, with a broad terete tube, and having the lobes almost one-half shorter than the tube. Habit of Ráchálitá nítida, but differs from it in the calyx being 4-lobed, without any accessory teeth. Anthers inclosed.

Health-like Anotis. Shrub ½ to ¾ foot. 11 A. lanceoláta (D. C. l. c.) plant shrubby, erect, tetragonal, with the angles a little winged; leaves sessile, lanceolate, acute, glabrous; stipulas lanceolate, membranous; corymbs trichotonous, terminal; corolla funnel-shaped; anthers exerted; capsule globose, half-adnate to the calyx. 14. F. Native of the south of Carolina, where it was detected by Bosc. Hed. lanceoláta, Poir. suppl. 3. p. 14. Genus novum, Fraser, ms. in herb. L'Her. Seeds nearly globose, 4-5 in each cell. Lobes of calyx linear, permanent, exceeding the capsule a little. Corolla purplish.
Lanceolate-leaved Anotis. Pl. ½ to ¾ foot.  
12 A. longifolia; stems erect, branched, tetragonal, very 
downy at the joints; leaves linear-oblong; radical ones 
attenuated at the base; stipulas broad, ovate, entire, bidentate or 
tristate, membranous, white; corolla funnel-shaped. 2. H. 
Native of Florida, in exposed places by the sea side; of Canada, 
about Lake Huron, and abundant about Lake Winecup and the 
49. f. 8. Hook. in bot. mag. 3099. Houstonia angustifolia, 
amer. bor. 1. p. 286. Flowers scarlet, terminal, almost sessile, 
5 in a fascicle. Capsules subterbinate.  

Long-leaved Anotis. Fl. May, July. Pl. ½ foot.  
13 A. ciliolosa; radical leaves ovate, obtuse, attenuated at the 
base, with ciliated edges; cauline ones ovate-spatulate, sessile; 
flowers corymbose, terminal, pedicellate; peduncles trichomes; 
calyx segments linear-lanceolate; stem glabrous, 
borne at the top. 2. H. Native of North America, in 
Goat Island, and at the Falls of Niagara. Houstonia ciliolosa, 
bor. 1. p. 286.  

Ciliated-leaved Anotis. Pl. 1 foot?  
14 A. purpurea; stems erect, branched at the top, and 
downy at the joints; leaves ovate-lanceolate or linear-lanceolate, 
sessile; corymbs terminal. 2. H. Native from Pennsylvania to 
Houstonia purpurea, Lam. ill. 251. Hedyotis umbellata, Walt. 
fl. car. 85. Hed. várians, Michx. fl. amer. bor. 1. p. 80. Flowers 
purple.  

Sect. III. PANETOS (the plants flower all the year round). Raffn. in ann. gen. sc. phys. 5. p. 227. D. C. prod. 4. p. 433. 
Prostrate or creeping plants, with the habit of Anagallis. Leaves 
ovate-roundish. Flowers axillary and terminal, solitary. Calyx 
not adnate to the ovary at the apex, and therefore the capsule 
is naked at the top.  

15 A. rotundifolia (D. C. prod. 4. p. 433.) stems herbaceous, 
prostrate, branched; branches tetragonal; leaves nearly 
orbicular, on short petioles, glabrous, hardly ciliated; stipulas 
small; flowers axillary, solitary, on short pedicels; corolla 
salver-shaped, having the tube 3 times longer than the calyx; 
capsule half-adnate to the calyx. 3. F. Native of Carolina and 
Florida, in dry exposed places by the sea side. Houstonia 
Anábynos procumbens, Walt. car. p. 86. Poiretia procumbens, 
Gmel. syst. 263. Habit of Verónica nummularifolia. Flowers 
white.  

Round-leaved Anotis. Pl. prostrate.  
16 A. salzmanni (D. C. l. c.) stems herbaceous, prostrate, 
branched; leaves nearly orbicular, on short petioles, glabrous, 
hardly ciliated; stipulas hardly any; flowers axillary, solitary, 
having the pedicels exceeding the leaves; corolla campanulate, 
twice the length of the lobes of the calyx, which are oval. 3. S. 
Native of Brazil, about Bahia frequent. Intermediate between 
the preceding and following species. Corollas pale red.  

Salzmann's Anotis. Pl. prostrate.  
17 A. seepens (D. C. prod. 4. p. 433.) stems suffruticose, 
creeping, much branched; branches tetragonal; leaves roundish-
ovate or elliptic, petiolar, acutish, glabrous, with spinulose 
ciliated edges; stipulas dentately ciliated; flowers axillary, soli-
tary, pedunculate; corolla subrotate, ciliated a little; anthers a 
little exerted. 3. F. Native of Quito, on the burning 
Mount Antisana. Hedyotis seepens, H. B. et Kunth, nov. gen. 
amer. 3. p. 390. t. 289. Hed. microphylla, Wildl. herb. in 
Rœm. et Schultes, syst. 3. p. 527. Houstonia microphylla, 
Wildl. herb.? Corolla white, with a very short tube, and the 
lobes of the calyx distant as in Oldenlandia. Seeds usually 
in each cell.  

Creeping Anotis. Pl. creeping.  
18 A. coriacea; plant tufted; stems erect, dichotomous; 
leaves ovate-lanceolate, attenuated at the base; radical ones 
spatulate, and a little hairy; peduncles elongated, 1-flowered; 
corollas salver-shaped, with acute lobes. 2. H. Native of 
Virginia; and of Canada, about Quebec. Houstonia coriacea, 
84. Hedyotis coriacea, Hook. fl. bor. amer. 1. p. 286. A 
small tufted plant, with the habit of Anagallis tenella, with 
light blue flowers. The first peduncles are 2-flowered. There 
is also a variety of this with white flowers.  

1/2 foot.  
19 A. serpyllifolia; plant tufted; stems very short; leaves 
oval, attenuated at the base; peduncles terminal, very long, 
solitary, divaricate; corolla salver-shaped, with acute lobes. 2. H. 
Native of Carolina, on the banks of rivulets in the mountains; 
and of Canada, about Lake William and Lake Superior. Houstonia 
sept. 1. p. 106. Graham, in bot. mag. 2822. Houstonia coriacea 
minor, Pursh, fl. amer. sept. 1. p. 106. Houstonia Linnaei 
286. Flowers white. A small tufted plant, very like the last.  

20 A. tentella; stems creeping, filiform; leaves orbicular, 
aeute, nervated; peduncles terminal, one-flowered, very long. 
3. F. Native of North Carolina, on high mountains. Houstonia 
Very like A. serpyllifolia.  

Slender Anotis. Pl. creeping.  
Cult. This is a genus of pretty little plants. All the species 
require to be grown in small pots, well drained with sherds, in 
a mixture of peat and sand. They are increased by dividing at 
the root. Those natives of warm climates require protection in 
winter, by placing them in a frame or green-house.  

LXXXII. RACHICALLIS (from ραχία, rachia, a crag by 
the sea side, and καλλós, kallos, beauty; because the plants 
ornament the rocks by the sea side). D. C. prod. 4. p. 433. 
Hedyotis species, Swartz, Kunth, &c.  
Lin. syst. Tetrándria, Monogynia. Calyx with a hemis-
pherical tube, and a 4-lobed limb, furnished with from 1-3 acces-
sory teeth between each of the lobes. Corolla with a long terete 
tube, a short spreading bluntly 4-lobed limb, and a beardless 
throat. Anthers at the throat, inclosed. Stigma 2-lobed. Capsule 
rather didymous, dehiscing by 2 valves at the cells, and 
crowned by the teeth of the calyx. Seeds 8-20 in each cell. 
—Small shrubby South American plants, inhabitants of rocks 
by the sea side, with the habit of Passerina. Leaves oblong, 
fleshy, with revolute edges, sessile. Stipulas connate, undivided 
or tridentate. Flowers solitary, sessile.  
1 R. nitida (D. C. prod. 4. p. 433.) plant shrubby, much 
branched; branches crowded, densely leafy; leaves linear, acute, 
fleshy, with revolute margins, glabrous, and shining on both 
surfaces; stipulas connate, short, trifid at the apex; flowers 
solitary, terminal, sessile; corolla glabrous. 3. S. Native near 
Santa Fe de Bogota. Hedyotis nitida, H. B. et Kunth, nov. 
gen. amer. 3. p. 392. Lobes of calyx 4, linear-lanceolate, fur-
nished with 2-3 linear accessory teeth between each. Anthers exerted. Capsule globose, turbinate at the base. Seeds ovate, angular, 8-9 in each cell.

Shining Rchiadalis. Shrubs 2 to 3 feet.

2 R. rupestris (D. C. prod. 4. p. 434.) plant shrubby, with branches branched; branches twisted, corky; leaves crowded in stellate fascicles, oblong, fleshy, with revolute edges, shining above; stipulas connate, pubescent inside; flowers axillary, solitary, sessile; corollas villous, with a curved tube. P. S. Native of the Caribbean Islands, on rocks by the sea side; as of Cuba, Jamaica, &c. Hedýotis rupestris, Swartz, prod. p. 29. H. B. et Kunth, nov. gen. amer. 3. p. 391. Hed. Americana, Jacq. amer. p. 20. Oldenándia rupestris, Lam. dict. p. 4. 535.

—Sloane, jam. t. 292. f. 1. Habit of Passerina. Corolla yellow. Calyx 4-cleft; lobes woolly inside, with 4 accessory teeth between each. Seeds ovate, angular, about 20 in each cell. This plant has been inadequately referred to the genus Buchéna by Smith in Rees's cycl. vol. 17.

Rock Rchiadalis. Shrubs 2 to 3 feet.

3 R. Caracasana (D. C. l. c.) plant suffruticose, much branched; branches leafy at top; leaves oblong, acute, fleshy, with revolute margins, spreading, glabrous, and shining; flowers terminal and axillary, solitary, sessile. P. S. Native of South America, on the southern declivities of the mountains called Silla de Caracas. Hedýotis Caracasana, H. B. et Kunth, nov. gen. amer. 3. p. 393. Corolla violaceous.

Caracas Rchiadalis. Shrubs 1 foot.

Cult. Elegant shrubby plants of difficult culture. A mixture of peat and sand will probably be the best soil for them, and they should be grown in pots half filled with pot-shorns. They may either be increased by seeds or by cuttings planted in sand, with a bell-glass over them. They should be placed on shelves in a greenhouse.

LXXXIII. LuCya (named by De Candolle after the late Lucy Dunal, who made many observations upon the Rubiaceous plants growing in the neighbourhood of Montpellier, as may be seen by comparing the fl. fr. ed. 3. vol. 5. p. 499., sister to Michel Félix Dunal, professor of botany at Montpellier). D. C. prod. 4. p. 434.—Dunália, Spreng. but not of Kunth.—Hedýotis species, Swartz and A. Rich.—Pépis species, Lin.

Lin. syst. Tetrahdria, Monogyinia. Calyx with a hemispherical tube, and the limb of 8 twin teeth or of 4 bifid ones, permanent. Corolla with a very short tube, and a 4-lobed limb; lobes obtuse. Stamens shorter than the corolla. Style short, bifid. Capsule globose, dished, 2-celled, with a loculicidal and half septicidal delusion; hence the capsule appears 8-valved at the apex. Seed 2 in each cell, ex Spreng, 5-6, ex Rich.—A small herb, with the habit of Pépis. Roots fibrous and tuberous. Stems short, glabrous. Leaves almost sessile, cordate-ovate, downy beneath; upper ones usually by fours. Flowers axillary, and nearly terminal, solitary on very short pedicels, small, white.

Tuberous-rooted Lucia. Herb small.

Cult. This plant should be treated like other tender annuals. It is not worth growing except in botanic gardens.

Lin. syst. Tetrahdria, Monogyinia. Calyx with a very short tube, adnate to the bottom of the ovary, and a 4-parted limb; lobes subulate. Corolla with a very short tube, a bearded throat, and a 4-parted limb; lobes or segments oval. Stamens 4, with very short filaments, and inclosed anthers. Style 1, undivided. Capsule ovate, compressed, 2-celled, with a loculicidal delusion. Placentas oblong, ascending, adnate to the bottom of the dissipated. Seeds numerous, very minute, angular, diaphanous. Embryo straight, slender, in fleshy albumen.—A glabrous herb, with the habit of Gálúm or Buffiónia. Leaves opposite, linear-subulate, having their bases connate from the almost entire stipular sheaths. Coryms terminal, dichotomous, cymose, with small sessile flowers in the forks and tops of the branches, each flower propelled by 2-4 bracteae. Corollas white.

Procumbent Polypremum. Pl. procumbent.

Cult. This plant should be treated as other tender annuals.

Tribe IV.

LXXXV. METABOLOS (from μεταβόλος, metaboles, changeable; but the application is not evident). Blum. biijdr. p. 990. D. C. prod. 4. p. 435.—Sclerococcus, Bartl. in herb. Hænke.

Lin. syst. Tetra-Pentándria, Monogyinia. Calyx with an obovate roundish tube, and a 4, rarely 5-parted limb. Corolla funnel-shaped, with a 4, rarely 5-cleft or parted limb. Stamens 4-5, inserted in the throat of the corolla. Style filiform; stamina thickened, 2-4-parted. Berry dry, crowned by the calyx, divisible into 2-4 many-seeded pyrene or nuts. Seeds angular, fixed to prominent placentae.—Suffruticose herbs. Stems tetragonal. Leaves opposite, with parallel veins. Stipulas twin on both sides, cut. Flowers disposed in whorles or axillary heads. This genus is evidently very distinct from Hedýotis in the fruit being indehiscent (ex Blum), and in the cells being usually 4 or 5.

1 M. venüs (Blum. biijdr. p. 991.) stem suffruticose, prostrate; leaves on short petioles, ovate-lanceolate, acuminate, lined with veins, rather scabrous; whorles of flowers glomerate, axillary. P. S. Native of Java, in the province of Buitenzorg, in shady places.

Véiny-leaved Metabolos. Shrub prostrate.

2 M. latifolius (Blum. I. c.) stem suffruticose, divaricate; leaves on longish petioles, elliptic-lanceolate, acuminate at both ends, rather scabrous; flowers disposed in dense axillary glomerate whorles. P. S. Native of Java, on the mountains.

Broad-leaved Metabolos. Shrub diffuse.

3 M. rugosus (Blum. I. c.) stem shrubby, decumbent; leaves
oblong-lanceolate, acuminated, wrinkled, a little ciliated, downy beneath; flowers in dense axillary heaps; fruit containing 4 pyrenees. \( \gamma \), S. Native of Java, on the top of Mount Gede. Stigma exserted, 4-cleft.

**Wrinkled** Metabolos. Shrub procumbent.

4 **M. prostratus** (Blum. l. c.) stem suffruticoso, prostrate; leaves oblong-lanceolate, glabrous; heads of flowers axillary, sessile or pedunculate. \( \gamma \), S. Native of Java, in woods on the mountains.

**Prostrate** Metabolos. Shrub prostrate.

5 **M. nidus** (Blum. l. c.) stem suffruticoso, erect; leaves elliptic-oblong, acuminated at both ends, stiff, glabrous; heads of flowers axillary, bibracteate; calyx campanulate, quadrifid. \( \gamma \), S. Native of Java, on Mount Seribu, and on Mount Bonok, in the province of Bantam. Leaves 6 long.

**Stiff** Metabolos. Shrub.

6 **M. lineatus** (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 435. under the name of **Sclerococcus**) stem herbaceous, erectish, and are, as well as the branches, beset with hairs; leaves on short petioles, ovate-lanceolate, acuminated, downy, lined with veins; heads of flowers somewhat corymbose, axillary, on short peduncules. \( \gamma \), S. Native of Mexico, according to Hænke, herb; but probably of the Philippine Islands. Very like the following species, and probably only a variety of it. Stipulas membranous, and connate at the base, ending in long subulate bristles, as in **M. cerulea**. Flowers small. Stamens a little exserted.

**Lined-leaved** Metabolos. Pl. erect.

7 **M. cerulea** (Blum. bijdr. p. 991.) stem suffruticoso, procumbent, and is, as well as the branches, beset with soft hairs; leaves lanceolate, on short petioles, acuminated, downy, lined with veins; heads of flowers subcorymbose, axillary. \( \gamma \), S. Native of Java, about Buitenzorg, in humid shady places.

**Blue-flowered** Metabolos. Shrub procumbent.

8 **M. radians** (Bartl. in herb. Hænke, under the name of **Sclerococcus**.) stem herbaceous, radicant at the base, glabrous, having 2 downy lines at the apex; leaves lanceolate, petiolate, glabrous, pale beneath; teeth of stipulas setaceous; pedicels axillary, very short, disposed in a kind of half whorls, very short.—Native of the island of Luzon, one of the Philippines.

**Rustling** Metabolos. Pl. creeping.

9 **M. anthophilius** (Bartl. in herb. Hænke, under the generic name of **Sclerococcus**) stems shrubby; leaves linear-lanceolate, almost sessile, lined with veins, downy on the nerves beneath, as well as the branches; stipulas ovate-lanceolate, cuspidate, downy, a little toothed at the apex; flowers on short pedicels, disposed in axillary and terminal heads. \( \gamma \), S. Native of the island of Manilla, near Sorzogon.

**Narrow-leaved** Metabolos. Shrub.

10 **M. ferrugineus** (Bartl. in herb. Hænke, under the generic name **Sclerococcus**, ex D. C. prod. 4. p. 436.) plant shrubby; leaves linear-oblong, attenuated at the base, glabrous above in the adult state, and clothed with rusty wool beneath, particularly on the nerves, as well as the branches; stipulas ovate, acute, quite entire; flowers axillary, glomerate, almost sessile. \( \gamma \), S. Native of Luzon, one of the Philippines, at Sorzogon. Some of the fruit examined have 3 cells only.

**Rusty** Metabolos. Shrub.

11 **M. leyvigtii** (Bartl. in herb. Hænke, under the generic name **Sclerococcus**, ex D. C. l. c.) plant shrubby, smoothish; leaves ovate-lanceolate, petiolate, glabrous above, rather scabrous on the nerves beneath, as well as on the petioles and branches; stipulas lanceolate, pectinately ciliated; flowers axillary, glomerate, almost sessile. \( \gamma \), S. Native of the island of Luzon, one of the Philippines.

**Smooth** Metabolos. Shrub.

**Cult.** For culture and propagation see **Hamélia**, p. 542.

**Lin. syst.** **Tetradria, Monograhy.** Calyx with a subglobose tube, and a 4-lobed limb. Corolla funnel-shaped or salver-shaped, villose outside: with a long cylindrical tube, ovate lobes or segments, and a downy or hairy throat. Stamens 4, inclosed. Style filiform; stigma usually 4, somewhat pressed together into a head. Berry containing 4 pyrenees, rarely 3-2-celled; cells or pyrene many seeded. Seeds minute, angular, dotted.—South American shrubs, with terete villous branches. Leaves oval-lanceolate, acuminated. Spikes terminal, or from the axils of the upper leaves, very long. Flowers disposed in fascicles on one side of the spikes, and sessile along its axis.—This genus is possibly divisible into two or three.

1 **G. fimbriata** (Pers. ench. l. c. p. 132.) leaves ovate, acute, bullately crenated; flowering branches pendulous; teeth of calyx bluntish; stipulas twin on both sides, subulate. \( \gamma \), S. Native of Peru, in groves in the province of Chinchao. Gonzaleziania dependens, Ruiz et Pav. fl. per. l. c. p. 56. t. 86. quinol. suppl. p. 84. t. 1. f. a. Corolla of a purplish rose-colour, woolly, with a bearded throat and acutish lobes. Berries black, woolly.

**Pendulous-branched** Gonzalezia. Shrub 10 to 12 feet. 2 **G. parviflora**; young parts of plant and inflorescence canescence from down, but the older parts are smoothish; leaves elliptic-lanceolate, acuminated at both ends; stipulas triangular, acute, kedeed; cymes 3-7-flowered, on short peduncles, the whole disposed in a terminal, elongated raceme. \( \gamma \), S. Native of Mexico, at Cuesta Grande de Jalacingo. Gonzaleziania? parviflora, Cham. et Schlecht. in Linnaea. 6. p. 415. Leaves half a foot long, feather-nerved, and reticulately veined. Tube of calyx tomentose outside. Corolla smoothish outside, and segments downy, and tube hairy inside. Stigma 2-lobed.

**Small-flowered** Gonzalezia. Shrub.

**Sect. II. Ly gist oides** (from lygistum and idea, similar; the plants contained in this section resemble species of **Ly gistum**). D. C. prod. 4. p. 436.—Buena. Cav. icon. 6. p. 50. t. 571. anal. hist. nat. hisp. 2. p. 279. but not of Polh.—Ly gistum spec. **Lunu** Knt.,—**procycopseum** species, Knt. Berry almost dry, containing 4, rarely 3 or 2 chartaceous pyrenees. Stipulas solitary on each side.

3 **G. tomentosa** (Humb. et Bonpl. pl. equin. 1. p. 225. t. 64.) leaves oblong, petiolate, acuminated, glabrous and bullate above, and clothed with white tomentum beneath, and on the branchlets; stipulas short, ovate, acute. \( \gamma \), S. Native of Peru, in hot places between **Luna** and Ganzanama. H. B. et Knt, nov. gen. amer. 3. p. 416. Corolla white, tomentose on the outside, with a hairy throat, and obtuse lobes.

**Tomentose** Gonzalezia. Shrub 8 to 9 feet. 4 **G. nivea** (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 436.) leaves oval-oblong, cuneated at the base, and acuminated at the apex, smoothish and flat above, and clothed with white tomentum beneath, as well as the branchlets and racemes; stipulas subulate. \( \gamma \), S. Native of Mexico. Very nearly allied to **G. tomentosa**.

**Snowy** Gonzalezia. Shrub 6 to 8 feet. 5 **G. pulv erulesta** (Humb. et Bonpl. pl. equin. 1. p. 228.) leaves lanceolate, obtuse at the base, clothed with powdery pubescence beneath, as well as the branchlets; stipulas subulate. \( \gamma \), S. Native of Peru, in hot places near Ganzanama. Corolla white. The rest unknown. 9
Powdery Gonzalea. Shrub 8 to 9 feet.
6 G. Paname'n's (Pers. ench. 1. p. 132.) leaves oblong, acuminate, acute at the base, petiolate, hairy from very short down above, and whitish from short tumescent beneath; stipulas broad at the base, and subulate at the apex, length of the petioles. F. S. Native of Panama and Mexico. Buena Panamén's, Cav. ikon. 6. p. 571. Branches sub-tetragonal. Corolla reddish yellow.

Panama Gonzalea. Shrub 5 to 7 feet.
7 G. cornicul'à (H. B. et Kunth, nov. gen. amer. 3. p. 416.) leaves oblong or ovate-oblong, acuminate, acute at the base, petiolate, glabrous above, and downy on the nerves and veins beneath, as well as the branchlets; stipulas ovate-subulate, length of the petioles. F. S. Native of New Granada, in rocky places near Honda. Perhaps only a variety of G. Panamén's.

Doggwood-leaved Gonzalea. Shrub.
8 G. spicat'à (D. C. prod. 4. p. 437.) leaves oblong, acuminate, downy on both surfaces; stipulas subulate at the apex; spikes terminal, elongated; calyce lobes linear; fruit almost always 2-celled. F. S. Native of Cuba, near Havana, Porto-Rico, and Guadaloupe. Lygistiun spicatùm, Lam. ill. no. 1477. Gonzalea Panamén's, ex Guadalupa, Spreng. syst. 1. p. 417. ex herb. Balb. Barlèria hirsuta, Jacq. obs. with a good figure.

Spike-flowered Gonzalea. Shrub 8 to 10 feet.
9 G. tincanà'sens (D. C. prod. 4. p. 437.) leaves pubescent above, and canescent from adpressed silky villi beneath; lobes of calyx oblong. F. S. Native of Tobago?

Hoary Gonzalea. Shrub.

Cult. For culture and propagation see Hamélia, p. 542.

Lín. syst. Hezán'dria, Monogynia. Calyx with a subglobose tube, and a short permanent 4-6-toothed limb (f. 97. a.), ex Rich. Corolla with a long tube (f. 97. b.), which is more slender in the middle than any where else (f. 97. b.); and with 6 or short obtuse erect lobes at the apex (f. 97. c.), which appear a little twisted before expansion, densely clothed with yellow down inside, having the recesses or sinuses between the lobes drawn out into little crests. Stamens 6, inclosed (f. 97. d.). Stigmas linear, erectly stellate (f. 97. e.). Berries globose (f. 97. g.), crowned by the calyx (f. 97. h.), containing 6 brittle many seeded triquetrous pyrenes (f. 97. c.), which are furrowed inside. Seeds subglobose, truncate at the base. Albumen fleshy. — South American trees or shrubs, with striated or quadrangular branches. Leaves oval, acuminate at both ends, on short petioles, clothed with short down beneath. Stipulas on both sides, lanceolate-subulate. Thyrses terminal, many-flowered, spike-formed or panicle-formed; peduncles opposite. Flowers scarlet.

1 I. spicéiformis (D. C. prod. 4. p. 437.) leaves oval-oblong, acuminate, acute at the base; thyrses spike-formed; flowers on long pedicels along the axis. F. S. Native of Guiana or Cayenne, where it was collected by Patris. Leaves and flowers like those of I. coccinea, but differing in the inflorescence. Spike cylindrical, having the flowers on the lower part remote and opposite, and those at the top crowded. Corollas scarlet.

Spike-formed Isertia. Shrub 10 to 12 feet.

3 I. hamè'm (Vahl, ecol. amer. 2. p. 27.) leaves oval, acuminate, acute at the base; thyrses oblong, panicled. F. S. Native of Guiana, Cayenne, and Maranham, as also on the banks of the Madeleine, among bushes. Guettàrdia coccinea, Audl. guian. 1. p. 317. t. 125. Lam. ill. t. 259. Corolla an inch long, velvety on the outside, scarlet. Berries red. There is a variety of this plant, according to Kunth, having the leaves disposed 3 in a whorl. The wood is bitter. A decoction of the leaves is used by the Creoles in fomentations. (fig. 97.

1 I. hamè'm (D. C. prod. 4. p. 437.) leaves oval, acuminate at both ends; thyrses ovate, panicle-formed, with verticillate branches. F. S. Native of Mexico. Isertia coccinea, Barl. in herb. Hænke, ex D. C. 1. c. Calyces as in I. parviflora. Corolla scarlet, a little smaller than those of the preceding, but one-half larger than those of the following, clothed with fine velvety down on the outside. (Hænke's Isertia. Shrub 8 to 10 feet.

4 I. parviflora (Vahl, ecol. amer. 2. p. 28. t. 15.) upper leaves oblong; lower ones cordate at the base; thyrses ovate, panicle-formed, with opposite branches. F. S. Native of Trinidad. Leaves almost glabrous, except on the nerves. Teeth of calyx 4, and 2 of these are larger than the rest, and are probably formed of 2 combined ones each. Corolla scarlet, unguicular, glabrous on the outside. Fruit unknown. Small-flowered Isertia. Shrub 8 to 10 feet.

Cult. The species are worth cultivating in every collection of stove plants, for the sake of their leaves and panicles of showy scarlet blossoms; their culture and propagation are the same as that recommended for Hamélia, p. 542.

Tribe V.

Lín. syst. Pentàndria, Monogynia. Calyx with an oblong tube, and a 5-toothed limb, 2 of the teeth opposite each other, larger than the rest, outer ones erect, incurved, the 2 smaller teeth connivent. Corolla and stamens unknown. Berry oblong, crowned by the limb of the calyx, 4-celled. Seeds many, nestling in the pulp. Albumen fleshy.—Perhaps this genus is distinct from Gonzalea or Evós-mià, but it is hardly known.

1 T. d'ub'lla (Gært. 1. c.) F. S. Native of Chili. Nothing is known of this plant except the fruit.

Doubtful Tepesia. Shrub.

Cult. For culture and propagation see Hamélia, p. 542.

LXXXIX. EVO'SMIÀ (from ēv, ev, well, and òmē,

**Lin. syst.** Tetra-Pentândria, Monogynía. Calyx with an ovate tube, and a very short 4-toothed limb (f. 98. a.). Corolla subrotate, 4-cleft beyond the middle (f. 98. e. b.), Stamens 4, inserted in the throat (f. 98. b.), a little exserted or inclosed; anthers ovate. Style filiform; stigma thick or 4-lobed. Fruit ovate (f. 98. f.), crowned by the calyx (f. 98. g.), 4-celled (f. 98. h.); cells many seeded.—Glabrous shrubs or small trees, with terete branches, natives of South America. Leaves petiolar, oval, acute at both ends, membranous. Stipulas ovate, acute, short, deciduous. Racemes short, by twos or threes from the axils of the lower leaves; pedicels elongated, capillary. Flowers red. The young fruit in *E. Caripensis* is sweet-scented; hence the generic name.

**E. Caripensis** (Humb. et Bonpl. l. c.) leaves oval, acuminate at both ends; racemes loose, a little longer than the petioles; pedicels slender, elongated, h. S. Native of South America, in the province of Cumana, near Caripe. Flowers red (f. 98.).

**Caripe Evosmia.** Tree 30 ft.

**2 E. aggregata** (Spreng. syl. 1. p. 417.) leaves lanceolate, acuminate; flowers in fascicles; pedicels shorter than the calyx. h. S. Native of Peru, in groves on the Andes at Cuchero, Chinchao, and Muna.

O-Higginsia aggregata, Ruiz et Pav. fl. per. 1. p. 55. t. 83. f. b. Higginsia aggregata, Pers. ench. 1. p. 133. According to Jussieu, this plant is referrible to *Sabicea*, but according to Kunth to *Gonzalezia*. But it certainly differs from all the other species of *O-Higginsia* of the fl. per. in the fruit being 4-celled and many-seeded. Flowers red.

**Aggregate-flowered Evosmia.** Shrub.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Lin. syst.** Tetra-Pentándria, Monogynía. Calyx with an oblong or turbinate tube, and a 4.5-parted permanent limb. Corolla salver-shaped, with a long slender tube, a hairy throat, and a 4.5-parted limb: with the lobes acute. Stamens 4.5, inclosed or hardly exserted. Style filiform, clavate at the apex, 4.5-lobed. Berry almost globose, crowned by the calyx, 4.5-celled; cells many seeded. Seeds minute, angular. Climbing shrubs or subshrubs. Leaves oval, acute, on short petioles. Stipulas solitary on both sides. Flowers white, axillary, in sessile fascicles, or corymbose and pedunculate. Corollas pilose.

**§ 1. Parts of flowers quinary.**

**Grey Sabicea.** Shrub cl.

2 *S. hi'ra* (Swartz, prod. 1. p. 46.) leaves ovate-lanceolate, acuminate, hairy on both surfaces; stipulas cordate-ovate, large, membranous; umbels 3-flowered, on short peduncles, involucrum of 4 leaves. h. S. Native of Jamaica, and probably of Trinidad, if the specimen in Sieb. Fl. trin. no. 327. be the same; of Porto-Rico, according to specimens from Bertero; and of Mexico, ex icon. fl. mex. ined. Flowers white. Berries snow white when ripe, ex Swartz; but in the figure in fl. mex. they are painted reddish, and is therefore probably a distinct species. Branches striated, hairy.

**Hairy Sabicea.** Shrub cl.

3 *S. hirsuta* (H. B. et Kunth, nov. gen. amer. 3. p. 417.) leaves elliptic-oblong, acuminate, pilose above, and hairy beneath; stipulas roundish-ovate, acute, reflexed; flowers disposed in verticillate fascicles, sessile. h. S. Native of South America, on the banks of the Orinoco; of Mexico, ex Hænke, and probably of Peru. S. villosa, Röm. et Schultes, syst. 5. p. 265. Schwenkfeldia villosa, Willd. rel. mss. Schwenkfeldia hirsuta, Spreng. syst. 1. p. 765. Flowers white.

**Hirsute Sabicea.** Shrub cl.

4 *S. eriantha* (D. C. prod. 4. p. 439.) leaves elliptic-oblong, acuminate, pilose above, and clothed with hairy tomentum beneath; branches very hairy; stipulas ovate, acute, glabrous inside; flowers numerous, axillary, sessile; lobes of calyx linear; tube of corolla very pilose on the outside. h. S. Native of Brazil, at Bahia, in hedges, where it was collected by Salzmann, G. Don, &c.

**Woolly-flowered Sabicea.** Shrub cl.

5 *S. triflora* (D. C. prod. 4. p. 439.) stems twiggly, velvety; leaves on short petioles, oblong-lanceolate, acuminate, pale and villous beneath; stipulas lanceolate-subulate, undivided; flowers axillary, 1-3-together, rising from a short peduncle; bracteoles ciliated; ovary long, glabrous, crowned by the elongated linear-subulate calycine teeth. h. S. Native of Madagascar. Triosteum triflorum, Vahl, symb. 3. p. 37.

**Three-flowered Sabicea.** Shrub cl.?

6 *S. diversifolia* (Pers. ench. 1. p. 203.) under side of leaves and branchlets hairy: the opposite leaves very unequal among themselves, the larger one broad, elliptic or ovate, obtuse, glabrous above, and hoary beneath; the smaller one bracteae-formed; flowers almost sessile, glomerate in the axils of the smaller leaves. h. S. Native of Madagascar and the Mauritius. Stamens half exserted. Berry pea-formed, 5-celled, crowned by 5 bristles, ex A. Rich. Schwenkfeldia diversifolia, Spreng. syst. 1. p. 765. The rest unknown. Perhaps this plant is properly referred to the present genus.

**Diverse-leaved Sabicea.** Shrub cl.

**§ 2. Parts of flowers usually or always quaternary.**

7 *S. aspera* (Aubl. guian. 1. p. 194. t. 76.) leaves elliptic, acuminate, rough above, and villous beneath; stipulas oval-oblong, acute; flowers sessile, disposed in subverticillate fascicles. h. S. Native of Guiana, on the banks of the river Sinemari. Lam. ill. t. 165. Schwenkfeldia aspera, Wild. spec. 1. p. 982. Flowers white. Berries red. Parts of flowers and fruit varying from quaternary to quinary, ex Aubl.

**Rough Sabicea.** Shrub cl.

8 *S. umbella* (Pers. ench. 1. p. 203.) leaves oval, acuminate, acute at the base, sebrosus on both surfaces from adpressed down, pale beneath; stipulas ovate, spreading; coryisms many-flowered, pedunculate. h. S. Native of Peru, in groves on the Andes at Cuchero, Macora, and Chinchao.

Umbellate-flowered Sabicea. Shrub cl.

9 S. pu'mila (Bartl. in herb. Hämke, ex D. C. prod. 4. p. 440.) stem herbaceous, glabrous; leaves oblong-lanceolate, glabrous, ciliated with silky down; stipulas subulate; heads pedunculate, axillary, few-flowered, glabrous.—Native of Peru, on the mountains about the Guanoco.

Dwarf Sabicea. Pl. cl.?

Cult. For culture and propagation see Olóstyla below.

XCI. OLOSTYLA (from ὕλος, holos, entire, and στυλός, stylós, a style; the style is undivided). D. C. prod. 4. p. 440.—Stylocorina, Labill. sert. cale. p. 47. but not of Cav.

Lin. syst. Pentándria, Monogynía. Calyx with an ovate tube, and a very short 5-toothed limb. Corolla sub-rotate, with a short tube, which is pilose inside, and a 5-lobed limb; lobes valvate in aestivation, linear-lanceolate, with inflexed edges. Stamens 5, inserted in the throat of the corolla; anthers linear, exserted. Style clavate, undivided. Berry glabrous, crowned by the teeth of the calyx and urceolus, 4-celled; cells many-seeded. Seeds minute, elliptic, nestling in the pulp.—A glabrous unarmed shrub. Leaves opposite, obovate-oblong, coriaceous, on short petioles. Stipulas broad, short, apiculate. Flowers disposed in a terminal somewhat thyrsoid corymb.—This genus differs from Stylocorina in the fruit being 4-celled, not 2-celled as in that genus.

Corymbose-flowered Olóstyla. Shrub 5 to 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root in sand under a hand-glass. It is a very pretty shrub, and therefore worth cultivating.

XCl. AXANTHES (from αξών, axon, an axle-tree, and ἀυξο-, anthos, a flower; the flowers are disposed in axillary heads or corymbos). Blum. bijdr. p. 1002. D. C. prod. 4. p. 440.—Wallichia, Reinw. cat. hort. buit. ex flora. 1825. p. 107. but not of Roxb. nor D. C.—Maschalálnte, Blum. herb. ex D. C. l. c.

Lin. syst. Pentándria, Monogynía. Flowers hermaphroditic, or dioecious by abortion. Calyx with an urceolate tube and almost entire limb. Corolla rotate, with a short cylindrical tube, which is furnished with 5 fascicles of hairs in the throat, and spreading lobes. Stamens 5 in the hermaphroditic flowers, inserted in the throat of the corolla, hardly exserted. Ovary and style wanting in the male flowers, but the ovary in the female flowers is covered by a sulate disk. Style short; stigma 5-lobed; lobes at first connivent. Berry globose, crowned by the permanent calyx, 5-celled, many-seeded; placenta fleshy. Seeds minute, shrunken with depressed dots.—Shrubs or trees. Leaves opposite. Flowers disposed in axillary heads or cymes, rarely in corymbos.

* Flowers dioecious by abortion.

1 A. macróphyllá (Blum. bijdr. p. 1002.) stem shrubby; ultimate branches rather tetragonal; leaves oblong, much acuminate, acutish at the base, shining above, but clothed with adpressed silky down beneath; heads of flowers axillary, sessile, involucrated. h. S. Native of Java, in mountain woods.

Long-leaved Axanthes. Shrub.

2 A. tomentósa (Blum. herb. and mss. ex D. C. prod. 4. p. 440.) stem unknown; branches geniculated, clothed with velvety tomentum; leaves oblong, much acuminate, glabrous above, but clothed with velvety tomentum on the nerves beneath as well as on the petioles; cymes pedunculate, axillary. h. S. Native of Pulo Penang.

Tomentose Axanthes. Shrub.

3 A. strióga (Blum. bijdr. p. 1002.) stem arborescent; ultimate branches geniculated, striose; leaves oblong, attenuated at both ends, glabrous above, but rather striose on the veins beneath; flowers on short peduncles, crowded, axillary. h. S. Native of Java, on the higher mountains, in woods. Wallichia arborea, Reinw. cat. hort. buit. p. 11. ex Blume.

Arboaceous Axanthes. Tree.

5 A. timórie'nsis (D. C. prod. 4. p. 441.) stem unknown; branchlets terete, glabrous; leaves oblong-lanceolate, acuminated at both ends, glabrous; cymes pedunculate, axillary. h. S. Native of Java, on the top of Mount Burangrang.

Corymbose-flowered Axanthes. Tree.

Cult. See Hamélia, p. 542. for culture and propagation.

XCl. UROPHYLLUM (from όυρο, oura, a tail, and φύλλον, phyllon, a leaf; the leaves terminate in very long taper points). Jack and Wall. in Roxb. fl. ind. 2. p. 184. D. C. prod. 4. p. 441.—Wallichia, Roxb. ined. but not of others.

1 U. vili'árum (Jack and Wall. l. c.) shrub villous; branchlets terete; calyx 5-lobed. h. S. Native of Pulo Penang. Branches as well as the veins of the leaves densely clothed with soft hairs. Leaves shining above and villous beneath, 10 inches long.

2 U. glábrum (Jack and Wall. l. c.) shrub glabrous; branches tetragonal; calyx almost entire. h. S. Native of Pulo Penang, where it is called Loda Utan by the Malays. Leaves about 6 inches long.

Glabrous Urophyllum. Shrub.

Cult. See Hamélia, p. 542. for culture and propagation.

XCIV. HAMELIA (so named in honour of Henry Louis du Hamel du Monceau, the celebrated author of several valuable

**Leaves verticillate.**

1 H. pâtens (Jaq. amer. p. 72. t. 50. pict. t. 72.) leaves 3 in a whorl, oval-oblong, acuminate at both ends, clothed with villous pubescence; cymes di-trichotomous, coloured, disposed in a terminal pedunculate umbel; corollas cylindrical. Ψ. S. Native of St. Domingo, Cuba, Mexico. Brazil, Peru, &c. in hedges on the mountains. Lam. spec. 246. Smith, exot. bot. t. 24. Geert. fil. carp. 3. p. 196. f. 3. H. cocinea, Swartz, prod. p. 46. Duhamélia pâtens, Pers. ench. 1. p. 203. H. pâtens, Ruiz et Pav. fl. per. 2. p. 221. f. 7. Flowers almost scarlet. Berries black. Branches villous at top. There are varieties of this species with velvety, villous, or downy leaves, always most so on the under surface.

Var. β. crêcet (Lam. dict. 3. p. 68.) racemes erect. Ψ. S. Native of Carthagena, in woods; and of Mango Island, H. crêcet, Jaq. amer. p. 71.

**Spreading** Hamelia. Fl. Jul. Aug. Clt. 1759. Sh. 5 to 10 ft. 2 H. xerülēnnes (H. B. et Kunth, nov. gen. amer. 3. p. 414) leaves 3 in a whorl, elliptic-oblong, acuminate, acute at the base, glabrous above and downy beneath; cymes composed of 5-6 spikes, terminal; corollas campanulate ventricose. Ψ. S. Native of Mexico on the burning Mount Xorullo. Flowers of a yellowish red colour.

**Xorullo** Hamelia. Shrub 4 to 5 feet.

3 H. spîcnæera (Ruiz et Pav. fl. per. 2. p. 69. t. 221. f. b.) leaves 3 in a whorl, oblong, hairy on both surfaces; cymes coloured, disposed in a terminal panicle; corollas cylindrically pentagonal. Ψ. S. Native of Peru, in groves. Duhamelia sphenocarpa, Pers. Petoide and peduncles red. Flowers viscid, petalate, pedicellate. Corollas of a reddish coppery colour. Berry dark purple, globose, hispid.

4 H. latîpōlia (Rich. in Sieb. fl. trin. no. 32.) leaves 3 in a whorl, ovate-lanceolate, acuminate, acute at the base, glabrous on both surfaces; cymes dichotomous, few-flowered, disposed in a terminal pedunculate umbel; corollas cylindrical. Ψ. S. Native of Trinidad. Flowers smaller than those of H. pâtens, but similar in colour.

5 H. ventricōsa (Swartz, prod. p. 46. fl. ind. occ. 1. p. 445). leaves 3 in a whorl, quite glabrous, oval-oblong, acuminate; racemes terminal (rarely axillary); flowers on long pedicels; corollas tubularly campanulate, ventricose. Ψ. S. Native of Jamaica, on hills, and among bushes in arid places, where we have seen it in great abundance from Kingston to the bottom of the Port Royal mountains, by the road side, and about Spanish Town; and of Mexico, about Real del Monte. Lindl. bot. reg. t. 1195. Sims, bot. mag. t. 1894. H. grandiflōra, L’Her. sert. angl. 4. t. 7. Salish, par. t. 55. Duhamélia ventricōsa, Pers. ench. 1. p. 203.—Sloane, hist. jam. 2. no. 63. t. 183. f. 2. Margins of leaves at length becoming reddish. Flowers yellow, almost an inch long. Berries oblong, scarlet. This species grows to a considerable sized tree, affording boards for tables and cabinets, of the softness and grain of elm, whence its name Spanish elm. The cabinet makers, who use it much, call it Prince-wood. Perhaps H. pauciflōra, Willd. rel. in Rœm. et Schultes, syst. 5. p. 207. Stigmas linear-subulate, not pinnatifid, as said by Willdenow. Corollas glabrous, purple. There is a variety of this species having a 6-cleft corolla and 6 stamens.

6 H. suaveōlers (H. B. et Kunth, nov. gen. amer. 3. p. 414.) leaves 3-4 in a whorl, oblong, acuminate, glabrous; cymes branched, of 5-6 rays; flowers almost sessile; corollas tubular, ventricose at the base. Ψ. S. Native of New Granada, on the banks of the Magdalena, near Carapata and Badilla. Duhamélia odorāta, Rœm. et Schultes, syst. 5. p. 207. Stigmas linear-subulate, not pinnatifid, as said by Willdenow. Corollas glabrous, purple. There is a variety of this species having a 6-cleft corolla and 6 stamens.

7 H. chrysaštā (Swartz. prod. p. 46. fl. ind. occ. 1. p. 444.) leaves opposite, oval-oblong, cuneated, acuminate, quite glabrous; racemes terminal; flowers pedicellate; corollas cylindrical. Ψ. S. Native of Jamaica, on the mountains among bushes; and according to Hanke, herb. of Mexico; and at Caracas, according to Vargas.—Browne, jam. 166. t. 14. f. 1.—Plum. amer. ed. Burm. t. 218. f. 1.—Duhamélia chrysaštā, Pers. ench. 1. p. 203. exclusive of the syn. of Jaq. H. pâtens, West. St. Croix. p. 200. Flowers yellow, almost an inch long, inflated in the middle.

8 H. lu'teà (Roht, ex Smith, in Rees’s cyc. vol. 17. no. 4.) leaves opposite, oval, acuminate, acute at the base, glabrous; cymes terminal; flowers almost sessile; corollas short, with a ventricose throat. Ψ. S. Native of Santa Cruz, and at Caracas. H. chrysaštā, Jaq. coll. 3. p. 204. icon. rar. 2. t. 335. but not of Swartz. Hamélia species, no. 2 without a name. West. St. Cr. p. 273. Corollas yellow, 4-5 lines long.

**Yellow-flowered** Hamelia. Shrub 4 to 5 feet.

9 H. axilērīs (Swartz, prod. p. 46. fl. ind. occ. 1. p. 443.) leaves opposite, ovate-lanceolate, glabrous; stem suffrutescent; cymes bifid or trifid, pedunculate, rising from the forks of the branches; flowers secund, sessile; corollas tubular, pentagonal; berry oval-oblong, crowned by the 5 distant subulate teeth of the calyx. Ψ. S. Native of Jamaica, in rocky places among...
bushes; and of St. Domingo near rivers. Branches sub-herbaceous. Flowers pale yellow. Berries small.

Var. β, appendiculata (D. C. prod. 4. p. 442.) leaves on longer pedioles, and more distinctly acuminate.  

H. S. Native of Porto Rico. H. appendiculata, Gaertn. fil. carp. 3. p. 64. t. 91. f. 4. H. lócida. Desf.

10 H. Rostrata (Bartl. in herb. Henke, ex D. C. prod. 4. p. 442.) leaves usually opposite, rarely 3 in a whorl, ovate, acuminate, downy beneath, as well as the pedioles and branchlets; cymes terminal, 3-4-parted, downy; corollas glabrous; berries ovate-globose, glabrous, beaked.  

H. S. Native of Mexico, at Acapulco. Branches terete or trigonal.

Beaked-berried Hamelia. Shrub 4 to 5 feet.

Cult. All the species of this genus are very ornamental while in blossom. They are free flowerers and of easy culture. A mixture of loam and peat is the best soil for them; cuttings strike root freely in the same kind of soil, under a hand-glass, in a moist heat.

Lin. syst. Pentandria, Monogynia. Flowers incompletely unisexual by abortion. Limb of calyx tubular, 5-toothed. Corolla tubular, longer than the calyx; limb spreading, 5-parted: segments ovate, acute. Stamens 5, almost sessile, inserted in the tube; anthers linear, incised. Style simple, in the male flower it is clavate, striated, and terminated by an acute simple stigma; in the female and hermaphrodite flowers the anthers are shorter than in the males, and the stigmas are 5 and linear. Berry somewhat corticate, globose, depressed, crowned by the tubular limb of the calyx, 5-celled; cells many-seeded. Seeds wrapped in thin pulp.—A small tree. Leaves opposite, coriaceous, oblong, acuminate. Stipulas rather connate, entire, acute. Flowers solitary or in fascicles, terminating the branches, cream-coloured, almost sessile.—Habit of Génipôa.

1 A. edulis (A. Rich. l. c.).  

Cult. See Hamelia above for culture and propagation.

Lin. syst. Pentáctandra, Monogynia. Calyx with an ovate tube, and a short truncate or sub-dentilicate limb. Corolla funnel-shaped, with a terete tube, and a rather dilated pilose throat; lobes or segments 5-8, spreading, thickened inside, and sometimes furnished with a retrograde callous toothlet. Anthers 5-8, sessile, linear, inserted in the throat of the corolla, hardly exserted. Style short; stigma bifid (ex Vahl and Rich), quadrifid (ex Swartz). Berries pea-formed, 3-4-sided, crowned by the limb of the calyx, 2-4-celled; cells many-seeded. Seeds very minute, nestling in the pulp.—Glabrous radicant shrubs, growing on trees. Leaves petiolate, oval or lanceolate, coriaceous. Stipulas oval-oblong, falling off at length, but those at the base of the peduncles are more permanent, and may be called bracteas. Peduncles solitary or numerous, longer than the pedioles. Flowers 4-12 together, sessile, capitulate, girded by an orbicular, entire, or rather lobed involucrum, which is formed from two or more bracteas.

1 S. capitâta (Vahl, cl. 1. p. 35. t. 5, exclusive of the syn. of Swartz) leaves elliptic, bluntish, but more acute at the base; peduncles solitary, terminal; head of flowers girded by a sublobe involucrum; limb of calyx truncate, quite entire; corolla 5-6-lobed.  

Capitate-flowered Schraderia. Shrub cl.

2 S. Brasileíssis (Mart. in Schultes, syst. 7. p. 164.) leaves elliptic, obtuse; peduncle terminal, solitary; head of flowers surrounded by an entire involucrum; limb of calyx quite entire; corolla 5-6-lobed: the segments reflexed.  

H. S. Native of Brazil, in woods at Lake d’Almada, in the province of Bahia.

Brazilian Schraderia. Shrub cl.

3 S. cephalôtes (Willd. spec. 2. p. 238.) leaves oblong, acuminate; peduncle terminal, solitary, short; head of flowers surrounded by an entire involucrum; limb of calyx somewhat denticulated; corolla 7-8-lobed.  

4 S. polyce’phala (D. C. prod. 4. p. 444.) leaves ovate, acute; peduncles numerous, terminal; heads surrounded by an entire involucrum; limb of calyx quite entire; corolla 5-lobed.  

H. S. Native of French Guiana, where it was collected by Patris. Berries ovate, crowned by the entire limb of the calyx, 2-3-celled; cells many-seeded.

Many-headed Schraderia. Shrub cl.

Cult. The species of this genus are elegant when in flower. Vegetable mould is the best soil for them; and they will be easily increased by separating the rooted branches.

XCVII. BRIGNOLIA (in honour of J. L. Brignoli, a professor of Verona, author of Fasciculus rarioorum plantarum Forajuliensium, 4to. Urbina, 1810). D. C. diss. ined. with a figure, prod. 4. p. 444. but not of Bertol.

Lin. syst. Hexántandra, Monogynia. Calyx with a short roundish tube, and a 4-toothed limb; 2 of the teeth larger than the other 2, and probably made up of 2 combined ones. Corolla with a short tube, and a 6-lobed limb; lobes linear-oblong, bluntish, longer than the tube, very hairy inside as well as the throat. Stamens 6, inserted in the tube, alternating with the lobes; filaments very short; anthers linear. Style filiform; stigma capitate, undivided. Fruit globose, fleshy, many-seeded, crowned by the calyx. The rest not sufficiently known. A shrub or tree. Branches terete, villous. Leaves opposite, petiolate, oval-oblong, obtuse at the base, acuminate at the apex, downy on the pedioles and nerves, the rest glabrous. Stipulas twin on both sides, lanceolate, acuminate, but when young combined into an inter-petiolar stipula, but at length separating from the base to the apex into 2 parts each. Corymbs terminal, pedunculate, with a short hairy rachis, and downy crowded, trichotomous branches. Bracteas ciliato. Flowers sessile in the forks of the corymb, and at the tops of the pedioles.—This genus is nearly allied to Iserita, but from the fruit not being sufficiently known, its place in the order is very doubtful.

1 B. acuminâta (D. C. prod. 4. p. 444.).  

H. S. Native of Trinidad, where it was collected by Lockhart. Leaves almost
a foot long and 3 inches broad, pale beneath. Petioles 8-12 lines long, a little longer than the stipulas. Corymbs much shorter than the leaves.

_Acuminate-leaved Brignolia_. Shrub. 

_Cult._ For culture and propagation see _Hamelia_, p. 542.

_Lin. syst._ **Pentádria**, _Monogyniá_. Calyx with an ovate tube, and a short, entire, urceolate, tubular, somewhat pentagonal limb, with a very short 5-toothed sinuate border. Corolla tubular, hardly dilated towards the apex, with a 5-parted limb: having the segments long-acuminate, and the inner surfaces clothed with dense silky down. Stamens 5, inserted in the tube; filaments short; anthers cordate-oblong, inclosed. Style simple. Berry roundish, crowned by the limb of the calyx, 4-6 but usually 5-celled; cells many-seeded. Seed very minute, fixed to a rather fleshy, 2-lobed, prominent trophosperm.—Small perennial, glabrous shrubs. Leaves opposite, petioled, ovate-oblong, acute at both ends. Stipulas solitary, short, broad, acute, permanent. Peduncles axillary, short, 1 or few-flowered.

1 P. _Guianénis_ (Aubl. guian. 1. p. 196. t. 77.) leaves on long petioles; pedicels numerous, 1-flowered, shorter than the petioles. _h._ S. Native of Guiana, in marshes. Leaves a foot long and 4 inches broad. Berries green.

_Guiana Patima_. Shrub 2 to 3 feet.

2 P. _Forsythii_ (D. C. prod. 4. p. 444.) leaves hardly petiolate; racemes few-flowered, longer than the petioles. _h._ S. Native country as well as the flowers known. This plant was received from Mr. Forsyth under the name of _Patima Guianénis_ of Aubl. but differs from the plant of Aubl. in the characters indicated.

_Forsythi's Patima_. Shrub 2 to 3 feet.

_Cult._ For culture and propagation see _Hamelia_, p. 542.

**XCIX. POLYPHYRÁGMON (from _poly_, _poly_, many, and _phyragmos_, _phragmas_, a dissepiment; there is a small transverse sepals separating each seed).** Desf. mem. mus. 6. p. 5. t. 2. Juss. mem. mus. 6. p. 399. D. C. prod. 4. p. 445.

_Lin. syst._ **Decándria**, _Monogyniá_. Calyx with an ovate tube, and a short, permanent, entire, or 5-toothed limb. Corolla salver-shaped, bristly, with a terete tube, and a 10-parted limb; lobes elliptic-oblong. Stamens 10, inserted in the middle of the tube of the corolla; anthers linear, inclosed. Style 1, thickened, furrowed lengthwise; stigmas 6-7 or more. Berry globose, 10-20-celled. Seeds oblong, disposed in 1 row in each cell, and as if they were imbricated, separated by small transverse dissepiments.—Shrubs. Leaves opposite, oval, lanceolate, acuminate at both ends, clothed with adpressed silky down beneath. Stipulas deciduous. Peduncles short, axillary, 1-flowered.

1 P. _seáneum_ (Desf. mem. mus. 6. p. 6. t. 2.) calyx quite entire. _h._ S. Native of the Island of Timor. _Silky Polyphyragmon_. Shrub.

2 P. _mixtus_ (A. Rich. diss. ex D. C. prod. 4. p. 445.) calyx 5-toothed. _h._ S. Native country unknown. _Erfthisál uniflóra_, Gaertn. fil. carp. 3. p. 93. t. 196. f. 4. Perhaps this plant is referred to _Timóneá_.

_Smaller Polyphyragmon_. Shrub. 

_Cult._ For culture and propagation see _Hamelia_, p. 542.

**C. MORELIA (evidently called after some person of the name of Morel, of whom we know nothing)._** A. Rich. mem. soc. hist. nat. par. 5. p. 23. D. C. prod. 4. p. 617.

_Lin. syst._ **Pentádria**, _Monogyniá_. Limb of calyx marginal, erect, nearly entire. Corolla short, tubular, with a 5-parted limb; segments lanceolate, spreading, imbricate in aestivation. Stamens 5, inserted in the throat, exserted; anthers linear. Style simple, thickened and fusiform towards the apex; stigma bifid: lobes approximate. Ovarium 4-5-celled; cells 3-5-ovulate; ovula fixed to the inner angle of the cell. Fruit rather fleshy, 4-5-celled; cells 2-3-seeded, crowned by the short neck of calyx.—A small glabrous tree, native of Senegal, with the habit of _Bacónia_. Branches terete, cinnereous, glabrous. Leaves opposite, elliptic, coriaceous, glabrous. Stipulas inserted, deciduous. Flowers axillary, racemose; racemes somewhat trichotomous.

1 M. _Senegálensís_ (A. Rich. l. c.). _h._ S. Native of Senegal, where it was collected by Leprieur and Perrottet. _Senegál Morelia_. Shrub. 

_Cult._ For culture and propagation see _Hamelia_, p. 542.

**Tribe VI.**

**CORONÍREÆ** (this tribe contains plants agreeing with the genus _Cordiera_ in having bacate many-celled fruit, and in the cells being 1-seeded). A. Rich. mem. soc. hist. nat. par. 5. p. 107 and 222. D. C. prod. 4. p. 445. Fruit bacate, of many seeds. This differs from _Tribe Guettardaceae_ in the fruit not containing pyrenes, but true cells; and from _Tribe Ha-melíaceae_ in the cells being 1-seeded, not many-seeded.

_Lin. syst._ **Penta-Hexándria**, _Monogyniá_. Limb of calyx 5-6-toothed, wide. Corolla with a shortish tube, a naked throat, and a 5-6-parted limb; segments narrow, spreading. Stamens 5-6, inserted in the throat of the corolla, exserted; filaments short; anthers linear. Stigmas 2, linear, shorter, somewhat recurved, exserted. Ovarium 2-celled; cells biovulate; ovula collateral.—Shrubs. Leaves opposite, linear-lanceolate, gradually tapering at the base, and joined by the broad, acuminate, entire stipulas. Flowers downy, almost sessile, crowded in the axils of the leaves.

1 T. _Angolésis_ (A. Rich. l. c.). _h._ S. Native of Angola. _Angola Tricalýsiá_. Shrub. 

_Cult._ For culture and propagation see _Hamelia_, p. 542.

_Lin. syst._ **Monóecia**, _Pentádria_. Flowers unisexual, with the sexes on different branches. Male flower. Calyx cup-shaped, solid, with an entire limb. Corolla salver-shaped, with a long tube, which gradually tapers to the apex, and is a little incurved, coriaceous, shining, and as if it were horny; with a 5-parted limb: having oblong acute lobes, and a very narrow naked throat. Stamens 4-5, inclosed, inserted in the middle of the tube; anthers rising from the bottom of the calyx. Styles only vestiges.—Female flower. Calyx sub-globose, adnate to the ovary, with an entire marginal limb. Corolla straight, less attenuated at the apex than in the male flowers, with a 4-5-parted limb. Stamens small, abortive. Disk depressed in the middle. Stigmas 4-5, subulate. Berry globose, depressed, umbilicate, fleshy, 4-8-celled; cells 1-seeded. Seeds black, smooth. Albumen fleshy. Embryo parallel with the hynum, having a terete radicle, and subcordate cotyledons, which are the length of the radicle.—Bushy shrubs, 4-5 feet high. Leaves opposite, elliptic, acuminate, glabrous; stipulas very acute, combined at the base. Flowers white, occupying the tops of the branches: male ones by threes, sessile, girded by 4 scale-formed brac-
teas: the female ones solitary, and furnished with 4 bracteas each.

1 C. triflora (D. C. prod. 4. p. 445.).  h. S. Native of Guiana, on the banks of the river Kourou.

Three-flowered Cordyera. Shrub 4 to 5 feet.

Cult. For culture and propagation see Heliamia, p. 542.

Tribe VII.

Sub-tribe I. Morindæ (this sub-tribe only contains the genus Morinda). D. C. prod. 4. p. 446. Flowers and fruit collected into heads and combined.

LIN. SYST. Pentândria, Monogynia. Tube of calyx obvolute, usually combined with those nearest it: limb short, hardly toothed. Corolla funnel-shaped, with a nearly terete tube, and a spreading, 5-lobed, rarely 4-lobed limb. Stamens 5, rarely 4; filaments short; anthers inclosed, except in one species. Style filiform, usually exserted; stigma bifid, except in one or two species, in which it is entire. Berries containing 2-4 1-seeded pyrenes each, usually combined, compressed or angular from being so close together, areolate from the vestiges of the calyx. Embryo terete, in fleshy albumen.—Shrubs or small trees, natives within the tropics. Leaves opposite, rarely 3-4 in a whorl. Stipulas intrapetiolar, usually obtuse and membranous. Peduncles solitary or numerous, axillary or terminal, sometimes combined at the base, when this is the case they are said to be branched. Flowers aggregate, sessile, upon a sub-globose naked receptacle, forming dense, globose, or ovate heads: having the berries at length combined into a spurious fruit or compound berry. The bark of the roots is styptic, and is used by dyers.

SECT. I. Roöc (Roöc is the American name of M. Royoc). Plum. gen. 11. t. 26. D. C. prod. 4. p. 446.—Morinda of most authors. Flowers pentamous, pentandrous. Stigma bifid. Berries containing 2-4 1-seeded pyrenes each.

* Peduncles terminal, twin, or lateral and opposite the leaves, in the latter case one of the opposite leaves is deficient or half abortive.

1 C. citrifolia (Lin. spec. 250.) plant glabrous, almost arboreous; branchlets tetragonal; leaves oblong, attenuated at both ends, shining; stipulas semi-lunar, membranous, obtuse; heads on short peduncles, opposite the leaves, bracteless; berries combined into an ovate mass.  h. S. Native of the East Indies, as in Malabar and Pegu, &c. as well as of the Society Islands. Gaertn. fruct. 1. p. 144. t. 29. Roxb. fl. ind. 2. p. 196. Ham. in Lin. trans. 15. p. 533. Lour. coch. p. 140.—Rheed. mal. 1. p. 97. t. 52.—Rumph. amb. 3. p. 158. t. 99. Peduncles opposite to a solitary leaf, on the upper side of the branchlets, each supporting a small head of small white flowers. Anthers half hid in the tube of the corolla. Berries combined in the head, white and polished. The root of this species is employed by the natives of India to dye red.

Var. β. papyracea (D. C. prod. 4. p. 446.) leaves oblong, acuminate at both ends, on long petioles, papery; stipulas triangular.  h. S. Native of the East Indies, where it was collected by Labillardiere.

Var. γ. latifolia (D. C. l. c.) leaves ovate, blunt at the base, hardly acute; stipulas broad, membranous, very blunt.  h. G. Native of the Islands of O-Wahu and Radak, where it was collected by Chamissus. M. citrifolia, Cham. et Schlecht. in Linnaea. 4. p. 149.

Citrin-leaved Indian-mulberry. C1t. 1793. Tree small.

2 M. tinctoria (Roxb. fl. ind. 2. p. 197.) glabrous and somewhat arboreous; leaves oblong, almost sessile, smooth, but not shining; peduncles opposite the leaves, solitary, much longer than the petioles; heads ovate; stamens inclosed.  h. S. Native of the East Indies, almost everywhere. M. citrifolia, Hunt. in asiat res. 4. p. 35. Trunk seldom above a few feet in height, but supporting a pretty large shady head of branches. Leaves pale beneath, from 6-10 inches long. Peduncles supporting an oval head of pure white jasmine-like sweet-scented flowers. Fruit like that of M. citrifolia. The bark of the root is used to dye red; the colour is fixed with alum, but it is neither bright nor durable. In some parts of India it is cultivated for the sake of its roots. In the Cirears the dyers use the bark of the fresh roots bruised and gently boiled in water for a short time. The cloth or yarn is prepared in a cold infusion of the powdered galls of Terminâlia Chebula, in milk and water; it is then dried and moistened with alum water, and again dried, and receives from the above decoction a pretty bright but fugitive red. The green fruit are picked by the Hindoos, and eaten with their curries. The wood is hard and very durable, variegated with red and white, and is employed for gun-stocks in preference to all other kinds.

Dyers' Indian-mulberry. Tree small.

3 M. bracteata (Roxb. fl. ind. 2. p. 198.) glabrous and sub-arborescent, stiff; leaves oblong, shining, on short petioles; stipulas large, semi-circular at the apex; peduncles solitary, opposite the leaves, bracteate.  h. S. Native of the East Indies, in the Gamjam district; also of the Moluccas and Philippines. Cham. et Schlecht. in Linnaea. 4. p. 149. Ham. in Lin. trans. 15. p. 534. Blum. bijdr. p. 1006.—Rumph. amb. 3. p. 157. t. 98. Leaves deep green and polished on both sides. The crown of the gern has frequently a small portion of it growing to be a long linear-lanceolate leaf. The anthers are inclosed, and the stigma exerted, as in most of the other species of the genus. Peduncles supporting each a small head of small pure white flowers. Berries combined, 4-seeded. Corolla with a very villos throat.

Bracteate Indian-mulberry. Tree small.

4 M. exserta (Roxb. fl. ind. 2. p. 199.) arboreous; branches somewhat tetragonal, sometimes villous; leaves on short petioles, oval, acute, smooth, or downy beneath; stipulas emarginate; peduncles opposite the leaves, generally solitary, but sometimes rising by twos or threes; heads roundish; stigma inclosed; stamens exerted.  h. S. Native of Bengal. Branches spreading in every direction. Peduncles supporting each a head of many pure white jasmine-like flowers. Berries 4-seeded, combined.

Exserted-stamened Indian-mulberry. Shrub 6 to 12 feet.

5 M. geminata (D. C. prod. 4. p. 447.) branches tetragonal, puberulous; leaves obvolute or oval, inclosed at the base, hardly petiolate, rather downy beneath; peduncles twin, opposite the leaves; stigma and anthers at the throat.  h. S. Native of
Gambia and Casamancan, among bushes, where it was collected by Leprieur and Perrottet. Flowers white.

**Twin-peduncled Indian-mulberry.** Shrub.

6 M. *multiflora* (Roxb. fl. ind. 2. p. 200.) sub-arborescent; leaves oval-oblong, acute, with undulated margins, downy on both sides, but particularly so beneath; peduncles terminal and opposite the leaves, solitary or twin or tern, villous, usually compound; heads nearly globose, many-flowered. *f. S. Native of the East Indies, in Berr. Stamens inclosed, Style exerted. Berries combined in a head, about the size of a mulberry, each containing 4 seeds. This plant is cultivated about Nagpore for the sake of its roots, as the other species are in various other parts of India, and for the same purpose.

**Many-flowered Indian Mulberry.** Tree small.

7 M. *pure-scens* (Smith, in Rees’s cyc. vol. 24. no. 3.) young branches tomentose; leaves elliptic-lanceolate, acuminate at both ends, scabrous, but with villous veins; peduncles hairy, opposite the leaves, and terminal; heads globose, few-flowered; corollas elongated, almost glabrous. *f. S. Native of the Mauritius.

**Downy Indian-mulberry.** Tree or shrub.

8 M. *serrata* (Ham. in Lin. trans. 13. p. 535.) shrubby, erect, glabrous; leaves elliptic or lanceolate, undulated; peduncles naked, opposite the leaves, solitary, twice the length of the petioles; heads ovate, nodose in the fructiferous state from the berries being prominent. *f. S. Native of the East Indies, among bushes at Campurra. Berries of a livid whitish colour: having the pulp white and diaphanous, each containing 4 seeds never combined or conformed, many of them abortive.

**Squarrose Indian-mulberry.** Shrub.

9 M. *angustifolia* (Roxb. fl. ind. 2. p. 201. but not of Roth.) shrubby, erect, glabrous; leaves elliptic or lanceolate, blistered, almost sessile; stipulas somewhat coriaceous, united into a ring; peduncles short, solitary, almost terminal, but usually opposite the leaves; heads globose, many-flowered; berries distinct in the head. *f. S. Native of the East Indies, at Chittagong. Roxb. cor. 3. t. 237. Peduncles seemingly terminal when they begin to blossom, but soon afterwards a branch shoots out from between each peduncle and its respective opposite leaf, which marks their proper situation to be opposite the leaves, supporting each a head of pure white jasmine-like flowers. Anthers hid in the middle of the tube. Berries succulent, of a deep shining black, with very dark-coloured pulp, containing 4 seeds each. The root of this species is used by the natives of India for dyeing, where the plant is in plenty.

**Narrow-leaved Indian-mulberry.** Fl. April, July. Clt. 1816. Shrub 4 to 5 feet.

10 M. *ferrugineola* (Ham. in Lin. trans. 13. p. 533.) suffruticose, diffuse, glabrous; branches tetragonal; leaves elliptic, acute, on short petioles; stipulas subulate, longer than the petioles; heads sessile, solitary, opposite the leaves, usually containing about 10 flowers, and sometimes binate by a leaf. *f. S. Native of Pegu and Ava, in woods. Corolla incurved, much longer than the head.

**Peach-leaved Indian-mulberry.** Shrub 1 to 2 feet.

11 M. *turbae’ensis* (H. B. et Kuth, nov. gen. amer. 3. p. 380.) shrubby downy, twining; leaves oboviate-oblong, acute; stipulas connate at the base, acute, downy; heads terminal and opposite the leaves, on very short peduncles; corollas villous on the outside. *f. S. Native of New Granada, between Turbaco and Cartagena. Flowers white.

**Turbaco Indian-mulberry.** Shrub cl.

**Terminal peduncles twin, but the lateral and axillary ones are solitary.**

12 M. *Routo* (Lin. spec. 250.) glabrous, procumbent at the vol. iii.

Rubiaceae. CIII. Morinda.

545

13 M. *longiflora*; a branched rather climbing shrub; leaves elliptic-lanceolate, acuminate; peduncles short, axillary, bearing each a head of 6-7 flowers. *f. S. Native of Sierra Leone, among bushes. Corolla white, with a very long tube.

**Long-flowered Morinda.** Shrub cl.

14 M. *multipulchra*; shrubby; branches rather quadrangular; leaves broad, oblong, acute, membranous, veiny; peduncles axillary, bearing each a head of 9-10 flowers. *f. S. Native of Sierra Leone, among bushes on the mountains, and in the lowlands. (V. S. in herb. Lamb.)

**Quadrangular-branched Indian-mulberry.** Shrub 8 to 4 ft.

15 M. *pedunculata* (H. B. et Kuth, nov. gen. amer. 3. p. 380.) glabrous, erect; leaves elliptic-oblong, acuminate, shining; stipulas short, connate, acuminate; heads axillary, on long peduncles; bacteas ovate, acuminate. *f. S. Native of South America, in woods on the banks of the Orinoco, near San Borja. Branchlets tetragonal. Corolla white, glabrous. Tube of calyx downy.

**Peduncular-flowed Indian-mulberry.** Shrub 4 to 5 feet.

16 M. *retusa* (Lam. and Poir. dict. 4. p. 316.) arboreous, glabrous; leaves obolate, obtuse, attenuated at the base, on short petioles, shining above; stipulas connate, membranous, obtuse; heads globose, on short peduncles, terminal? *f. S. Native of Madagascar, where it is called Lingo. Poiré says, in his diagnosis of this species, that the heads are lateral, but in his description he says they are exactly terminal.

**Retuse-leaved Indian-mulberry.** Tree.

17 M. *palmetorux* (D. C. prod. 4. p. 448.) shrubby, glabrous; leaves oval-lanceolate, acuminate, on short petioles; stipulas broad-ovate, cupulate, membranous, foliaceous; heads almost terminal, solitary, globose, on peduncles, which are shorter than the leaves. *f. S. Native of Africa, in Cayor and Gambia at the roots of palm-trees, where it was collected by Leprieur and Perrottet. Peduncles variable in length, from 1/2 to 3 inches long. Limb of calyx campanulate, hardly 5-toothed. Corolla villos on the outside. Style short. Anthers almost exerted.

**Palu Indian-mulberry.** Shrub.

18 M. *stenophylla* (Spreng. syst. 1. p. 748.) branches nearly terete, glabrous, but when young rather tetragonal, and clothed with grey tomentum; leaves elliptic-lanceolate, acuminate at both ends, on short petioles, grey from very short tomentum; stipulas lanceolate, at length reflexed; peduncles axillary, solitary, tomentose. *f. S. Native of the East Indies, near Beddir, where it is cultivated for its roots, which are used for dyeing. M. angustifolia, Roth, nov. spec. p. 147. but not of Roxb. The figure in Rumph. amb. 3. t. 98. is sometimes referred to for this species, but is probably distinct.

**Narrow-leaved Indian-mulberry.** Shrub or tree.

19 M. *tomentosa* (Heyn. in Roth, nov. spec. 147.) branchlets angular, glabrous; leaves sub-cordate, ovate, acuminate, clothed with grey tomentum beneath, and on the veins above; petioles long, channelled; peduncles axillary, solitary. *f. S. Native of the East Indies. Perhaps the same as the following, but it differs in the glabrous branches and long petioles.

4 A
Tomentose Indian-mulberry. Shrub.
20 M. Mudia (Ham. in Lin. trans. 13. p. 536.) sub-arborescent; branchlets tetragonal, tomentose; leaves cordate-elliptic, acuminate, tomentose on both surfaces, on very short petioles; stipulas usually bifid; peduncles axillary, solitary, bractless, shorter than the petioles.  ʃ. S. Native of the coast of Coromandel, in the woods of Carnata, where it is called Mudia. Each head contains 5-6 flowers.

Mudi Indian-mulberry. Tree small.
21 M. Chalc'ea (Ham. l. c.) sub-arborescent; branches hexagonal; leaves elliptic, acute, often 3 in a whorl, scabrous above, pubescent beneath, and bearded at the axils of the ribs; stipules semi-circular, often 2-lobed; peduncles axillary, solitary, naked, a little longer than the petioles. ʃ. S. Native of Bengal, in woods at Matsia and Magadha, where it is called Chakhuca, i. e. six eyes, from the heads containing only 6 flowers. The bark of the root is used in dyeing red, like others of the species.

Chakhuca Indian-mulberry. Shrub.
22 M. Nov.dia (Ham. l. c.) sub-arborescent; branches obtuse-angled; leaves opposite, or 3-4 in a whorl, glabrous, elliptic, acute, on very short petioles; stipulas marcescent; heads axillary and terminal, pedunculate, egg-shaped, nodose from many of the berries being abortive. ʃ. S. Native of the East Indies, in the woods of Mithila, where it is called by the natives Koria. Flowers white, large, sweet-scented, 10-12 in each head.

Koria Indian-mulberry. Tree.
23 M. Cor'ia (Ham. l. c.) arboreous; branches with obtuse angles, glabrous; leaves elliptic, acute, undulated, glabrous, on very short petioles; stipulas marcescent; peduncles axillary, and terminal, much longer than the petioles, glabrous, bracteate at the apex; heads roundish. ʃ. S. Native of the East Indies, in the woods of Mithila, where it is called by the natives Koria. Flowers white, large, sweet-scented, 10-12 in each head.

Koria Indian-mulberry. Tree.

** Peduncles crowded, umbellate.**

24 M. Umbell'a (Lin. spec. 250.) arboreous, erect; leaves petiolate, lanceolate-ovate; peduncles crowded, terminating the branches. ʃ. S. Native of Ceylon. This plant is unknown at the present day, and probably the same as M. microcephala. Umbellate-flowered Indian-mulberry. Clt. 1809. Tr. or sh.

25 M. Microce'phala (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) shrub glabrous, climbing a little; branches terete; leaves ovate-oblong, acute; stipulas ovate-triangular, acuminate, 3 times shorter than the petioles; heads pedunculate, 4 together, forming umbels at the tops of the branches. ʃ. S. Native of the Island of Luzon. Flowers white.

Small-headed Indian-mulberry. Shrub cl.

Cochin-china Indian-mulberry. Tree.

27 M. Sc'andens (Roxb. fl. ind. 2. p. 202.) shrubby, climbing; leaves oblong-lanceolate, acuminate at both ends, on short petioles; stipulas membranous, obtuse; peduncles numerous, umbellate, terminal. ʃ. S. Native of the East Indies, on the east side of Point de Galle Bay. Leaves 3 inches long, and an inch broad. Petioles hardly longer than the stipulas. Peduncles 7-8, short. Fruit-bearing heads globose, about the size of a pea. Flowers white, few in each head.

Scandent Indian-mulberry. Shrub cl.

28 M. Sarment'osa (Blum. bijdr. p. 1006.) climbing; leaves oblong-lanceolate, acuminate, glabrous; peduncles terminal by two or three, and twin and axillary, concrete at the base, or they may be said to be solitary and bifid; heads usually containing only 4 flowers. ʃ. S. Native of Java, on Mount Buran-grang in the province of Krawang. Allied to M. scandens.

Twiggy Indian-mulberry. Shrub cl.

29 M. La'xa (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) leaves oblong, acuminate at both ends, membranous, downy beneath as well as on the branchlets; stipulas semi-circular, cuspinate; floriferous branchlets rising from the axis of the superior leaves, opposite, bearing each 2 leaves, and numerous small peduncled heads, which are disposed in an umbellate manner. ʃ. S. Native of Mexico.

Loose Indian-mulberry. Shrub.

Sect. II. Padava'ra (Pada-cara) is the Malabar name of M. tetrandra. D. C. prod. 4. p. 449. Flowers tetramerous, tetrandrous. Style bifid at the apex. Berries containing each 4 1-seeded pyrene. Perhaps a proper genus.

Tetrandrous Indian-mulberry. Shrub diffusely.

31 M. Parviv'olia (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 449.) shrubby, glabrous; sterile branches twining; leaves linear-oblong, cuspitate, glabrous, as well as in the axis of the veins; stipulas combined into a truncate sheath; heads terminal, 4-5 together in an umbel, pedunculate. ʃ. S. Native of the Island of Luzon. Very like the last species, but the number of the parts of the flower is unknown.

Small-leaved Indian-mulberry. Shrub.

Sect. III. Phyllir'eastrum (from Phyllir'eas and astrum, an affixed signification, like; the shrub contained in this section has much the habit of Phyllir'eas). D. C. prod. 4. p. 449. Flowers tetramerous, tetrandrous. Style clavate, undivided. Berries containing each 4 1-seeded pyrene. Perhaps a proper genus.

Phyllir'eas-like Indian-mulberry. Shrub 5 feet.

Sect. IV. Chrysorhiza (from χρυσός, chrysa, gold, and ρηίς, rhiza, a root; the roots are yellow). D. C. prod. 4. p. 450. Flowers pentamerous, pentandrous. Berries 2-celled, 2-seeded, Heads of flowers opposite the leaves. Habit of the other species of Morinda, but probably a proper genus.

33 M. Chry'sorhiza (D. C. prod. 4. p. 450.) shrub much branched; branchlets glabrous; bluntly tetragonal; leaves oblong-elliptic, on short petioles, pubescent in the axis of the veins beneath; stipulas roundish, foliaceous, entire; heads pedunculate, opposite the leaves. ʃ. S. Native of Guiana, where it is called by the natives Boj-togi-ťo. Psychotria? chrysorhiza, Schum. pl. guin. p. 111. Corolla salver-shaped, white. Stigma bipartite.

Golden-rooted Indian-mulberry. Shrub.
34 M. MACROPHYL'LA (Desf. ex. Hort. par. ed. 3. p. 404.) stem erect; branches quadrangular; leaves broad-elliptic, acute, glabrous, on short petioles; stipulas twin, ovate, spreading. nat. S. Native country unknown. Cultivated in the stove of the Jardin du Roi, Paris, but has never flowered.

Long-leaved Indian-mulberry. Shrub. Cult. For culture and propagation see Hamelia, p. 542.

S. SUBSITIIB. GUERRA'EDA (this sub-tribe contains shrubs agreeing with Guettarda in the flowers being distinct.) D. C. prod. 4. p. 450. Flowers distinct, never combined.

LIN. SYST. TETRAN'DRIA, Monogynia. Limb of calyx tubular, with an entire border. Corolla funnel-shaped, 4-cleft, having the throat closed by arched scales or hairs. Stamens 4, inclosed. Ovary conic by a fleshy disk. Style 1. Stigma simple (ex Jack.),—quadrifid (ex Blum.). Drupe baccate, crowned by the annular base of the calyx, containing each 4 triquetrous, 1-seeded, chartaceous arillate pyrene. Embryo erect.—Half parasitical suffruticose plants, tuberous at the base. Leaves opposite, crowded, petiolate, glabrous. Stipulas petiolar, ciliate. Flowers sessile. The germinating plant has a tumid base (ex Blum.).

Unarmed Myrmecodia. Shrub.

2. M. arma'ta (D. C. prod. 4. p. 450.) tubers covered with rows of prickles; leaves oblong-cuneated; limb of calyx quite entire; throat of corolla closed with arched scales; stigma quadrifid. nat. S. Native of the western provinces of Java, in the mountains, upon trees, where it is called by the natives Tankurah. M. tuber'osa, Blum. bijdr. p. 1001.—M. echinata, Gaud. in Freyc. voy. pt. bot. t. 96. has the stem beset with rows of prickles; stipulas twin on both sides, connected by their bases within the petioles into a bifid limb; leaves petiolate, elliptic, acute at both ends; but perhaps both plants are the same. Ar'med Myrmecodia. Shrub. Cult. For culture and propagation see Schrader, p. 542.

LIN. SYST. TETRAN'DRIA, Monogynia. Limb of calyx short, entire. Corolla with a short tube, which is hairy inside, and a flat, 4-lobed limb. Stamens 4, inserted in the throat; filaments short. Style filiform; stigma 2-lobed. Drupe juicy, containing 2 1-seeded pyrene, which are flat inside, and convex on the back, coriaceous. Embryo erect, in the center of the albumen.—False parasitical shrubs, growing upon trees, tuberous at the base. Leaves oval, on short petioles. Stipulas small, linear. Flowers axillary, sessile, white.—Habit of the Myrmecodia.

1. H. FORMICA'RIUM (Jack. l. c. Blum. l. c.) leaves almost sessile, oval, rounded at the apex. nat. S. Native of the Moluccas, Sumatra, and Nusa-Kambanga, upon trees in the woods. Lasiostoma formicarium, Spreng. syst. 1. p. 428. Nidus gérm mins formicarium nigrarum. Rumph. amb. 6. p. 119. t. 55. The trunk of this plant is an irregular tuber, fixed to trees by fibres like the stem of ivy; it is hollow inside, and becomes the nest of black ants.

Ants' Hydnothyrm. Shrub parasitical.

2. H. MON'TANUM (Blum. bijdr. p. 956.) leaves on short petioles, oblong, obtuse. nat. S. Native of Java, on the mountains, in the province of Buitenzorg, upon trees. The base of the stem is swollen, as in the first species. Mountain Hydnothyrm. Shrub parasitical. Cult. For culture and propagation see Schrader, p. 542.

LIN. SYST. TETRAN'DRIA, Monogynia. Limb of calyx small, 4-toothed. Corolla small, sub-campanulate, with a villous throat, and a 4-cleft spreading limb. Stamens 4, inserted in the mouth of the tube; filaments very short. Style short, perforating the disc; stigma bifid in the throat. Drupe crowned by the calyx; 2-celled; cells containing each 2 1-seeded pyrene. Embryo inverted in the albumen.—A shrub, having the habit of Coffea, with divaricate branches. Leaves distich. Flowers densely crowded on sessile hemispherical, axillary receptacles, sessile, bracteate, umbellate; but the fruit is pendicellate.

1. H. flua'scens (Blum. l. c.) nat. S. Native of Java, in woods on Mount Burangrang.

Shrubby Hydnothyrm. Shrub 4 to 5 feet. Cult. For culture and propagation see Hamelia, p. 542.

FIG. 100.

LIN. SYST. TETRAN'DRIA, Monogynia. Calyx with an ovate tube and a small 4-toothed limb. Corolla funnel-shaped, sub-campanulate, 4-cleft (f. 100. b.), glabrous inside. Filaments rising from the bottom of the corolla (f. 100. c.), but not adnate to its tube; anthers roundish, hardly exserted. Style filiform; stigmas 2, hairy (f. 100. d). Berry roundish (f. 100. e), umbilicate, containing 2-4 1-seeded, coriaceous pyrene. Seeds semi-ovate, convex on the outside, flat and furrowed inside. Alumen horny. Embryo dorsal, straight, inverted (ex Gærtn.), erect (ex Pet. Th. and Blum.).—Creeping herbs, with the habit of Michèlla. Leaves opposite, rather fleshy, oval. Stipulas small. Flowers terminal, sessile, solitary, white. Berries red.—Perhaps this genus is sufficiently distinct from Michèlla.

p. 49. N. répens, Ruiz & Pav. fl. per. 1. p. 60. t. 90. The
figure in Smith’s icon. ined. exhibits much exerted anthers, and
the figure of fl. per. a long exerted style, but the figure in
Pet. Th. trist. has neither the anthers nor style exerted. There
are therefore two distinct species confounded under this name.
The specimens from Madagascar have pentameros flowers (ex Rich.),
and those from Java have acuter leaves, on longer peti-
toles than any other; these are probably specifically distinct.

Depressed Nertera. Pl. creeping on the ground.

2 N. adsur’gens (Pet. Th. fl. trist. d’ac. t. 11.) stems root-
ing at the base, but at length ascending at the points; leaves
almost sessile, oval, undulate, with callous edges. 3. F. Native of
the Island of Tristan d’Acuña. Carm. in Lin. trans. vol. 12.
p. 505. Erythrodisa mágus, Pet. Th. fl. trist. d’ac. p. 42. A
larger plant than the preceding.

Rising Nertera. Pl. creeping.

3 N. ? alsismoide (Cham. et Schlecht. in Linneá. 6. p. 413.)
leaves pubescent, and ciliated at first, but at length becoming
glabrous; peduncles axillary, deflexed when in fruit, about equal
in length to the leaves; drupes juicy, globose. 3. F. Native of
Mexico, at Cuesta Grande de Jalacingo. Herb beset with a
few toment white hairs. Drupe bluish-black, containing 2 coria-
ceous 1-seeded pyrene.

Chickweed-like Nertera. Pl. creeping.

Cult. The species of Nertera are small creeping suffruticose
evergreen plants, of little beauty even when in flower; they
grow best in a mixture of turfy peat and sand; and are increased
easily by separating the rooted creeping stems. They may be
planted among the alpine plants in summer, but in winter they
will require the protection of a green-house. They should be
grown in pots well drained with shers, placed in pans of water.

C.VII. MITCHELLA (so named by Linnaeus in honour of
John Mitchell, M.D. a physician in Virginia, who described
many genera of Virginian plants, which were published in act.
mus 6. p. 373. Lam. ill. t. 63. Goertn. fil. carp. 3. p. 70. t.
p. 4. p. 452.—Chamadaphne, Mitch. gen. p. 17. but not of
Buxb.

Lin. syst. Tetrándria, Monogynia. Calyx with an ovate-
globose tube, and a large 4-toothed limb. Corolla funnel-
shaped, with a terete tube, and a 4-loped spreading limb, having
the throat and lobes of the limb hairy inside. Filaments adnate
to the tube, almost to the throat; anthers ovate, hardly excised.
Style filiform; stigmas 4, inclosed. Berries almost globose,
crowned by the teeth of the calyx, containing 4 hardy 1-seeded
pyrene each; and sometimes containing 8, when 2 berries are
combined. Albumen somewhat cartilaginous. Embryo minute,
erect, with very short cotyledons.—American glabrous creeping
evergreen herbs, with the habit of Linneá or Nertera. Leaves
roundish or ovate. Stipulas small, solitary on each side.
Flowers axillary and terminal, sometimes combined by two at
the tops of the peduncle, and sometimes solitary and sessile.

1 M. répens (Lin. spec. p. 161.) leaves roundish; flowers 2
on the top of each peduncle, combined; berries combined. 3. F.
H. Native of North America, from Boston to Carolina; Upper
Canada; and of Mexico between Pueblo-Viejó and Real del
Monte, in shady woods at the roots of trees, and among moss.
—Pluk. alm. t. 444. f. 2.—Cat. car. t. 20.—Petiv. gaz. t. 1. f.
13. Corollas white, tinged with purple, usually 2 together on
the top of each peduncle, and seceded on two combined ovaries;
the flowers are sometimes also combined, and therefore 8-cleft,
according to the obs. of Torrey. Berries red, insipid.

Creeping Mitchellia. Fl. June. Cl. 1791. Pl. cr.

2 M. ováta (D. C. prod. 4. p. 493.) leaves ovate, acutish;

flowers solitary, sessile. 3. F. Native of South America, in
humid places at the foot of the burning mount Tangurugas, in
the kingdom of Quito. Flowers white, solitary, not by twos.
Nertera tetrasperma, H. B. et Kunth, nov. gen. amer. 3. p.

Ovate-leaved Mitchellia. Pl. cr.

Cult. These are small creeping evergreen plants of very little
beauty; they will grow very well in a peat border, or in pots
filled with a mixture of peat and sand, placed among other
alpine plants; they are easily increased by separating the
creeping stems.

CIX. MEPHITIDIA (from mephitis, a damp of the earth;
in reference to the ungrateful smell of the shrubs.) Reinw. in

Lin. syst. Tetra-Hezändria, Monogynia. Limb of calyx
3-6-parted or toothed. Corolla funnel-shaped, regular, 4-
cleft, for the most part hairy. Stamens 4-6, inserted towards
the throat; filaments very short; anthers linear, exserted or
inclosed. Stigmas 4-9, linear, thick. Drupe baccate, crowned
by the permanent calyx, containing 4-9 triquetrous coriaceous
arillate 1-seeded pyrene.—Shrubs or subshrubs, natives of
Indies, usually with an ungrateful smell. Flowers crowded or in
dense heads, axillary, and terminal, baccate. Drupes usually
blue.—This genus, according to Blume, is nearly allied to
Ascyllanthus and Psathhura.

* Limb of calyx 3-6-parted.

1 M. cyanocarpa (Jack, in Lin. trans. 14. p. 125. under
Lasianthus,) plant suffruticose, hairy; leaves oblong, acuminated,
attemuated at the base; flowers usually by threes, involucreted
by bracteas. 3. S. Native of Sumatra and Java, in shady
places on the mountains. Blum. bijdr. p. 996. Bracteas cor-
date. Corollas yellow, ex Jack, white, ex Blume. Berry
blue, pilose, size of a gooseberry.

Blue-fruiting Mephitidia. Shrub.

2 M. attenuata (Jack, l. c. p. 126. under Lasianthus,) plant
suffruticose, villous; leaves oblong, attenuated at the apex, but
roundly cororate at the base, glabrous above; flowers axillary,
3-4-together, almost sessile, involucrated by lanceolate bracteas.
3. S. Native of the interior of Bencoolen. Calyx 4-parted.
Corollas yellow, pilose. Berries deep blue, smaller than those
of the preceding species.

Attenuated-leaved Mephitidia. Shrub.

3 M. inequalis (Blum. bijdr. p. 996. under Lasianthus,
under as well as all the following species,) shruhy, hairy; leaves oblong,
acuminated, unequally rounded at the base; flowers axillary,
crowned, involucreted by bracteas. 3. S. Native of Java, on
mounts Salak and Seribu. Corollas white.

Unequal-leaved Mephitidia. Shrub.

4 M. rhinocerotis (Blum. bijdr. p. 996.) shruhy; leaves
oblong, acuminated, rounded at the base, glabrous above, but
hairy beneath, as well as the branches and calyces; flowers
crowned, axillary. 3. S. Native of Java, in the higher woods
on mounts Salak, Gedé, &c. Corollas white.

Horn-soumd Mephitidia. Shrub.

5 M. capitata (Blum. bijdr. p. 996.) shruhy; leaves oblong-
lanceolate, acuminated, attenuated at the base, glabrous
above, and hairy beneath, as well as the branches, peduncles,
and calyces; heads of flowers pedunculate, axillary. 3. S.
Native of Java, in woods on the mountains. Flowers white.

Capitate-flowered Mephitidia. Shrub.

6 M. tomentosa (Blum. bijdr. p. 997.) shruhy; leaves ob-
long, long-acuminated, acute at the base, glabrous above, but
tomentose on the veins beneath, as well as on the branches; flowers axillary, solitary or twin, sessile. \( \varpi \). S. Native of Java, in woods on mounts Salak, Gede, \&c. Corollas white.

* * * 

** Limb of calyx with short lobes.**

12 M. inodo'ra (Blum. bidjr. p. 998.) shrubby; branches glabrous; leaves oblong or oblong-lanceolate, acuminate at both ends, glabrous, downy on the veins beneath; flowers crowded, axillary,giard by blunt bracteas. \( \varpi \). S. Native of Java, in woods on mount Gede. The leaves of this species are without any ungrateful smell.

*Scentless Mephitidia.* Shrub.

13 M. hexa'ndra (Blum. bidjr. p. 998.) shrubby; leaves lanceolate, long-acuminated, clothed with strigose down on the rib above, and on the veins beneath, as well as the branchlets; flowers axillary, usually solitary, hexandrous. \( \varpi \). S. Native of Java, in the more elevated woods on mount Salak. Corollas white.

*Hexandrous Mephitidia.* Shrub.

** * * * Limb of calyx with short teeth.**

14 M. vex'oša (Blum. bidjr. p. 999.) shrubby; leaves on short petioles, oblong-lanceolate, acuminate at both ends, glabrous, veiny, clothed with adpressed down on the veins beneath, as well as on the branchlets; flowers crowded, axillary, sessile. \( \varpi \). S. Native of Java, in woods on the Scribu mountains. Corollas white.

*Veiny Mephitidia.* Shrub.

15 M. syl'vestris (Blum. bidjr. p. 999.) shrubby; leaves on short petioles, oblong-lanceolate, acuminate at both ends, glabrous, veiny, clothed with adpressed down on the veins beneath, as well as on the branchlets; flowers crowded, axillary, sessile. \( \varpi \). S. Native of Java, along with the preceding, from which it differs in the smaller leaves, which are unequally narrowed at the base, in the fewer and remoter veins, and in the more ostensibly toothed calyx.

*Wild Mephitidia.* Shrub.

16 M. reticula'ta (Blum. bijdr. p. 1000.) shrubby; leaves large, on short petioles, oblong, acuminate, acute at the base, glabrous above, and reticulately veined, rather tomentose on the veins and branchlets; flowers crowded, axillary, almost sessile. \( \varpi \). S. Native of Java, on the Scribu mountains. Flowers white.

*Reticulated-leaved Mephitidia.* Shrub.

17 M. purpure'ea (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, and are as well as the branchlets glabrous; peduncles crowded, 1-flowered, axillary, or lateral from the leaves having fallen. \( \varpi \). S. Native of Java, on mounts Salak, Gede, \&c. in shady places. Flowers purple.

*Purple-flowered Mephitidia.* Shrub.

18 M. stercora'ria (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, acute at the base, glabrous except the veins beneath, which are clothed with adpressed down, as well as the branchlets; flowers crowded, axillary, sessile; fruit globose, containing 7-9 pyrenae. \( \varpi \). S. Native of Java, on the mountains. Allied to M. sylvesteris; but the fruit is evidently distinct. Flowers white.

*Stinking Mephitidia.* Shrub.

*Cult.* See *Hamelia*, p. 542, for culture and propagation.

---

**CX. VANGUERIA**

(altered from *Voo-Vanguard, the Madagascar name of the first species*).

**Lin. syst. Pentandria, Monogynea.** Calyx with a short ob ovate tube, and a small spreading 3-toothed deciduous limb. Corolla campanulate globose, 5-cleft, hairy inside at the throat: lobes lanceolate, acut e, reflexed. Stamens 5, with very short filaments, and oblong hardly exerted anthers. Stigma capitate, (bilamellate, ex Vahl) 4-5 lobed (ex Roxb.). Berry apple-shaped, not crowned at the apex by the calyx, but marked by a sunated areola, indicating the place from which the limb of the calyx had fallen off; containing 5 bony 1-seeded pyrenae, which are obtuse at the base, and acute at the apex. Seed oblong, fixed to the inner angle of the cell, near the middle. Albumen fleshy. Embryo large, inverted, with long plano-convex cotyledons, and a bluntly cordate compressed superior radicle.

—Small trees. Leaves petiolate, ovate. Stipules solitary on both sides, lanceolate. Cymes branched, subpanicled, axillary, or rising beneath the leaves from the cicatrices, occasioned by the falling of the old leaves. Flowers white.—This genus is anomalous in the order, from the structure and situation of the seeds; it is allied to *Cântium*, but differs from that genus in the ovarium being 5-celled, not 2-celled.

1 V. edulis (Vahl, symb. 3 p. 36.) unarmed; leaves ovate, membranous, glabrous; cymes rising beneath the leaves. \( \varpi \). S. Native of Madagascar, from whence it has been introduced to China and the Mauritius. Ram. ill. t. 159. Sieb. fl. mao. exs. 2. no. 77 and no. 138. V. cymo'a, Gaurtn. fil. carp. 3. p. 75. t. 193. V. Madagascaris, Gmel. syst. 1. p. 367. V. Commersòni, Desf. ex Steud. Jacq. hort. vind. 1 t. 44. Vavângga Chinénis, Rohr, and Vavângga edulis, Vahl, act. soc. hist. nat. hafn. 2 pt. 1 p. 207. and p. 208. t. 7. The habit of the tree
RUBIACEÆ.  

CX.  VANGUERIA.  

CXI.  GUETTARDA.

There is much like that of Callicarpa. The fruit is eaten by the natives of Madagascar and the Mauritius under the names of Foa-vanga and Foó-vangier. Flowers white.

Edible-fruited Vangueria.  

2 V. spīnosa (Roxb. fl. ind. 2. p. 172.) spines decussate; leaves ovate-oblong, smooth; cymes axillary, in fascicles.  

Native of Bengal and China; in Bengal it is called Magna. Mýeyna spīnosa, Link, jahrb. 1-3.  

3 C. prod. 4. p. 455. — Guettardia species and Matthiola.  

Lin. syst. Tetra-Enneàndria, Monogynía.  

Calyx with ovate or globose tube; and a tubular permanent or deciduous limb, which is either truncate or irregularly toothed (f. 101. a). Corolla salver-shaped, with a cylindrical tube (f. 101. c), and from 4-9 ovate-oblong lobes (f. 101. b). Anthers 4-9, sessile in the throat of the corolla, inclosed. Stigma capitate, rarely 2-lobed. Drupe roundish or ovate, crowned by the tube of the calyx (f. 101. d), containing a bluntly angled 4-9-celled putamen (f. 101. e), having the cells straight or curved, 1-seeded. Seeds erect, nearly terete.—Small trees or shrubs, natives of South America, and a few of India. Leaves ovate or lanceolate, rarely cordate. Stipulas lanceolate, deciduous, except in one species in which they are sheathing and truncate. Peduncles axillary, bifid, rarely twice bifid. Flowers sessile and unilaterial along the branches of the peduncles, and solitary in the forks.

Sect. I. Cada'mba (vernacular name of G. speciosa).  

D. C. prod. 4. p. 455.—Cada'mba, Sonner. trav. 2. p. 228. t. 128.  

Limbs of calyx soon falling off. Cells of drupe curved at top.  

1 G. speciosa (Lin. spec. 1406.) leaves broad, ovate or oblong, usually subcordate at the base, obtuse and apiculated at the apex, downy beneath; stipulas ovate or lanceolate, acuminate, deciduous; cymes pedunculate, velutin, much shorter than the leaves; flowers of from 4 to 9 parts; fruit depressed, marked by an areola at the apex.  

Native of the East India islands; coast of Coromandel and Malabar, &c. Lam. ill. t. 154. f. 2. Roxb. fl. ind. 2. p. 521. Lindl. bot. reg. t. 1589. Cada'mba jasminiìföra, Sonn. trav. 2. p. 128. Rava-Pou, Reed. mal. 4. p. 47. and 48. Leaves canescent from vili in the young state, but the adult ones only along the nerves. Branches horizontal, forming a large shaggy head. Peduncles twice bifid. Flowers unisexual, large, white, exquisitely fragrant, partaking much of the scent of cloves. Seeds much curved, with the concave part of the curve outwards. Leaves sometimes downy on both surfaces. (f. 101.)  

Var. f., glabratæ (D. C. prod. 4. p. 455.) young leaves downy along the nerves and veins, but the adult ones are glabrous.  

Native of Mexico, but probably only cultivated in gardens. There are varieties of this with the leaves either subcordate or subattenuated at the base.  

Shouy Guettardia.  

Fl. June, July.  

Cl. 1771.  

Tree 30 ft.

Sect. II. Guettardæria (altered from the generic name).  

D. C. prod. 4. p. 455. Limbs of calyx usually permanent, truncate or irregularly subdentate. Corolla silky on the outside, with the lobes flat. Drupe having the cells of the putamen straight.

§ 1. Tube of corolla silky, villous or downy. Drupe containing a 4-7-celled putamen.

2 G. argentea (Lam. dict. 3. p. 54. ill. t. 154. f. 1.) leaves ovate, acuminate, on short petioles, glabrous and smooth above, but clothed with silky velvety down beneath, with the transverse nerves parallel; stipulas villous on the outside, ovate, terminating in a subulate point; cymes pedunculate, bifid, velvety, flowers hexameric, with a villous tube, which is 10 times longer than the ovary.  

Native of Cayenne.  

Silvery Guettardia.  

Tree 20 feet.

3 G. Havane'nsis (D. C. prod. 4. p. 455.) leaves obovate, acutish at the base, and mucronate at the apex, scabrous above, and tomentose beneath; stipulas acuminate, 3 times shorter than the petioles; peduncles hairy, about the length of the leaves; cymes trifid; tube of corolla 4 times longer than the ovary, and the limb 5-6-cleft.  

Native of Cuba, about the Havana. Allied to G. ambigua.  

Flowers white.

Havannah Guettardia.  

Tree.

4 G. Missio'nis (Wall. cat. no. 6221.) leaves oblong, acuminate, paler beneath, glabrous in every part, except on the mid-rib beneath; cymes pedunculate, axillary, dichotomous; calyx 5-parted, permanent; corolla villous on the outside; fruit roundish, crowned by the calyx.  

Native of the East Indies. Stipulas ovate. Flowers white, not so large as those of G. speciosa.

Mission Guettardia.  

Shrub or tree.

5 G. ambigua (D. C. prod. 4. p. 455.) leaves ovate or oblong, coruate at the base, and rather mucronate at the apex, scabrous above, but clothed with downy tomentum beneath; stipulas acuminate, one-half shorter than the petioles; peduncles hairy, about the length of the leaves; cymes bifid; fruit globose, reticulated, crowned by the tubular calyx.  

Native of Guadaloupe, and also of Jamaica, if, as is suspected, this be the Haliaes, P. Browne, jam. p. 205. t. 20. f. 1. Flowers white?

Ambiguous Guettardia.  

Shrub 8 to 10 feet.

6 G. corda'ta (H. B. et Kunth, nov. gen. amer. 3. p. 420.) leaves ovate-elliptic, deeply coruated, rounded at the apex, rather pilose above, and clothed with white tomentum beneath; stipulas ovate, acute, length of petioles; peduncles 3 or 4 times longer than the petioles; cymes 3-flowered; flowers hexameric, with a downy tube, which is 4 times longer than the ovary.
Native of New Granada, near Ibagué and Cuesta de Tolina, in hot places. Said to be nearly allied to G. scabra.

Coriaceous-leaved Guettarda. Tree or shrub.

7 G. rufo-sa (Swartz, prod. p. 59. fl. ind. occ. 1. p. 632.) leaves ovate-subcorporate, mucronate, scarious above, and tomentose beneath; peduncules 3 or 4 times longer than the leaves, compressed, villous; cymes bifid; flowers hexameric, with a villous tube, which is 3 times longer than the ovary. \( \tilde{\text{S}} \). S. Native of the Caribbee islands, as of Santa Cruz, Antigua, and Dominicana. Vahl, symb. 3. p. 50. Tube of corolla an inch and a half long, silky. Very nearly allied to G. scabra, but differs in the nerves of the leaves being less prominent and straight, not reticulated. Drupe purplish, containing a 6-seeded putamen.

8 G. scabra (Lam. ill. t. 154. f. 3.) leaves obovate, mucronate, coriaceous, scarious above, reticulated and pubescent beneath; stipulas lanceolate, acuminate, caducous; peduncles compressed, villous, almost 4 times longer than the pedicels; cymes bifid; limb of corolla 6-7-parted; stematis 6-7; tube of corolla villous, 3 times longer than the ovary. \( \tilde{\text{S}} \). S. Native of the West Indies, as of Porto-Rico. Vent. choix. t. 1. Mathioli scabra, Lin. spec. 1661. Mathioli, Plum. ed. Burm. t. 179. f. 2. Flowers white. Drupe containing an angular 4-7-celled putamen, and crowned by the somewhat crenate limb of the calyx.

9 G. viburnoides (Cham. & Schlecht. in Linnaea. 4. p. 128.) leaves ovate, acute, on long petioles, smoothish above, but not scarious, and clothed with silky tomentum beneath, as well as the branchlets and inflorescence; stipulas elongated, triangular, very soon falling off; peduncles shorter than the leaves, twice bifid, with the branch expanded; limb of calyx very short, somewhat truncate; drupe globose, depressed. \( \tilde{\text{S}} \). S. Native of Brazil within the tropics. Leaves 4 inches long and 2½ broad, on petioles about 15 lines long. Corolla densely clothed with silky down, having the tube almost an inch long, and the limb 4-6-parted.

Fiburnum-like Guettarda. Shrub 10 feet.

10 G. pedunculatis (Wall. cat. no. 6222) leaves ovate-oblong, acuminate, glabrous; peduncles axillary, solitary, 1-flowered, girded by a ring just under the fruit, which is extended into 2 opposite subulate points; fruit oblong, crowned by the 4 permanent teeth of the calyx. \( \tilde{\text{S}} \). S. Native of Srinagar.

Peduncular-flowered Guettarda. Shrub or tree.

11 G. platyrhoda (D. C. prod. 4. p. 456.) leaves oval, mucronate, acute at the base, on short petioles, glabrous and smooth above, but hairy beneath; stipulas triangular, acute; peduncles compressed, smoothish, length of the leaves, cyme at the apex, and bearing 5-7 flowers; limb of calyx short, tubular, a little toothed: fruit globose, depressed. \( \tilde{\text{S}} \). S. Native of Brazil, in the sand by the sea side at Bahia, where it was collected by Salzman.

Broad-peduncled Guettarda. Shrub.

12 G. mollis (D. C. prod. 4. p. 456.) leaves elliptic, somewhat mucronate, downy above and villous beneath; peduncles 5 times longer than the petioles; cymes capitulate, villous; flowers hexameric, with a villous tube, which is 2 or 3 times longer than the ovary. \( \tilde{\text{S}} \). S. Native of St. Domingo. G. elliptica, ex Hispaniola, Spreng. syst. 1. p. 789.

Soft Guettarda. Tree or shrub.

13 G. xylosteoides (B. H. et Kuntth. nov. gen. amer. 3. p. 420.) leaves oblong, acute, rounded at the base, glabrous above, and downy beneath, but hairy on the veins, as well as on the branchlets; stipulas lanceolate, length of the pedicels; peduncles 6 times longer than the petioles; cymes 3-7-flowered; flowers hexameric, having the tube 8 times longer than the ovary. \( \tilde{\text{S}} \). S. Native on the banks of the Orinoco, between Angustura and Ferreras. Dicrónbyrum divaricatum, Wild. in Schultes, syst. 5. p. 221. Flowers white. Fruit globose, downy, containing a 5-celled putamen.

Fly-Honeysuckle-like Guettarda. Tree 20 feet.

14 G. parviflora (Vahl, ecol. amer. 2. p. 26.) leaves oblong, polished, and glabrous on both surfaces, but having the middle nerve rather downy; stipulas small, subulate; peduncles crowded at the tops of the branches, rather shorter than the leaves, 3-flowered, rarely bifid, each branch bearing 3 flowers; flowers small, either pentamerous or hexameric; ovary striated; tube of calyx often obscurely bifid; tube of corolla villous. \( \tilde{\text{S}} \). S. Native of Santa Cruz, Montserrat; and of Mexico, at Acapulco. Edechei, Laefl. trav. 259, and p. 271. ex Rohr. Ixora pentandra, West. ms. Fruit globose, about the size of a pea, not crowned.

Small-flowered Guettarda. Shrub 6 to 8 feet.

15 G. odorata (Lam. ill. t. 154. f. 4.) leaves oval, acute at both ends, glabrous above, but rather villous on the nerve beneath, as well as on the petioles and branchlets; stipulas subulate, deciduous; peduncles almost one-half shorter than the leaves, villous, as well as the cymes, which are bifid; flowers pentamerous; tube of calyx unequal, 7 times longer than the ovary. \( \tilde{\text{S}} \). S. Native about Carthagena and Havana, among bushes by the sea side. Laugèria odorata, Jacq. amer. p. 64. t. 177. f. 91. pict. t. 259.

f. 16. Drupe containing a roundish 5-furrowed 5-celled putamen. Flowers of a dirty reddish colour, 9-10 lines long, villous on the outside, very sweet-scented at night. Fruit black, size of a pea. There is a spinaceous variety of this species according to Jacquin.

Sweet-scented-flowered Guettarda. Clt. 1818. Sh. 6 to 10 ft.

16 G. membranacea (Swartz, prod. p. 59. fl. ind. occ. 1. p. 635.) leaves ovate, acuminate, membranaceous, rather hispid on both surfaces; down very minute, curved; peduncles length of the pedicels, dichotomous; flowers secund, tetramerous; limb of calyx rather bifid, truncate; tube of corolla downy. \( \tilde{\text{S}} \). S. Native of Hispaniola, among bushes on the mountains. Corolla white, half an inch long. Drupe oblong, 4-seeded.

Membranous Guettarda. Shrub.

17 G. elliptica (Swartz, prod. p. 59. fl. ind. occ. 1. p. 634.) leaves elliptic, obtuse, smoothish above, and downy beneath, as well as on the branches; peduncles shorter than the leaves; cymes bifid; flowers tetramerous, with a silky tube, which is 3 times longer than the calyx. \( \tilde{\text{S}} \). S. Native of Jamaica, in dry fields. Drupe roundish, 4-seeded. Stigmae 2, blunt. Flowers small. This species is easily distinguished from G. mollis, with which it has been confused by Sprengel in his syst. Elliptic-leaved Guettarda. Tree 20 feet.

18 G. microphylla (Bartl. in herb. Hækne, ex D. C. prod. 4. p. 457.) leaves ovate-oblong and oblong, smoothish above, and rather downy beneath; peduncles 3 or 4 times shorter than the leaves, 3-flowered; calyx quadridifid, with acute segments; corolla silky on the outside, with rounded lobes. \( \tilde{\text{S}} \). S. Native of Luzon, one of the Philippines. Very like G. pareflora.

Small-leaved Guettarda. Shrub.

19 G. uruguayensis (Cham. & Schlecht. in Linnaea. 4. p. 183.) leaves elliptic-oblong, acuminate, rather pilose above, and

FIG. 101.
Rubiaceae. CXL. Guettarda.

Canescent from tomentum beneath, as well as the petals, branchlets, and inflorescence; stipulas lanceolate, triangular, caduceous; peduncles twice bifid, shorter than the leaves; limb of calyx very short, somewhat truncate; corolla silky; drupe oblong, 3-4-seeded. Υ. S. Native of the south of Brazil, on the banks of the Uruguay. Leaves 2 inches long, and an inch broad, on pedioles 1-2 lines long. Tube of corolla 2-3 lines long; lobes 5, roundish.

Uruguay Guettarda. Shrub 10 feet.

20 G. Finlaysoniana (Wall. cat. no. 6223.) leaves obovate-oblong, obtuse at the apex; calyx truncate; pedicels solitary, axillary, 1-flowered, much shorter than the leaves; corolla villose outside. Υ. S. Native of the East Indies.

Finlayson’s Guettarda. Shrub.

21 G. Wallychiana (leaves oblong, acuminate, glabrous; pedicels 1-flowered, rising in numbers from short axillary peduncles; calyx truncate; corolla glabrous, apparently purple, ½ inch long. Υ. S. Native of the East Indies; fruit roundish, not crowned. Perhaps belonging to the first section.

Wallych’s Guettarda. Shrub.

§ 2. Doubtful species, having 4-cleft silky corollas, and the drupes containing a 2-3-celled putamen. Perhaps species of the genus Stenostomum.

22 G. ? protracta (Bartl. in herb. Haecke, ex D. C. prodr. 4. p. 457.) leaves ovate or ovate-lanceolate, acuminate, rather villous on both surfaces, silky on the nerves and veins beneath; peduncles cymose, bifid, having the branches recurved. Υ. S. Native of Mexico. Perhaps a species of Stenostomum.

Var. β. longipes (D. C. l. c.) leaves ovate-lanceolate, with 7-8 rather prominent nerves on each side of the mid-rib; peduncles 4 times longer than the petioles; drupes ovate-oblong, acute, 2, sometimes 3-celled. Υ. S. Native of Mexico, at Acapulco.

Protracted Guettarda. Shrub.

23 G. ? armata (Bartl. in herb. Haecke, ex D. C. prodr. 4. p. 457.) armed with opposite spines; leaves ovate, acuminate, smoothish above, but clothed with hoary tomentum on the nerve and veins beneath, as well as on the branchlets; peduncles cymose, bifid, 3 or 4 times longer than the petioles; segments of calyx 4, narrow-lanceolate, acute; corolla silky, with acute lobes; drupe ovate-oblong, (ex Bartl.) 2-3-celled. Υ. S. Native of Mexico. Very nearly allied to G. protracta.

Armed Guettarda. Shrub 6 to 8 feet.

24 G. ? paniculata (Bartl. in herb. Haecke, ex D. C. l. c.) leaves ovate, acuminate, glabrous above, clothed with silky tomentum on the nerve and veins beneath, as well as on the branchlets; cymes dichotomous, many-flowered, on long peduncles, axillary, but the ultimate ones are disposed in a panicle; corolla clothed with silky tomentum outside, with ovate-oblong lobes. Υ. S. Native of Peru, on the mountains. Corolla 6-7 lines long. Teeth of calyx acute, smoothish. Fruit unknown.

Panicled-flowered Guettarda. Shrub 6 to 8 feet.

Sect. III. Ulolobus (from ovolos, ovulos, curled, and λυπος, lobos, a lobe; in reference to the curled lobes of corolla). D. C. prodr. 4. p. 457.—Laugéria, Ruiz et Pav. fl. per. 2. p. 22. but not of Jacq. Limb of calyx short, 5-parted almost to the base, permanent. Corolla silky on the outside, with 5 lobes, which are curled on the margins.

25 G. crisipilöra (Vahl, eclog. 1. p. 36. t. 6.) leaves broad-ovate, acuminated, obtuse at the base, having the lower lateral nerves approximate. Υ. S. Native of the Island of Montserrat, towards the tops of the mountains; ex Vahl; and of St. Vincent, on the edges of mountains, in inundated places, ex Forsyth; and about Santa Fe de Bogota, ex Mutis, in H. B. et Kunth, nov. gen. amer. 3. p. 420. G. crisipilöra var. a. Pers. Ræm. et Schultes. Stipulas large, undulatæ, foliaceous, ovate, acuminated. Guettarda membranacea, Sieb. pl. exsiccat. mart. no. 57, from Martinico, is the same as a very nearly allied species.

Crisipilöra Guettarda. Tree or shrub.

26 G. hirsuta (Pers. ench. 1. p. 200.) leaves ovate-oblong, acuminated, acute at the base; stipulas longer than the petioles; drupes ovate. Υ. S. Native of Peru, and in the hot parts of New Granada. Laugéria hirsuta, Ruiz et Pav. fl. per. 2. p. 22. t. 145. f. a. Guettarda hirsuta, H. B. et Kunth, nov. gen. amer. 3. p. 420. Peduncles equal to the petioles, even to the bifurcation, having the branches subrevolute and many flowered.

27 G. defensëns (D. C. prodr. 4. p. 458.) leaves ovate-oblong, acuminated, acute at the base; stipulas shorter than the petioles; drupes oblong, 3-4-celled. Υ. S. Native of Peru, in groves about Muna. Laugéria defensëns, Ruiz et Pav. fl. per. 2. p. 23. t. 145. f. b. Branches of cyme spreading, usually dependent. G. crisipilöra var. β. Pers. and Ræm. et Schultes, but is more nearly allied to hirsuta than to G. crisipilöra.

Dependent-cymed Guettarda. Tree 20 feet.

28 G. coriacea (Pers. ench. 1. p. 200.) quite glabrous; leaves elliptic-ovate, rather coriaceous, bluntish, almost nerveless, rather paler beneath; stipulas acuminated, deciduous; peduncles about equal in length to the leaves, compressed, bifid or twice bifid; flowers tetramerous, glabrous, unilateral, and distant along the branches of the peduncle; tube of calyx bluntly 4-toothed. Υ. S. Native of the Island of Montserrat, ex Vahl; and Guadaloupe, at Pointe-a-Pitre. Laugéria coriacea, Vahl, eclog. 1. p. 26. Laugéria tubulosa, Fors. in herb. L’Her. Drupe oblong, ex Vahl, containing a 4-celled putamen. Corolla 6-7 lines long. Perhaps Viviania Domingensis, Rafin. specchi. 1. p. 117.

Coriaceous-leaved Guettarda. Tree or shrub.

29 G. resinosæ (Pers. ench. 2. p. 200.) leaves lanceolate, attenuated at both ends, glabrous, glaucous beneath; stipulas combined into a somewhat truncate ciliated sheath; branchlets and cymes clothed with chamyln resin; peduncles a little shorter than the leaves; cymes bifid, crowded with flowers; flowers pentamerous, glabrous; limb of calyx short, truncate, or hardly 5-toothed. Υ. S. Native of Montserrat, ex Vahl; and Guadaloupe, where it was collected by Perrottet; of Porto Rico, Riedley, of Trinidad, ex Sieber, fl. trin. no. 112; and of Mexico, ex herb. Puerrari. Laugéria resinosæ, Vahl, eccl. 1. p. 27. t. 10. f. 6. with a figure. Terebraria, Sesse, fl. mex. icon. ined. Drupe oblong, containing a 4-celled, 4-seeded putamen, ex Vahl, but in the specimen examined the drupe contains a 4-5-celled 4-5-seeded putamen; there are therefore 2 species confused under this name.

Resinosæ Guettarda. Shrub 8 to 10 feet.

30 G. ? Bruxëixis (Wall. cat. no. 6220.) leaves elliptic, acuminated, coriaceous, quite glabrous; peduncles axillary, solitary, or twin; cymes dichotomous; stipulas ovate, acuminated. Υ. S. Native of the East Indies, in Siringagur. Flowers small. Calyx a little twisted.

Brown’s Guettarda. Shrub.
Species not sufficiently known.

31. G. Fontane'shi (D. C. prod. 4. p. 458.) stem arborescent; leaves broad-ovate, acuminate, and are, as well as the divaricate branches, villous; stipulas ovate, acute, deciduous. S. Native country unknown. G. hirsuta, Desf. cat. hort. par. ed. 3. p. 404. but not of Pers. Habit of G. argentea.

Desfontaines's Guettarda. Shrub.

32. G. umbellata (Spreng, neu entd. 3. p. 48.) leaves oblong, quite glabrous on both surfaces; branches tubercular, compressed, dilated at the top; peduncles axillary, aggregate; flowers pentamemorous, glabrous. S. Native of Brazil. The calyx is said to be 5-toothed, and the drupe 6-celled. This plant ought probably to be excluded from the order. Umbellate-flowered Guettarda. Shrub or tree.

Cult. For culture and propagation see Hamiltonia, p. 555. The species bear very fine leaves and flowers, and are therefore worth cultivating.

Lin. syst. Tetrandria, Monogynia. Calyx with a very short tube, and a 4-toothed limb. Corolla small, almost rotate, with a very short tube, and a 4-lobed spreading limb. Stamens 4, with exerted filaments, which are about equal in length to the limb of the corolla, and roundish anthers. Drupe dry, thin, oval, crowned by the calyx, containing a 2-celled nut; cells 1-seeded.—A sermentose shrub, native of Guiana, climbing among bushes. Leaves opposite, petiolate, ovate, acute. Stipulas oval, obtuse, deciduous, interpetiolar. Peduncles axillary, 3 times shorter than the leaves, racemose panicled: having the branches opposite opposite, the lower ones the longest. Flowers small, sessile along the branches, bluish.

1 M. sarmentosa (Aubl. guian. 1. p. 106. t. 41.) S. Native of French Guiana, upon trees on the banks of rivers. Lam. ill. t. 66. f. 2. Cunninghamia sarmentosæ, Willd. spec. 1. p. 615. Stipulas acute, ex Aubl., and the leaves tomentose beneath; but in the specimens examined the stipulas are obtuse, and the leaves are rather villous beneath, and at length glabrous. Perhaps there are two distinct species, Aublet's and Patris's.

Sarmentose Malanee. Shrub cl.

Cult. See Pedérida, p. 561. for culture and propagation.

Lin. syst. Tetrándria, Monogynia. Calyx with an ovate or oblong tube, and a short campanulate 4-toothed limb. Corolla tubular, 4-cleft, with acutish lobes, which are shorter than the tube. Anthers oblong, almost sessile in the throat, not exserted. Stigma bifid. Drupe somewhat baccate, ovate or oblong, crowned, containing a 2-celled putamen: cells 1-seeded. Seeds terete—Small trees, natives of the Mauritius. Leaves petiolate, opposite, or 3 in a whorl, oblong or obovate, glabrous, usually hsett with glandular hairs in the axils of the veins. Stipulas interpetiolar, acute, deciduous. Peduncles axillary, shorter than the leaves, bifid. Flowers small, whitish, sometimes dioecious from abortion, unilateral, and sessile along the branches of the peduncles. This genus has the inflorescence of Stenostomum, but differs in the parts of the flowers being quaternary, not quinary. The flowers are nearly like those of Malanea, but the inflorescence is different; the tube of the corolla is longer, and the anthers almost sessile.

Wheeled-leaved Antihrea. Tree 20 feet?

Var. β, barbinéris (D. C. prod. 4. p. 466.) nerves of young leaves bearded, and very hairy in the axils. S. Native of the Mauritius, Guettarda barbinéris, Sieb. fl. maur. 1. no. 61. Cham. et Schlcht. in Linnaea, 4. p. 190.

Var. γ, acuminata (D. C. l. c.) leaves almost smooth, long-acuminated. S. Native of the Mauritius. Guettarda acuminata. Sieb. fl. maur. 1. no. 60.

Dioecious Antihrea. Tree 20 feet?

3 A. frangula'cea (D. C. prod. 4. p. 460.) leaves opposite, ovate, acutish at the base, and rather acuminate at the apex, smoothish, with the axils of the veins glandless; flowers hermaphrodite; drupes ovate. S. Native of the Mauritius. Guettarda frangulaceà, Sieb. fl. maur. exsic. 2. no. 59. Drupe one-half shorter than in the first species, sometimes 3-celled and 3-seeded, which shows its affinity with Guettarda. Flowers small, whitish.

Frangula-like Antihrea. Tree.

Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a small 5-toothed limb; teeth permanent, connivent, rather unequal. Corolla funnell-shaped, having the tube a little wider at the throat, and a 6-lobed limb; lobes lanceolate, bluish. Anthers 5, oblong, hardly exserted. Stigma 2-lobed. Drupe ovate-oblong, crowned, containing a 2-celled putamen. Seeds terete, solitary in the cells, inverted. Embryo central, in the fleshy albumen.—West Indian trees. Leaves opposite, oval or oblong, on short petioles. Stipulas at length deciduous. Peduncles axillary, divided into a bifid cyme. Flowers small, white, sessile and unilateral along the branches of the cyme, and one in each fork.—Inflorescence of Antihrea a, but differs from that genus in the parts of the flowers being quinary; and from Guettarda in the putamen of the fruit 2-celled, not many celled.

§ 1. Corollas glabrous.

1 S. lu'cidiim (Geurt. fl. carp. 3. p. 69.) leaves oblong, obtuse, shining above, glabrous on both surfaces; teeth of calyx short, obtuse. S. Native of the West Indies, as in Jamaica, Santa Cruz, St. Lucia, Porto-Rico, Trinidad, etc. Stürmià lucidiim.
Rubiaceæ.

1 C. glabra (Rich. l. c. under Crisca,) h. S. Native of Toritoisland. 

Psychotria megalospérmia, Vahl, eclog. amer. 

3. p. 3. t. 21. ex herb. Juss. but neither the description nor the figure agree well with it, and it is therefore Jacquinia venosâ, 

Glabrous Chione. Clt. 1824. Tree 40 feet! 

Cult. For culture and propagation see Hamiltoniâ, p. 555. 

CXVI. TIMONIUS (Timon or Aytimon is the name of the first species in Amboya). 

Rumph. amb. 3. p. 216. t. 140. 

D. C. prod. 4. p. 461.—Bobea, Gaud. voy. uran. t. 93. 

Bobâeâ, A. Rich. mem. soc. hist. nat. Par. 5. p. 215.—Burnéya, Cham. et Schlecht. in Linnaea. 4. p. 188.—Erichthis, Forst. but not of Lin. 

LIN. SYST. Tetrandria, Monogynia. Calyx with an ovate tube, and a tubular truncate 2-6-toothed limb. 

Corylina tubular, salver-shaped, with a 4-6-parted spreading limb, a naked throat, and ovate oblong lobes. Stamens 4, almost sessile, inserted in the upper part of the tube of the corolla. Anthers oblong-heart-shaped, sessile in the throat. Stigma 2, exerted, digitately 5-cleft, with the lobes linear. 

Drupe globoso, smooth, crowned by the limb of the calyx, containing from 7-25 bony distinct 1-seeded indesinable pyrene. 

Seeds inverte, linear. Albumen fleshy. Embryo terete. Glabrous trees. Leaves opposite. Stipulas interpetiolar, acute, entire. Peduncles axillary, shorter than the leaves, bearing each 3 flowers at the apex, the middle flower sessile, and the lateral ones pedicellate, each girdled by a cup-shaped 5-lobed persistent bractea at the base.—Allied to Guettardâ, but differs in the pyrene being distinct, not combined. 

1. T. Rumphi (D. C. prod. 4. p. 461.) leaves lanceolate; 

Rumphius's Timonius. 

Tree. 

The flowers are described by Chaminso and Schlecht. as quaternary and quinary, but they are also sometimes senary. 

Forster's Timonius. 

Tree. 

3 T. Gaudichaudii (Cham. et Schlecht. in Linnaea. 4. p. 190. under Burnéya) leaves elliptic, bluish, acute at the base; cymes on long peduncles: fertile ones 3-flowered: but the sterile ones are twice bifid and 7-flowered. h. S. Native of the Island of O-Walu, and of a number of the Sandwich Islands. Bœba élaióis, Gaud. in Freyc. voy. p. 478. t. 98. Fruit containing usually 12 bony pyrene. 

Gaudichaud's Timonius. 

Tree. 

Cult. For culture and propagation see Hamiltoniâ, p. 555. 

CXV. CHIONE (a mythological name, the daughter of Deucalion, or from χιονος, chionos, snowy, white as snow; in reference to the cymes of white flowers). D. C. prod. 4. p. 461.—Crúseia, A. Rich. mem. soc. hist. nat. Par. 5. p. 204. t. 19. f. 1. but not of Schiedea and Dipsacaceae, nor Bartl. nor D. C. 

LIN. SYST. Pentandra, Monogynia. Calyx with an obovate tube, and a marginal repandly 5-toothed limb. 

Coryllina tubular, short, with a 5-lobed limb; lobes flattish, obtuse. Stamens inserted above the tube. Style simple; stigma 2-lobed: lobes short, obtuse. Fruit olive-formed, rather fleshy, much furrowed when dried, crowned by the limb of the calyx, containing a 2-celled pericarp. Seeds solitary, almost terete.—A glabrous tree. 

Leaves opposite, coriaceous, joined together by an entire stipular sheath. Flowers white, cymose; cymes terminal, pedunculate. Allied to Malacnea. 

Cult. For culture and propagation see Hamiltoniâ, p. 555.
Corolla funnel-shaped, with a long straight tube (f. 102 b.), and 5 oblong lobes (f. 102 c.). Stamens 5, inserted in the throat of the corolla, inclosed. Stigma 5-cleft. Capsule crowned by the calyx, dehiscing at the apex, 1-celled, containing 5 triangular 1-seeded pyreneae. Seeds inserted by the base, erect, covered by a dry reticulated membrane or epidermis. Albumen very sparing. Embryo erect, with an oblong radicle, and cor- date foliaceous cotyledons.—East Indian shrubs. Leaves lanceolate, on short petioles. Stipulas short, acute, broad and adpressed at the base. Flowers disposed in fascicles or umbels, sweet-scented.—This genus has been joined with Ancylanthus by Jussieu, but is sufficiently distinct from that genus.

1 H. suaveolens (Roxb. hort. beng. p. 16. fl. ind. 2. p. 223) glabrous; leaves broad-lanceolate; heads of flowers densely umbellate, pedunculate, terminal; calyx beset with glandular hairs. \( \hat{\gamma} \). Native of the East Indies, on the Rajmuhal hills. Spermadicyon suaveolens, Roxb. ex. corn. 3. p. 32. t. 226. R. Br. in bot. reg. t. 343. Lianathus tubiflorus, Blum. bijdr. p. 990. Leaves 3-6 inches long. Stipulas broad, ensiform. Flowers sessile, in terminal corymbose-formed heads, on short trichotomous branchlets, numerous, pure white, delightfully fragrant.

Sweet-scented Hamiltonia. Fl. Oct. Cll. 1818. Sh. 4 to 6 ft. 2 H. corbina (D. Don, prod. fl. nep. p. 137.) leaves ovate-lanceolate, short-acuminated, scabrous on both surfaces, rounded at the base; calyceine segments linear, villous. \( \hat{\gamma} \). S. Native of Nepaul, at Narainhetti, and between Hetounra and Bhempedi, chiefly between Bhinousoban, and the last-mentioned village, forming the most extensive thickets. Dr. Wallich has also met it with about the village near Cheemasgurree, and on several mountains in the valley. Hamiltonia Dulina and Nonatelia filamentosa, Hamilton. mss. Hamilton. azereum, Wall. in Roxb. fl. ind. 2. p. 225. Spermadicyon azereum, Lindl. bot. reg. 1235. Flowers azure blue, perfuming the air by their delicious fragrance from November until March, during which time they are very beautiful. Inflorescence ample, densely villous, especially the corollas. The tender parts of the plant emit a fetid smell, like those of Pediéra and Serissa.

Scabrous Hamiltonia. Fl. Jan. Cll. 1823. Sh. 4 to 6 ft. 3 H. pilosa (Roxb. fl. ind. 2. p. 226) shrub stiff, very pilose; leaves lanceolate; fascicles of flowers axillary, intermixed with hairy bractees. \( \hat{\gamma} \). S. Native of the Moluccas.

Pilose Hamiltonia. Shrub 4 to 6 feet.

Cult. The species are desirable for every collection of stoves plants, being free flowerers, very fragrant, and of easy culture. They succeed best in a mixture of loam and peat; and cuttings strike root readily in sand, with a hand-glass over them, in a moist heat.

CXVIII. LEPTODERMIS (from \( \lambda \varepsilon \rho \tau \)o, lepto, slender, and \( \delta \varepsilon \rho \mu \a, \)derma, the skin; the branches are covered with separating fibrous bark). Wall. in Roxb. fl. ind. 2. p. 191. A. Rich, mem. soc. hist. nat. par. 5. p. 221. D. C. prod. 4. p. 462.—Hamiltonia species, D. Don, prod. fl. nep. p. 137.

Lin. syst. Pentandra, Monogyna. Involucrum calyciform, of 2 leaves, closely girding the ovarium. Tube of calyx inclosed within the involucrum; limb of calyx short, permanent, 5-lobed; lobes roundish, adpressed. Corolla funnel-shaped, seaflores from minute papillae, with a terete tube, which is hairy inside, and 5 ovate cuspidate lobes which are involucrately valvate in aestivation. Stamens 5, with very short filaments and in- closed anthers. Ovaryum 5-celled; cells 1-seeded. Style filiform; stigma quadrifid. Fruit oblong, 5-celled? 5-valved?—Shrubs, with decussate, tetragonal branches. Leaves lanceolate or oblong, on short petioles, membranous. Stipulas 5-length of petioles, adpressed, permanent, acute. Flowers sessile, scentless, white.—Perhaps sufficiently distinct from Hamiltonia.

1 L. lanceolata (Wall. in Roxb. fl. ind. 2. p. 191.) leaves lanceolate, attenuated, acute, membraneous, villous; flowers sessile by threes at the ends of the branches; stipulas triangular, villous; branches quadrangular, downy while young. \( \hat{\gamma} \). G. Native of Nepaul, on the mountains, though it is among the less common plants. Hamiltonia fruticosa, D. Don, prod. fl. nep. p. 137. Flowers white, scentless. According to the description in fl. nep. the flowers are said to be hexameric and hexan- drous.

Lanceolate-leaved Leptodermis. Shrub 3 to 4 feet.

2 L. oblonga (Bunge, in mem. acad. sc. Petersb. 2. p. 108.) leaves oblong, glabrous; flowers terminal, aggregate. \( \hat{\gamma} \). G. Native of China, on the mountains.

Oblong-leaved Leptodermis. Shrub.

Cult. See Hamiltonia above for culture and propagation.

CXIX. PSATHURA (from \( \psi \alpha \theta \varphi \omega \rho \sigma, \)psathuros, fragile or brittle; the branches are brittle). Comm. in Juss. gen. p. 206. mem. mus. 6. p. 396. Lam. ill. t. 260. Garri. fl. carp. 3. p. 82. t. 194. f. 4. A. Rich, mem. soc. hist. nat. par. 5. p. 214. D. C. prod. 4. p. 462.—Chicoinaéa, Comm.—Psathura, Poir. dict. 6. p. 587.—Psathyra, Spreng. syst. 2. p. 127. but not of Fries.

Lin. syst. Penta-Hexandra, Monogynia. Calyx with an ovate tube, and a campanulate 5-tubed persistent limb. Corolla bearded inside, with a short tube, and a 5-tubed spreading limb; lobes acute, rather longer than the tube, valvate in aestivation. Anthers 5-6, almost sessile at the throat. Stigmata 5-6-lamellate. Berry globose, furrowed, crowned by the limb of the calyx, containing 4-6 1-seeded pyreneae. Seeds erect. Albumen fleshy. Embryo erect.—Small glabrous trees, with knotted fragile branches. Leaves lanceolate, acute at both ends, petiolate, smooth. Stipulas ovate, caducous, with an elevated zone, which is joined to the petioles. Peduncles rising from the axis of the upper leaves, loosely panicked, shorter than the leaves.

1 P. Borbonica (Gmel. syst. 1. p. 577.) leaves oblong-lan- ceolate; peduncles 7-8-flowered. \( \hat{\gamma} \). S. Native of the Island of Bourbon, on the mountains, where it is called Bois cassant. P. corymbosa, Gardn. fl. carp. 3. p. 82. P. Borbonica, Roxb. fl. ind. 2. p. 158. Flowers minute, pentandrous, disposed in axillary and terminal trichotomous corymbs. Stigma 2-lobed. Drupes containing 5 pyreneae.

Bourbon Psathura. Tree small.

2 P. Murtifolia (A. Rich, diss. 1. c.) leaves oblong, bluish; peduncles usually 3-flowered, lateral flowers sterile and deciduous; limb of calyx 5-parted; lobes lanceolate. \( \hat{\gamma} \). S. Native of the Mauritius. Perhaps sufficiently distinct from the preceding.

Myrtile-leaved Psathura. Tree small.

3 P. terniflora (A. Rich. diss. 1. c.) leaves elliptic-lanceolate, acute; peduncles at the tops of the branchlets, usually by threes, 1-flowered; limb of calyx wide, obsolescently 5-7-toothed.

\( \hat{\gamma} \). S. Native of the Mauritius.

Three-flowered Psathura. Tree small.

Cult. For culture and propagation see Hamiltonia above.

4 & 2
‡ 1. Fruit containing 4 pyreæ. Myroniæ véræ.
1 M. obovata (Lam. ill. no. 1482. t. 68. f. 1. dict. 4. p. 397.) leaves obovate, obtuse, on short petioles; peduncles 1-3-flowered; berries bluntly tetragonal. 樨 S. Native of the Island of Bourbon, where it is called Bois de rat, from the fruit being grateful to mice and rats. M. Borbonica, Ræu. nom. Berries red, size of grapes.

Obovate-leaved Myronia. Shrub 4 to 6 feet.
2 M. MYRTIFLLA (Lam. ill. no. 1483. t. 58. f. 2. dict. 4. p. 398.) leaves ovate-lanceolate, acute, on short peduncles; peduncles 1-3-flowered; berries spherical. 樨 S. Native of the Island of Bourbon. M. lanceolata, Willd. spec. 1. p. 614. Rubiaceæ. no. 103. Sieb. fl. maur. fasc. 2.

Myrtle-leaved Myronia. Shrub 4 to 5 feet.

Many-flowered Myronia. Shrub 4 to 5 feet.

4 M. UMBELLATA (Barl. in herb. Haæeq, ex D. C. prod. 4. p. 463.) leaves obovate or obovate-oblong, coriaceous; peduncles axillary, many-flowered at the apex; pedicels 7-8, umbellate; berries roundish; calyceal teeth very short, acute. 樨 S. Native of the Island of Luzon, one of the Philippines. Segments of corolla valvate in aestivation. Genital not exserted. Seeds narrow, cylindrical, as in Guettârd, ex Barl. Perhaps a section of Myronia, as Laugèria is of Guettârdâ. Umbellate-flowered Myronia. Tree small or shrub.

Cult. For culture and propagation see Hamiltônia, p. 555.

Lin. syst. Tetra-Pentándria, Monogonyia. Calyx with an obovate tube, and a small 4-5-toothed limb. Corolla subcampanulate, spreading, 4-5-cleft, with lanceolate acute lobes, and a tomentose throat. Stamens 4-5, hardly exserted. Stigma capitate, bifid: having the lobes approximate (ex Rich.). Fruit pear-shaped, 6-8-striped, but not crowned, containing 4-5 1-seeded, bony, combined pyreæ. Embryo inverted. Alburnum fleshy.—Small glabrous trees, natives of the Mauritius. Leaves on short petioles. Stipulas lanceolate, acuminate, rather longer than the petioles. Peduncles axillary, 1-3-flowered. The number of the cells of the fruit is variable.

1 P. oleoides (Lam. ill. no. 1484. t. 65. f. 3.) leaves oblong, obtuse; stipulas glabrous; peduncles 1-3-flowered; drupes 8-seeded. 樨 S. Native of the Island of Bourbon, where it is called Bois Mussard. P. Commersœni, Gmel. syst. 1. p. 247. P. salicifolia, Willd. spec. 1. p. 614.

Olive-like Pyrostria. Tree 20 feet.
2 P. HEXASPERMA (Roxb. fl. ind. 1. p. 403.) leaves oblong, acute; stipulas pilose; corymbs axillary, dichotomous, with recurved branches; drupes 6-seeded.  SqlDbType. Native of the East Indies in the Island of Hominoa.

Six-seeded Pyrostria. Tree.
3 P. orbiculâris (A. Rich, 1. c.) leaves oval-oblong, sessile at the base and rather cordate, obtuse at the apex; stipulas glabros; peduncles 1-flowered, furnished each with an involucel composed of 2 keeled leaves, which girds the flower.  SqlDbType. Native of the Island of Bourbon.

Orbicular-leaved Pyrostria. Shrub.
4 P. cordifolâlia (A. Rich, 1. c.) leaves oval, acute, rather cordate at the base, on very short petioles; stipulas combined, sheath-formed, obtuse, and permanent; flowers pedicellate, solitary, girded by scales, which are combined into the form of an involucel; lobes of corolla oval, acute.  SqlDbType. Native of the Mauritius.

Heart-leaved Pyrostria. Tree small.
5 P. POLYMOPHÂ (A. Rich, 1. c.) leaves sometimes linear-lanceolate, sessile, variegated: sometimes orbicular and obtuse, petiolate: sometimes oblong-cordate, acute; stipulas acute, hardly combined at the base, caducous; flowers solitary, girded each by a 3-4-toothed tomentose involucel; lobes of corolla lanceolate.  SqlDbType. Native of the Mauritius.

Variable Pyrostria. Tree small.
6 P. MACROPHYLÂA (A. Rich, 1. c.) leaves oval-oblong, somewhat cordate, on short petioles, scrobiculate in the axils of the veins beneath; stipulas glabrous; flowers sessile, solitary, axillary, girded each by a 2-leaved involucel.  SqlDbType. Native of the Mauritius. Fruit egg-shaped, ribbed, crowned by the calyx.

Long-leaved Pyrostria. Tree small.
Cult. For culture and propagation see Hamiltônia, p. 555.
of the flowers; but it appears to come nearest to Pyrostria, but differs from that genus in the truncate calyx and in florescence. 1 O. sessiliflora (D. C. l. c.) h. s. Native of French Guiana, where it was collected by Patris. 

Sessile-flowered Octavia. Shrub. 

Cult. See Hamiltonia, p. 555. for culture and propagation.

Lin. syst. Tetrandria, Monogynia. Limb of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short spreading 4-cleft limb. Stamens 4, incised; filaments very short, inserted beneath the throat; anthers linear. Style incised, perforating the fleshy disk; stigma subelliptic, 4-toothed at the apex. Drupe succulent, obovate, umbonate, inflated, when young 4-celled, but in the adult state usually 1-celled, containing generally 4 1-seeded pyrenes, which are furnished with papery aril at the base, and fixed to the central axis, which is incomplete. Embryo incurved.—A shrub, with the habit of Farnelia. Leaves small, trapeziform, almost sessile. Peduncles axillary, filiform, usually bearing 2 flowers at the apex.—This genus is nearly allied to Pyrostria. 

1 L. biflora (Blum. l. c.) h. s. Native of the western parts of Java, on the mountains in woods. 

Two-flowered Litosantes. Shrub 4 to 6 feet. 

Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Peta-Decandria, Monogynia. Calyx with an ovate tube, a short permanent subtruncate limb, having its border hardly 5-10-toothed. Corolla rotate, almost without a tube, 5-10-parted; lobes linear-oblong, spreading. Stamens 5-10, scarcely adnate at the bottom of the corolla; filaments subulate; anthers linear. Stigma appearing simple at first sight, but on more close examination it will be found to be bilamellate. Drupe globose,arrowed, crowned by the calyx, containing 5-10 1-seeded pyrenes. Seeds pendulous. Albinum fleshy.—Glabrous shrubs. Leaves petiolate, having the lateral nerves hardly evident. Pediculus broad, short, mucronate, sheathing, permanent. Pedunclices axillary, paniced, rather longer than the leaves. 

Flowers small, white. 

1 E. fruticosa (Lin. spec. 251.) leaves obovate; panicles pedunculate; berries 8-10-furred, crowned by the truncate limb of the calyx. h. s. Native of Martinico, Guadaloupe, Jamaica, St. Thomas, Porto-Rico, Cuba, &c. in woods on the mountains. Swartz, obs. p. 80.—Browne, jam. t. 17. f. 3.—Plum. ed. Burn. t. 249. f. 2.—Eritalis odorifera, Jacq. amer. 72. t. 173. f. 23. Flowers white, sweet-scented, usually hexandrous. Berries purple. 

Var. β: inodora (Jacq. amer. p. 72.) shrubby; branches procumbent; flowers inodorous; berries white. h. s. Native of Curaçao, on rocks by the sea side. E. inodora, Rem. et Schultes, syst. 5. p. 268. This is a shrub about 2 feet high. 

2 E. angustifolia (D. C. prod. 4. p. 465.) leaves oblong-lanceolate, acuminate at both ends; panicles pedunculate, few-flowered; berry 5-9-furred, crowned by the 5-toothed limb of the calyx. h. s. Native of Cuba, about the Havannah. 

Teeth of calyx 5-6, more conspicuous than those of the first species, and the tube of the corolla is a little longer. Berry nearly dry, containing 5-7 pyrenes. 

Narrow-leaved Erithalis. Shrub. 

2 E. ? pentactomia (D. C. prod. 4. p. 465.) leaves oval-lanceolate, acute; pedicels terminal; fruit deeply 5-furred, not crowned by the calyx; style very short, crowned by 5 reflexed stigmas. h. s. Native of Cuba. Fruit the size of a pea, containing 5 chartaceous compressed narrow pyrene. Style permanent. Corolla and stamens unknown. Habit of the other species of Erithalis, but is probably a distinct genus. 

Five-angled-fruit Erithalis. Shrub 4 to 6 feet. 

Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentandria, Monogynia. Calyx with a subglobose tube, a 5-cleft limb, and acute lobes. Corolla salver-shaped, with a terete tube, and 5 spreading linear obtuse lobes. Stamens 5; filaments exerted from the throat of the corolla; anthers oblong. Stigma thick, undivided. Drupe globose, crowned by the calyx, furrowed, containing 5 bony 1-seeded pyrenes. 

—Small glabrous trees. Leaves obovate, obtuse or emarginate at the apex, cuneate at the base, coriaceous, downy beneath. Stipulas sheathing. Spikes of flowers axillary, at the tops of the branches, pedunculate. Flowers second, 2-4 in a cluster, flesh-coloured, propped by 3-5 coloured bracteas. 

1 R. secundiflorus (Humb. et Bonpl. l. c.) h. s. Native of South America, on the shady banks of the Orinoeco and Ataparo, near St. Balthazar. Nonatelia secundiflora, Spreng. syst. 1. p. 751. The leaves and branches are covered by a kind of yellow resinous matter. Berries size of a pea, brownish. 

Second-flowered Retiniphyllum. Shrub 10 to 12 feet. 

Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a 5-toothed permanent limb. Corolla tubular, funnel-shaped, having the tube as if it was gibbous, and a 5-lobed limb. Stamens 5, almost inclosed. Stigmas 2? obtuse. Drupe globose, furrowed, containing 5 coriaceous 1-seeded pyrenes. Albinum horny.—Shrubs or small trees. Leaves glabrous or downy, oval-oblong. Stipulas combined together more or less, or free. Thyrse terminal, panicle-formed or corymb-formed. Flowers often bracteaclate, white. 

2 N. Paneméssis (D. C. prod. 4. p. 466.) leaves oblong, acuminated at both ends, petiulate; stipulas twin on both sides,
connected at the base by a ligula, linear-subulate, longer than the petioles; thryse terminal, panicked, divaricate, sessile, short. t. S. Native of Panama. N. divaricata, Bartl. in herb. Henke, but not of A. Rich. Drupe roundish, depressed, containing 5 pyrenes. Allied to N. racemosa.

Panama Nonatelia. Shrub 3 to 4 feet.

3 N. violacea (Aubl. guian. 1. p. 188. t. 73.) leaves elliptic, acuminate, tapering into the short petioles at the base; stipulas solitary on both sides, ovate, obtruse, deciduous; thryse many-flowered, about half the length of the leaves; flowers bracteate. t. S. Native of Guiana, in woods. Roxm. et Schultes, syst. 5. p. 221. exclusive of the observations. Psychotria violacea, Willd. spec. 1. p. 966. but not of Aubl. Orihasia violaceae, Gmel. Bracteas permanent. Corollas white. Berries ovate, 5-celled, of a violaceous color, about the size of currants.

4 N. officinalis (Aubl. guian. 1. p. 182. t. 73.) leaves ovate, acute, glabrous; stipulas combined into a 4-toothed sheath; panicles corysbose; involucrum small, 3-leaved under each flower. t. S. Native of Cayenne, in sterile places. Lam. dict. 1. p. 342. Stems nodose. Flowers white. Berry 5-celled and 5-seeded, according to Aublet. Psychotria involucrata, Swartz. fl. ind. occ. p. 413. a native of Jamaica, is certainly distinct from the plant of Aubl. in the fruit being 2-celled and 2-seeded.

5 N. luttea (Aubl. guian. 1. p. 190. t. 74.) leaves broad-ovate, acuminate; stipulas bluntly 2-lobed; panicles erect; tube of corolla narrow at the base, long, and with the segments of the limb acute. t. S. Native of French Guiana, at the foot of Mount Couron. Psychotria luttea, Willd. spec. 1. p. 971. but not of Sieb. Flowers yellow. Young fruit 5-celled, ex Aubl.

6 N. longiflora (Aubl. guian. 1. p. 185. t. 71.) leaves lanceolate, acuminate, acute at the base, glabrous; stipulas combined into a sheath, furnished with 2 acute lobes on each side; thryse panicked, few-flowered, pedunculate, one-half shorter than the leaves; tube of corolla incurved, and with the segments of the limb bluntish. t. S. Native of French Guiana, in woods. Psychotria longiflora, Willd. spec. 1. p. 971. but not of Poir. Leaves greenish yellow. Berry globose, brownish purple, 10-stripped, 5-celled, ex Aubl. Habit of Pollicaria Pavetta.

Long-flowered Nonatelia. Shrub 2 to 3 feet.

7 N. grandiflora (H. B. et Kunth, nov. gen. amer. 3. p. 422.) leaves elliptic-oblong, acuminate, acute at the base, glabrous; stipulas connate, bifid; corymbs pedunculate, terminal. t. S. Native of South America, on the banks of the Orinoco and the Tumini, near Javita. Flowers rose-coloured. Fruit oval, furrowed, 5-celled, ex Bonpl.

Great-flowered Nonatelia. Shrub.

8 N. macrophylla (H. B. et Kunth, l. c. p. 423.) leaves ovate, acuminate, membranous, glabrous above, and clothed with fine down beneath; panicles terminal, pedunculate. t. S. Native of South America, in the woods of the Orinoco near Javita. Schwenkfeldia macrophylla, Spreng. syst. 1. p. 765. Stamens probably 5. Flowers yellow. Drupe globose, 10-furrowed, 4-5-celled, ex Kunth.

Long-leaved Nonatelia. Shrub.

9 N. formosa (A. Rich. in mem. soc. hist. nat. Par. 5. p. 207.) leaves elliptic, long-acuminate, abruptly petiolate, glabrous above, and rugged from tument beneath; spikes terminal, simple, erect, length of leaves; flowers tetramerous; fruit 4-celled; corolla with a long tube, which is very villous inside. t. S. Native of French Guiana. Allied to N. longiflora.

Beautiful Nonatelia. Shrub.

10 N. divaricata (A. Rich. l. c.) leaves elliptic, acuminate, tapering into the petioles at the base; flowers 5-6-together, on the top of a common peduncle; fruit globose, 4-furrowed, containing 4 pyrenes. t. S. Native of French Guiana, in woods. Flowers unknown.

Divaricate Nonatelia. Shrub.

11 N. fusiâ (Walt. in Roxb. fl. ind. 2. p. 187.) leaves oblong, acuminate, oblique at the base, villous beneath; stipulas linear-lanceolate, broad at the base; flowers sessile, axillary, verticillate, with hispid bracteae; stigma 5-lobed. t. S. Native of the East Indies, in Silhet. Corolla funnel-shaped, white. Ovarium hairy, 5-celled. Habit of Sabicia. Perhaps a proper genus.

Hispid Nonatelia. Shrub 3 to 4 feet.

Cult. For culture and propagation see Hamiltônia, p. 555.

LIN. SYST. Tetra-Pentandra, Monogynia. Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside, with the segments of the limb conning at the base, and spreading at the apex, each tipped by a short inflexed claw. Stamens 4-5, inserted, in closed in the base of the corolla. Stigma bifid, warted. Drupe globose, baccate, umbilicate, containing 4 1-seeded triquetrous pyrene, which are furnished with papery aril. Embryo albuminous, erect.—A climbing glabrous shrub. Leaves opposite, oblong-oblong, acute, coriaceous, glabrous. Stipulas permanent, twin on both sides, approximate, erect, at length marcescent. Flowers crowded, axillary. This genus is nearly allied to Nonatelia according to the author.

1 G. coriacea (Blum. l. c.) t. S. Native of Java, among bushes between Rompient and Kuriapan.

Coriaceous-leaved Gynochthodes. Shrub cl.

Cult. For culture and propagation see Perdoria, p. 561.

LIN. SYST. Tetra-Pentandra, Monogynia. Limb of calyx urceolate, quite entire, deciduous. Corolla with a short tube, and a spreading 4-5 eell limb; lobes oblong-linear. Stamens 4-5, exserted; filaments inserted in the throat; anthers long, linear, incumbent. Style perforating the disk. Stigma bifid, exserted. Drupe globose, umbilicate, containing 4 1-seeded charactefesally arilliuate pyrene, which are hollow inside, and gibbous on the outside. Embryo albumaceous, erect.—Glabrous climbing shrubs, with terete branches. Leaves opposite, petiolate. Stipulas broad, short, truncate. Corymbs or umbels axillary and terminal, simple or compound. This genus is nearly allied to Gynocbitodes, but differs from it in the stamens being exserted.

1 C. scandens (Blum. bijdr. p. 468.) leaves oval, acute; flowers subumbellate, exceeding the upper leaves. t. S. Native of Java and the island of Nusa-Kambang, on the mountains, climbing upon trees, where it is called Sambon and Tjen-kankan.

Climbing Celsonpermum. Shrub cl.

2 C. corimbosum (Blum. herb. ex D. C. prod. 4. p. 468.) leaves oblong, acuminate at both ends; flowers subumbellate, 3 times shorter than the upper leaves. t. S. Native of Java.

Lin. syst. Pentändria, Monogynia. Calyx with an ovate tube, and a 5-parted limb (f. 103. d.); lobes acute. Corolla tubular, incurved (f. 103. b.), with the tube widened at the apex, and an irregular 5-lobed limb (f. 103. c.).: the 2 superior lobes the longest, all ending in callous points. Anthers 5, sessile at the throat (f. 103. e.). Stigma thick, terete, 5-lobed at the apex (f. 103. d. e.). Ovarium 5-celled (f. 103. g.); cells 1-seeded. — A shrub, with villous branches. Leaves elliptic, obtuse, puberulous, on short pedioles, reticulated beneath. Stipulas coriaceous, acute, sheathing at the base. Flowers 1-3 together, on short pedicels, axillary, spreading, bracteolate, hairy. — From the stigma and lobes of the corolla this genus agrees with Cuviera.

1 A. rubiginosa (Desf. l.c.) Ṣ. Native of Angola, on the western coast of Africa (f. 103). Rasty Ancylanthus. Shrub 2 to 3 feet. Cult. For culture and propagation see Hamiltönia, p. 555.

1 P. horizontalis (Schum. pl. guin. p. 112.) branches horizontal, unarmed; peduncles umbellate. Ṣ. Native of Guinea. Stigma conical, and as if it was furnished with a reflexed membrane from the very loose margin, truncate at the apex. Horizontal-branched Phallaria. Shrub.

Lin. syst. Pentändria, Monogynia. Calyx with a short hemispherical tube, and a 5-toothed limb. Corolla funnel-shaped, with a long tube, and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed; stigma cylindrical, truncate at the base and apex, 5-furrowed. Drupa dry, containing a 2-celled rugose nucleus; cells 1-seeded, but one of them is usually abortive. — A shrub. Leaves opposite, on short pedioles, ovate-oblong, attenuated at both ends, glabrous. Stipulas unknown. Corymb terminal; pedicels 2-3-flowered. Flowers white. This genus is nearly allied to Paliacaea, if the fruit be 2-celled, but if it be 5-celled it is more nearly allied to Nonatélia; but in the form of the stigma it agrees with Cuviera.

1 H. Owarieæ (Beauv. l.c.) Ṣ. Native of Western Africa, in the kingdom of Waree in deserts. Waree Hylaciurn. Shrub. Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentändria, Monogynia. Calyx with a short tube, and a 5-parted limb: lobes linear, acute, foliaceous, spreading, 3 times longer than broad. Corolla campanulate, 5-cleft; lobes linear, very acute, hardened, and therefore spinaceous? Anthers 5, inserted in the throat; filaments very short. Stigma large, dilated, cup-formed, obtuse, and somewhat pentagonal, with reflexed edges. Fruit baccate, 5-celled; cells 1-seeded. — A glabrous shrub, with diverging branches. Leaves oval-oblong, acute, almost sessile. Stipulas combined into a short bidentate sheath. Panicles terminal, corymbose. The corolla has a membrane on the inside, which is separable from it, and this membrane is probably furnished with the stamens. Ovarium destitute of the urceolus at the apex.

1 C. Acutiflora (D. C. l. c.) Ṣ. Native of Sierra Leone, where it was collected by Smeathmann. Cuviera Africana, Spreng. syst. 1. p. 700. Acute-flowered Cuviera. Shrub 3 to 4 feet. Cult. For culture and propagation see Hamiltonia, p. 555.

CXXXIII. DONDEA (named after James de Dondis, who was among the first who illustrated the descriptions of plants by figures). D. C. prod. 4. p. 469. but not of Adams. nor Scop. nor Rchb.

Lin. syst. Pentändria, Monogynia. Calyx with a tubinate tube, which is adnate to the ovarium, and a very short hardly 5-toothed limb. Corolla with a short broad tube, furnished with one series of retrograde scarious stiift hairs inside, which is perhaps the loose jagged part of a membrane inside the tube; lobes 5, acuminated, valvate in aestivation, but at length spreading. Stamens 5, inserted in the throat of the corolla between the lobes; filaments short, slender. Style filiform, tumid in the middle, and hispid. Stigma ovate, truncate at the base, almost cup-shaped. Ovarium 1-celled? many seeded? Fruit unknown. — A glabrous shrub, native of India, with slender branches. Leaves oblong, acuminated, acute at the base, on very short pedioles. Stipulas acute, short, deciduous. Racemes 3-4-flowered, short, axillary or rising from very short branches, bracteolate, much shorter than the leaves. — This genus is nearly allied to Cuviera and Stigmántthus, but differs from both in the truncate calyx, which is 5-parted in those genera; from Cuviera in the limb of the corolla being unarmled, in the tube being pilose inside, not clothed by a membrane, in the form of the stigma, and perhaps of the fruit; and from Stigmántthus in the tube of the corolla being short, not long, in the style being tumid in the middle, and in the ovarium being turbinate, not roundish.

1 D. Leschenaultii (D. C. prod. 4. p. 469.) Ṣ. Native of the East Indies, on mountains, where it was collected by Leschenault.

Leschenault’s Dondeia. Shrub 4 to 5 feet. Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. Syst. Pentândria, Monogynia. Calyx with a short tube, a 5-parted limb, and filiform segments. Corolla funnel-shaped, with a long tube, and 5 ovate-oblong spreading lobes. Stamens 5; filaments very short; anthers reflexed. Style filiform, longer than the corolla; stigma ovate, furrowed, large. Berry dry, tabercular, compressed, 1-celled. Seeds many, bony.—A climbing shrub, with glabrous lanceolate leaves, Cymes large, axillary, and terminal. Flowers white.—This genus is not sufficiently known; it differs from Cuvieria in the 1-celled fruit; and from Dondisia in the 5-parted calyx. Perhaps both this genus and Dondisia are referrible to Tribe Gardeniaceae, subtribe Gardeniinae.

Cymose-flowered Stigmatthus. Shrub climbing.

Cult. See Hamiltonia, p. 555. for culture and propagation.

Lin. Syst. Pentândria, Digoyna. Limb of calyx campanulate, cleft in 5 parts beyond the middle; lobes acuminate. Corolla sub-campanulate, deeply 5-parted, with hardly any tube, but with erectish lanceolate lobes or segments, which are somewhat reflexed at the apex. Stamens 5; filaments very short, inserted in the bottom of the corolla, conuate; anthers combined into an ovate-oblong somewhat pentagonal tube, which is 5-celled inside; cells regularly disposed, 3 external and 2 internal. Style length of stamens. Stigma bifid; with the lobes erect and obtuse. Ovarium 2-celled; cells ovulate. Drupe pea-formed, umbilicate, containing a 2-celled globose nucleus, rarely 1-celled from abortion.—A small shrub with a short stem. Leaves fleshy, in a whorl, linear, obtuse, with revolute margins. Stipulas interpetiolar. Flowers small, disposed in short, nearly simple axillary racemes: having 2 opposite scale-formed bracteas under each flower.

1. S. mari̇tima (Jacq. 1. c.). ². S. Native of Curacao, on rocks by the coast. The leaves resemble those of rosemary, and the stipulas are blackish. Flowers small. The whole plant has a disagreeable smell.

Sea-side Strumpfia. Shrub 3 feet.

Cult. For culture and propagation see Hamiltonia, p. 555.

CXXXVI. BILLIO'TIA (named by Aloysia Colla, of Turin, after his daughter, Madame Tecofila Billioti, a famous botanical artist). D. C. prod. 4. p. 618. but not of Colla.—Vivaniâ, Colla. ann. soc. lin. par. 1825. but not of Cav. nor Radii nor Rafin.—Melanopsisium, Cels. hort. but not of Poit.

Lin. Syst. Penta-Iepiândria, Monogynia. Calyx with the tube adhering to the ovarium, and a 5-parted limb. Corolla salver-shaped: having the tube bearded with bristles inside, and a 5-parted limb. Stamens 5-7, adnate to the tube. Ovarium crowned by a nearticiferous urceolus. Style 1; stigmas 4. Drupe 1-seeded by abortion.—A smoothish shrub. Leaves opposite, petiolate, elliptic, acuteish, villous on the petioles, margins, and the nerves on the under side of the leaves, the rest glabrous. Stipulas solitary at each of the nodi, probably formed of 4, which are combined into a sheath, which is
cleft on one side, and denticulated at the apex, downy when young, brown in the adult state, falling off at length in a circular manner at the base.

1 B. psychotrioides (D. C. l. c.). ². S. Native country unknown. Vivaniâ psychotioides, Colla, l. c. Melanopsisium nigrum, Cels. hort. Colla, hort. rip. t. 35. Leaves 3 inches long and 15 lines broad, on pedioles 3-4 lines long. Stipulas 6-7 lines long. Flowers white, disposed in terminal heads.

Tribe VIII.

PEDERIE'Æ (this tribe agrees with Pædræ in important characters). D. C. prod. 4. p. 470.—Lygodysodeæce, Bartl. in herb. Hænke, ex D. C. prod. 4. p. 470. Fruit 2-celled, indescendent, barby, fleshy, and the rind is easily separated from the carpels or nuts, which are compressed, 1-seeded (f. 104. f.), and hanging from the central filiform axis. Albumen fleshy.—Climbing shrubs, with opposite leaves and interpetiolar stipulas.

Lin. Syst. Pentândria, Monogynia. Calyx with an ovate globose tube, and a 5-toothed acute, permanent limb (f. 104. a.). Corolla having the tube much longer than the teeth of the calyx (f. 104. b.), with a hairy throat, and 5 somewhat revolute lobes (f. 104. c.). Anthers oblong, sesilar within the tube (f. 104. c.). Style equal in length to the tube; stigmas 2, slender (f. 104. d.), exerted. Fruit indescendent, oval, somewhat compressed, shining, crowned by the calycine teeth (f. 104. g.); the rind is crustaceous, and at length becomes brittle and breaks irregularly, and therefore is easily separated from the carpels or seeds. Carpels or seeds 2 in each fruit, indescendent, oval, applied together, girded by a nerve-formed winged margin, hanging by a thread from the base of the fruit, and when the rind has been separated from them appear pendulous. Albumen a thin fleshy membrane, combined with the tegument of the carpella or wanting altogether. Embryo straight, with an inferior terete radicle, cordate foliaceous flat cotylodons, and an inconspicuous plumule.—Smoothish twining shrubs, holding the same station in America as the genus Pædræ does in Asia. Stems terete or compressed. Leaves opposite, petiolate, cordate or ovate, acuminate. Stipulas very short, rather truncate, combined with the petioles. Panicles few-flowered, loose, terminating in few-leaved, axillary branchlets, or axillary and leafy.—This genus comes very near Pædræ, and might probably form a distinct order with it from the distinct calyx and carpels.

1 L. fæ'tida (Ruiz et Pav. fl. per. 2. p. 48. t. 185.) stems alternately compressed and furrowed; corvymb parasolitary, leafless, one half shorter than the leaves; leaves all more or less cordate. ². S. Native of Peru, in groves at Muna and Pozuzo. Dysodea fæ'tida, Pers. ench. 1. p. 210. Petioles 4 lines long. Flowers purplish white. This plant has been confused with Pædræ fæ'tida by Sprengel.

Fetid Lygodysodea. Shl. tw. 2 L. cilia'ta (Bartl. in herb. Hænke, ex D. C. prod. 4. p.
561. P. pederea (Linn. mant. p. 52.) leaves oblong or lanceolate, coriaceate at the base, glabrous; panicles axillary, opposite, short, few-flowered, rarely terminal; bracteoles minute; anthers inclosed; berry ovate, a little compressed. \( \text{E. S. Native of the East Indies, very common in many places, as well as of} \)

**Petid Paèderia.** Clt. 1806. Shrub cl. 2 P. recurvata (Roxb. fl. ind. 2. p. 518.) leaves lanceolate, acuminate, glabrous; corollas terminal, recurved; anthers inclosed; berries globose, dry, striated a little. \( \text{E. S. Native of the East Indies, at Chittagong. Leaves 6 inches} \)
long and from 2-3 broad. Stirps with a subulate hairy point. Stigma simple, linear, clavate. Berry size and colour of a black currant.

**Recureted-coromboid Paèderia.** Shrub cl. 3 P. macrogæa (Wall. cat. no. 7392.) leaves broad, coriaceae, acuminate, downy above and woolly beneath; racemes long, axillary and terminal, panicled, downy; fruit oblong, compressed, with a polished rind. \( \text{E. S. Native of the Burmese Empire, on the banks of the river Abrain. Flowers} \)
green and purple.

**Woolly-leaved Paèderia.** Shrub cl. 4 B. lanuginosæ (Wall. pl. asiatic. rar. 2. p. 52. t. 165.) leaves broad-ovate, and ovate-lanceolate, acuminate, sagittately coriaceae at the base, downy above and woolly beneath; racemes long, axillary and terminal, panicled, downy or ploose as well as the petioles; fruit roundish, compressed. \( \text{E. S. Native of the Burman Empire, on the banks of the river Abrain. Flowers} \)
green and purple.

**Whorled-leaved Paèderia.** Shrub cl. 5 P. tennesia (Blum. biujr. p. 968.) leaves ovate-cordate, acute, tomentose beneath; panicles axillary and terminal, elongated, leafy. \( \text{E. S. Native of Java, among bushes on the mountains, common.} \)

**Whorled-leaved Paèderia.** Shrub cl. 6 P. verticillata (Blum. biujr. p. 968.) leaves 3 in a whorl, elliptic-oblong, acuminate, glabrous; panicles axillary and terminal, elongated, leafy. \( \text{E. S. Native of Java, on Mount} \)
Salak.

**Erect shrubs, which probably do not rightly belong to the genus.**

7 P. erëcta (Roxb. fl. ind. 2. p. 519. but not of Spreng.) erect; leaves almost sessile, broad-lanceolate, smooth; panicles terminal, erect, in the forks of the branches; stems exserted a little. \( \text{E. S. Native of the East Indies, in Silhet. Leaves} \)
4 inches long and 1 ½ broad. Flowers numerous, small, white, inodorous. Berries the size of a pea, when ripe highly polished, black, smooth.

**Erect Paèderia.** Shrub 2 to 3 feet.

8 P. ternæa (Wall. in Roxb. fl. ind. 2. p. 520.) erect, trichotomous, smooth: with triangular branches; leaves 3 in a whorl, oblong-lanceolate; corollas axillary, trichotomous, erect, shorter than the leaves; limb of calyx campanulate, obscurely 5-toothed. \( \text{E. S. Native of the East Indies, on the} \)
Juyuntyapoora mountains bordering on Silhet. Flowers rather large, funnel-shaped, white, on long filiform pedicels, each pedicel having a pair of linear ciliated bracteoles above the middle. The flowers are said to be fragrant when quite fresh, but they emit a very offensive smell on being steeped in water after they have been dried. Corolla fleshy, half an inch long, with a 5-cleft, rarely 4-cleft border. Fruit unknown.
Ternate-leaved Pæderia. Tree small.

† Species not sufficiently known.

9 P. ? Valleria kar'a (Juss. mem. mus. 6. p. 381.) climbing; branches terete, villously tomentose; leaves broad-ovate, acute, somewhat cordate, rather pilose above, and rather woolly beneath; coryms axillary, many-flowered. b. C. Native of Malabar. Rheed. mau. 7. p. 35. t. 18. Hombiensis, Adams, fam. 2. p. 159. Berry globose, green, probably 1-seeded. Flowers 5-cleft, according to the figure, but tetrandrous according to the description.

Valleria Kar'a Pæderia. Shrub cl.

10 P. sessiliflor a (Poir. suppl. 2. p. 449.) stems ascending; leaves lanceolate, glabrous; petioles geniculated at the base; racemes rather longer than the leaves, bracteate, pannicled; flowers sessile, sub-secund. b. S. Native of the Mauritius. Said to be allied to P. fastida, but is probably a species of Laugertia.

Sessile-flowered Pæderia. Shrub ascending.

11 P. Brasiliana (D. C. prod. 4. p. 472.) leaves cordate-oblong, pilose beneath and on the branches; panicles terminal, much branched; flowers pedunculate. b. S. Native of Brazil, in the province of Minas Geraes. Anciers inclosed. Berry dry, containing 2 pyrene. Pædræa erética, Spreng. n. entd. 3. p. 34. but not of Roxb.

Brazilian Pæderia. Shrub 3 to 4 feet.

Cult. The species of Pæderia are free growers, and will thrive in any kind of rich light soil; and cuttings strike root readily in the same kind of soil, under a hand-glass.

Tribe IX.

COFFEACEÆ (this tribe agrees with the genus Coffea in the fruit being baccate, and in containing 2 hard 1-seeded nuts). D. C. diss. 1806. H. B. et Kunth, non. gen. amer. 3. p. 352. exclusive of some genera. A. Rich, ex D. C. prod. 4. p. 472. —Psychotriaceæ and Cephalidæae, Cham. et Schlecht. in Linnaea. 4. p. 4. and p. 193. Fruit 2-celled (f. 105. h. f. 107. c.), baccate, containing 2 1-seeded bony or crustaceous nuts (f. 107. d.), which are flat inside and usually marked by a furrow on the outside; rarely containing only 1 nut from abortion. Nuts adhering by the inner sides. Albumen horny. —Trees or shrubs. Leaves opposite. Stipulas inter-petiolel, with 2 on each side, which are either combined or distinct.

Sub-tribe I. COFFEEÆ (this sub-tribe contains shrubs agreeing with the genus Coffea in having distinct flowers). D. C. prod. 4. p. 472. —Psychotriaceæ, Cham. et Schlecht. 4. p. 4. Flowers distinct, not combined.

CXL AMARACARPUS (from ama, amara, leading water, and carpus, karpos, a fruit; probably in reference to the furrow on the outside of the pyrene or nuts). Blum. biijdr. p. 954. A. Rich, mem. soc. hist. nat. par. 5. p. 198. D. C. prod. 4. p. 472.

Lin. sys. Tetradnria, Monogyния. Calyx with an ovate tube and a 4-cleft unequal limb. Corolla funnel-shaped, with a villous throat and a deeply 4-cleft limb. Stamens 4, inserted in the throat of the corolla. Style 1; stigma 2-lobed. Drupes baccate, crowned by the calyx, containing 2 bony 1-seeded pyrene, which are furrowed a little on the back.—A small shrub, with downy branches. Leaves opposite, on short petioles, lanceolate, glabrous above, paler beneath, and rather downy on the veins. Stipulas connate at the base, bifid at the apex, deciduous. Flowers small, solitary, in the axils of the leaves, rarely terminal, sessile, bracteolate at the base.—Habit and axillary inflorescence of this genus disagree with Psychotria.

1 A. Pubescent (Blum. biijdr. p. 954). b. S. Native of Java, and the Island of Nusa-Kambanga.

Pubescent Amaracarpus. Shrub.

Cult. See Coffea, p. 584. for culture and propagation.

Lin. sys. Pentändria, Monogyния. Calyx with a globose tube, and a small 5-toothed permanent limb. Corolla, stamens, and style unknown. Berry globose, 3-celled, crowned by the calyx. Seeds solitary in the cells, and fixed to the bottom of the cells. Albumen cartilaginous fleshly. Embryo very minute, seated in the base of the albumen, with a short inferior radicle.—An Indian shrub, furnished with opposite spines, but the leaves and flowers are hardly known.—This genus is nearly allied to Canthium, but differs in the seeds being fixed to the bottom of the cells, not to their tops, and in the embryo being small. The Spina spinarum of Rumph. am. cited by Gaertn., for this plant has nothing to do with Rubiaceæ, in the leaves being alternate and serrated, and is therefore referable to Stigmatoria Janghiomas; but perhaps the Oxyæanthes Javanica, Rumph. fam. 7. t. 19. f. 3. is a species of Damnacanthus or Canthium.

1 D. Indicus (Gaertn. fil. l. c.). b. S. Native of the East Indies. Carissa spinarum, Thunb. in litt. to Gaertn.

Indian Damnacanthus. Shrub.

Cult. For culture and propagation, see Chioceœa, p. 569.

Lin. sys. Tetra-Pentändria, Monogyния. Calyx with an ovate tube, and a short 4-5-toothed limb. Corolla with a short tube, a broadened throat, and 4 or 5 spreading lobes. Anthers 4-5, inserted at the throat, hardly exerted. Style filiform, exserted; stigma undivided, thick, ovate-globose, or mitre-formed. Berry globose, or didymously, fleshy, crowned by the calycine teeth, 3-celled. Seeds solitary in each cell, inserted towards the apex, inverted, incurved. Albumen fleshy. Embryo central, with a long superior radicle.—Asiatic or African shrubs, with spinose or unarmed branches. Leaves opposite, rather coriaceous. Stipulas interpetiolar, solitary on both sides. Pediuncles axillary, short, many-flowered.

Sect. I. EUCA'THUM (from eu, well or good, and canthium; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 473. Mature fruit 2-celled, terminated by an umbilicus.

* Unarmed shrubs, with pentandrous flowers.

1 C. Cornelia (Cham. et Schlecht. in Linnaea. 4. p. 14.) branches unarmed; peduncles, calyces, and petioles villous; leaves oval, obuse at the base, acute at the apex, rather villous on both surfaces; peduncles bifid; cymes dense, many-flowered. b. S. Native of Senegal. Pavetta Cornëlía, Reichh. in Sieb. fil. seneg. excis. no. 21. Fruit unknown. Flowers white.

Cornélia Canthum. Shrub 4 to 5 feet.

2 C. Subcor'batum (D. C. prod. 4. p. 473) unarmed; leaves ovate, rather cordate, acutish, downy beneath, as well as on the branches; peduncles bifid, cymose, many-flowered; fruit a little compressed and rather cordate. b. S. Native of Senegal,
humid places; and of Gambia, near Albreda, where it was collected by Leprieu and Perrottet. Flowers smaller than in any other species of the genus. Stigma ovate. Fruit almost like that of the following.

Subordinate-leaved Canthium. Tree.

3. C. diodymum (Gartn. fil. carp. 3. p. 94. t. 196. exclusive of the syn. of Rehder.) shrubby, unarmed, glabrous, and smooth; leaves on short petioles, obtuse, and oval, glandular in the axils of the veins beneath; cymes axillary, on short peduncles; fruit didymous. \( \varphi \). S. Native of Coromandel, on the mountains.

Didymous-fruited Canthium. Shrub.

4. C. Moluccanum (Roxb. fl. ind. 2. p. 172.) shrubby, unarmed; leaves oblong; tube of corolla gibbous, length of style; stigma turbinate. \( \varphi \). S. Native of the Moluccas. The rest unknown.

Molucca Canthium. Shrub.

5. C. Fasciculatum (Blum. bijdr. p. 967.) arboreous, unarmed; leaves elliptic-lanceolate, glabrous; flowers in axillary fascicles. \( \varphi \). S. Native of the west of Java, in mountain woods. Said to be allied to C. diodymum.

Fascicled-flowered Canthium. Tree.

6. C. glabrum (Blum. bijdr. p. 967.) arboreous, unarmed; leaves ovate, or elliptic-oblong, obtuse, acutish at the base, glabrous; cymes axillary, branched, many-flowered. \( \varphi \). S. Native of Java, in woods on the mountains.

Var. \( \beta \), puberulum (Blum. l. c.) leaves roughish above and puberulous beneath. \( \varphi \). S. Native of Java, at the foot of Mount Salak.

Glabrous Canthium. Tree.

7. C. militae (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, ovate, acuminate, glandular in the axils of the veins beneath; cymes axillary, loose, 3 times shorter than the leaves. \( \varphi \). S. Native of the Island of Luzon, one of the Philippines. Stipulas acuminate. Cymes bipartite, with diverging branches, and many-flowered branchlets. Calyx with 5 short, acute teeth.

Mild Canthium. Shrub.

8. C. lucidum (Hook. et Arn. in Beech, voy. pt. bot. p. 65.) branches unarmed; leaves on short petioles, elliptic, obtuse, attenuated a little at the base, coriaceous, shining above, pale beneath; cymes pedunculate, axillary, nearly globose. \( \varphi \). S. Native of the Society Islands. Calyx 4-5-toothed. Corolla 4-5-lobed. Stamens 4-5. Closely allied to C. glabrum and C. niten.

Lucid-leaved Canthium. Shrub.

** Unarmed shrubs, with tetrandrous flowers.

9. C. nitens (D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, broad-ovate, bluntish, shining and glossy above; racemes compound, axillary, many-flowered, a little longer than the petioles. \( \varphi \). S. Native of the East Indies, where it was collected by Leschenault. Petioles 8 lines long. Stipulas triangular, deciduous. Peduncles disposed in dense panicles. Tube of corolla a little longer than the lobes, which are oval and obtuse. Stigma thick, ovate, much exerted.

Shining-leaved Canthium. Shrub.

*** Spinose shrubs, with tetrandrous flowers.

10. C. Parviflorum (Lam. dict. 1. p. 602.) shrubby; branchlets glabrous; spines opposite, horizontal, supra-axillary; leaves ovate, on short petioles, smooth, longer than the spines, usually in fascicles; racemes rising beneath the spines at the axils; berries nearly globose. \( \varphi \). S. Native of Coromandel, frequent. Roxb. cor. l. p. 39. t. 51. fl. ind. 2. p. 170. Gartn. fil. carp. 2. p. 196. f. 37. W. Schinz tetrandra, Wildl. spec. 1. p. 1224. Kandn-kara, Rheed. mal. 5. p. 71. t. 36. When the plant is in luxuriance, the spines are sometimes threefold. Flowers small, yellow. Berries yellow, obovate, compressed laterally, size of a cherry. The bush makes excellent fences. The leaves are universally eaten in curries; on this account the plant has the name of Balusoo-kura, which latter word means esculent.

Small-flowered Canthium. Shrub 5 to 6 feet. 11. C. Hebe cladum (D. C. prod. 4. p. 474.) shrubby; branchlets velvety; spines opposite, rising from an acute angle; leaves obovate, glabrous, hardly longer than the spines; pedicels numerous, 1-flowered, axillary. \( \varphi \). S. Native of the Island of Luzon, one of the Philippines. C. parviflorum, Bartl. in herb. Henke, but not of Lam.

Downy-branched Canthium. Shrub 5 to 6 feet.

*** Spinose shrubs, with pentandrous flowers.

12. C. Mundita n'um (Cham. et Schlecht. in Linden. 4. p. 131.) a small erect shrub; with opposite spinescent branches; leaves ovate-oblong, of the same colour on both surfaces, membranous; pedoie domed inside; cymes axillary, pedunculate. \( \varphi \). G. Native of the Cape of Good Hope, at Plitenberg's Bay. Habit of Electromia ventosa, but the cymes are on longer peduncles; the flowers are smaller, and the stipules are glabrous inside, not leaving a margin of white wool on falling, as in that plant.

Var. \( \beta \), pubescens (D. C. prod. 4. p. 474.) leaves downy on both surfaces. \( \varphi \). G. Growing along with the species. Mundt's Canthium. Shrub 4 to 5 feet.

13. C. nördicum (Blum. bijdr. p. 966.) shrub; erect; spines spreading, straight; leaves small, almost sessile, ovate-oblong, acutish, downy on both surfaces, as well as the branches and stipulas; flowers twin or tern, axillary, on very short peduncles. \( \varphi \). S. Native of Java, among bushes about Buiten-zorg. Branches spreading, opposite.

Horrid Canthium. Shrub 5 to 6 feet.

14. C. Parviflorum (Roxb. fl. ind. 2. p. 170.) shrub thorny and hairy; leaves oval, hairy beneath; flowers axillary, crowded; tube of corolla gibbose. \( \varphi \). S. Native of the East Indies. The inside of the tube of the corolla is surrounded by a circle of straight white bristles of its own length, inserted round its mouth, and pointing to its bottom. The figure in Pluk. alm. 27. t. 133. f. 3. so often referred to, has nothing to do with it; consequently it is neither Manetia diancatha, Willd. spec. 1. p. 670, nor Azima diancatha, Lam. dict. 1. p. 343.

Small-leaved Canthium. Shrub 5 to 6 feet. 15. C. Augustiflorum (Roxb. fl. ind. 2. p. 169.) shrub thorny; leaves lanceolate, glabrous, and shining, on short petioles; flowers numerous, axillary, on short pedicels; berries roundish, retuse. \( \varphi \). S. Native of the East Indies, on hills, in the vicinity of Chittagong, Silhet, and the whole eastern frontier of Bengal. Branches glabrous. Flowers small, greenish-yellow. Corolla with a short gibbous tube, and 5 lanceolate segments. Drupes roundish, when ripe yellow.

Narrow-leaved Canthium. Shrub.

16. C. Rheed' ei (D. C. prod. 4. p. 474.) shrub thorny; leaves oval-lanceolate, acuminate, on very short petioles, shining; flowers numerous, axillary, on short pedicels; berries roundish-ovate, compressed. \( \varphi \). S. Native of Malabar, where the Brachmans called it Canti, hence the generic name. Tsjeron-kara, Rheed. mal. 5. p. 75. t. 37. Root reddish, bitter. Flowers small, greenish. Berries green. It differs from C. parviflorum in the flowers being 5-leafed and pentandrous.

Rheed's Canthium. Shrub.

17. C. Pedunculare (Cav. icon. 5. p. 21. t. 436.) shrub thorny; leaves ovate, acute, almost sessile, downy; pedicels 4 c 2
axillary, solitary, longer than the leaves. \( \eta \). S. Native of the Island of Luzon, one of the Philippines. Teeth of calyx subulate. Corolla pale purple, with a woolly throat, and 5 lanceolate, very acute segments. Filaments shorter than the corolla. Berry ovate, sub-compressed. This shrub is perhaps generically distinct from Canthium.

**Peduncular Canthium.** Shrub 5 to 10 feet.

18 C. lycocomes (A. Rich. dis. p. 108.) spines supra-axillary, simple; leaves small, oblong-ovate, acuminate, rather hairy; stipulas broad, ending in a long abrupt point at the apex; flowers axillary, pedunculate, solitary. \( \eta \). S. Native of Magnolia. Habit of a species of Lycium. The rest unknown.

**Lycium-like Canthium.** Shrub.

19 C. Chinesse (Pers. ench. 1. p. 200.) shrub thorny; leaves ovate; flowers sessile, hairy. \( \eta \). G. Native of China, at Macao; and of Madras. Gardénia spinosa, Thunb. diss. gard. no. 7. t. 2. f. 4. exclusive of the synonyms. Wildl. spec. 1. p. 1299. Rândia spinosa, Poir. dict. 2. p. 829. Leaves many from the buds under the spines, glabrous. Corolla white, a little longer than the calyx, with ovate, obtuse, spreading segments. Stigma clavate. This plant does not probably belong to Canthium.

**China Canthium.** Fl. Ju. Aug. Clt. 1800. Sh. 5 to 8 ft.

20 C. sceândens (Blum. bijdr. p. 966.) climbing; spines divaricate or recurved; leaves on short petioles, oblong, acuminate, downy beneath as well as on the branches; flowers disposed in axillary fascicles; fruit didymous. \( \eta \). G. Native of the Island of Nusa-Kambanga, near Java, among bushes. Thorns much shorter than the leaves, straight, or a little recurved, but sometimes wanting on the branchlets. Fruit rather rugged, like that of *Psydrax*.

**Climbing Canthium.** Shrub el.

**Sect. II. Pleurogaaster (from πλευρός, pleuron, a side, and γαστρα, gaster, a belly; the cicatrices occasioned by the falling of the flower is left on one side of the fruit).** D. C. diss. ined. acad. sc. par. 1806. prod. 4. p. 475. Mature fruit 1-celled, furnished with the floral cicatrice on one side at the base.

21 C. anomocærum (D. C. prod. 4. p. 475.) glabrous; branches divaricate, and probably at length becoming spinose; leaf ovate, acuminate, on short petioles; pedicels slender, elongated, 1-flowered, corymbose, usually deflexed, rising from the axils of the superior leaves. \( \eta \). S. Native of Sierra Leone, where it was collected by Smeathmann; and of the Gambia, at Albreda. This plant comes near to *Plectronia venosa*, from the singularity of the fruit.

**Anomalous-fruited Canthium.** Shrub.

**Cult.** For culture and propagation see Chioc Scotia, p. 569.

**CXLIII. Plectroonia** (from πλεκτρον, plektron, a whip; in reference to the square branches). Lin. mant. p. 6. no. 1249. Lam. ill. t. 146. A. Rich. mem. soc. hist. nat. par. 5. p. 189. but not of Burm. or Lour.—Rhâmus species, Burm.

**Lin. syst. Tetrandria, Monogynia.** Calyx with an ovate or oblong tube, and a 5-toothed limb. Teeth very short, acute. Corolla short, rather funnel-shaped, with a 5-parted limb, and a bearded throat; segments acute, reflexed. Stamens 5, inserted in the throat, a little exserted. Style short; stigma sub-capitate, of 2 approximate lamellae. Berry dry, naked at the apex, emarginate, obovate-oblong, compressed, didymous, containing 2 chartaceous coriaceous, 1-seeded, induscent pyrene, which are flat inside.—Small African trees, with opposite, sub-spinose branches. Leaves opposite, petiolate, elliptic, acute at both ends, rather coriaceous, pale beneath. Stipulas solitary on each side, apiculate. Peduncles axillary, short, solitary, racemose, or corymbose; pedicels about equal in length to the fruit, slender.—This genus, along with Damnacanthus, *Psydrax*, and Canthium ought probably to be united.

**Windy Plectronia.** Clt. 1816. Tree.

2 P. Madagascarensis (A. Rich. in mem. soc. hist. nat. Par. 5. p. 189.) branchlets glabrous, compressed; pedicels axillary, 1-flowered. \( \eta \). S. Native of Madagascar, where it was collected by M. Chapelier. The whole shrub is glabrous. Leaves ovate, attenuated at the base, petiolate. Stipulas short, acuminate, deciduous. Flowers unknown. Fruit ovate, emarginate at the apex, and probably obcordate and compressed, usually 1-celled by abortion.

**Madagascar Plectronia.** Shrub or tree.

3 P. Hieratia (D. C. prod. 4. p. 476.) branchlets villous; leaves villous beneath; stipulas length of petioles. \( \eta \). S. Native of Senegal, by the sides of woods near Dagana, where it was collected by Leprieur and Perrottet. Câñthium Senegalense, A. Rich. l. c. p. 188. Branches terete, divaricate, spreading, forming straight angles. Peduncles axillary, villous, compressed, corymbose at the apex. Berry 2-celled, emarginate at the apex; but one of the cells is usually abortive, in this case the fruit becomes 1-celled, and the umbilicus lateral, which is indicated by the permanent 5-toothed calyx.

**Hairy Plectronia.** Shrub 4 to 6 feet.

**Cult.** See Chioc Scotia, p. 569, for culture and propagation.

**Lin. syst. Pentándria, Monogynia.** Calyx with an ovate tube, and a 5-toothed deciduous limb. Corolla with a short tube, a hairy throat, and 5 oval acute reflexed lobes. Stamens inclosed, inserted at the throat. Style much exserted; stigmata bilamellate. Berries fleshy, areolate at the apex, ovate, compressed, wrinkled from tubercles, marked by a furrow on both sides, 2-celled, containing usually 2, rarely 3 pyrenes; pyrenes oblong, scarious from wrinkles, 1-seeded, marked by a linear furrow, and an umbilicus in the middle. Seeds bony, filling the pyrene. Albumen amygdalaceous, scrobilicate. Embryo inverted, filiform, curved into the form of a Greek sigma, with linear cotyledons.—Shrubs, with opposite ovate leaves, and axillary racemes of small flowers. This genus, from the hard fruit being often 5-celled, and from the form of the embryo, almo t agrees with the tribe Gustárdaceae.

1 P. mocoëcos (Guett. fruct. 1. p. 125. t. 26. f. 2.) leaves elliptic, long-acuminate, gradually tapering into the short petioles at the base; stipulas lanceolate, acute, permanent; cymes pedunculate, branched; fruit rather heart-shaped. \( \eta \). S. Native of Ceylon.

**Two-seeded Psydrax.** Shrub.

2 P. Major (A. Rich. l. c. p. 191.) leaves elliptic, on short petioles, short-acuminate; stipulas semi-oval, bluntish; cymes pedunculate, simple; fruit heart-shaped. \( \eta \). S. Native of Madagascar. Very like the preceding species, but differs in the broader leaves with shorter points, caducous stipulas, simple cymes, and larger fruit.

**Larger Psydrax.** Shrub.
3 P. medica (A. Rich. l. c.) leaves oval, very blunt, gradually attenuated at the base; stipules ending in long points, caducous; cymes hardly pedunculate, simple, few-flowered; fruit deeply emarginate, didymous. \( h \). S. Native of Madagascar.

Intermediate Psydax. Shrub.

4 P. angustifolia (A. Rich. l. c.) leaves linear, acutish at the apex, gradually attenuated at the base; stipulas lanceolate, caducous; cymes hardly pedunculate, 3-5-flowered; fruit small, heart-shaped, didymous. \( h \). S. Native of Madagascar.

Narrow-leaved Psydax. Shrub.

Cult. For culture and propagation see Chiocécea, p. 569.

Lin. syst. Pentandria, Monogyenia. Calyx with an ovate tube, and a short acutely 5-parted limb. Corolla with a short tube, a glabrous throat, and 5 oblong spreading bluntish lobes, which are longer than the tube. Anthers 5, ovate, sessile at the throat of the corolla. Style filiform, length of tube; stigmas 4-6. Berry ovate, fleshy, 2-celled, crowned by the calyx. Seed or pyrene solitary in the cells, erect, convex on the outside, but flat and furrowed inside.—A glabrous shrub, with spinose branches. Leaves on short petioles, opposite, lanceolate, small, attenuated at both ends. Stipulas small, solitary on both sides, adhering to the petioles. Pedicels axillary, solitary, 1-flowered, deflexed, calyculate by 4 small combined bracteae under the flower. Flowers small. This genus differs from Cánthumus in the stigma being divided into many lobes, and in the seeds rising from the bottom of the cells, not from the top.

1 M. Billardieri (A. Rich. l. c.) \( h \). G. Native of Van Diemen's Land. Cánthumus quadrifidum, Labill. nov. holl. 1. p. 69. t. 94. A very spinose shrub, very variable in habit, having the branches sometimes loose and elongated, and sometimes short and crowded. Pedicels rising each from a sheath.

La Billardier's Marquisia. Shrub 5 to 6 feet.

Cult. For culture and propagation see Chiocécea, p. 569.

CXLVI. NESCIDIA (from nevico, to be ignorant; the fruit being unknown the genus is very doubtful). A. Rich. Mem. soc. hist. nat. Par. 5. p. 192. D. C. prod. 4. p. 477.

Lin. syst. Pentandria, Monogyenia. Limb of calyx hardly any, quite entire. Corolla with a short tube, a naked throat, and a 5-cleft limb; segments incumbent, bluntish. Stamens 5, inserted in the throat, almost sessile, inclosed. Anthers linear, acute. Style short; stigmas 2, linear, acute, joined face to face. Ovarium 2-celled; ovula solitary in the cells, fixed to the middle dissepiment. Seeds unknown.—A glabrous shrub, native of the Mauritius. Leaves opposite, petiolate, like those of a myrtle, coriaceous, scarcely acute. Stipulas short, interpetiolar. Flowers axillary, solitary, girded by a bidentate calycalous at the base.—This is a doubtful genus from the fruit being unknown, but it has the habit of Myrtinia.

1 M. Myrtifolia (A. Rich. l. c.) \( h \). S. Native of the Mauritius.

Myrtle-leaved Nesvidia. Shrub 5 to 6 feet.

Cult. See Chiocécea, p. 569. For culture and propagation.

CXLVII. DIPOLESPORA (from diplos, diploë, double, and spora, spora, a seed; in reference to the cells of the fruit being 2-seeded). D. C. prod. 4. p. 477.—Cánthumus species, Lindl.

Lin. syst. Tetrandria, Monogyenia. Calyx with an obovate tube, a very short subcampanulate 4-toothed limb. Corolla with a wide tube, which is shorter than the lobes, a pilose throat, and 4 obovate fleshy spreading lobes. Anthers 4, sessile at the throat, semi-exserted. Style length of the tube; stigma bifid. Ovarium 2-celled; cells 2-seeded; ovula collateral, ascending. Fruit and seeds unknown.—A glabrous shrub, native of China, with tetragonal branches. Leaves opposite, petiolate, oblong-lanceolate, acuminate at both ends. Stipulas solitary on both sides, ovate, acuminate, permanent. Flowers axillary, crowded, almost sessile, yellowish-green, calyculate by combined bracteae at the base. This genus agrees with Epithinia in the cells of the ovarium being biovolate, but differs in the ovula being collateral, not one on the top of the other.

Cult. See Chiocécea, p. 569. for culture and propagation.

CXLVIII. EPITHI'NIA (from eri, epi, upon, and thn, thin, the seashore; the shrub grows among mangroves on the seashore). Jack, in mal. misc. 1. no. 2. p. 12. D. C. prod. 4. p. 477.

Lin. syst. Tetrandria, Monogyenia. Limb of calyx cylindric, scarcely 4-toothed, permanent. Corolla tubular, with a 4-parted spreading acute limb, and a villous throat. Stamens 4, exserted; anthers linear. Style exserted; stigma bifid. Berry 8-furrowed, containing 2 oblong 2-seeded pyrene. Seeds placed one above another.—An Indian shrub. Leaves opposite, petiolate, obovate, smooth, almost veinless. Stipulas wanting? Peduncles axillary, dichotomous, many flowered, with a solitary flower in the fork. Flowers white.—This genus is said to be allied to Malânca, but differs in the cells of the fruit being 2-seeded, and from all other Rubieaeae plants in the want of stipulas.

1 E. Malaya'na (Jack, l. c.) \( h \). S. Native of the islands of Malacca, Singapore, in marshes among mangroves.

Malaya Epithinia. Shrub.

Cult. For culture and propagation see Chiocécea, p. 569.

Lin. syst. Tetrandria, Monogyenia. Calyx with a subglobose tetragonal tube, and a very small 4-toothed limb. Corolla with a long terete tube, which is hardly widened at the apex, a glabrous throat, and 4 oval roundish bluntish spreading lobes. Anthers 4, sessile in the throat of the corolla, oblong, hardly exserted, one-half shorter than the lobes of the corolla. Style bifid at the apex, length of the corolla. Berry dry, nearly globose, naked at the apex, 2-celled, 2-seeded. Seeds convex on the outside, concave inside, and furnished with a circular areola as in Bacconia. Albusman cartilaginosus. Embryo unknown.—Glabrous hard-wooded trees, natives of South America. Branches terete, but tetragonal when young, as well as the pedicels. Leaves opposite, oval-oblong, acute, rather coriaceous, petiolate. Stipulas solitary on both sides, apiculated by a short point. Peduncles axillary, trifid or trichotomous. Flowers rose coloured on the outside, and white inside. This genus is nearly allied to Coffea.

1 S. triplure (Vahl, eel. 1. p. 10.) peduncle twin, axillary, 3-flowered. \( h \). S. Native of the islands of Montserrat and Martinico, where it is called bois de fer or iron-wood. S. férreum, Lam. ill. p. 282. Sideroxyloides férreum, Jacq. amer.
p. 10. t. 173. f. 9.—Pluk. aln. t. 224. f. 2. Petioles short, and the leaves are acute at the base, ex Vahl.

2 S. multiflorum (A. Rich. 1. c.) peduncles axillary, tripartite, having the lateral branches trifid, and the middle one twice trifid.  ½. S. Native of French Guiana. Petioles 2-3 lines long. Peduncles 3 or 4 lines longer than the petioles. Leaves acuminate at the apex, but hardly acute at the base.

Var. β. angustifolium (D. C. prod. 4. p. 478.) leaves oblong, acuminate.  ½. S. Native along with the species.

Many-flowered Ironwood-tree. Tree.

† A doubtful species.

3 S. paniculatum (Willd. herb. no. 2811. ex Cham. et Schlecht. in Linnaea. 4. p. 26.) panicles axillary, pedunculate, hairy, with subichotomous branches; leaves ovate-cordate, acutely mucronate, nearly sessile.  ½. S. Native of South America, on the banks of the river Atabapo, near San-Balthazar. Psychotria cordifolia, H. B. et Kuntz, nov. gen. amer. 3. p. 365, but not of Dietr. The fruit is unknown, but the tree agrees better with Sideroxylon than with Psychotria in the tetradrous flowers and axillary panicles. Flowers blue, glabrous, with a villous throat.

Panicled-flowered Ironwood-tree. Shrub.

Cult. See Chicoëcca, p. 569. for culture and propagation.

1 E. caíreena (D. C. prod. 4. p. 479.)  ½. S. Native of the island of Namok, one of the Friendly Islands. Petesiæ cármen, Forst. 2. no. 51.

Peach-coloured-flowered Eumachia. Tree.

Cult. For culture and propagation see Chicoëcca, p. 569.

Lin. Syst. Tetrandria, Monogyânia. Calyx with an obovate tube, and a 4-parted limb (f. 105. b.). Corolla funnel-shaped (f. 105. g.), with a terete tube (f. 105. f.), a bearded throat, and 4 spreadingly reflexed lobes. Stamens 4, inserted in the throat; filaments filiform; anthers linear, fixed by the middle, exserted (f. 105. c.); stigma bifid (f. 105. c.). Berry nearly dry, 2-celled, subdidymous, compressed (f. 105. h.), crowned by the permanent calyx (f. 105. b.), containing 2 chartaceous coarceous 1-seeded pyreneae. Albumen horny. Embryo unknown.—Shrubs, rarely herbs, natives of America. Stems erect, tetragonal when young. Leaves opposite or in whorles, nearly sessile. Stipulas small, interpetiolar. Coryms terminal, tripartite, bracteate, with dichotomous branches. Flowers white, lateral and sessile, or terminal and pedunculate, bibracteate.

1 D. chiococoides (H. B. et Kuntz, nov. gen. amer. 3. p. 355. t. 281.) shrubby, glabrous; leaves opposite, sessile, oblong-lanceolate, acute, cuneate at the base, with rather revolute edges; coryms sessile, tripartite; stamens about equal in length to the lobes of the corolla.  ½. S. Native of New Andalusia, on the banks of the Oriñoco, near the monastery of Caripé; and of Rio Janeiro, ex Cham. et Schlecht. in Linnaea. 4. p. 4. Rœm. et Schultes, mant. 3. p. 112. Houstinia fruticosa, Wild. mass. in Rœm. et Schultes, syst. 3. p. 597. Shrub 4 feet high. Flowers white. (f. 105.)

Chiococoides-like Declieuxia. Shrub 4 feet.

2 D. mexicana (D. C. prod. 4. p. 479.) suffrutescent, glabrous; leaves opposite or 3 in a whorl, sessile, oblong-lanceolate, obtuse at the base, acute at the apex; coryms pedunculate, 4-5-parted; stamens about equal in length to the lobes of the corolla.  ½. S. Native of Mexico. D. chiococoides, Bartl. in herb. Hænke. Flowers white. Mexican Declieuxia. Shrub ½ foot.

3 D. thymoides (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 111.) shrub much branched; leaves disposed in verticillate fascicules, sessile, linear, acute, attenuated at both ends, and are, as well as the branches, roughish; flowers solitary or few together on the tops of the branches.  ½. S. Native of Brazil.

Thymoides-like Declieuxia. Shrub.

4 D. natureoides (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 111.) shrub much branched; leaves linear-lanceolate, attenuated at the base, sessile, opposite or 6 in a whorl, and are, as well as the branches, scabrous from hairs; flowers axillary, solitary.  ½. S. Native of Brazil. The rest unknown.

Savory-like Declieuxia. Shrub.

5 D. galloides (Pohl, in litt. under the name of Psyllocarpus,) plant subherbaceous, glabrous; branches terete; leaves 3 in a whorl, linear; whorles distant; panicles terminal, having the branches disposed 3 in a whorl, cymose.  ½. S. Native of Brazil, where it was collected by Pohl.

Galium-like Declieuxia. Shrub 1 foot.

6 D. spargoulfoïdæ (Mart. et Zucc. 1. c.) shrubby, glabrous; leaves linear-subsutulate, opposite, sessile; racemes dichotomous; terminal.  ½. S. Native of the south of Brazil. Cham. et Schlecht. in Linnaea. 4. p. 6. Panicles terminal, dichotomously compound from cymes: having the branches capillary, elongated, and erect, with alternate flowers. Flowers twin, one of each pair sessile. Stamens inclosed. Cham. et Schlecht.

Spurry-leaved Declieuxia. Shrub.

7 D. marioides (Mart. et Zucc. 1. c.) shrubby; stem and branches clothed with soft down; leaves 4 in a whorl, rarely 4, ovate-lanceolate, almost sessile, glabrous, with revolute edges; flowers axillary, almost terminal.  ½. S. Native of Brazil.

Cat-thyme-like Declieuxia. Shrub.

8 D. genanthoides (Mart. et Zucc. 1. c.) plant herbaceous, glabrous; stem nearly simple; leaves 4 in a whorl, rarely 4, ovate-lanceolate, almost sessile, glabrous, with revolute edges; flowers axillary, almost terminal.  ½. S. Native of Brazil. Panicle, ex Cham. et Schlecht. in Linnaea. 4. p. 5. terminal, from whorles.
of branches, usually twin, and forming a terminal umbel, with a
central flower. _Flowers sessile._

_Cenanthe-like Declieuxia._ Shrub.

9 **D. foliosa** (Pohl, in litt. under the _Psilocarpus_) shrubby, scarous in every part; branches tetragonal; leaves opposite, linear-oblong, acuminate at both ends, revolute at the margins while young; cymes terminal, few-flowered.  S. Native of Brazil, where it was collected by Pohl. In the axils of the leaves there are two young leaves, and therefore at first sight appear 6 in a whorl.

**Leafy Declieuxia.** Shrub.

10 **D. cordigera** (Mart. et Zucc. i. c.) suffrutescent, nearly simple, clothed with roughish pubescence; leaves opposite, decussate, approximate, sessile, ovate-cordate, acute, concave on the back; racemes bident, terminal, crowded into a dense panicle.  S. Native of Brazil within the tropic. _Cam. et Schlecht._ in _Linnaea._ 4. p. 7. Psilocarpus coriifolius, Pohl, in litt. Leaves rarely 3 in a whorl. Panicle terminal, erect, many flowered, nearly globose, with angular flexuous branches, dichotomous, hence bearing sessile flowers.

_Hart-bearing Declieuxia._ Shrub.

11 **D. glauca** (Mart. et Schlecht. in _Linnaea._ 4. p. 8.) shrubby, glabrous, pruinose glaucenceous; leaves opposite, sessile, ovate, very acute, erectly adpressed, coriaceous; panicle terminal, erect, nearly globose, dense.  S. Native of Brazil within the tropic. Very nearly allied to the preceding species.

_Glaucous Declieuxia._ Shrub.

12 **D. Passerina** (Mart. et Zucc. in _Roem. et Schultes._ mant. 3. p. 112.) shrubby, glabrous; leaves opposite, decussate, sessile, adpressed, imbricating in 4 rows, ovate, acute, 3-5-nerved beneath; flowers axillary, sessile, covered each by a leaf.  S. Native of Brazil.

_Passerina-like Declieuxia._ Shrub.

13 **D. raphiolepis** (Mart. et Zucc. i. c.) shrubby; branches twiggy; leaves opposite, decussate, somewhat imbricating in 4 rows, sessile, ovate-cordate, acute, rather concave above, scarous from hairs beneath, 7-9-nerved; peduncles axillary, few-flowered.  S. Native of Brazil. The rest unknown.

_Daphne-like Declieuxia._ Shrub.

14 **D. imbricata** (Pohl, in litt. under the name of _Psilocarpus_) shrubby, glabrous; branches terete; leaves opposite, sessile, deciduous, erect, ovate, hardly subcordate, cuspidate, stilt, having 4 small ribs on each side of the midrib; peduncles axillary, few-flowered.  S. Native of Brazil.

_Imbri-leafed Declieuxia._ Shrub.

15 **D. rheoxeoides** (Mart. et Zucc. i. c.) shrubby, glabrous; young branches subumbellate, twiggy; leaves opposite, deciduous, erect, ovate, hardly subcordate, cuspidate, stilt, having 4 small ribs on each side of the midrib; peduncles axillary, few-flowered.  S. Native of Brazil.

_Rheoxe-like Declieuxia._ Shrub.

16 **D. origanoides** (Zucc. i. c.) shrubby, clothed with roughish hairs; branches dichotomous, terete; leaves opposite, rather remote, on short petioles, nearly orbicular, acute, many nerved; flowers terminal, thysroid.  S. Native of Brazil. Leaves like those of _Origaniurn Dictamnus._

_Origaniurn-like Declieuxia._ Shrub.

17 **D. molle** (Zucc. i. c.) shrubby; leaves opposite, ovate-lanceolate, somewhat rhomboid, acute, tapering into the short petioles at the base, with ribbed veins, clothed with villi; flowers terminal, disposed in dichotomous panicles.  S. Native of Brazil.

_Soft Declieuxia._ Shrub.

18 **D. lysimachioides** (Zucc. i. c.) plant herbaceous or suffrutescent, downy; branches simple, erect; leaves 3 in a whorl, ovate, attenuated at both ends, acute; flowers terminal, dichotomously panicked.  S. Native of Brazil.

_Lysimachia-like Declieuxia._ Shrub.

19 **D. rubigoides** (Zucc. i. c.) shrubby, glabrous; leaves opposite, decussate, ovate, acute, rounded and cordate at the base, shining above; flowers terminal, disposed in dichotomous panicles.  S. Native of Brazil.

_Rubia-like Declieuxia._ Shrub.

20 **D. a'la** (Zucc. i. c.) shrubby, scarous; leaves opposite, decussate, ovate, acute, sessile, rounded at the base; racemes terminal, bident, disposed in dichotomous cymes.  S. Native of Brazil.

_White Declieuxia._ Shrub.

21 **D. divergentiflora** (Pohl, in litt. under _Psilocarpus_) suffrutescent; branches terete, clothed with velvety hairs; leaves opposite, sessile, ovate, acute or acuminate; cymes terminal, of many rays, subtangulate.  S. Native of Brazil, where it was collected by Pohl.

_Diverging-flowered Declieuxia._ Shrub.

22 **D. pulverulenta** (Mart. et Schlecht. in _Linnaea._ 4. p. 9.) suffrutescent, clothed with short dense hairs in every part except the corollas; leaves usually 3 in a whorl, rarely opposite, sessile, ovate, acute or acuminate; cymes terminal, of many rays, subdichotomous.  S. Native of Brazil.

_Powdery Declieuxia._ Shrub.

23 **D. polygaloides** (Zucc. in _Schultes._ mant. 3. p. 113.) suffrutescent; branches twiggy, erect; leaves 3 or 4 in a whorl, sessile, lanceolate, acute, erect, smooth; flowers terminal, panicked.  S. Native of Brazil. The rest unknown.

_Polygala-like Declieuxia._ Shrub.

24 **D. vincoideas** (Mart. et Zucc. i. c.) shrubby, glabrous; leaves opposite or 3 in a whorl, ovate, attenuated at both ends, acute, sessile, shining; flowers terminal, disposed in dichotomous panicles.  S. Native of Brazil.

_Vinca-like Declieuxia._ Shrub.

25 **D. fruticosa** (Pohl, in litt. under _Psilocarpus_. D. C. pro. 4. p. 481.) suffrutescent, glabrous, glaucous; branches terete; leaves opposite, sessile, orbicularly ovate, mucronate; cymes terminal, trichotomous, on short peduncles, fastigiate.  S. Native of Brazil.

_Frosted Declieuxia._ Shrub.

26 **D. mucronulat'a** (Mart. Cham. et Schlecht. in _Linnaea._ 4. p. 10.) suffrutescent, quite glabrous; leaves opposite, sessile, elliptic or obovate, cuneate at the base, mucronate at the apex; the mucron usually reflected; cymes terminal, on short peduncles, somewhat fastigiate.  S. Native of Brazil within the tropic. Stem and branches terete, furnished with 2 slight wings. _Psilocarpus trichotomus_. Pohl, in litt. may be referable to this, but the mucrones of the leaves are not reflexed in the specimens of that plant collected by Pohl.

_Mucronate-leaved Declieuxia._ Shrub.

27 **D. glabra** (D. C. pro. 4. p. 481.) plant suffrutescent, glabrous; stem somewhat tetragonal; leaves opposite, petiolate, elliptic-oblong, acuminate at both ends, but not mucronate; cymes terminal, of many rays, subumbellate.  S. Native of Brazil, Pohl; about Caracas, Vargas. _Psilocarpus glaber_. Pohl. In litt. Very like the preceding.

_Glabrous Declieuxia._ Shrub.

28 **D. ? psychotrioides** (D. C. pro. 4. p. 481.) suffrutescent, glabrous; leaves opposite, on short petioles, elliptic, long-acuminated, acute at the base; cymes terminal, on short peduncles, trichotomous, one-half shorter than the leaves.  S. Native of Cayenne, where it was collected by Patris; and of Panama and Mexico, according to Hanke. herb. _Coffea didyma._
mocárpa, Bartl. in herb. Hænke. Flowers unknown. Stipulas twin on both sides, subulate.

**Psychotria-like Declœiuxia.** Shrub.

29. *D. herbaacea* (Cham. et Schlecht. in Linneæa. 4. p. 11.) plant herbaceous, glabrous; branches straight, glabrous, terete, a little winged; leaves opposite, petiolate, ovate-lanceolate, attenuated, acute; cymes axillary, on long peduncles, of 5 spreading rays. 2. S. Native of Brazil, about Rio Janeiro. Knœxia Brasilensis. Spreng. syst. 1. p. 406. Habit of *Borrêira lúeza*. Corolla a line long. Fruit nearly dry. This plant ought probably to be excluded from the present genus, according to Martius in Linneæa. 1. c.

**Herbaceous Declœiuxia.** Shrub.

*Cult.* For culture and propagation see *Chiocœca*, p. 569.

### CLII. TERTREA (named after J. B. du Tertre, a traveller in the French West Indian Islands), and who has written a general history of them). D. C. prod. 4. p. 481.—Schiedea, A. Rich. mem. soc. hist. nat. Par. 5. pt. 1. p. 186. (1830) but not of Schlecht. in 1826.

**Lin. syst. Pentändria, Monogyinia.** Limb of calyx 4-parted: lobes erect, oval, obtuse, ciliated. Corolla short, funnel-shaped, 4-cleft; lobes short, obtuse, rather spreading; throat beset with hairs. Stamens inserted, exerted in the upper part of the tube. Style shorter than the corolla. Stigma 2, short, obtuse. Drupe oblong, compressed, crowned by the calyx, with 2 opposite furrows, containing 2 cartaceous 1-seeded pyrenae. Seed oblong, compressed, pendulous.—A shrub, native of Martinico, having the branches usually spinose at the apex. Leaves opposite, oval, acute, on short pedioles, membranous, glabrous. Stipulas interpetiolar, acuminate. Flowers small, disposed in a terminal oppositely branched raceme.

**Martineo Tertrea.** Shrub 1 to 2 feet.

*Cult.* For culture and propagation see *Chiocœca*, p. 569.

**Lin. syst. Pentändria, Monogyinia.** Calyx with an ovate tube, and an acutely 5-toothed permanent limb. Corolla funnel-shaped, with an obconical tube or throat, and 5 acute lobes. Stamens with the filaments hardly adnate to the bottom of the corolla, downy, and shorter than the anthers, which are incised and linear. Style rather clavate at the apex, entire or slightly 2-lobed. Berry somewhat didymous, compressed, crowned by the teeth of the calyx, containing 2 cartaceous 1-seeded pyrenae. Seeds pendulous. Embryo with a long superior radicle. Albumen cartilaginous.—Shrubs generally with a somewhat climbing habit. Leaves opposite, ovate or oblong, acute, glabrous. Stipulas broad at the base, permanent, more or less apiculate. Racemæ axillary, opposite, simple or panicked. Flowers pedicellate, of a yellowish white colour. Roots emetic and alexiteric.

1. C. racemosa (Jacq. amer. p. 68. Lin. spec. 246.) leaves oval, acuminate at both ends, smooth; stipulas broad at the base, and apiculate by a long point at the apex; racemes many flowered; corolla much longer than the teeth of the calyx; filaments of stamens downy. ? S. Native of the West India islands, Mexico, and Carthagea, on hills. Swartz, obs. p. 76. Andr. bot. rep. t. 284. Tratt. tab. t. 631. Hook. fl. exot. t. 93.—Sloane, hist. t. 188. f. 3.—Dill. lort. elth. t. 228. f. 295. and therefore the Loniceræ albæ, Lin. spec. ed. 1. p. 175. A very variable shrub. Corollæ at first white and scentless, but at length becoming yellowish and sweet-scented. leaves shining on the upper surface. Berries snow white, hence the English name snow-berry, and the Greek one *chiocoecca*. The stamens are glabrous in the figure given by Hooker, and the stigma is trifid in that given by Andrews, variations which have never been seen in nature. The root has much the same acid bitter taste as snake-root, and has been long used as a strong resolutive or astringent, and is administered with great success in obstinate rheumatisms, and old syphilitic taints. It is best given in decoction; it is also an excellent emetic, and may be used as ippecauana.

Var. β, scándens (Pers. ench. 1. p. 209.) branches very slender, and evidently climbing; leaves oblong; racemes shorter than the leaves, simple. ? S. Native of Jamaica, and the island of Santa Cruz.—Browne, jam. p. 164. n. 2. Swartz, obs. 76. var. β.

Var. γ, laziflora (D. C. prod. 4. p. 482.) climbing; leaves oblong; racemes panicked, longer than the leaves. ? S. H. Cultivated in the botanic garden at Calcutta.

Var. ϵ, longiflora (D. C. prod. 4. p. 482.) leaves longer, oblong-acuminated; racemes simple, equal in length to the leaves. ? S. Native of Guadaloupe, where it was collected by Badier.

2. C. vending (Mart. spec. med. bras. p. 17. t. 6) leaves ovate, rather coriaceous; stipulas broad at the base, apiculate by a longish point; racemes many flowered; corolla much longer than the teeth of the calyx; filaments densely bearded. ? S. Native of Brazil, in woods at Almadas and Ferradas, on the mountains of Bahia; and at the Port of St. Catharine, ex Cham. et Schlecht. in Linneæa. 4. p. 13. Racemes simple. Flowers white, sweet-scented. This species grows plentiful about Bahia, where we have seen it either with loose or crowded branches and leaves.

Var. β, Cubénia (D. C. prod. 4. p. 482.) leaves ovate, subcordate; racemes rather compound; filaments bearded. ? S. Native of Cuba.

**Dense-flowered Snow-berry.** Shrub 3 to 4 feet.

3. C. angiófuga (Mart. spec. med. bras. p. 17. t. 5) leaves ovate, acuminate; stipulas very broad, short, each ending in a short point; racemes panicked; corolla hardly 3 times longer than the calyxine teeth. ? S. Native of Brazil, in woods, French Guiana, Trinidad, Peru, Cuba, and about Cumaná, on the Spanish Main. Cham. et Schlecht. in Linneæa. 4. p. 13. C. brachiiôta, Ruiz et Pav. fl. per. 2. p. 67. t. 219. f. and C. racemosa, H. B. et K. nov. gen. amer. 3. p. 252. Sieb. fl. trin. excis. no. 58. C. parviflora and C. paniculata, Willd. in Rém. et Schultes, syst. 5. p. 205. Pedicels and branches glabrous. Flowers white. Root diuretic, and is called by the Brazilians Caiiçar.

4. C. odora-ta (Hook. et Arn. in Bech. voy. pt. bot. p. 65) leaves broad-oval, rather coriaceous, very blunt, acute at the base, and running down the short pedioles; peduncles axillary, solitary, 3-4-flowered; corolla with a bearded throat. ? S.
Native of Elizabeth Island, one of the Society Islands. Coffea odorata, Forst. prod. 1. p. 94. The flowers are described as fragrant, and smelling like coals.

Sweet-scented Snow-berry. Shrub.

5 C. barbat'a (Forst. prod. 1. p. 96. Hook. et Arn. in Beech. voy. pt. bot. p. 65. t. 14.) erect; leaves oval, acute at the base, and tapering into the short petioles, acuminate and obtuse at the apex; peduncles axillary, solitary, 1-3-flowered; corolla with a bearded throat, 6-cleft. ɣ. S. Native of the Society and Friendly Islands. Flowers white. Drupe size of a filbert.

Bearded-flowered Snow-berry. Shrub.

6 C. Java'na (Blum. bijdr. p. 968.) shrub parasitical; leaves oblong-lanceolate, acuminated at both ends, glabrous, velvety and shining above; corymbs terminal, trichotomous. ɣ. S. Native of Java, in woods on the mountains upon trees. Coffea Javanica, Blum. cat. hort. bult. p. 46. Perhaps a species of Psychotria.

Java Snow-berry. Shrub parasitical.

 Cult. A mixture of loam, peat, and sand is the best soil for the species of Chioceca; and cuttings strike root freely in sand under a hand-glass in heat.

CLIV. MARGARIS (from ἀργαρόν, margaron, a pearl; the berries are white and shining in M. nudiflora, and are called peritías, or pearls, by the Mexicans). D. C. prod. 4. p. 483.— Deschía’a, Moc. et Sesse, fl. mex. icon. ined. ex D. C. l. c.

Lin. syst. Pentándria, Monogynía. Calyx with a globose tube, and a somewhat turbinate semi-5-cleft limb; teeth acutish, permanent. Corolla funnel-shaped, with an obconical tube, which is 5-toothed or 5 with 5 short lobes at the apex. Stamens 5, inserted in the middle of the tube; filaments a little shorter than the corolla; anthers ovate. Stigma capitate, undivided or slightly 2-lobed. Berry globose, crowned by the calyx, 2-celled, 2-seeded. Seeds semi-ovate, acute at one end.—Shrubs, with slender branches. Leaves opposite, ovate, glabrous, about the size of those of the common myrtle. Stipulas small, solitary on both sides. Pedicels axillary, opposite, short, 1-flowered. Flowers white, usually secund, bibracteolate under the calyx. Berries white.

1 M. bari-n'ea (D. C. prod. 4. p. 483.) leaves acute; corollas bearded inside. ɣ. S. Native of Mexico. Deschía’a leucocárpa, Moc. et Sesse, fl. mex. icon. ined. Berries size of a pea.

Beard-bearing Pearl-berry. Shrub.

2 M. nudiflóra (D. C. prod. 4. p. 483.) leaves mucronate; corolla glabrous inside. ɣ. S. Native of Mexico, about Ta-pelapa. Chioceca axillária, Moc. et Sesse, fl. mex. icon. ined. Deschía’a margaritária, Moc. et Sesse, fl. mex. icon. ined. Shrub 8 feet high. Berries ovate, globose, a little smaller than a pea, white and shining, hence they are called perítias by the Mexicans.

Naked-flowered Pearl-berry. Shrub 8 feet.

 Cult. See Chioceca above for culture and propagation.

Lin. syst. Tetrándria, Monogynía. Limb of calyx short, subcampanulate, obsoletely repand. Corolla with a short tube, a 4-parted limb, and a pilose throat; lobes oblong, acute, spreading. Stamens 4, inserted in the throat, hardly exerted; anthers oblong, almost sessile. Fruit small, egg-shaped, compressed, umbilicated by the limb of the calyx, drupaceous, usually 1-celled, and 1-seeded by abortion. Seed erect, oblong. Embryo nearly terete, slender. Albumen fleshy.—Shrub. Leaves opposite, elliptic, acuminate, coriaceous, glabrous on short petioles. Sti-
pulas subulate, acute. Flowers small, almost sessile, 4-5-together in the axis of the leaves.

False-Morinda Shrub.

 Cult. See Chioceca above for culture and propagation.

Lin. syst. Tetrándria, Monogynía. Calyx with a short ovate tube, and 4 linear-lanceolate acute lobes. Corolla tubular, somewhat tetragonal before expansion; the tube somewhat quadrangular at the apex; lobes 4, ovate, acute, revolute. Stamens having the filaments downy and adnate to the tube at the base; anthers linear, not exerted. Stigmas 2, obtuse, hardly longer than the tube. Drupe nearly globose, crowned by the calyx, containing a 2-celled 2-seeded nucleus, ex Rich., or very often 1-celled and 1-seeded by abortion.—West Indian shrubs, with the habit of Catesbaea or Justicia spinosa. Leaves small, almost sessile, oblong or obovate, coriaceous, opposite, usually disposed in fascicles in the axils. Stipulas small, interpetiolar. Peduncles 1-flowered, axillary, 1-4-together, and sometimes they are hardened into simple bifid or trifid spines, which are usually naked, rarely floriferous. Flowers small, purple or safron coloured.

1 S. vers'í-color (Vahl, ecol. amer. 1. p. 11. t. 10.) leaves obovate, shining above; spines simple, bipartite or twin. ɣ. S. Native of Santa Cruz and Porto Rico. Chomelia versicolor, Spreng. syst. 1. p. 110. Catesbaea parviflora, Lam. ill. t. 67. f. 2. Leaves 3 lines long. Spines commonly in pairs from each alternate axil, combined at the base, for the most part a little longer than the leaves, stiff, purplish, often bearing a flower at one of the points; they are the peduncles which have hardened, and keep growing on after the flowers have fallen. Flowers on short peduncles; those from the tops of the spines solitary, usually drooping, purple, and abortive; others are axillary, solitary, or more rarely 2-4-together, erect, saffron coloured, and fertile. Fruit snow white.

Party-coloured-flowered Scolosanthus. Shrub 3 to 4 feet.

2 S. triaca'nthus (D. C. prod. 4. p. 484.) leaves oblong, rather glaesuscent; spines for the most part trifid. ɣ. S. Native of St. Domingo, where it was collected by Bertero. Catesbea triacantha, Spreng. syst. 1. p. 416. Leaves 4-5 lines long. Flowers and fruit not sufficiently known, but the habit is that of Catesbaea.

Three-spined Scolosanthus. Shrub.

 Cult. See Isóra, p. 574. for culture and propagation.

Lin. syst. Tetrándria, Monogynía. Calyx with a turbinate tube, and a permanent limb, which is 4-toothed to the middle. Corolla oblong-shaped, with a long slender throat, a glabrous throat, and 4 spreading lobes, which are shorter than the tube. Anthers 4, sessile, or on short filaments, inserted at the throat of the corolla. Style bifid at the apex, situated among the anthers. Drupe ovate, crowned, containing a 2-celled (or 1-4 D
cell from abortion) nucleus; cells 1-seeded. Seeds pendulous in the cells, oblong.—American shrubs, usually spinous, glabrous or downy. Leaves opposite on short pedicles, stiff, coriaceous. Stipula short, interpetiolar. Peduncles axillary, or with few-flowered, short.—This genus differs from Isóra in habit and florescence, but more particularly in the fruit containing a hard nut; and from this it is more nearly allied to Scolostachys than to Isóra.

1 C. spinó'sa (Jacq. amer. 18. t. 13.) leaves ovate, acuminate, nearly sessile, glabrous; peduncles axillary, usually 3-flowered; lobes of calyx and corolla acute. h. & S. Native of Carthage, in woods; and of probably of St. Domingo. Isóra spinó'sa, Lam. dict. 3. p. 344. Flowers white, fragrant at night, 1½ inch long.

*Spiny* Chomelia. Clt. 1793. Shrub 8 to 12 feet.

Fascicled-flowered *Chomelia*. Clt. 1825. Shrub 5 feet.

3 C. obtus'a (Cham. et Schlecht. in Linnae. 4. p. 185.) leaves elliptic, acute at the base, glabrous, on short pedicels; peduncles axillary, 1-flowered; lobes of calyx and corolla obtuse. h. & S. Native of the south of Brazil. Flowers white.

Blunt-calymbed *Chomelia*. Shrub 4 to 5 feet.

4 C. pubescens (Cham. et Schlecht. in Linnae. 4. p. 187.) leaves ovate, acute, on short pedicels, pilose on the nerves above, and silky beneath; peduncles axillary, 1-flowered. h. & S. Native of Brazil within the tropic. Perhaps the same as C. Brasiliána, A. Rich. mem. soc. hist. nat. Par. 5. p. 183.

Downy *Chomelia*. Shrub.

Clt. See Isóra, p. 574. for culture and propagation.

Lin. syst. Tetrádrus, Monogónia. Calyx with a very short tube, adnate to the ovarium at the base, and a bluntly 4-cleft limb. Corolla funnel-shaped, with a short terete tube, a bearded throat, and 4 oblong acute lobes, which are longer than the tube, and twisted in resivation. Anthers 4, linear, almost sessile, erect, situated at the throat between the lobes, and a little shorter than them, at length twisted spirally. Style filiform, exserted, stigma undivided, or hardly 2-lobed. Disk thick, crowning the ovary. Berry dry, 2-celled, 2-seeded. Seeds semi-globose. Albumen cartilaginous. Embryo erect, nearly tertet.—A glabrous African shrub. Leaves opposite, petiolate, oval, acuminate at both ends. Stipula connate, sheathing, short. Corymb terminal, trichotomous. Flowers white.—This genus is nearly allied to Isóra, but differs in the tube of the corolla being shorter; and to Polygoñus, but differs in the stigma being undivided.

1 B. corymbós'a (D. C. Diss. ined. 1. ann. mus. 9. p. 219.) h. & S. Native of Sierra Leone, where it was collected by Smette. Verulámbia corymbós'a, Poir. dict. 8. p. 543. Isóra nírfida, Schumpl. pl. guin. p. 77.

Var. β. angustifólia (D. C. prod. 4. p. 485.) leaves narrower than in the species, and more acuminate at both ends. h. & S. Native of Gambie and Cayor, in humid places, where it was collected by Leprieur and Perrottet.

Corymbose-flowered *Baconia*. Shrub 4 to 5 feet.

Clt. See Isóra, p. 574. for culture and propagation.

Lin. syst. Tetrádrus, Monogónia. Calyx with an ovate tube, and a small 4-toothed limb (f. 106. a.). Corolla salver-shaped (f. 106. b.), with a slender terete tube (f. 106. d.), and a 4-parted spreading limb (f. 106. b.); tube longer than the lobes. Anthers 4, almost sessile in the throat, exserted a little. Style equal in length to the tube of the corolla, or a little longer, but shorter than the corolline lobes, bifid at the apex (f. 106. c.); lobes of stigma diverging or revolute. Berry drupaceous, nearly globose, crowned by the permanent calyx, 2-celled, containing 2 chartaceous 1-seeded pyreneæ, which are flat or hollow inside, and gibbous on the back. Albumen cartilaginous. Embryo dorsal, erect, incurved, with foliaceous cotyledons, and a long radicle.—Shrubs, sometimes rising to the height of small trees, natives of Asia, rarely of Africa. Leaves opposite. Stipulas broad at the base, acute at the apex, or ending in a bristle-like awn. Corymb terminal, usually trichotomous. Flowers scarlet, rose-coloured, flame-coloured or white, usually fragrant.

* Flowers scarlet, flame-coloured, rose-coloured, or flesh-coloured.

1 I. grandifióra (Ker. bot. reg. t. 154.) leaves sessile, cordinate, oblong, acute, shining; lobes of calyx acute; lobes of corolla ovate-lanceolate, acute; corolline umbellate; style hardly exserted; berry crowned by the lobes of the calyx. h. & S. Native of the East Indies, at Tanjore; and of China and Ceylon.—Bur. fl. zeyl. t. 57.—Pluk. alm. t. 59. f. 2. I. coccínea, Lin. spec. 159. exclusive of the synonymes. Roxb. fl. ind. 1. p. 385. Smith in Rees’ cycl. no. 1. Pavéttá coccínea, ex Blum. bijdr. 920. An elegant shrub. Flowers scarlet, disposed in ample corymbes. Tube of corolla almost 2 inches long.

2 I. propíq'qua (R. Br. in Wall. cat. 6119.) leaves almost oval, ovate or oblong, cordate at the base, coriaceous, glabrous, mucronate or acuminate; corymbes compound, sessile,
many flowered; calyceous teeth acute; lobes of corolla oblong, acuminate; style exerted, biform, smooth. $\ast$. S. Native of Madras, Ceylon, and Martaban. I. coccinea Ceylonensis, Roxb. Flowers scarlet. Very nearly allied to I. Bandhana.

**Allied Ixora.** Shrub.

5 I. crocata (Lindl. bot. reg. 782.) leaves firm, rather coriaceous, oval-lanceolate, much attenuated; coryms many-forked, decomposed, crowded, fuscagitate; teeth of calyx ovate, acute; short; lobes of corolla obvate-cuneate, 3 times or more shorter than the tube; style a little exerted, hairy in the middle. $\ast$. S. Native of China. I. Cinnamomea, Lam. dict. 3. p. 344. Flowers orange coloured. Tube of corolla 15 lines long. The species is very nearly allied to I. stricta; but differs in the leaves being stiffer, and in the tube of the corolla being twice the length.

6 I. incarna (D. C. prod. 4. p. 486. but not of Roxb. ex Smith.) leaves almost sessile, oblong, obtuse and rather cordate at the base, and bluish at the apex; coryms on short peduncles; lobes of calyx acute; lobes of corolla oval-oblong, acute. $\ast$. S. Native of the Moluccas, and now cultivated in Java. Lodd. bot. cab. t. 1049. Pavetta incarna, Blum. bijdr. p. 950. The flowers are either pale rose-coloured, flesh-coloured or white; but in the British gardens there is only the pale red-flowered variety to be found. Tube of corolla 10-11 lines long.

**Flesh-coloured-flowered Ixora.** Shrub 2 to 3 feet.

7 I. amoen'a (Wall. cat. no. 6121.) leaves oblong-lanceolate, glabrous, petiolate; stipulas cuspidate at the apex; coryms compound, pedunculate; lobes of calyx obtuse; lobes of corolla bluish; style and anthers exerted. $\ast$. S. Native of the East Indies, at Amherst, Chapeppong, Tavoy, Pulo-Penang, &c. Apparently pale, scarlet.

**Pleasant Ixora.** Shrub.

8 I. fulgens (Roxb. fl. ind. 1. p. 387.) leaves almost sessile, lanceolate, acute; coryms terminal, compound; lobes of calyx cordate; tube of corolla with a contracted mouth; lobes of corolla lanceolate, acute; berry 2-lobed. $\ast$. S. Native of the Moluccas. I. lanceolata, Lam. dict. 3. p. 343. I. longifolia, Curt. bot. mag.—Rumph. amb. 4. t. 46; and therefore I. longifolia, Smith in Rees' cyc. no. 3? Branches weak. Flowers deep scarlet. Berries deep purple.Perhaps the Bem-Schetti, Rhed. mal. 2. t. 57 is a paler variety of this or a nearly allied species.

**Full-grown Ixora.** Fl. June, Aug. Clt. 1823. Shrub 2 to 5 feet.

9 I. Notosisia'na (Wall. cat. no. 6132.) leaves ovate-oblong or oblong, acuminate, coriaceous, glabrous; panicles terminal, with the branches coriaceous and dense; lobes of corolla obtuse; stigma exerted, undivided; stipulas much acuminate. $\ast$. S. Natives of the East Indies, on the Nellighery mountains. Flowers apparently red or scarlet.

**Noton's Ixora.** Shrub.

10 I. tenuiflora (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, obtuse, smooth; panicles terminal, coriaceous, contracted; lobes of calyx cuneate, obtuse; corolla with a long slender tube, and oblong obtuse lobes, which are longer than the erect style and stamens. $\ast$. S. Native of the Moluccas. Flowers scarlet. Allied to I. fulgens.

**Slender-flowered Ixora.** Shrub 2 to 4 feet.

11 I. congo'sta (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, coriaceous, acuminate, with coarse parallel veins; coryms terminal, short, dense; flowers almost sessile; teeth of calyx bluish; lobes of corolla oblong, obtuse; stigma exerted. $\ast$. S. Native of the Moluccas. Flowers scarlet. Allied to I. fulgens.

**Crowded-flowered Ixora.** Shrub 2 to 4 feet.

12 I. pen'dula (Jack, mal. misc. no. 2. p. 11.) leaves broadly elliptic, quite glabrous, pale beneath; branches compressed; coryms on long trichotomous peduncles, pendulous; lobes of calyx small, acute; lobes of corolla narrow; stigma exerted. $\ast$. S. Native of Pulo-Penang, where the most of the Malay Ixoras are called Bunga-yarum. Flowers red.

**Pendulous Ixora.** Shrub 2 to 4 feet.

13 I. elongata (Heyne, ex Wall. cat. no. 6131.) leaves petiolate, broad-ovate, tapering much to the base, glabrous; floral ones ovate, sessile, coriaceous at the base, and clasping the stem; peduncles terminal, trichotomous, with the branches coriaceous; corollas hairy; corolla with a smooth tube, but the segments are downy on the outside, particularly in aestivation; lobes of corolla acute; stigma exerted. $\ast$. S. Native of the East Indies. Flowers apparently red or scarlet.

**Elongated-peduncled Ixora.** Shrub.

14 I. rosea (Wall. in Roxb. fl. ind. 1. p. 398.) leaves almost sessile, oblong, acute, acuminate, contracted at the base and somewhat emarginate, rather downy on the nerves beneath, as well as the branchlets; coryms terminal, decomposed, large, loose; lobes of calyx acute, rather ciliated; lobes of corolla oblong-cuneate, acute; stigma exerted. $\ast$. S. Native of Bengal, on the hills of Silhet. Ker. bot. reg. t. 540. Sims. bot. mag. 2428. Lodd. bot. cab. t. 729. Flowers rose coloured. Tube of corolla about an inch long. There is a variety of this plant having the leaves glabrous beneath.

15 I. parviflora (Vall, symb. 3. p. 11. t. 52. but not of Lam.) leaves on short petioles, coriaceous, lanceolate-oblong, obtuse, coriaceous at the base, glabrous; stipulas triangular, acute; corollas pedicellate; terminal; teeth of calyx short, bluish; lobes of corolla oblong, 3 times shorter than the tube; stigma a little exerted. $\ast$. S. Native of the East Indies. Flowers scarlet.

**Small-flowered Ixora.** Shrub.

**Amboyna Ixora.** Shrub 4 feet.

17 I. erubescens (Wall. cat. no. 6143.) leaves oblong, blunt at both ends, glabrous, on short petioles; upper ones sessile; corollas downy; lobes of corolla linear; stigma exerted. $\ast$. S. Native of the Burmese empire, on the banks of the Atram. Flowers reddish. I. affinis, Wall. cat. no. 6144. does not app-
pear to differ from this species, except in the more acuminated leaves.

Reddish-flowered Ixora. Shrub.

18 I. Java'nicia (D. C. prod. 4. p. 487.) leaves on short pedi-
toes, ovate-oblong, acuminated, glabrous; corymbs on long peduncles, tripartite, few-flowered; teeth of calyx acute; lobes of corolla ovate, acutish. 'S. Native of Java, on the mountains. Pavetta Java'nicia, Blum. bidjr. p. 949. Flowers of a deep vermilion colour. Habit of I. coccinea and I. incarnata.

Java Ixora. Shrub 3 to 4 feet.

19 I. Pauci'flora (D. C. 1. c.) leaves on short pedi-
toes, oblong, acuminated, acute at the base, glabrous; cymes on short peduncles, tripartite, few-flowered; teeth of calyx acute; lobes of corolla ovate, acute. 'S. Native of the west of Java, on Mount Pangaranjha, in woods. Pavetta pauci'flora, Blum. Flowers of a vermilion colour. Allied to I. Java'nicia, but differs in the cymes being fewer-flowered, and on shorter peduncles; and in the teeth of the calyx being acute.

Few-flowered Ixora. Shrub.

20 I. Salici'folia (D. C. prod. 4. p. 487.) leaves on short pedi-
toes, linear-lanceolate, acuminated, glabrous; corymbs brac-
tete; calycine segments acute; segments of corolla lanceolate, acuminated. 'S. Native of Java, on the mountains. Pavetta salici'folia, Blum. bidjr. p. 951. Flowers scarlet. A very beautiful species. Leaves 9-10 inches long, and 6 lines broad.

Willow-leaved Ixora. Shrub 3 to 4 feet.

21 I. Finlay'son'ia (Wall. cat. no. 6166) leaves ovate-
lanceolate, glabrous, tapering much to the base, obtuse, and 
mucronate at the apex, petiole; corymbs terminal, compound; 
lobes of calyx membranous; lobes of corolla obtuse; stigma 
exserted. 'S. Native of the East Indies. Flowers appar-
ently red.

Finlayson's Ixora. Shrub.

** Flowers white.

22 I. Blan'da (Ker. bot. reg. t. 100.) leaves oval or ovate-
lanceolate, almost sessile; cymes trichotomous, compound, con-
tracted, many-flowered; teeth of calyx short, bluntest; lobes 
of corolla obovate, reflexed; style a little exserted. 'S. Native of the East Indies. I. alba, Roxb. fl. ind. 1. p. 389. but not of Lin. Nearly allied to I. stric'ta, but differs in the corolla being white. Peduncles and calyces red. Stigma exserted, but shorter than the lobes of the corolla. Tube of corolla 10 lines long. Flowers at first white, but becoming yellow as they fade. Stipulas broad at the base, and ending in an awn.

Bland-flowed Ixora. Fl. Aug. Cit. 1768. Sh. 3 to 4 ft.

23 I. Macropphi'lla (Bartl. in herb. Henkx, ex D. C. prod. 
4. p. 487.) glabrous; leaves cuneate-obovate, or oblong-ob-
voate, acute on short pedi-
toes; peduncles elongated, bracteate at the base, and trichotomously corymbose at the apex; teeth of calyx acutish, hardly perspicuous; stigma exserted, with revolute lobes; fruit nearly globose. 'S. Native of the Island of Manilla. Allied to I. cuneifolia. Flowers blackish in the dried state, but probably white in the recent state.

Large-leaved Ixora. Shrub.

24 I. Subs'tillis (Wall. cat. no. 6130) leaves oblong, ta-
pering to both ends, petiole, glabrous; corymbs almost sessile, dense; lobes of calyx subulate; lobes of corolla acute; stigma exserted. 'S. Native of the Island of Silhet, on the mountains. Stipulas subulate at the apex. Flowers apparently white.

Almost-sessile-corymbed Ixora. Shrub.

25 I. Cunei'folia (Roxb. fl. ind. 1. p. 390.) leaves broad-
cuneate, lanceolate or oblong-lanceolate, acuminated, glabrous; 
corymbs terminal, on long peduncles, panicled; flowers crowded; 
lobes of calyx oblong, conic; lobes of corolla oblong, obtuse; 

stigma exserted. 'S. Native of the East Indies, about Dacca and Serampore. Ker. bot. reg. 648. Loddd. bot. cab. t. 1215. Corolla white, with the tube about 6-7 lines long. Berries turbinate, red. Down very minute on the peduncles, branchlets, and usually on the nerves of the leaves underneath.

26 I. Bar'atta (Roxb. fl. ind. 1. p. 394.) leaves oblong, 
short pedicellate, shining; upper ones almost sessile, and roundly 
cordate at the base; panicle spreading, long, sub-corymbose; 
lobes of calyx acutish; lobes of corolla oblong, bearded with 
long white hairs at the throat; stigma exserted. 'S. Native of the East Indies. Smith, in Rees' cycl. no. 6. Sims, bot. Third. 2705. Bem.—Schetti, Rhed. mal. 2. t. 13. Flowers white. Stigma, according to Roxb. almost at the throat, but in the specimens examined it is exserted. Berries red.

Bearded Ixora. Fl. June, July. Cit. 1823. Sh. 8 to 12 ft.

27 I. OxypHI'lla (Wall. cat. no. 6159) leaves elliptic-lan-
ceolate, long-acuminated, glabrous, on short pedicels; stipulas 
subulate at the apex; lobes of calyx subulate; stigma exserted. 'S. Native of Silhet, on the mountains. Flowers apparently white.

Sharp-leaved Ixora. Shrub.

28 I. Undu'la (Roxb. fl. ind. 1. p. 395.) leaves broad-
lanceolate, acuminated, undulated, glabrous; panicle terminal, 
compound, having its branches corymbose at the apex; lobes 
of calyx acutish; segments of corolla linear, bluntest; stigma 
exserted; berry transversely oval, somewhat didymous. 'S. Native of Bengal, in woods. Smith, in Rees' cycl. no. 7. Roth, 

hort. trans. 7. p. 50. Ixora Cana. Ham. ex Wall. cat. 
no. 6130. Flowers white. Tube of corolla 5 lines long; lobes 
reflexed.

Waxed-leaved Ixora. Fl. June, Aug. Cit. 1820. Sh. 3 to 4 feet.

29 I. Specta'illis (Wall. cat. no. 6183) leaves broad, elliptic-
lanceolate, petiole, glabrous; upper ones oblong, cordate at 
the base and stem clasping; peduncles elongated, trichotomous, 
having the branches corymbose; teeth of calyx small, acute; 
lobes of corolla narrow. 'S. Native of the Burmese Em-

pire, near Martaban. Flowers apparently white.

Showy Ixora. Shrub.

30 I. Lan'ceolaria (Coebr. in Roxb. fl. ind. 1. p. 397) 
leaves approximate, very long, ovate-lanceolate, acuminated, 
on short pedi-
toes, glabrous; corymbs terminal, almost sessile, small; 

bracteoles coloured; corolla with a filiform tube, and 

linear-oblong lobes; anthers linear, bifid at the base; style 
exserted. 'S. Native of the East Indies, in Travancore. 
Branches twiggy, pendulous, somewhat dichotomous. Stipulas 
subulate at the apex, rather longer than the pedioles. Corolla 
white, having the tube 9 lines long. Berries red, globose.

Lanceolar-leaved Ixora. Shrub 4 to 6 feet.

31 I. Leu'ca'stha (Wall. cat. no. 6148) leaves ovate-
lanceolate, acuminated on short pedi-
toes; peduncles and corymbs 

downy; stipulas subulate at the apex; lobes of calyx, and 

bracteas subulate; lobes of corolla long and narrow; stigma 

much exserted; corymbs loose. 'S. Native of the East 

Indies, near Travancore. Flowers white.

White-flowered Ixora. Shrub.

32 I. Arbo'rea (Roxb. mss. ex Smith, in Rees' cycl. no. 5. but 

not of Loddd.) leaves elliptic-oblong, obtuse, on short pedi-
toes, rather 

undulated, smooth; corymbs trichotomous, divariccate, sessile, 

many-flowered; teeth of calyx acutish; lobes of corolla oblong, 

obtuse, one-half shorter than the tube; stigma hardly exserted. 

'S. Native of the East Indies. I. Pavetta, Andr. bot. rep. 
t. 78. Pers. ench. 1. p. 130. but not of Roxb. Corolla white, 

5 lines long. Stigmas 2, thickish, greenish at the throat.
RUBIACEÆ.  CLIX. Ixora.

573

33 I. brachi'poda (D. C. prod. 4. p. 488.) glabrous leaves, on very short petioles, elliptic-oblong, bluntly acuminate; stipules intrapetiolar, combined, truncate, and mucronated on both sides; corymbs terminal, pedunculate, shorter than the leaves; limb of calyx very short, bluntly 5-toothed.  h. S. Native of equinoctial Africa, in the woods of Casamancia, where it was collected by Lepricur and Perrottet.  Leaves 6 inches long, and 2 broad, and the petioles about 2 lines long.  Tube of corolla, almost an inch long.  Bracteas small.  Flowers pale in the dried specimens, but are probably white in the recent state.

Short-petioled Ixora.  Shrub 4 to 5 feet.

34 I. acumin'ata (Roxb. fl. ind. 1. p. 393.) leaves petiolate, broad-lanceolate, acuminate, smooth, glaucous; floral leaves stem-clasping, and broader; corymbs supra-decompound, crowded, almost sessile; lobes of calyx ensiform; lobes of corolla ovate-oblong, obtuse; stigma exerted, undivided.  h. S. Native of the East Indies, in the province of Silhet, in woods.  Flowers large, white, with the tube 1 1/2 inch long.  Calyces white.

Acuminated-leaved Ixora.  Shrub 8 to 5 feet.

35 I. siame'nsis (Wall. cat. no. 6168.) leaves ovate-oblong, mucronate, cordate at the base: upper ones attenuated at both ends; corymbs terminal; lobes of corolla acute; stigma exerted.  h. S. Native of Siam, in the East Indies.  Flowers white?

Siam Ixora.  Shrub.

36 I. opa'ca (R. Br. in Wall. cat. no. 6141.) leaves long-lanceolate, acuminate, petiolate, glabrous; corymbs downy; teeth of calyx small; lobes of corolla obtuse; stigma exerted.  h. S. Native of Pulo-Penang.  Flowers apparently white.

Opaque-leaved Ixora.  Shrub.

37 I. brach'ica (Roxb. fl. ind. 1. p. 391.) leaves on short petioles, broad-lanceolate, obtuse, glabrous; panicle bracthate, with remote diverging corymbose branches; tube of corolla filiform, and the lobes are obovate and emarginate; anthers sessile at the throat; stigma exerted.  h. S. Native of Bengal, in woods.  Flowers small, white.  Nearly allied to I. paviliflora, Vahl, but differs in the flowers being white.  Berries deep purple, rather larger than peas.  Petioles about half an inch long.

Brachiat-leaved Ixora.  Ct. 1825.  Shrub 2 to 4 feet.

38 I. decip'iens (D. C. prod. 4. p. 488.) glabrous; leaves on short petioles, oblong-lanceolate, acutish at the base, acute or obtuse at the apex; stipulas broad at the base, and ending in a subulate awn at the apex; corymbs terminal, tripartite at the base, sessile, with panicled branches; lobes of calyx short, bluntish; corolla with a slender tube, and oval, bluntish lobes; style pilose.  h. S. Native of Coromandel, on the mountains.  I. pavilifiora, Roxb. fl. ind. 1. p. 393. but not of Vahl, nor Lam.  Flowers white, sweet-scented.  Tube of the corolla 4 lines long, twice the length of the lobes.  Berries roundish, black.

39 I. brun'oxtis (Wall. cat. no. 6136.) leaves obovate-lanceolate, sessile, corollas at the base, acuminate at the apex, downy beneath, but villous on the nerves; peduncles and corymbs villous, as well as the calyces and corollas outside; bracteas and teeth of calyx subulate; lobes of the corolla narrow, acute; stigma exerted.  h. S. Native of Pulo-Penang.  Flowers apparently white.  Allied to I. villis.

Brook's Ixora.  Shrub.

40 I. litt'ulicas (Roxb. fl. ind. 1. p. 392.) leaves broad-cuneate-lanceolate, acuminate, villous beneath, on short petioles; corymbs trichotomous, or 6 to 7 times divided, with the branches trichotomous and villous; lobes of calyx oblong, ciliate; corolla with a very long slender tube, and oblong obtuse lobes.  h. S. Native of the East Indies, in Silhet.  Flowers white, fragrant.  Stipulas and branches villous.  "Villosus" Ixora.  Shrub 4 to 5 feet.

41 puriflora (D. C. prod. 4. p. 489.) leaves sessile, obvate-oblong, cuneate, and somewhat cordate at the base, acuminate at the apex, downy on the nerves on both surfaces, as well as the branchlets, corymbs, and corollas; stipulas long, subulate at the apex; corymbs terminal, dense, sessile; teeth of calyx and alabastra, very acute.  h. S. Native of the East Indies.  A very distinct species.  Leaves 8 inches long and 3 broad.  Corolla having the tube about 9 to 10 lines long, and the lobes linear and acute, about 5 lines long.  "Downy-flowered" Ixora.  Shrub.

42 I. longiflora; leaves broad, elliptic-lanceolate, tapering to both ends, glabrous above, and villous beneath, particularly on the nerves, as well as the branchlets, pedicels, peduncles, panicles, fruit; segments of the calyx subulate.  h. S. Native of Pulo-Penang.  I. macrophylla, R. Br. in Wall. cat. no. 6165.  "Long-leaved Ixora."  Shrub.

† Species not sufficiently known.

43 I. alba (Lin. spec. 160. but not of Roxb.) leaves ovate-lanceolate; flowers fasciculate.  h. S. Native of the East Indies, but is a very obscure species, and probably fictitious; the description taken from the figure in Pluk. aln. t. 109. f. 2. and Bem.—Schetti Rheald. mal. t. 4. 14. Pluknet's plant belongs to I. incarnata, and Rheedé's probably to I. fulgens.  The flowers are said to be terminating in small clusters, white, and without scent.

White-flowered Ixora.  Shrub 6 to 7 feet.

44 I. louren'si; leaves ovate-oblong, acute, smooth, nearly sessile; cymes or corymbs fasciculate.  h. G. Native of Cochin China.  I. alba, Loure. coch. 76.  Flowers white.  Berries red.

Louren's Ixora.  Shrub 3 to 4 feet.

45 I. mort'n'a (Loure. coch. 76.) leaves oblong, broadest at the apex, obvate, cuneate and corolate at the base, nearly sessile, glabrous; corymbs terminal, fastigate.  h. G. Native of Cochin China, on the mountains.  Flowers scarlet.

Mountain Ixora.  Shrub 3 to 4 feet.

46 I. novem' niektóry (Loure. coch. 76.) climbing; leaves ovate-lanceolate, almost sessile, 9-nerved, rough; cymes terminal, hemispherical.  h. G. Native of Cochin China, in uncultivated places.  Flowers white, terminating in hemispherical cymes.  Tube of the corolla very long and slender.  Stigma ovate, bifid.  Berry 1-seeded.

Nine-nerved-leaved Ixora.  Shrub cl.

47 I. viola'cea (Loure. coch. 76.) climbing; leaves lanceolate, almost sessile, pilose, 9-nerved; cymes axillary.  h. G. Native of Cochin China, in uncultivated places, climbing over trees.  Flowers violaceous.  Berry 1-seeded.  Seed ovate, rough.

Violaceous-flowered Ixora.  Shrub cl.

48 I. thyrsiflora (Poir. suppl. 3. p. 208.) leaves almost sessile, ovate-cuneate, obtuse, glabrous on both surfaces, hoary beneath; stipulas ovate, acute; thyrase terminal, crowded; teeth of calyx acute, somewhat setaceous; corolla with a slender tube, and oval obtuse lobes, which are shorter than the tube.  h. G. Native of the Cape of Good Hope.

Thyrse-flowered Ixora.  Shrub.

49 I. laxiflora (Smith. in Rees' cyclo. vol. 19. no. 8.) leaves elliptic-oblong, acute, tapering into the petioles at the base: upper ones rounded at the base, almost sessile; panicles corymbose, loose, longer than the leaves; lobes of the corolla convex, spreading, bearded in the disk above: style nearly the length of
Rubiaceae. CLIX. Ixora. CLX. Pavetta.

4 P. montana (Reeves. in Blum. bijdr. p. 952.) leaves on long petioles, oblong-lanceolate, much acuminate at both ends, downy, as well as the corymb, which are terminal, trichotomous, and bractiace; calyces teeth acute; segments of corolla acutish. ₇. ₈. Native of Java, in woods on the mountains. Very nearly allied to P. indica. Flowers white, having the segments tipped with green.

Mountain Pavetta. Shrub 4 to 5 feet.

5 P. odorata (Blum. bijdr. p. 932.) arboreous; leaves on short petioles, oblong, acute at both ends, but usually bluish at the apex, coriaceous, glabrous; corybas terminal, trichotomous, many-lobed; limb of calyx bluntly toothed; segments of corolla obtuse. ₇. ₈. Native of Java, on the mountains in woods. Flowers white, very sweet-scented.

Sweet-scented-flowered Pavetta. Shrub 4 to 5 feet.

6 P. macropphylla (Blum. bijdr. p. 953.) leaves on short petioles, oblong, very blunt, attenuate at the base, coriaceous, glabrous; corybas axillary and terminal, downy, trichotomously fastigate; segments of calyx and corolla blunt. ₇. ₈. Native of Java, in mountain woods. Flowers white.

Long-leaved Pavetta. Shrub 4 to 5 feet.

7 P. reticulata (Blum. bijdr. p. 955.) leaves oblong, acuminate at both ends, coriaceous, glabrous, reticulated beneath; corybas terminal, trichotomous, long on peduncles; segments of calyx acute; segments of corolla lanceolate, acuminate. ₇. ₈. Native of Java, on Mount Salak. Flowers white. Stem 4 feet high. Young branches compressed. Fruit didyrmously globose.

Reticulated-leaved Pavetta. Shrub 4 feet.

8 P. longipes (D. C. prod. 4. p. 490.) leaves oval-oblong, acuminate, petiolate, glabrous; stipules short, acuminate; peduncles terminal, longer than the leaves, coriaceous at the apex, few-flowered; fruit ovate, didymous, naked at the apex. ₇. ₈. Native of the island of Timor. Upper leaves 4-5 inches long, ½ to 2. Peduncles slender, 6 inches long. Corolla with a slender tube, and 4 oblong spreading reflexed lobes. Anthers linear. Style a little exerted; stigma thick, bipartite.

Long-peduncled Pavetta. Shrub 4 to 5 feet.

9 P. paludosus (Blum. bijdr. p. 954.) leaves on short petioles, oblong, bluish, membranous, glabrous: the upper ones oblong-cordate, sessile; corybas terminal, on long peduncles, trichotomous, coloured; teeth of calyx obtuse; segments of corolla oblong, acute. ₇. ₈. Native about Batavia, in marshes. Flowers white. Allied to Ixora barbatá.

Marsh Pavetta. Shrub 4 to 5 feet.

10 P. sylvatica (Blum. bijdr. p. 953.) leaves oblong-lanceolate, acuminate at both ends, membranous, glabrous, downy in the axils of the veins beneath; corybas terminal, pedunculate, loosely trichotomous; limb of calyx obseously decimated; segments of corolla oblong, obtuse. ₇. ₈. Native of Java, in woods on the Seribu mountains. Flowers small, white.

Wood Pavetta. Shrub 4 to 5 feet.

11 P. breviflora (D. C. prod. 4. p. 491.) leaves oval, acute, acuminate at the base, on short petioles, rather membranous, glabrous; petiole coriaceous, many-flowered, with opposite branches and branchlets, and as well as the flowers glabrous; tube of corolla hardly longer than the lobes. ₇. ₈. Native of the East Indies, on the Nelligerry mountains, where it was collected by Leschenault. Tube of corolla 3 lines long. Style 4 lines long, clavate at the apex. Stipules broad, rather membranous. Plant becoming blackish on drying.

Short-flowered Pavetta. Shrub 3 to 4 feet.

12 P. rothiána (D. C. prod. 4. p. 491.) branchlets and calyces clothed with hoary villi; leaves elliptic, petiolate, rather hairy, but while young clothed with hoary tomentum;
triangular, glabrous inside; flowers disposed in panicked corolls, bearded; corolla with a long terete tube, which is bearded at the throat, and oblong obtuse lobes; style setaceous, glabrous. h. S. Native of the East Indies. P. villōsa, Roth. nov. spec. p. 88. but not of Vahl.

Roth's Pavetta. Shrub to 3 ft. 4

13 P. Naucloseflor (R. Br. in Wall. cat. no. 6171.) villous in every part; leaves oblong-lanceolate, acuminate; corolls terminal; teeth of calyx short, acute; lobes of corolla obtuse. h. S. Native of Pulo Penang. Fruit round.

Nauclose-flowered Pavetta. Shrub.

14 P. Brunönis (Wall. cat. no. 6172.) soft and villous all over; leaves obovate; stipulas and bracteas broad, membranous; peduncles trichotomous, having the branches dense and corymbose; lobes of calyx subulate. h. S. Native of the East Indies, on the Nelligerry mountains. Pavetta mollis, Wall. cat. no. 6179. Leaves smooth leaves in the adult state.

Brown's Pavetta. Shrub.

15 P. Webereffolia (Wall. cat. no. 6182.) leaves broad-lanceolate, glabrous, tapering to both ends; corollums downy; fruit spherical. h. S. Native of Sumatra. Flowers white.

Sumatra Pavetta. Shrub to 3 ft. 4

17 P. Longiflora (Vahl, symb. 3. p. 12.) leaves lanceolate-lanceolate, and are as well as the branches glabrous; stipulae pilose inside; flowers disposed in fascicles; teeth of calyx rather long, acute. h. S. Native of Arabia Felix. Ixora occidentalis, Forsk. cat. p. cv. Ixora longiflora, Poir. suppl. 3. p. 208. Flowers white. Berries black. Corolla an inch and a half in diameter.

Var. Jatana (D. C. prod. 4. p. 491.) leaves on short petioles, oblong, acute at both ends, coriaceous; corolls terminal, fastigiate, trichotomous, downy; tube of corolla very long; lobes of calyx and corolla acute. h. S. Native of Java, in woods on the mountains. Pavetta longiflora, Blum. bijdr. p. 952.

Long-flowered Pavetta. Shrub.

Villous Pavetta. Shrub.

* * * African species.

19 P. Owarie'ssis (Beauv. fl. d'ow. 1. p. 87. t. 52.) leaves on long petioles, ovate-oblong, attenuated at both ends, membranous, glabrous; corolls terminal; lobes of calyx ovate, acutish; lobes of corolla linear, obtuse, almost the length of the tube; style twice as long as the tube, clavate at the apex. h. S. Native of the west coast of Africa, between Waree and Buonopomo. Ixora Owarie'ssis, Poir. suppl. 3. p. 207. Flowers white. Throat of corolla very villous. Stipulas short, stem-elapping, apiculated by a short point at the apex.

Waree Pavetta. Shrub to 4 ft. 5

20 P. Ca'ftra (Thoub. prod. p. 20. fl. cap. 1. p. 535.) leaves obovate, almost sessile, glabrous; stipulas membranous, connate; flowers subumbellate; teeth of calyx setaceous; lobes of corolla oblong, acute, shorter than the tube. h. G. Native of the Cape of Good Hope, in the woods of Krakokamma. Ixora Ca'ftra, Poir. suppl. 3. p. 209. Pavetta coryboma, Houtt. ed. 1. p. 11. t. 40. and Crintina Capêniss, Houtt. pl. syst. 5. p. 357. t. 40. f. 1. ex Thoub. and Reem. syst. 3. p. 175. Ixora alba, Burm. herb. Pav. thysiflora, Thomb. herb. Corymb of flowers terminating in shorter branches. Flowers white. Style much exserted, clavate at the apex. This is a beautiful shrub in flower.

21 P. Parviflora (Afz. rem. guin. p. 47.) leaves oblong, attenuated at both ends; stipulas acute; peduncles dichotomously umbratell; calyces and corollums villous. h. S. Native of Guiana. Flowers white.

Small-flowered Pavetta. Shrub to 4 to 5 feet.

22 P. Smethmanni (D. C. prod. 4. p. 492.) leaves ovate, short-acuminated, coriaceous, smooth, on short petioles; corollums axillary, on short peduncles; teeth of calyx oblong, ciliately; corolla with a terete tube, and the limb glabrous before expansion. h. S. Native of Sierra Leone. Pavetta parviflora, Smetham. herb. Perhaps this plant belongs to a different genus.

Smethmann's Pavetta. Shrub to 3 to 4 feet.

23 P. Subglabra (Schum. pl. guin. p. 78.) branches terete, nearly glabrous; leaves ovate, acuminate, rather ciliately at the base; pedilium rather hairy; stipulas ciliately on the inside, ovate, mucronate; corollums festigiate, terminal; lobes of calyx lanceolate, acute. h. S. Native of Guinea. Flowers white. Stigma glabrous.

Nearly-glabrous Pavetta. Shrub to 4 to 5 feet.

24 P. Genipeflora (Schum. pl. guin. p. 78.) branches terete, downy; leaves oblong-lanceolate, acuminate, shining, glabrous, downy beneath and on the petioles; stipulas setaceous acuminate; corollums terminal, glabrous; peduncles and calyces hairy. h. S. Native of Guinea. Flowers white.

Genipa-leaved Pavetta. Shrub to 4 to 5 feet.

25 P. Lateriflora; leaves oblong-lanceolate, coriaceous, acuminate, almost sessile, disposed in 3 rows; peduncles axillary, subcoriaceous, h. S. Native of Sierra Leone. Flowers white. Berry roundish, containing a 1-seeded nut. Cotyledons long, twisted. Perhaps the same as P. Smethmanni.

Side-flowered Pavetta. Shrub to 4 to 6 feet.

26 P. Cane'scens (D. C. prod. 4. p. 492.) branchlets clothed with white hairs; leaves elliptic, attenuated at the base, on short petioles, reticulately veined, downy above, and clothed with canescent villi beneath; corollums lateral, many-flowered, almost sessile; pedicels and calyxes hairy; corolla with a downy tube, and a glabrous limb; style much exserted, rather clavate at the apex. h. S. Native of the South Western Coast of Africa, in Angola. Pavetta tomentosa, A. Rich. mem. soc. hist. nat. par. 5. p. 181. but not of Roxb. Flowers white.

Cane-crest Pavetta. Shrub.

* * * Species natives of Madagascar.

27 P. ? Anthophylla (A. Rich. in mem. soc. hist. nat. par. 5. p. 181.) quite glabrous; leaves short, oval, acute, rather fleshy; stipulas broad, short, acuminate, permanent; flowers cymose, terminal, pentamorous; one of the calycine lobes is drawn out into a leaf; anthers inclosed; style much exserted. h. S. Native of Madagascar. Perhaps a proper genus.

Leafflowered Pavetta. Shrub.

28 P. Cineea (A. Rich. l. c.) shrub clothed with grey tomentum; leaves rather oval, acute, gradually narrowed at the base, clothed with cinereous tomentum, especially beneath; stipulas connate, lanceolate, permanent; cymes terminal, peduncu-
late, branched; flowers tomentose. \( \gamma \). S. Native of Madagascar.

*Gumnerous* Pavetta. Shrub.

29 P. *graecilis* (A. Rich. l. c.) quite glabrous; leaves elliptic-oblong, very acute, almost sessile; stipulas connate, narrow-lanceolate; cymes few-flowered, terminal; flowers very long, slender; stamens exserted; style hardly exserted beyond the tube. \( \gamma \). S. Native of Madagascar. Perhaps a proper genus.

Slender-flowered Pavetta. Shrub.

***Species natives of the South Sea Islands.***

*Guelder*-rose-like Pavetta. Shrub.

*Elder*-like Pavetta. Shrub.

Three-flowered Pavetta. Shrub.

† *Species not sufficiently known.*

33 P. *angustîfolia* (Rom. et Schultes, syst. 3. p. 175.) leaves linear-lanceolate, attenuated at both ends; cymes terminal, trichotomous, subumbellate; teeth of calyx acute; corolla with a slender tube, and oblong acute lobes. \( \gamma \). S. Native of the East Indies. Pavetta Indica, Burm. fl. ind. p. 35. t. 13. f. 3. exclusive of the synonyms. Ixôra angustîfolia, Lam. dict. 3. p. 45. Flowers white. Stigma nearly entire as in Pavetta, and about equal in length to the lobes of the corolla, as in Ixôra.

Narrow-leaved Pavetta. Shrub 3 to 4 feet.

34 P. *ampliæcorus* (Pers. ench. 1. p. 131.) glabrous; leaves stem-clasping, oval; segments of corolla acute, lanceolate. \( \gamma \). S. Native of the East Indies; and is often mixed with *P. Indica* according to Persoon.

Stem-clasping-leaved Pavetta. Shrub 3 to 4 feet.

35 P. ? *parasîtica* (Lour. coch. p. 73.) stem parasitical, much branched; leaves verticillate, ovate, tomentose; corolla with a long tube, and 4 oblong infixed lobes; style equal in length to the corolla; berry 1-seeded. \( \gamma \). G. Native of Cochín-china, in gardens, growing upon trees. Flowers small, dusky yellow. This plant should probably be removed from the genus.

Parasitical Pavetta. Shrub 1 foot.

*Cult.* For culture and propagation see Ixôra, p. 574.

LIN. SYST. *Tetrandria*, *Monogynia.* Calyx with an oval tube, and a small 4-toothed permanent limb. Corolla 4-cleft, with a hairy throat. Stamens 4, inserted in the throat of the corolla; filaments short; stigma bifid. Berry oval, smooth, umbilicate, 1-seeded, crowned by the permanent calyx. Embryo erect, in fleshy albumen.—Trees or shrubs, natives of Java. Leaves opposite, glabrous, acuminated at both ends. Flowers crowded, terminal, rarely axillary, sessile. Berry and wood very fetid.—This genus comes very near the following.

1. S. arbo' reum (Blum. bijdr. p. 956.) arboreous; leaves peltate, elliptic-oblong; flowers crowded, terminal, and sometimes axillary. \( \gamma \). S. Native of Java, in mountain woods.

*Tree* Saprosma. Tree.

2 S. *fruticos's* (Blum. bijdr. p. 956.) shrubby; leaves almost sessile, oblong-lanceolate; flowers crowded, terminal. \( \gamma \). S. Native of Java, on Mount Parang.

*Shrubby* Saprosma. Shrub.

*Cult.* See Ixôra, p. 574. for culture and propagation.

LIN. SYST. *Tetrandria*, *Monogynia*.
Stipulas very short, rounded, acuminated on both sides, ex Vahl; but in the specimen collected at Porto-Rico by Ryan, the stipulas are connate a little way at the base, and bilobate at the apex; both are, however, probably the same species.

Frelich's 'Cosseuraea.' Shrub.

Cult. For culture and propagation see Isóra, p. 574.

Lin. syst. Tetra-Pentándria, Monogynía. Calyx with a turbinate tube, and an obliquely denticulated deciduous limb. Corolla with a cylindrical tube, a villous throat, and 4-5 spreadingly reflexed lobes, which are longer than the tube. Anters 4-5, alternating with the lobes of the corolla, hardly exserted. Style short; stigma bifid. Ovarium crowned by the disk. Berry drupaceous, nearly globose, 2-celled, naked at the apex; cells containing 1 pyrena each. Pyreæa excavated on the inside, and gibbous on the back, coriaceous, 1-seeded. Albumen cartilaginous. Embryo minute, erect.—Small glabrous trees, natives of Asia and the Mauritius. Leaves opposite. Stipulas interpetiolar. Cymes trichotomous, axillary, and terminal.—This genus is nearly allied to Isóra, but differs in the tube being shorter than the corolline lobes, and in the limb of the calyx being deciduous. It is also nearly allied to Bácio, but differs in the stigma being bifid.

1 P. Lanceol'ata (Lour. coch. p. 75.) leaves lanceolate, petiolate; racemes terminal, compound; flowers tetramerous and tetrandrous. f. G. Native of China, about Canton. Branches diffuse. Flowers reddish.

 Lanceolate-leaved Polyozus. Shrub 4 feet.

2 P. Acumináta (Blum. bijdr. p. 948.) leaves oblong-lanceolate, very much acuminated; racemes axillary; flowers tetramerous and tetradrous. f. S. Native of the western part of Java, on the mountains. Branchlets compressed. Stipulas broad, short. Flowers small, corymbosæ; corymb in the axils of the superior leaves on short peduncles.

Acuminated-leaved Polyozus. Shrub.

3 P. Latífoliá (Blum. bijdr. p. 948.) leaves elliptic-oblong, acute at both ends; flowers pentamerous and pentandrous. f. S. Native of the island of Nusa-Kambanga, near Java.

Broad-leaved Polyozus. Shrub.

† Doubtful species.

4 P. I Maderaspa'ta'na (D. C. prod. 4. p. 495.) leaves petiolate, oblong-lanceolate, hardly acute at the base, and rather acuminated at the apex; coryms terminal, trichotomous; flowers pentamerous and pentandrous. f. S. Native of the East Indies, about Madras. Stipulas broad, short, acuminated, adpressed. Leaves coriaceous, those of the flowering branches 4 inches long and 1½ broad, standing on petioles about half an inch long.

Madras Polyozus. Shrub.

5 P. I Barba'ta (Smith, in Rees' cycI. vol. 26. under Pavétta,) leaves lanceolate-oblong, acute, smooth; panicles brachiate, divaricate, smooth; tube of corolla one-half shorter than the lobes, which are 5, and beset with bristles in the mouth. f. S. Native of the island of Honomia, in the East Indies. Leaves coriaceous, a foot long, and 2 inches broad. Stigma cylindrical, acute. From the tube of the corolla being shorter than the lobes, and the flowers being pentameric and pentandrous, it is probably a true species of Polyozus.

Bearded Polyozus. Shrub.

N. B. P. bipinnátus (Lour. coch. p. 75.) should be excluded from the present order altogether, from the bipinnate leaves, but its true place is unknown.

Cult. For culture and propagation see Isóra, p. 574.

Lin. syst. Pentándria, Monogynía. Calyx with an ovate tube, and a 5-toothed limb. Corolla, stamens, and style unknown. Berry crowned by the calyx, ovate-globose, rather coriaceous, 2-celled, rarely 3-celled. Seeds solitary in each cell, plano-convex or angular. Albumen rather cartilaginous, grumose from chinks and fissures. Embryo erect, small, rather curved, and nearly dorsal, with lanceolate cotyledons.—This genus is hardly known, but from the albumen it comes very near to Rutidea; and to Psychotria from the form of the fruit.

1 G. tão (Gaertn. fruct. 1. p. 138. t. 28. f. 2.) berry smooth; teeth of calyx on the top of the fruit, convoluted and rounded. f. S. Native of Ceylon, where it is called Hodgale. Berries black.

Black-berried Grumilea. Shrub.

2 G. Psychotrioides (D. C. prod. 4. p. 495.) berry striated lengthwise, crowned by the short tubular truncate limb of the calyx. f. S. Native of the western coast of Africa, in Casamance at Iou, where it was collected by Leplinier and Perrotted. Shrub glabrous. Leaves petiolate, elliptic, cuneated at the base, acute at the apex, shining. Stipulas solitary on both sides, lanceolate, deciduous. Flowers unknown. Fruit 5-6 together at the tops of the branches, sessile, almost capitate, black, ovate, 2-celled. Seeds ruminated as in Annona.

Psychotria-like Grumilea. Shrub 4 to 5 feet.

Cult. For culture and propagation see Isóra, p. 574.

Lin. syst. Pentándria, Monogynía. Calyx with a globose tube, and a small 5-parted limb; lobes ovate. Corolla funnel-shaped, with a terete tube, which is dilated at the apex, and 5 spreading oval lobes. Anters 5, sessile in the throat of the corolla, exserted, oblong, but shorter than the lobes of the corolla. Style clavate at the apex; stigmas 2, combined, indicated only by a furrow. Berry nearly dry, globose, crowned by the vestiges of the calyx, 1-celled, 1-seeded. Seed globose, umbilicate at the base, wrinkled on the outside. Albumen large, grumose, cartilaginous. Embryo oblique, terete.—Shrubs, natives of India and Africa. Branches terete, hispid while young. Leaves opposite, on short petioles, hispid on the nerves and petioles. Stipulas twin on both sides, combined to the middle, subulate at the apex. Spikes racemose, interrupted, terminal; flowers disposed in almost sessile opposite fascicles. Bracteas and calyces hispid. Corollas glabrous, becoming black on drying, but probably white in the recent state.

1 R. Farviplo'ra (D. C. I. c.) branches, petioles, and nerves of leaves on the under surface, rather hispid; leaves elliptico-oblong; spikes terminal, formed of interrupted fascicles of flowers; fruit glabrous. f. S. Native of Sierra Leone, where it was collected by Smeathmann; and of Casamance near Iou, where it was collected by Leplinier and Perrotted.

Small-flowered Rutidea. Shrub 3 to 4 feet.

2 R. Milílis (Blum. ex D. C. prod. 4. p. 495.) every part of the plant is clothed with soft hairyomentum; leaves elliptico-oblong, short, nearly sessile, villous; corolla the same; flowers sessile, the calyx and stamens usually wanting; fruit dry, with the calyx and stigmas persistent.

Small-flowered Rutidea. Shrub.
oblong, clothed with soft hairs on both surfaces, but most so beneath; corymbs terminal, dichotomous; fruit rather villous, globose, 1-seeded.  It. S. Native of the island of Pulo-Penang. The fabric of the seed is unknown.

Soft Rutidea. Shrub.

Cult. For culture and propagation see Ixora, p. 574.

CLXVI. FARÁ'MEA (Aublet does not give the meaning of this name). A. Rich. mem. soc. hist. nat. Par. 5. p. 175. t. 17. f. 1 and 2. D. C. prod. 4. p. 496.—Farámea and Tetramérium, Juss. mem. mus. 6. p. 376.

Lin. syst. Tetrándria, Monogýma. Calyx with a turbinately globose tube, and a very short 4-toothed or entire limb. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear acute lobes, which are longer than the tube. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, 2-celled while young, but in the adult state it is globose, depressed, 1-celled, and 1-seeded, marked by 8 crenulations at the cincture. Seeds fixed to the bottom of the cell, umbilicate at the base, globose depressed. Albumen horny. Embryo lateral, small, horizontal.—Glabrous, dichotomously branched shrubs, natives of America. Leaves petiolate, ovate or oblong, acuminate. Stipulas interpetiolar, solitary on each side, broad at the base, and setaceous cuspitate at the apex. Flowers corymbose or umbellate, on the tops of the branches or peduncles. Corollas white.

Sect. I. Eufãra'mea (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 496.—Farámea, Aubl. guian. 1. p. 102. t. 40. Lam. dict. 2. p. 460. ill. t. 63.—Farámea, Vittm. summ. pl. 1. p. 357. Peduncles terminal, 1-3 together, bearing each a simple umbel of flowers at the apex. Flowers involucrated by caducous bracteas. Stipulas ending in an ann.

1 F. sessili'fóra (Aubl. guian. 1. p. 104. t. 40. f. 2.) umbels terminal, solitary, simple, sessile; calyx 4-toothed.  It. S. Native of Guiana, in the woods called Cauxwoods. Leaves oblate. Flowers white.

Sessile-flowered Farámea. Shrub 7 to 8 feet.

2 F. sertulí'fóra (D. C. prod. 4. p. 496.) peduncles terminal, solitary, nearly terete, bearing a simple umbel of flowers at the apex; calyx truncate.  It. S. Native of Cuba, about the Havana. Branches slender, dichotomous. Leaves oblong, acuminate at both ends.

Garland-bearing Farámea. Shrub.

3 F. trunca'ta (D. C. prod. 4. p. 496.) peduncles terminal by threes, compressed at the apex, bearing each a simple umbel of flowers; calyx truncate.  It. S. Native of French Guiana. Very like the following species, but differs in the calyx being truncate. Corolla marcescent. Fruit pale, but exactly like those of F. odoratissima.

Truncate-calyxed Farámea. Shrub 4 to 5 feet.

4 F. cory'mbosa (Aubl. guian. 1. p. 102. t. 40. f. 1.) peduncles terminal by threes, compressed at the apex, each bearing a simple umbel of flowers; calyx 4-toothed.  It. S. Native of French Guiana, in the woods called Cauxwoods. Lam. ill. t. 63. Flowers white.

Corymbose-flowered Farámea. Shrub 7 to 8 feet.

* Stipulas ending in an ann.

5 F. odoratissima (D. C. prod. 4. p. 496.) leaves oval-oblong, acute at the base, and abruptly acuminate at the apex; stipulas broad, ending in a subdorsal ann; corymbs terminal; limb of calyx very short, truncate, ten times shorter than the tube of the corolla; berry crowned by the very short bluntly 4-toothed limb of the calyx.  It. S. Native of the West Indian islands, as in St. Domingo, Jamaica, Porto-Rico, Guadaloupe, Cayenne, Panama, and probably of Mexico. Plum. ed. B. t. 156. f. 2. P. Browne, Jam. t. 6. f. 1. but not fig. 2.—Coffea occidentalis, Jacq. amer. t. 47. Lin. spec. p. 246. Ixora Americana, Lin. amerc. gen. 5. p. 393. ex Swartz. Tetramérium odoratissimum, Gaertn. fil. carp. 3. p. 90. t. 196. Tetramérium occidentale, Nees and Mart. nov. act. nat. cur. 12. p. 13. Flowers white, sweet-scented, about the size of those of the jasmine; hence it is called jasmine in Jamaica.

Very sweet-scented-flowered Farámea. Ckt. 1793. Sh. 6 ft.

6 F. latifoli'la (D. C. prod. 4. p. 497.) leaves oval, abruptly acuminate; stipulas broad, ending in a subdorsal ann; corymbs terminal; limb of calyx slightly tetragonal, somewhat 4-toothed, 5 times shorter than the tube of the corolla.  It. S. Native of Brazil, in the province of Rio Janeiro. Tetramérium latifolium, Cham. et Schlecht. in Linnaea. 4. p. 30. It differs from the preceding species in the flowers being one-half smaller. This plant is probably also a native of Trinidad and Santa Cruz.

Broad-leaved Farámea. Shrub 6 feet.

7 F. montevide'nsis (D. C. prod. 4. p. 497.) leaves oblong, acuminate at both ends; stipulas broad, ending in a subdorsal ann; corymbs terminal; berries crowned by the limb of the calyx, which is tubularly cup-shaped and subtruncate.  It. S. Native of Brazil, about Monte Video; and of Porto-Rico. Tetramérium montevideënse, Cham. et Schlecht. in Linnaea. 4. p. 29. Flowers white. Leaves and inflorescence almost like those of F. odoratissima; but the limb of the calyx on the fruit is very different.

Monte-Video Farámea. Shrub 4 to 6 feet.

8 F. stipul'acea (D. C. prod. 4. p. 497.) leaves oblong, attenuated at the base, and acute at the apex; stipulas broad at the base, and ending in a dorsal ann at the apex; corymbs terminal; limb of calyx acutely 4-toothed; berry globose, crowned by the short limb of the calyx.  It. S. Native of Brazil, within the tropic. Tetramérium stipulaceum, Cham. et Schlecht. in Linnaea. 4. p. 31. Flowers white. Habit of F. jasminoides, but differs in the dorsal ann to the stipulas.

Stipulaceous Farámea. Shrub 4 to 6 feet.

9 F. corre'lea (D. C. 1. c.) leaves ovate-elliptic, acute at both ends; stipulas dilated at the base, and ending in a short ann at the apex; peduncules axillary, usually 3-flowered; limb of calyx acutely 5-toothed, 6 times shorter than the tube of the corolla.  It. S. Native of Brazil. Tetramérium corroleum, Nees et Mart. nov. act. bonn. 12. p. 12. Peduncles and branches 2-edged. Corolla of an amethyst colour, with lanceolate segments.

Blue-flowered Farámea. Shrub 5 to 6 feet.

10 F. axillari'fóra (D. C. prod. 4. p. 673.) leaves sessile, ovate-oblong, cordate at the base, acuminate at the apex; stipulas ending in a long-awned acumen; branches much compressed; flowers on short pedicels, in fascicled corymbs from the axils of the leaves.  It. S. Native of Brazil, about Bahia, where it was collected by Salzmann, G. Don, etc. Flowers white. Fruit exactly like that of F. odoratissima. Leaves 7-8 inches long, and about 2 broad.

Axillari-flowered Farámea. Shrub 4 to 6 feet.

11 F. guayaquile'nsis (D. C. 1. c.) leaves oblong, acuminate, almost sessile; stipulas oblong, acuminate, and a little awned, permanent: upper ones bifid on both sides; panicle ter-

** Stipulas never ending in an ann.**

12 F. Jasmínóides (D. C. prod. 4. p. 497.) leaves elliptic-oblong, acuminate at both ends; stipulas ovate, large, acutish; corymb terminal; calyx urceolate, with 4 long teeth; berry globose, crowned by the short limb of the calyx. \( \gamma \). S. Native of New Granada, near Ibagué. Tetramérion jasmínóides, H. B. et Kunth, nov. gen. amer. 3. p. 373. t. 287. Coffée flávicans, Wildl. miss. in Rœm. et Schultes, syst. 5. p. 201. Branches tetragonal. Leaves pale green, yellowish beneath. Lobes of corolla one-half shorter than the tube. Flowers white.

Jasmine-like Faramea. Shrub.

13 F. ? sessífiólia (D. C. l. c.) leaves oblong, acuminate, cordate, sessile; stipulas ovate, acuminate subulate; corymb terminal, trichotomous; limb of calyx urceolate, 4-toothed. \( \gamma \). S. Native in woods on the banks of the Orinoco, between May- pure and St. Fernando de Atabapo. Tetramérion sessífió- lium, H. B. et Kunth, nov. gen. amer. 3. p. 374. Issôra sessífi- ólia, Spreng. syst. 1. p. 409. Flowers white. Anthers probably exserted. From the fruit being unknown, it is doubtful whether it belongs to the present genus.

Sessile-leaved Faramea. Shrub.

14 F. multíflóra (A. Rich. in mem. soc. hist. nat. Par. 5. p. 176.) leaves oval-elliptic, acuminate, abruptly periolate; stipulas interolatorial, comate, sheath-formed, acuminate; flowers corymbose, terminal. \( \gamma \). S. Native of French Guiana. Many-flowered Faramea. Shrub.

15 F. calycífolía (A. Rich. l. c.) leaves elliptic, acuminate; stipulas interolatorial, acuminate; flowers spiked; spikes terminal, pedunculate; limb of calyx tubular, large, permanent. \( \gamma \). S. Native of French Guiana. From the calyx being permanent, it does not probably belong to the present genus.

Calyx-flowered Faramea. Shrub.

Sect. III. Farameoides (from faramea, and idea, like; but is meant only as an alteration of the generic name). D. C. prod. 4. p. 498. Panicles thyrsoid, terminal.

16 F. abedescens (D. C. prod. 4. p. 498.) panicle terminal, pedunculate, having its branches bearing umbels of flowers at the apex; calyx truncate. \( \gamma \). S. Native of French Guiana. Branchlets compressedly angular. Leaves oblong, acuminate at both ends, shining on both surfaces, pale green. Stipulas acute, deciduous while young. Peduncles 2-edged, furnished with 3-4 pairs of branches. Panicles white, one-half shorter than the leaves. Corollas elongated, very like those of F. tru- cótía.

Whitish-panicled Faramea. Shrub 4 to 6 feet.

17 F. Martini (D. C. l. c.) panicles terminal, on short peduncles, shorter than the leaves; branches corymbose at the apex; calyx hardly toothed; leaves large, oval; anthers ex- serted at the throat. \( \gamma \). S. Native of Guiana, at Mount Kaw, where it was collected by Martin. Branchlets compressed. Stipulas broad, short, permanent. Leaves glabrous, membranous, attenuated at the base. Lobes of corolla 4, a little longer than the tube. Calyx urceolate. Fruit unknown.

Martin's Faramea. Shrub 4 to 6 feet.

Cult. For culture and propagation see Coffea, p. 584.

Lin. syst. Tetra-Pentándria, Monogynia. Calyx with an obovate-globose tube, and a campanulately tubular 4-5-toothed limb. Corolla tubular, terete, with a 4-5-parted spreading limb, lanceolate acute segments, and a naked throat. Stamens inserted in the middle of the tube; filaments beset with short hairs in the free part; anthers linear, inclosed. Fruit ovoid, striated, fleshy, crowned by the tubular limb of the calyx, containing 2 bony 1-seeded indehiscent nuts, which are flat on the inside, and furnished in the middle. Seed erect. Embryo nearly terete.—A Guiana shrub. Leaves opposite, elliptic. Stipulas fringed. Flowers sessile, umbellate on the tops of the peduncles.

1 S. Guiana'ssis (A. Rich. l. c.) \( \gamma \). S. Native of French Guiana.

Guiana Strempelia. Shrub.

Cult. For culture and propagation see Coffea, p. 584.

Lin. syst. Tetra-Pentándria, Monogynia. Calyx with an ovate, globose or turbinate tube, and a 4-5-toothed limb (f. 107. a.). Corolla tubular, funnel-shaped, with a spreading 4-5-parted limb (f. 107. b.), and oblong lobes. Stamens 4-5, rising from the middle of the tube of the corolla, or from its apex, exerted or inclosed. Style bident at the apex, having the lobes rarely combined. Berry umbilicate (f. 107. b.), naked or crowned, containing 2 1-seeded nuts of the consistence of parchment, which are convex on the outside, and flat inside, and marked by a longitudinal furrow. Embryo erect, in honey albums, with a terete obtuse radicle, and foliaceous cotyledons.—Trees and shrubs. Leaves opposite. Stipulas interolatorial. This genus is probably divisible into several genera, but that has not been attempted on account of specimens of the greater number of the species being rare in European collections.

* Peduncles axillary. Flowers 5-7-cleft, pentandrous or heptandrous.

1 C. Árabica (Lin. spec. p. 245.) leaves oval-oblong, acuminate, glabrous, shining on the upper surface; peduncles axillary, short, aggregate; corolla 5-cleft: anthers exerted; berries ovate. \( \gamma \). S. Native of Arabia Felix and Ethiopia, from whence it has been carried to almost all parts of the world within the tropics. Gärtn. fuct. 1. t. 25. Sims, bot. mag. 1303. Tratt. tab. t. 400. RUBIACEÆ.  CLXVIII. COFFEA.

Arabia is always better than that from the West India Islands. In cultivating the coffee in the West Indies, the berries are sown immediately after being gathered, as they are found to retain their vegetative quality only a few weeks. In three months the seeds so sown produce plants fit for transplanting to the final plantation. In the low lands they are planted five feet apart, and in the mountains ten feet or more. In three years the plants will produce a crop, and continue bearing a number of years. The berries are gathered when they are just about to drop.

Qualities and chemical properties.—When the seeds of coffee are roasted, a portion is converted into tannin by the action of heat, and an agreeable aromatic substance is developed, the nature of which has not been ascertained. The same principle is also developed by roasting barley, beans, and many other vegetables, which, on that account, are occasionally employed as substitutes for coffee, and suit some stomachs better. The infusion of unroasted coffee in boiling water is of a yellowish green colour; but the decoction, by continuing the boiling, becomes brown, and turbid on cooling. From experiments made chiefly by Cadet, it appears that coffee contains an aromatic principle, a little oil, gallic acid, mucilage, extractive and bitter principle. Other analyses have been made by chemists. M. Grindel found it to contain cinque acid, and M. Payss has discovered what he has endeavoured to show as a peculiar acid, to which he has given the name of coffee acid. More recently, M. Robiquet is said to have demonstrated another principle, which he names Caffeine. It is in silk-like acicular crystals, bearing a resemblance to Benzoc acid. It liquefies by the aid of a gentle heat; in close vessels it volatilizes, and sublimes in needles. Caffine is neither acid nor alkaline; it furnishes a great quantity of azote; it dissolves with difficulty in ether, but quickly in water and alcohol.

Medical properties and uses.—It is evident that we are indebted to the Arabians for our use of this pleasant beverage, as the first rite of Eastern hospitality is the presentation of a bowl of coffee. In Europe it is said to have been first used in Italy, in the year 1650; and, according to Dulaune, was introduced at the court of Paris, in 1669, by Solomon Aga, ambassador from the Porte. An Armenian, named Pascal, opened the first Café, and Procope the second, in "Rue des Fossés, Saint Germain des Prés." Nearly at the same time coffee was introduced into London.

By some, coffee is supposed to be best suited to the aged; and its abuse, as when taken too strong, is said to impair digestion, instead of promoting it; and it stimulates, heats, and produces watchfulness in certain constitutions. The Mahometans of India, who use a great deal of coffee in the same way as we do, with the exception of combining milk with it, believe it to have the effect of soothing and allaying nervous irritations, and prescribe it to stop the vomiting in cholerous morbus. Dr. Anstis also states, that it is often employed for the same purposes by the Spaniards at Manilla. It is said that Sir John Floyer, during his residence in Lichfield, found great benefit in his own person by the use of coffee in asthma. Sir John confirms its success in a letter to Dr. Percival, "On reading the section of coffee," says he, "in the second volume of your essays, one quality occurred to me which I had observed of that liquid, confirming what you had said of its sedative powers. It is the best abater of periodic asthma that I have seen. The coffee ought to be the best Mocha, newly burnt, and made very strong immediately after grinding it. I have commonly ordered an ounce for one dish, which is to be repeated afresh after the interval of a quarter of an hour, without milk or sugar." Percival's Essays, vol. iii.

As a general palliative, strong coffee is often serviceable in various kinds of headache; and where its own sedative power
is unavailing, it forms one of the best vehicles for the administration of laudanum. It diminishes in some degree the hypnotic power of the latter, but counteracts its distressing secondary effects. When laudanum is intermixed with strong coffee for the cure of many modifications of head-ache, tranquillity and ease are produced, though there may be no sleep; when laudanum, on the contrary, is taken alone, sleep will, perhaps, follow, but is mostly succeeded by nausea and a return of pain. Hence the Turks and Arabians make strong coffee their common vehicle for opium, from its tendency to counteract the narcotic principle of the latter; and on the same account it is plentifully administered after the stomach has been evacuated of its contents, in cases of poisoning by opium.

For common purposes, infusion of coffee is the most agreeable method of preparing it, as the aromatic and volatile principles are dissipated by boiling.

Coffee is named by the Persians Colhua and Coko; by the Turks, Chawba and Cawba; by the Arabians, Cachua, Cawwa, Caffaye, and Cahounah; and by the Egyptians, Elawra. In Germany it is called Arabische Kafferbaun; in Cochín China, Caycaphe.

The Galla, a wandering nation of Africa, in their incursions in Abyssinia, being obliged to traverse immense deserts, and being also desirous of falling on the Abyssinians without warning, that they may be encumbered as little as possible with baggage, carry nothing with them to eat, but coffee roasted till it can be pulverized, and then mixed with butter into balls, and put into a leathern bag: one of these, about the size of a billiard-ball, keeps them, they say, in strength and spirits during a whole day's fatigue, better than a loaf of bread, or a meal of meat.

2 C. Mauritia (Lam. dict. 1. p. 550. ill. t. 160. f. 2.) leaves oval, acute at both ends, reticulately veined; peduncles axillary, solitary, 1-flowered, very short; berries oblong, acute at the base. H. S. Native of the Island of Bourbon, in the woods. C. Arábia β, Willd. spec. 1. p. 974. C. sylvestris, Willd. in Roem. et Schultes, syst. 5. p. 201. 1 Flowers white. This species is known in the Island of Bourbon under the name of Café-Marron, but should not be confounded with the variety of C. Arábia, known in commerce under the name of Café Bourbon, or Bourbon Coffee.

Mauritian Coffee-tree. Shrub 4 to 5 feet.

3 C. Benghalensis (Roxb. Hort. Beng. p. 15. fl. ind. 2. p. 194.) leaves oval-oblong, acuminate at both ends; flowers axillary, rather aggregate, sessile; stipulas undivided, subulate, much acuminate; corolla 5-cleft, with oblong lobes; anthers inclosed. H. S. Native of Bengal, but chiefly about Silhet; and of Nipaul. Roth. nov. spec. 148. Röem. et Schultes, syst. 5. p. 200. Branches so placed as to form a bush of a pyramidal form. Leaves from ovate to oblong, glabrous. Flowers 1-together or more, axillary, white, sweet-scented. Berry black, size of a small cherry. It was for some time much cultivated in Bengal, under the idea of its being the Arabian Coffee; it is now neglected, being of inferior quality, and not productive; however, the number of its flowers entitle it to a conspicuous place in the flower-garden.

Bengal Coffee-tree. Shrub 4 to 6 feet.

4 C. stenophylla; leaves oblong-lanceolate, acuminate; peduncles almost sessile, axillary, 2-3-flowered. H. S. Native of Sierra Leone, where it is cultivated. Flowers white. Berries oblong, black. The seeds of this species are roasted and used as the common coffee, and are even considered superior to it.

Narrow-leaved Coffee-tree. Shrub 4 to 6 feet.

5 C. hirsutus; leaves ovate, acuminate, on short pedioles; young branches, petioles, and veins of leaves hairy; peduncles axillary, 3-flowered. H. S. Native of Sierra Leone in the low lands. Flowers white.

Hairy Coffee-tree. Shrub 4 to 5 feet.

6 C. micocaera (D. C. prod. 4. p. 499.) leaves elliptic-oblong, short-acuminate, and are, as well as the branches, quite glabrous; flowers in fascicles along the branches, after the falling of the leaves, and therefore they appear as if they were disposed in interrupted racemes, but in fact the flowers are merely in fascicles from the axils of the fallen leaves; fruit elliptic, 3 times longer than their pedicels, and crowned by the cup-shaped limb of the calyx. H. S. Native of Africa in Casamance, in woods, at Cape Rouge, where it was collected by Ferretto and Leprieur. Leaves 2½ inches long, and 8-9 lines broad. Stipulas solitary, undivided, acuminate subulate, deciduous. Flowers white.

Small-fruited Coffee-tree. Shrub 4 to 5 feet.

7 C. laurina (Smeath. in herb. L'Her. et D. C. prod. 4. p. 499.) leaves oblong-lanceolate, mucronate, cuneated at the base, coriaceous, quite glabrous; racemes axillary, crowded with flowers, much shorter than the leaves; corolla 5-cleft, with a villous throat; anthers exerted, but rather shorter than the lobes of the corolla; berries globose. H. S. Native of Sierra Leone. Poir. suppl. 2. p. 14. Leaves yellowish in the dried state. Calyx truncate. Corollas white.

Laurel-like Coffee-tree. Shrub 4 to 5 feet.

8 C. stipulacea (D. C. prod. 4. p. 492.) leaves elliptic or oblong, petiolate, acuminate at both ends; stipulas foliaceous, oblong, acute, striated lengthwise, deciduous; peduncles axillary, very long, corymbose at the apex, trichotomous. H. S. Native of French Guiana, where it was collected by Patris. Limb of calyx obscurely but acutely 5-toothed. Flowers unknown. Berries ovate, not crowned. Peduncles 6 inches long.

Stipulaceous Coffee-tree. Shrub 4 to 6 feet.

9 C. pedunculata (Roxb. fl. ind. 2. p. 195.) leaves elliptic, almost sessile, smooth; peduncles terminal and axillary, in fascicles, long, 1-flowered; tube of the corolla slender, smooth; stamens inclosed. H. S. Native of the Moluccas.

Pedunculated Coffee-tree. Shrub.

** Peduncles axillary. Flowers tetramerous and tetradrous.

—Ixora species, Spreng.

10 C. Guianensis (Aubl. guian. 1. p. 150. t. 57.) leaves oval-oblong, bluntly acuminate, quite glabrous; peduncles axillary, aggregate, very short, 1-flowered; corollas 4-cleft, with acute lobes; anthers inclosed; berries globose, small. H. S. Native of French Guiana, and of the Island of Trinidad, ex Sieb. fl. trin. no. 44. Ixora Guianensis, Spreng. syst. 1. p. 409. Flowers small, white. Berries violaceous.

Guiana Coffee-tree. Shrub 1 to 3 feet.

11 C. rosa (Mee. et Sesse. fl. mex. Icon. ind. ex D. C. prod. 4. p. 499.) leaves oval-oblong, acuminate at both ends, glabrous; peduncles axillary, 5-flowered, much shorter than the leaves; corollas 4-cleft, with revolute lobes; anthers exerted; berries globose. H. S. Native of Mexico. Corollas rose-coloured. Berries reddish, size of a pea.

Rose-coloured-flowered Coffee-tree. Shrub 4 to 6 feet.

12 C. obovata (Cham. et Schlecht. in Lunaea, 6. p. 412.) glabrous; leaves obovate, cuneate, acuminate, acute, feather-veined; cymes axillary, almost sessile, aggregate, short, manyflowered; stipulas ovate-triangular, caducous. H. S. Native of Mexico, in shady places, near Masantla. Leaves half a foot long. Tube of the calyx ovate, with short acute teeth. Corolla with a short tube and a naked throat. Anthers linear, exerted.
Oboate-leaved Coffee-tree. Shrub.

13 C. lanceolata (Cham. et Schlecht. in Linnae. 6. p. 412.) stems, petioles, nerves, and primary veins of leaves underneath downy; leaves lanceolate, glanscent beneath, feathered-veined; cymes axillary, usually solitary, few-flowered, on short peduncles; stipulas small, ovate-triangular, caducous. S. Native of Mexico, near Jalapa. Leaves 2-3 inches long, acuminate. Calyx with a clavate tube, and small acute teeth. Anthers linear, exerted.

14 C. tetrasperma (Roxb. fl. ind. 2. p. 193.) leaves broad-lanceolate, acute, shining; stipulas bifid; peduncles axillary and terminal, in fascicles, long, slender, 1-flowered; corollas usually 4-cleft, with a long slender tube; anthers inclosed; berries globose. S. Native of Sinhet and Chittagong, and the whole east border of Bengal. Leaves 4-5 inches long, and hardly 2 broad. Corolla with a 4-5-cleft border. Stigmas 4-5. Berries size of a small cherry, blackish-purple when ripe, 1 or 2-celled. An erect slender-branched Shrub.

Tetradrous-flowered Coffee-tree. Shrub.

15 C. densiflora (Blum. bijdr. p. 965.) leaves oval-oblong, acuminate, clothed with fine down on the veins beneath; flowers crowded, axillary; corollas 5-cleft. S. Native of Java, on Mount Salak. There are varieties of this with smaller and larger flowers.

Dansi-flowered Coffee-tree. Shrub.

16 C. angustifolia (Roxb. fl. ind. 2. p. 195.) leaves lanceolate, stiff, shining; panicles axillary; throat of corolla bearded; lobes of corolla linear, longer than the tube, but equal to the anthers, which are filiform and exerted. S. Native of Pigeon Island, one of the Malay Archipelago.

Narrow-leaved Coffee-tree. Shrub.

17 C. racemosa (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. a. but not of Lour.) leaves oblong-oval, acuminate, glabrous; stipulas bifid; racemes axillary and terminal, drooping while in flower, but erect in the fruit-bearing state; flowers almost sessile, 5-cleft; anthers exerted; berry oval. S. Native of Peru, in groves at Pati and Macora, where it is called Café. Rüdigea racemosa, Spreng. syst. 1. p. 735. Flowers white.

Racemose Coffee-tree. Shrub 4 to 6 feet.

18 C. zanquebar (Lour. corh. p. 145.) leaves ovate-lanceolate, glabrous; peduncles axillary, many-together, short, 1-flowered; corollas 6-7-cleft; berries oblong-ovate, angularly nerved. S. Native of Africa, on the coast of Zanquebar, in woods. Amajuta Africana, Spreng. syst. 2. p. 126. Flowers white. Berries red. This species is cultivated near Mozambique in gardens along with C. Arábica, and where the seeds are used as a substitute for the common coffee.

Zanquebar Coffee-tree. Shrub 5 to 6 feet.

19 C. indica (Poir. suppl. 2. p. 14.) leaves ovate-oblong, acuminate, glabrous; stipulas very short, undivided; panicles short, divaricate, terminal; pedicels elongated; fruit small, obovate, not crowned by the calyx. S. Native of Java. Flowers unknown.

Indian Coffee-tree. Shrub.

...Panicles terminal. Flowers 4-5-parted, tetradrous or pentandrous.

20 C. paniculata (Aubl. guian. 1. p. 152. t. 58.) leaves ovate-oblong, acuminate, shining; branches tetragonal; stipulas acute, caducous; panicles terminal, divaricate; flowers 4-cleft; anthers inclosed. S. Native of Guiana, in woods. Tetramére paniculatum, Spreng. syst. 1. p. 109. Flowers white, sweet-scented. Berries ovate-globose, bluish, containing 2 seeds or nuts, one of which is usually abortive. Paniced-flowered Coffee-tree. Clt. 1822. Sh. 6 to 8 feet.

22 C. semisessilis (Colbr. in Roxb. fl. ind. 2. p. 195.) leaves oblong-lanceolate, acuminated; coryombs terminal. S. Native of Bengal, in Silhet. Berries purple, size of large peas. Habit of Leûra.

Sect. II. Hoûnia (named after M. Van Horn, who, in the year 1690, carried coffee from Arabia to Batavia, and in the year 1710 to the gardens of Amsterdam). D. C. prod. 4. p. 500. Tube of calyx increasing after the flowers have fallen, and crowning the berry by a neck, having the teeth almost obsolete. Flowers 5-cleft. Stigma bifid. Throat of corolla glabrous. Berry ovate or globose, usually 1-seeded from abortion.—Shrubs, natives of Peru. Inflorescence axillary or terminal. Peduncles solitary on both sides, unilobed, never toothed or ciliated.

23 C. subspinosus (Ruiz et Pav. fl. per. 2. p. 64. t. 215. lower figure,) leaves glabrous, coriaceous, sessile, oblong-lanceolate, acuminated, excavated at the base; stipulas ovate; racemes axillary, trichotomous, shorter than the leaves. S. Native of Peru, on the Andes in forests at Chincho, Quebrada, and Pati. Coffea macrophylla, Dietr. nachtr. 2. p. 544. Leaves a foot long, shining above. Peduncles quadrangular. Berries ovate, at first red, but at last becoming purplish, ovate, 1-seeded, size of cherries. Probably a species of Forâmea.

Sessile-flowered Coffee-tree. Shrub 5 to 6 feet.

24 C. umbelellata (Ruiz et Pav. fl. per. 2. p. 64. t. 215. upper figure,) leaves glabrous, coriaceous, petiolate, oblong, acuminated, nerved by transverse veins; stipulas roundish; peduncles terminal, usually by threes; flowers crowded, umbellate, involucrated. S. Native of Peru, on the Andes in forests. Branches dichomorous, rather tetragonal. Involucrum 4-leaved, and involucels 7-leaved. Berries, red, ovate.

Umbellate-flowered Coffee-tree. Shrub 10 to 12 feet.

25 C. ? cumina (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. b.) leaves petiolate, oval, acuminated, glabrous, villous in the axils of the veins; stipulas ovate, deciduous; racemes terminal, few-flowered; flowers crowded. S. Native of Peru, on the Andes in forests. Branches tetragonal, rather compressed. Berries white, 5-cleft (ex descript.), with revolt segments. Berries ovate, red, 1-seeded, size of cherries, blurt at the apex, crowned by the tubular limb of the calyx.

Acuminated-leaved Coffee-tree. Shrub 5 to 6 feet.

Sect. III. Pancra'sia (named after M. Pancras, who first transmitted the coffee-tree from the gardens of Amsterdam to those of Paris, in the year 1713). D. C. prod. 4. p. 501. Throat of corolla bearded. Berries crowned by the vestiges of the calyx. Racemes or corymbs terminal. Stipulas usually fringed or ciliately toothed, as in Rüdigea, but differs from that genus in the calyx not being parted, and in the lobes of the corolla not being horned. Flowers 5-cleft.—Glabrous Peruvian shrubs.

...Stipulas ciliated.

26 C. ciliata (Ruiz et Pav. fl. per. 2. p. 65. t. 216. f. a.) leaves oblong, acuminated; stipulas truncate, ciliated; racemes subpudicled, terminal; flowers aggregate, sessile, 4-5-cleft;
anthers exerted. ß. S. Native of Peru, in forests on the Andes. Rúdgea ciliatá, Spreng. syst. 1. p. 755. Branches thickened at the nodi. Bracteas small, subulate, at the ramifications of the panicle. Corollas white, with reflexed segments. Berries red, globose. Perhaps the same as C. ciliatá of Brazil, which was collected on the road to Felisbert, by the Prince de Neuwied, but according to Nees and Martius, in nov. act. bonn. 12. p. 13., it differs from the Peruvian plant in the racemes being shorter.

Pitted-leaved Coffee-tree. Shrub. 28 C. MEXICANÁ (D. C. prod. 4. p. 501.) leaves oblong, acuminate, reticulately veined beneath; stipulas crested; corynbs terminal, trîflíd; limb of calyx truncate, obtuse; ß. S. Native of Mexico. Rúdgea Mexicaná, Bartl. in herb. Hanke. Branches dichotomous. Fruit dry, indehiscent, chartaceous, the nuts separating at length from each other. Seeds hemispherical, having a very narrow furrow in front. It differs from Rúd-gea in the limb of the calyx not being 5-parted, but quite entire. Mexican Coffee-tree. Shrub.

Shining-leaved Coffee-tree. Shrub 5 to 6 feet. 30 C. laurifó'lia (H. B. et Kunth, nov. gen. amer. 3. p. 372. but not of Salisb.) leaves oblong, somewhat acuminate, coriaceous, shining; stipulas ciliately multifid; corynbs terminal; berries elliptic. ß. S. Native of South America, in shady humid places at the Missions of the Orijono. Coffea coriáceas, Willd. mss. in Rœm. et Schultes. syst. 5. p. 201. ex Kunth. Corollas and stamens unknown. Perhaps a species of Psychotria, ex A. Rich.?

* * Stipulas undivided or bidentate, but never ciliated.

32 C. longífo'lia (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. a.) leaves oblong-lanceolate, redundantly undulated; stipulas ovate, undivided; panicles terminal; anthers exerted. ß. S. Native of Peru, in forests on the Andes. Leaves shining above, a foot long. Corolla white with reflexed segments. Berries globose, red.

Long-leaved Coffee-tree. Shrub. 33 C. microcár'pa (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. b.) leaves lanceolate, acute; stipulas bidentate on both sides; cymes axillary and terminal, spreading; anthers hardly exerted. ß. S. Native of Peru, on the Andes in forests. Branches a little compressed at the apex. Bracteas subulate. Corollas white, downy on the outside. Berries reddish, globose, size of black pepper. Perhaps belonging to a different section.

Sect. IV. STRAU'SSIA (named after Laurence Strauss, who was the first, in 1666, to recommend coffee as a beverage). D. C. prod. 4. p. 502. Berries turbinate or acuminate at the base. Stipulas ovate, deciduous, ciliated on the lower margin of the cicaetra. Flowers 4-6-cleft. Stamens 4-6. Stigma bifid. Berries globose or oval.—Shrubs, natives of the islands in the South sea. Cymes terminal.

36 C. luzón'ie'sis (Cham. et Schlecht. in Linnaea. 4. p. 32.) leaves lanceolate, acute at both ends, with rather reflexed margins; stipulas ovate-oblong, rather scarious, deciduous, with the cicaetrae rather ciliated at the margins; cymes terminal, sessile, contracted while young; flowers 4-6-cleft; throat of corolla bearded. ß. S. Native of the Island of Luzon. Corolla white, glabrous. Anthers exerted a little. The central flower is 5-cleft, and the rest either 4 or 5-cleft. Berries almost globose, acute at the base, sometimes 1-seeded by abortion. Branches fistular.

Luzon Coffee-tree. Shrub 4 to 6 feet. 37 C. kadua'na (Cham. et Schlecht. in Linnaea. 4. p. 33.) leaves cuneate-obovate, somewhat scrobiculate in the axils of the veins, with reflexed margins, usually clothed with rufescent down beneath; stipulas ovate, acute, caducuous, the inner margins of the cicaetrae ciliated; cymes terminal, on long peduncles, of 5 rays, 4 of which are disposed in a whorl around the other, which is central; corolla 5-cleft, with a naked throat. ß. S. Native of the Sandwich Islands, particularly in O-Wahu. Berry elliptic, attenuated at the base, rarely 1-seeded by abortion. Branches compressed. Mr. Arnott remarked, that the segments of the calyx are not ciliated as stated by the authors, although the bracteas are.

Kadua's Coffee-tree. Shrub 4 to 5 feet. 38 C. chammi'so'nis (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) leaves elliptic-oblong, scrobiculate in the axils of the veins, with reflexed margins, quite glabrous on both surfaces; stipulas ovate, acute, caducuous, having the inner margins of the cicaetrae glabrous; cymes on long peduncles of 5 rays, which are disposed in a whorl; corolla 5-cleft, with a naked throat. ß. S. Native of the Sandwich Islands. Very like the preceding.

Chamissonis's Coffee-tree. Shrub 4 to 6 feet. 39 C. Marinará'na (Cham. et Schlecht. in Linnaea. 4. p. 35.) leaves elliptic, acute at both ends, scrobiculate in the axils of the veins; stipulas ovate, deciduous, with the inner margins of the cicaetrae ciliated; cymes terminal, pedunculate, with the branchlets decussate; corolla 5-cleft, with a bearded throat. ß. S.
Native of the Island of O-Wahu, in forests on the mountains. Branches and branchlets of panicle compressed.

Cult. All the species of Coffea thrive well in a mixture of turfy loam, turfy peat, and sand. They require to be watered a good deal, and to have plenty of pot-room to thrive well. Ripe cuttings strike root freely in sand under a head-glass in a moist heat; and the young plants so raised, produce flowers and fruit more readily than those raised from seed. As the plants are apt to be infested by insects, particularly the mealy bug, they should be examined often, and the insects rubbed off with a brush, otherwise the plants will look unsightly.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate-globose tube, and a 5-parted limb; lobes acute. Corolla with a long slender terete tube, 5 linear spreadingly recurved segments, which are hooked on the back and acute, and a naked throat. Anthers sessile, within the throat, inclosed. Stigma bilamellate. Fruit 2-seeded, 2-seeded.—Trees or shrubs, natives of Guiana. Branchlets and petioles clothed with cinereous down. Leaves opposite, large, smoothish. Stipulas interpetiolar, large, ovate, fringed, deciduous. Panicles terminal, dense, bracteolate, with the branches opposite. Flowers blackish in the dried state, but most probably white in the recent state. Fruit not sufficiently known.

1 R. lanceolata (Salisb. l. c. t. 18.) leaves lanceolate, acuminate; tube of corolla 10 times longer than the lobes of the calyx. h. S. Native of French Guiana. Leaves 10 inches long, and about 3 broad. Corolla downy outside.

Lance-leaved Rudgea. Shrub or tree.

2 R. ovalifolia (Salisb. l. c. t. 19.) leaves oval, acuminate; tube of corolla 6 times longer than the lobes of the calyx. h. S. Native of French Guiana. Leaves 4-5 inches broad, and 7-8 long. Corolla downy outside.

Oval-leaved Rudgea. Shrub or tree.

Cult. See Coffea above for culture and propagation.

CLXIX. ANTHERURA (from anthera, anther, and ovum, ovum, a tail; the anthers end in a long tail each). Lour. coh. p. 144. D. C. prodr. 4. p. 503.—Psychotria species, Wild. Poir.

Lin. syst. Pentandria, Monogynia. All as in Psychotria, but the corolla is rotate and 5-parted; the anthers sagittate at the base, and furnished with a long reflexed tail at the apex; the style subulate, and longer than the corolla, and the stigma simple.—A glabrous shrub, with reddish diffuse branches. Leaves opposite, ovate-lanceolate, on short pedioles. Panicles terminal, erect, loose, racemose. Flowers white, with red filaments. Berries ovate, brownish red. Stipulas unknown.

Red-branched Anthurum. Shrub 5 feet.

Cult. For culture and propagation see Coffea above.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a small 5-toothed limb. Corolla oblong, rather funnel-shaped, with 5 spreading acute lobes, and a naked throat. Anthers 5, oblong, inclosed. Stigma bilamellate. Berry ovate, umbilicate, containing 2 1-seeded nuts, which are flat inside, and convex outside.—Glabrous shrubs, natives of Guiana. Leaves oval, acute, on short pedioles. Stipulas solitary on both sides. Peduncles axillary, 2-6-flowered, shorter than the pedicels. Flowers small, white. Bracteoles 2 under each flower.—Allied to Psychotria, but differs in the berries not being ribbed. Perhaps the species of Psychotria with axillary peduncles ought to be joined to this genus.

Broad-leaved Ronabia. Shrub 2 to 3 feet.

Erect Ronabia. Shrub 1 to 2 feet.

3 R. ? Myrodenron (A. Rich. in mem. soc. hist. nat. 5. p. 270.) leaves linear-lanceolate, very acute, petiolar; flowers disposed in few-flowered terminal corymb; fruit didymous, hardly umbilicate. h. S. Native of French Guiana. Flowers white.

Morinda-like Ronabia. Shrub.

4 R. ? Morindaoides (A. Rich. l. c.) leaves elliptic, acuminate, petiolar; flowers small, crowded into many terminal pedunculate pea-formed heads; fruit pea-formed, rather umbilicate at the apex; seeds chinky outside. h. S. Native of French Guiana. Flowers white.

Morinda-like Ronabia. Shrub.

5 R. ? Didymocarpus (A. Rich. l. c.) leaves elliptic, acuminate, on short pedioles; stipulas conuate intrapietal truncate, furnished each with 2 bristles; flowers disposed in a terminal cyme; fruit didymous, umbilicatated by a terminal dot. h. S. Native of French Guiana. This and the two preceding are very doubtful species of Ronabea, from the flowers being terminal, and ought perhaps on that account to be joined with Psychotria.

Twin-fruited Ronabia. Shrub.

Cult. For culture and propagation see Coffea above.

CLXXI. PSYCHOTRIA (said to be from psyche, psyche, life; in allusion to the powerful medicinal qualities of P. emetica, or as others say from ψυχοπόρος, psychrophor, an ancient name for an herb loving shade). Lin. gen. no. 229. H. B. et Kuhn, nov. gen. amer. 3. p. 354. D. C. prodr. 4. p. 504.—Psychotropium, F. Browne, jard.—Psychotria species, Juss. Lam. Wild.—Psychotria and Mapoquira, A. Rich.—Psychotria Simira and Mapoquira, Aubl. Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a short 5-lobed 5-toothed or nearly entire limb. Corolla short, funnel-shaped, 5-cleft, regular; limb spreading or reflexed; throat bearded or glabrous. Stamens 5; anthers exerted or inclosed in the throat. Stigma bifid. Berry drupaceous, crowned by the limb of the calyx, furnished with 10 blunt ribs in the dried state, containing 2 1-seeded chartaceous coriaceous ribbed pyrenae. Seed erect, with cartilaginous albumen, and a small basilar embryo.—Small trees or shrubs, rarely
herbs, natives within the tropics. Leaves opposite, petiolate. Stipulas variable. Peduncles sometimes axillary, but usually terminal. Flowers disposed in panicles or corymb, rarely tetramerous, but almost always pentameros; sometimes, however, there are tetramerous and pentameros flowers to be found at the same time, and on the same plant. The species are very numerous and truly intricate, therefore difficult to define.

§ 1. Peduncles axillary.—Perhaps all the species belonging to the present section belong to the genus Ronaña.

* Species natives of South America.

1 P. exsul'sa (H. B. et Kunth, nov. gen. amer. 3. p. 355. t. 281.) arboresous; branchlets terete, downy; leaves oblong, acuminate, narrowed at the base, membranous, glabrous; stipulas deciduous; peduncles axillary, few-flowered; flowers tetramerous and tetrads. $. Native of Mexico, near Xalapapa. Corolla white, glabrous: with the lobes oblong, and longer than the tube. Drupe globose, red, 2-celled; cells 1-seeded; ovula erect.

Tall Psychotria. Tree tall.

Emetic Psychotria or Spanish American Ipecacuana. Sl. 1 to 1 1/2 foot.

3 P. hi'rra (Willd. in Ræm. et Schultes, syst. 5. p. 191.) branches, peduncles, petioles, and under side of leaves hairy; leaves obovate-oblong, acuminate at both ends; stipulas ovate, obtuse; peduncles axillary, 3-flowered. $. Native of New Granada, on Mount Quindiiu. The rest unknown. Perhaps a variety of P. ryse'scens.

Hairv Psychotria. Shrub.

4 P. macrop'hyl'la (Ruiz et Pav. fl. per. 2. p. 56. t. 202. f. a.) plant herbaceous, glabrous; branches terete; leaves oval-lanceolate, acuminate, large, membranous; stipulas broad-ovate, unidentate, short-acuminate; panicles axillary, on short peduncles, with opposite dichotomous branches; fruit ovai. $. Native of Peru, in forests on the Andes. Flowers small, sessile, white. Fruit of an obscure violaceous colour. Leaves a foot long. Stipulas beset with glands inside at the base.

Long-leaved Psychotria. Pl. 7 to 8 feet.

6 P. uli'i'no'sa (Swartz. prod. p. 43. fl. ind. occ. p. 421.) plant subherbaceous, simple, erect, glabrous; leaves lanceolate-oblong, acuminate, shining; stipulas connate, acute, convex; cymes pedunculate, tripartite, opposite in the axis of the upper leaves; flowers sessile; corolla with a villous throat; berries spherical; seeds crested on the outside. $. Native of Jamaica, in low rather humid parts of the mountains. P. Browne, jan. p. 160. no. 1 ? Root long, creeping. Berries scarlet, compressed in the dried state. Flowers pale red.

Bog Psychotria. Pl. 2 to 3 feet.

7 P. le'vis (D. C. prod. 4. p. 505.) glabrous; leaves oval, acute at the base, and ending in a short cuspitate point at the apex, smooth above, almost nerveless; stipulas thick, with a reflexed accumen; peduncles axillary, compressed, shorter than the leaves, trifid at the apex, and each of the branchlets bearing crowded sessile flowers; fruit nearly globose, not crowned. $. Native of Porto-Rico, where it was collected by Bertero. P. Physot'icea, Spreng. In herb. Balb. And probably of Poir. Seeds compressed. Ribs of fruit thick, distant.

Smooth Psychotria. Shrub.

8 P. hoo'kerii shrubby, glabrous, branches tetragonal; leaves lanceolate, tapering into the short petioles, coriaceous and membranous, with finely reflexed margins, pale and reticulated beneath; stipulas ovate, acute, deciduous; peduncles axillary, short; flowers on short pedicels, bracteate at the base; bracteae small, convoluted, toothed; flowers dioecious; fruit ovate, crowned by the limb of the calyx, which is tubular, and minutely 5-toothed at the apex. $. G. Native of Juan Fernandez. Hippotis triflora, Bertero, in ann. des. scienc. nat. 21. p. 348. but not of R. and Pav. P. triflora, Hook. et Arn. in bot. misc. 3. p. 359. but not of Schum. Fruit a drupaceous berry, nearly half an inch long, inclosing 2 chartaceous pyrenes.

Hooker's Psychotria. Shrub 3 to 5 feet.

9 P. pyrif'o'lia (Hook. et Arn. in bot. misc. 3. p. 360.) arboresous, glabrous; branches obscurely tetragonal; leaves broad-ovate or oblong, on long petioles, with scarcely siniated finely reflexed margins, coriaceous and membranous, paler beneath and reticulated: stipulas broad-ovate, acute, deciduous; peduncles axillary, 3-flowered; drupe turbinate, crowned by the erect acuminate teeth of the calyx. $. G. Native of Juan Fernandez, where it is called Peralillo according to Bertero. Hippotis pyrifolia, Bertero, mss. Bertero thinks it may only be a variety of the preceding species, but it is much larger; he did not meet with the flower; but if its structure prove to be the same as the other, both merit being raised to the rank of a genus according to Arnott.

Pear-leaved Psychotria. Shrub 4 to 6 feet.

10 P. aox'a'na (D. C. prod. 4. p. 505.) leaves narrow, oblong, attenuated at both ends, shining above, hairy beneath, and bearded on the mid-rib on both surfaces; stipulas acutely bidentate; peduncles axillary, coriaceous at the apex, downy; flowers crowded on the tops of the branches of the peduncles; fruit nearly globose. $. Native of St. Domingo. Nerves of leaves yellowish. Leaves and branchlets crowded. Flowers downy outside when young. Berries glabrous. Perhaps sufficiently distinct from the next species.

Kindred Psychotria. Shrub.

11 P. neuro'tricha (D. C. 1. c.) leaves elliptic-oblong, acuminate at both ends, glabrous, except the middle nerve, which is beset with a series of hairs on both surfaces; stipulas acutely bidentate, permanent; panicles axillary, rather deflexed, racemos; and rather pilose; flowers sessile, crowded on the tops of the lateral short branches of the panicle; fruit subobovate. $. Native of Porto-Rico. Bracteae broad, ovate, permanent, under the flowers. Berries glabrous. Flowers unknown.

Hairv-nerved-leaved Psychotria. Shrub.

* * * Species natives of Africa.

12 P. trifl'ora (Schum. pl. guin. p. 108.) shrubby; branches brachiate; branchlets rather tetragonal, pilose; leaves ovate, 4 F.
bluntly acuminated, downy beneath; stipulas reniformly cordate, acute, entire; peduncles very short, axillary, 3-flowered. | S. Native of Guinea. Flowers white.

**Three-flowered Psychotria.** Shrub 3 to 4 feet.

13 P. multiformis (Schum. pl. guin. p. 108.) plant shrubby, decumbent or scandent, quite glabrous; branchlets rather tetragonal; leaves oblong-ovate, attenuated at the apex, on short petioles; stipules entire, acuminate; panicles axillary, subcapitate; peduncles length of the pedioles. | S. Native of Guinea, at Asiana. Corolla white, downy inside.

**Many-flowered Psychotria.** Shrub decumbent.

14 P. umbellata (Schum. pl. guin. p. 108.) shrub much branched, glabrous; branchlets alternately compressed; leaves hardly petiolate, lanceolate; stipulas acuminate, cleft at the apex, deciduous; peduncles axillary, angular, trifid at the apex, umbelliferous; berries globose, umbilicate at the apex. | S. Native of Guinea. Leaves 2-4 inches long. Peduncles 2 inches long. Corolla white.

**Umbrallate-flowered Psychotria.** Shrub 3 to 4 feet.

15 P. kollyi (Schum. pl. guin. p. 110.) shrubby, glabrous; branchlets compressed; leaves petiolate, ovate-elliptic, acutish, of a different colour beneath; stipulas ovate, acutish; coryms axillary and terminal, fastigiate; tube of corolla cylindrical. | S. Native of Guinea, where it is called *Kolly-Tjo* by the natives.

**Kolly-Tjo Psychotria.** Shrub 3 to 4 feet.

16 P. ovella (Schum. pl. guin. p. 111.) plant herbaceous, creeping; petioles elongated, rather hairy at the apex; leaves oblong, cordate, obtuse, glabrous; stipulas ovate, acutish; peduncles almost axillary, usually 3-flowered; flowers girded by a foliaceous 4-leaved involucre. | S. Native of Guinea, at Aquapim.

**Enrobed Psychotria.** Pl. creeping.

**Species natives of Asia.**

17 P. philippensis (Cham. et Schlecht. in Linn.ae. 4. p. 21.) glabrous and resinous; branchlets tetragonal; leaves obovate, very blunt, petiolate, coriaceous; stipulas very short, intrafoliaceous, permanent; cymes opposite, axillary or supra-axillary, 3 times shorter than the leaves, dichotomous; ovary cylindrical, crowned by the truncate limb of the calyx. | S. Native of the Island of Luzon, about Tierra Alta by the sea side.

**Philippine Psychotria.** Shrub.

§ 2. Peduncles terminal.

**Species natives of Peru.**

18 P. reticulata (Ruiz et Pav. 2. p. 56. t. 121. f. b.) plant herbaceous, downy; branchlets tetragonal, glabrous; leaves ovate-lanceolate, acuminate, reticulated veined, rather coriaceous; stipulas subconcrete at the base, bident beyond the middle, with the lobes linear-lanceolate and acuminate; panicles terminal, longer than the leaves, with opposite spreading hairy-velvety branches, and crowded flowers. | S. Native of Peru, on the Andes in groves. Leaves a foot long, downy beneath, and having the nerves purplish. Corolla small, yellow, downy outside, with a villous throat.

**Reticulated-leaved Psychotria.** Pl. 7 to 8 feet.

19 P. acutiflora (D. C. prod. 4. p. 506.) leaves oblong, acuminate, ciliated, downy beneath, rather searibrous above, clothed with hairyomentum on the mid-rib on both surfaces, as well as the branchlets; panicles terminal, erect, rather hairy, longer than the leaves, with cymose bifid branches; segments of corolla mucronate cuspitate. | S. Native of Guayaquil, where it was collected by Henke. Guettardia acutiflora, Barb. in herb. Hænke. Nearly allied to *P. deglazii*. Stipulas connate, sheathing, ending each in a sublanceolate acumen.

**Acute-flowered Psychotria.** Shrub.

20 P. pilosa (Ruiz et Pav. fl. per. 2. p. 60. t. 208. f. a.) suffruticose, pilose; branches tetragonal; leaves oblong, acuminate at both ends; stipulas bifid, with lanceolate acute lobes, which are about the length of the pedioles; panicles short, terminal, on short peduncles, with opposite branches; bracteae lanceolate, acute, ciliated; teeth of calyx acute. | S. Native of Peru, on the Andes in humid parts of forests. Leaves 4 inches long. Inflorescence as in *Aspœra*. Bracteae bluish. Peduncles hairy. Berries blue, about the size of peas.

**Pilose Psychotria.** Shrub 2 feet.

21 P. cymosa (Ruiz et Pav. fl. per. 2. p. 59. t. 206. f. b.) suffruticose, glabrous; branches compressedly tetragonal; leaves oblong-lanceolate, acute, shining above; stipulas bipartite, with the lobes linear-subulate and distant; cymes terminal, on short peduncles, of 5 rays; segments of the calyx long, subulate; tube of corolla villous at the base; ovaries ovate. | S. Native of Peru, in groves on the Andes. Leaves 6 inches long. Peduncles compressed. Corolla purplish. Berries violaceous. Calyx almost as in *Geœphila*.

**Cymose-flowered Psychotria.** Shrub 3 to 4 feet.

22 P. magnollefolia (H. B. et Kunth, nov. gen. amer. 3. p. 360. but not of Willd.) glabrous; branchlets compressed; leaves elliptic, blunting at both ends, rather membranous; stipulas oblong, obtuse, length of the pedioles; cymes pedunculate, of 4 spreading rays; flowers sessile, usually by threes. | S. Native about Quito. Fruit unknown. Said to be allied to *P. ardisiefolia*. Leaves 7-8 inches long and 4-5 broad, on petioles 8-9 lines long.

**Magnolia-leaved Psychotria.** Shrub 4 to 6 feet.

23 P. ollerosa (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branchlets compressed; leaves oblong or ob-ovate-oblong, acute, narrowed at the base, membranous; stipulas lanceolate, acuminate, ciliated; peduncles pedunculate, very simple, spreading; flowers disposed in verticillate heaps, sessile; fruit nearly globose. | S. Native of Peru. Said to be allied to *P. ardisiefolia*, but the inflorescence is different. Sprengel asserts this species to be a native of New Granada and Brazil, but without giving any authority for so stating.

**Hearted-flowered Psychotria.** Shrub.

24 P. ruguosa (H. B. et Kunth, nov. gen. amer. 3. p. 553.) glabrous; branches compressed; leaves lanceolate, long-acuminated, rather coriaceous, narrowed at the base, a little wrinkled, foveolate in the axils of the veins beneath; stipulas lanceolate, acuminate; peduncles pedunculate, having the lower branches 4 in a whorl, and spreading; fruit nearly globose, didymous. | S. Native of the temperate parts of Peru.

**Wrinkled-leaved Psychotria.** Shrub.

25 P. viridis (Ruiz et Pav. fl. per. 2. p. 61. t. 210. f. b.) glabrous; branchlets somewhat tetragonal; leaves oblong, acuminate, foveolate in the axils of the veins beneath the base; stipulas connate, lanceolate, caduceous, one-half longer than the petioles; panicles pedunculate, terminal, with opposite branches; flowers crowded, sessile; berry globose. | S. Native of Peru, in groves on the Andes. Paliçura viridis, Rom. et Schultes, syst. 5. p. 195. Corollas small, green, with a hairy throat. Anthéra inserted. This has nothing to do with *Paliœura tinctoria*, with which it has been confounded by Sprengel. Leaves 3-4 inches long.

**Green-flowered Psychotria.** Shrub 6 to 7 feet.

26 P. repanda (Ruiz et Pav. fl. per. 2. p. 61.) glabrous; branches somewhat tetragonal, leafy at the top; leaves lanceolate-oblong, repand; stipulas connate at the base, lanceolate, ciliated on the back and margins, caduceous; panicles terminal, with brachiate compressed branches; bracteoles ovate, acute; flowers sessile, on the tops of the branches of the panicle.
\textit{S.} Native of Peru, on the Andes in groves. Corolla small, yellow, with a villous throat. Berries size of pepper-corns, purple.

\textit{Repand-leafed Psychotria.} Shrub 4 to 6 feet.

32 P. \textit{foveolat\'a} (Ruíz et Pav. fl. per. 2. p. 59. t. 207. f. b.) leaves narrow-lanceolate, acuminate at both ends, hardly petiole-like, with the axes of the upper veins often glandularly foveolate, but downy on the veins beneath, as well as the branchlets and peduncules; stipulas oval, deciduous; panicles pedunculate, having the branchlets drooping while bearing the fruit; flowers 3-5, sessile at the top of each branch of the panicle. \(\gamma.\) S. Native of Peru, on the Andes in groves, at Chinchao and Cuchero, ex Ruiz et Pav.; and on the mountains about the Guanoaco, ex Herb. Henke. P. foveolata, Spreng. syst. 1. p. 743. no. 39. exclusive of the synonyms. Branches rather tetragonal. Corolla small, cream-coloured. Berries ovate, purplish-green, ex Bartl. globose and rufous, and about the size of pepper berries.

\textit{Foveolate-leafed Psychotria.} Tree 18 feet.

28 P. \textit{divaricata} (H. B. et Kunth, nov. gen. amer. 3. p. 362. but not of Wild.) glabrous; branchlets terete; leaves lanceolate-oblong, acute, narrow at the base, membranous, foveolate in the axils of the veins beneath; panicles pedunculate, rather ovate, with opposite spreading branches; flowers pedicellate. \(\gamma.\) S. Native of Peru, on the Andes in temperate places about Quito. Very nearly allied to \textit{P. foveolata.} There is a variety of this with tetracromatic tetrands flowers.

\textit{Divaricate Psychotria.} Shrub.

29 P. \textit{virgat\'a} (Ruíz et Pav. fl. per. 2. p. 60. t. 209. f. a.) glabrous; leaves oblong or elliptic, acuminate, coriaceous, reticulately-veined beneath; stipulas bluntly bifid, length of the petioles; cymes on short peduncles, trichotomous, crowded with flowers; flowers almost sessile, on the tops of the branches of the cyme; fruit oval. \(\gamma.\) S. Native of Peru, on the Andes in cold mountain forests. Leaves 4 inches long, with red nerves, and reflexed margins, bitter, and supplying a yellow colour when dried. Corollas sulphur-coloured, with a villous throat. Berries ovate, deep blue, size of peas. P. virgata Janacensis, Spreng. syst. 1. p. 742. is perhaps a very distinct species from the present.

\textit{Twiggy Psychotria.} Shrub 9 to 10 feet.

30 P. \textit{cuneifolia} (D. C. prod. 4. p. 507.) glabrous; leaves obovate, cuneate at the base, and ending in a short cuspate point at the apex; stipulas small, deciduous; panicles erect, shorter than the leaves, with opposite branches. \(\gamma.\) S. Native of Peru, at Guayaquil. P. glabrata, Bartl. in herb. Hanke, but not of Swartz. Flowers unknown. Berries ovate-globose, 10-striped in the dried state. Seeds semi-ovate.

\textit{Wedge-leafed Psychotria.} Shrub.

31 P. \textit{Henkei} (D. C. prod. 4. p. 507.) glabrous; leaves oval-oblong, acuminate at both ends; stipulas bifid on both sides, acuminate; peduncle a little shorter than the leaves; cymes contracted. \(\gamma.\) S. Native of Guayaquil, and probably of Mexico. P. pedunculata, Bartl. in herb. Hanke. Allied to P. pedunculata, Swartz, but differs in the stipulas being much more acuminate, in the leaves being narrower, and more acuminate at both ends. Cymes obconical. Flowers and fruit unknown.

\textit{Hanke's Psychotria.} Shrub.

32 P. \textit{trifida} (Ruíz et Pav. fl. per. 2. p. 60. t. 209. f. b.) smoothish; branchlets bluntly tetragonal; leaves lanceolate, acuminate, shining above, but downy along the nerves and veins beneath; stipulas connate at the base, acutely bifid at the apex; cymes sessile, tripartite, with the branches again trifid; flowers sessile, by threes at the tops of the branchlets of the cyme; corollas downy; berries roundish-turbinate. \(\gamma.\) S. Native of the Andes of Peru, in mountain groves. Leaves 3 inches long. Throat of corolla villous. Berries black.

\textit{Trifid-cymed Psychotria.} Tree 18 feet.

33 P. \textit{capitata} (Ruíz et Pav. fl. per. 2. p. 59. t. 206. f. a.) smoothish; branchlets slightly tetragonal; leaves oblong, acuminate, very veiny, downy beneath; stipulas bifid, obtuse; panicles shorter than the leaves, ovate, terminal, on short peduncles; peduncles bracteate, opposite; flowers crowded. \(\gamma.\) S. Native of Peru, on the Andes in groves. Cephal\'is Peruviana, Spreng. syst. 1. p. 749. Stipulas hispid, glandular on the inner side at the base. Bracteas lanceolate; bracteoles ovate, acute. Berries ovate, blackish, umbilicate.

\textit{Capitate-flowered Psychotria.} Shrub 9 to 10 feet.

34 P. \textit{villo\'a} (Ruíz et Pav. fl. per. 2. p. 59. t. 207. f. a.) branchlets, peduncles, petioles, and nerves of leaves clothed with rufous villi; leaves attenuated at both ends, glabrous above in the adult state, downy on the nerves beneath; stipulas ovate-oblong, acute, caducous; panicles pedunculate, with the branches and branchlets opposite; flowers by threes, glabrous. \(\gamma.\) S. Native of the Andes of Peru, in mountain groves. Bartl. in herb. Hanke. Knots of branches pilose. Leaves 4-5 inches long. Bracteas small, acuminate. Berries red, globose, rather compressed, size of small peas. Allied to \textit{P. micrantha} and \textit{P. hirsuta.}

\textit{Villo\'a Psychotria.} Shrub 9 to 10 feet.

35 P. \textit{micrantha} (H. B. et Kunth, nov. gen. amer. 3. p. 363. t. 284.) hairy from rufescent vili; branchlets terete; leaves obovate-elliptic, acuminate, cuneate at the base, rather coriaceous; stipulas oblong, awnedly bidentate; cymes pedunculate, of 6 rays, diffuse; flowers glomerate; corollas hairy on the outside; fruit globose, elliptic, hairy. \(\gamma.\) S. Native of Peru, ex Kunth, or at the river Magdalena, ex Wild. P. rufescens, Willd. in Rom. et Schultes, syst. 5. p. 192. but not of Kunth.

\textit{Small-flowered Psychotria.} Shrub.

36 P. \textit{subsutomentosa} (Ruíz et Pav. fl. per. 2. p. 61. t. 210. f. a.) clothed with downy tomentum; branchlets bluntly tetragonal; leaves lanceolate-oblong, acute; stipulas connate at the base, acutely bifid at the apex; corymb pedunculate, trifid, bearing almost sessile crowded flowers at the tops of the branchlets; corollas hairy. \(\gamma.\) S. Native of the Andes of Peru, in mountain groves. Leaves 3 inches long, white beneath. Stipulas glandular. Calyx and corolla blue. Bracteas subulate. Cephal\'is subtomentosa, Spreng. syst. 1. p. 749.

\textit{Subtomentose Psychotria.} Shrub 4 to 6 feet.

** Species natives of Brazil.

37 P. \textit{Alba} (Ruíz et Pav. fl. per. 2. p. 58. t. 205. f. a.) smoothish; branchlets compressed; leaves elliptic-oblong, acute at both ends, beset with rows of hairs along the nerves beneath, and often foveolate in the axis of the nerves; stipulas ovate-oblong, undivided, rather concrete; panicles pedunculate, terminal, shorter than the leaves, with the branchlets opposite; calyx short, truncate; berries ovate. \(\gamma.\) S. Native of South America, especially in tropical Brazil, Guayaguay, and Andes of Peru. Cham. et Schlecht. in Linnaea. 4. p. 19. P. ardisiaefolia, H. B. et Kunth, nov. gen. amer. 3. p. 359. Bartl. in herb. Hanke. P. densiflora, Willd. in Rom. et Schultes, syst. 5. p. 189. P. pátula, Willd. in Rom. et Schultes, syst. 5. p. 189. P. ardisiaefol\'ia, P. pátula, and P. álba, Spreng. Leaves 6-8 inches long. Stipulas obovate, hairy at the base. Bracteas conning, ovate, acute. Flowers and berries white.

\textit{Var. \beta. tóneo} (Cham. et Schlecht. in Linnaea. 4. p. 10.) leaves glabrous, nearly obovate, few-veined. \(\gamma.\) S. Native of Brazil, near Rio Janeiro.

\textit{White-berried Psychotria.} Shrub 12 feet.

38 P. \textit{leiocha\'ra} (Cham. et Schlecht. in Linnaea. 4. p. 22.)
smoothish; leaves narrow-lanceolate, acuminated at both ends, membranous; stipulas rather concrete, bidentate on both sides; cymes pedunculate, terminal; with the branchlets slender, opposite or verticillate, downy; flowers tetradrous, rarely pentadrous; calyx 5-lobed; fruit globose, ribless. \( \text{S.} \) Native of tropical Brazil.

**Var. \( \beta \) extratropical** (Cham. et Schlecht. in Linnaea. 4. p. 22.) cymes quite glabrous; flowers triandrous or tetradrous; calycine teets unequal. \( \text{S.} \) Native of the south of Brazil, without the tropic. Perhaps a proper species.

**Smooth-fruited Psychotria.** Shrub 4 to 6 feet.

39 P. *nîlīdu* (Cham. et Schlecht. in Linnaea. 4. p. 25.) quite glabrous; leaves lanceolate, acuminated, on very short petioles; stipulas triangular, acute, at length bident, permanent; cymes terminal, pedunculate, length of 5 leaves compressed rays, 4 of them in a whorl, and the other in the center of these 4; calyx acutely 5-toothed. \( \text{S.} \) Native of tropical Brazil. Leaves 3-4 inches long, and 10-18 lines broad. Flowers small, deciduous. Fruit unknown.

**Shining-leaved Psychotria.** Shrub 4 to 6 feet.

40 P. *fôrmosa* (Cham. et Schlecht. in Linnaea. 4. p. 24.) leaves glabrous, obovate or elliptic, short-acuminated, cuneated at the base, of the consistence of parchment; stipulas ovate, acute, small, deciduous; panicles terminal, pedunculate, loose, smaller than the leaves, downy or hairy; lobes of the corolla acute, bidentate at the base. Very like *P. álba*, and the calicarites of the stipulas are beset with rufous villi, as in it.

**Beautiful Psychotria.** Shrub 6 to 8 feet.

41 P. *cûspidâta* (Bred. ex Willd. in Rœm. et Schultes, syst. 5. p. 192.) smooth and glabrous; leaves oval, cuneated at the base, acuminated at the apex, seriociliately villous in the axils when old; stipulas bidentate, truncate; panicles terminal, pedunculate, 3 times shorter than the leaves, with compressed branches, which are dilated at the ramifications. \( \text{S.} \) Native of tropical Brazil, and at Caracass. Allied to *P. nonatêloides* and *P. cornifôlia*.

**Cuspidated-leaved Psychotria.** Shrub 5 to 6 feet.

42 P. *nonatêloides* (Cham. et Schlecht. in Linnaea. 4. p. 26.) smooth and glabrous; branchlets compressed; leaves lanceolate, acute at the base, and long-acuminated at the apex, membranous; stipulas 2-lobed, permanent; cymes racemose, terminal, one-half shorter than the leaves; pedicels 3-flowered; middle flower and one of the lateral ones tricreate. \( \text{S.} \) Native of tropical Brazil, and at Caracass. P. involucrata, Wild. herb. Fruit unknown. Habitat of *P. cornifôlia*.

**Nonatêlo-leaf Psychotria.** Shrub.

43 P. *nôxia* (St. Hil. pl. rem. bras. p. 234. t. 21. f. a.) branchlets compressed, furnished with 2 rows of hairs; leaves lanceolate, acuminated, at short petioles, approximate, glabrous; stipulas short, biserate; flowers 2-4 in a fascicle, sessile, bracteate, terminal, and axillary; bracteae acuminated, ciliated; fruit elliptic. \( \text{S.} \) Native of Brazil. Leaves a span long, and 3-4 inches broad, of a vivid black colour in the dried state.

**Elder-like Psychotria.** Shrub.

44 P. *lonifôlia* (Hoffmanns. ex Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves ovate-lanceolate, acuminated, petiolate; stipulas deciduous; branches of the panicle glabrous, verticillate, 3 times shorter than the leaves. \( \text{S.} \) Native of Brazil. Leaves a span long, and 3-4 inches broad, of a vivid black colour in the dried state.

**Great-leaved Psychotria.** Shrub.

45 P. *grandifôlia* (Hoffmanns. ex Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves ovate, acute; stipulas bident, obtuse; flowers panicked. \( \text{S.} \) Native of Brazil. Leaves half a foot long. Corollas yellow. Very like *P. latifôlia*, but differs in the form of the stipulas.

**Great-leaved Psychotria.** Shrub.

* * * Species natives of Guiana.

51 P. *mapûria* (Rœm. et Schultes, syst. 5. p. 187.) glabrous; leaves obovate, each in a short blunt acumen, cuneated at the base; stipulas ovate-roundish, deciduous; panicles terminal, shorter than the leaves; fruct ovate-globose, striate. \( \text{S.} \) Native of French Guiana, on the banks of rivers.

**Mapûria** Psychotria. Shrub 7 to 8 feet.
leaves elliptic, cuneated at the base, short-acuminated at the apex; stipulas obvate, foliaceous, deciduous, length of the petioles; panicles rising from the forks of the branches, pedunculate, hardly shorter than the leaves; fruit ovate, striated. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. Very nearly allied to \( P. \) *Mapouria*. but differs from that species in the above characters, besides in the longer leaves, larger stipulas, and in the peduncle of the fruiciferous panicle being 4 inches long.

*Mapouria*-like *Psychotria*. Shrub 5 to 6 feet.

53 \( P. \) *Simira* (Raem. \& Schultes, syst. 5. p. 187.) glabrous; leaves elliptic-ovate, abruptly acuminated, with parallel veins, paler beneath; stipulas ovate, acuminated, deciduous; panicles erect, on short peduncles, one-half shorter than the leaves; berries oval. \( \bullet \). S. Native of French Guiana, in humid parts of woods. Simira tinctoria, Aubl. guian. 1. p. 170. t. 65. P. parviflora, Wild. spec. 1. p. 962. Bark red on the inside. Leaves 14 inches long, and 6 broad, with the nerves red beneath. Branches of the panicle short. Corolla white, with rounded segments, ex Aubl., but acute segments, ex Rich., shorter than the stamens. The bark of this shrub is used to dye silk and cotton of a red colour. *Simira* is the Guiana name of the tree.

*Simira* *Psychotria*. Shrub 10 to 12 feet.

54 \( P. \) *Patrisii* (D. C. prod. 4. p. 510.) glabrous; leaves elliptic-oblong, acuminated at both ends; stipulas elliptic, acutish, deciduous; panicles pedunculate, a little shorter than the leaves, having the branches and branchlets opposite; fruit nearly globose, striated, truncate at the apex. \( \bullet \). S. Native of French Guiana, where it was collected by Patris, along with many other species. Branches terete. Leaves 5-6 inches long, and 2 or 3½ broad. From the stipulas and liabi, this species comes near to \( P. \) *Mapouria*.

*Patris*’s *Psychotria*. Shrub 6 to 8 feet.

55 \( P. \) *sororia* (D. C. l. c.) glabrous; leaves elliptic-oblong, acuminated at both ends; stipulas triangularly-elliptic, acute, deciduous; panicles terminal, pedunculate, hardly shorter than the leaves, with the branches and branchlets opposite; fruit nearly globose, striated, truncate at the apex. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. Very nearly allied to \( P. \) *Patrisii*, but the berries are fewer, and larger round, without horns, and crowned by the 5 small teeth of the calyx.

*Sister* *Psychotria*. Shrub 6 to 8 feet.

56 \( P. \) *pissonia* (D. C. prod. 4. p. 510.) glabrous; leaves oval, acuminated at both ends; stipulas oblong, acuminated, deciduous; panicles pedunculate, longer than the leaves, having the branches and branchlets opposite; fruit ovate, striated. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. The buds and stipulas are oblong and acute, and very much like those of the fig-tree. Peduncle of the panicle 3 inches long. Fruit small. Allied to \( P. \) *Simira*.

*Fig-budded* *Psychotria*. Shrub 5 to 6 feet.

57 \( P. \) *racemosa* (A. Rich. act. soc. hist. nat. par. 1792. p. 107.) glabrous; leaves elliptic-oblong, acuminated at both ends, shining beneath; stipulas bifid, with the lobes acuminated; racemes terminal, pedunculate, straight, one half shorter than the leaves; racich of the raceme angular, downy; fruit compressed, coarsely ribbed. \( \bullet \). S. Native of French Guiana. Leaves 10 inches long, and 3 broad, on petioles which are nearly an inch long. Flowers unknown.

*Racemose*-flowered *Psychotria*. Shrub.

58 \( P. \) *flexuosa* (Wild. spec. 1. p. 966.) glabrous, subherbaceous; branches compressed; leaves oval, acuminated, on short petioles, membranous; stipulas bipartite, acuminated, equal in length to the petioles; panicles terminal, racemose, pedunculate, shorter than the leaves; berries globose, compressed, rather didymous. \( \bullet \). S. Native of Cayenne, in stereile places. Nonatelia paniculata, Aubl. guian. 1. p. 181. f. 70. f. 2. Flowers white. Berries violaceous.

*Flexuous* *Psychotria*. Shrub 2 feet.

59 \( P. \) *deleixa* (D. C. prod. 4. p. 510.) glabrous; branches and peduncles compressed; leaves ovate-lanceolate, or oval-lanceolate, acuminated at the apex, and acute at the base, membranous; stipulas twin on both sides, lanceolate, hardly joined at the base; panicles pedunculate, shorter than the leaves, with reflexed compressed branchlets, which are bearded in the axils; flowers small, tetraterous. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. Very nearly allied to \( P. \) *flexuosa*, but differs in the flowers being tetraterous and tetradiomous.

*Deflexed*-peduncled *Psychotria*. Shrub 1 to 2 feet.

60 \( P. \) *paniculata* (Wild. spec. 1. p. 970.) glabrous; leaves ovate, acuminated at both ends, veiny; stipulas connate, bidentate; panicles terminal, erect; berries globose, compressed, subdidymous. \( \bullet \). S. Native of Surinam and other parts of South America.

*F. var. oblongata* (D. C. prod. 4. p. 510.) leaves oblong; panicles weak. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. Nerves of the leaves and peduncles yellowish. Panicles the length of the leaves.

*Panicled*-flowered *Psychotria*. Tree, tall.

61 \( P. \) *bracteata* (D. C. prod. 4. p. 510.) glabrous; leaves oblong, acuminated, almost sessile, stiff, shining above, with revolute margins; stipulas twin on both sides, linear, acuminated, longer than the petioles, which are very short; cymes trichotomous, on short peduncles; bracteas oblong, many, under the flowers; fruit nearly globose, striated. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. This is a very distinct species. Leaves 3 inches long, and 8-9 lines broad. Petioles 1-2 lines long. Peduncle of the cyme compressed, 9-10 lines long.

*Bracteate*-flowered *Psychotria*. Shrub 4 to 6 feet.

62 \( P. \) *flattypoda* (D. C. l. c.) glabrous; leaves oval or oblong, acuminated, with parallel nerves; stipulas connate, short, bidentate on both sides; cymes terminal, 4-parted, on very short peduncles, girded by 4 large ovate bracteas, having the branches compressed so much as to be 2-edged, the secondary branches bearing the flowers at their tops; fruit round, depressed, coarsely ribbed. \( \bullet \). S. Native of French Guiana, where it was collected by Patris. The leaves and peduncles become yellowish on drying. Leaves 5-6 inches long, and 2-3 broad. Petioles 4-6 lines long.

*Broad-peduncled* *Psychotria*. Shrub 6 to 8 feet.

63 \( P. \) *breveipes* (D. C. prod. 4. p. 511.) glabrous; branchlets compressed; leaves elliptic, acuminated at both ends, shining above; stipulas twin on both sides, linear, acuminated, hardly joined at the base; cymes irregularly branched, on short peduncles, rather bracteate; fruit roundish, compressed, profusely ribbed. \( \bullet \). S. Native of French Guiana. Fructiferous cymes equal in length to the attenuated part of the base of the leaves. Leaves 5 inches long, and 2 broad. Petioles 1-3 lines long.

*Short-peduncled* *Psychotria*. Shrub.

**** Species natives of Columbia.

64 \( P. \) *Carthagenensis* (Jacq. amer. 65. t. 174. f. 22.) glabrous; leaves obovate or elliptic, rather coriaceous, attenuated at both ends; stipulas ovate, rather membranous, Rufous, deciduous; peduncles elongated, corymbose, trichotomous, rising from the forks of the branches; throat of the corolla villous;
berries ovate. ∎ S. Native of Carthagen@, among bushes, ex Jacq.; and of St. Domingo, ex Bertero.  P. Carthagenensis, Spreng. ex Balb. Corollas white, having the tube much exceeding the limb, which is said to be 6-7-cleft, and the stamens are 6-7, according to Jacquin. Berries red, crowned by the calyx, which is of the same colour. Willdenow says that the stipulas are emarginate; but they are probably entire and obtuse.

**Carthagen@** Psychotria. Shrub 5 to 6 feet.

65 P. ? cymata (H. B. et Kunth, nov. gen. amer. 3. p. 356.) glabrous; branchlets compressed; leaves lanceolate or oblong, long-acuminated, narrow at the base, membranous; stipulas oblong, obtuse; corymbs pedunculate, trichotomous, spreading; calyces cucullately spathaceous, cleft on one side. ∎ S. Native of New Granada. Calyx campanulate, 5-toothed, one half shorter than the corolla. On account of the form of the calyx, this plant does not agree with the present genus, but the fruit is unknown.

**Large-calyxed** Psychotria. Shrub.

66 P. salicifolia (H. B. et Kunth, nov. gen. amer. 3. p. 360. but not of Willd.) glabrous; branchlets compressed; leaves lanceolate, acuminate at both ends, membranous; stipulas aculeate, acute, fasscescent; panicles pedunculate, with opposite, much-spreading branchlets; fruit spherical. ∎ S. Native of New Granada.

**Willow-leaved** Psychotria. Shrub.

67 P. ? uncia (H. B. et Kunth, nov. gen. amer. 3. p. 360.) glabrous; branches 2-edged; leaves oblong, acuminate at both ends, shining above, scrobiculate in the axils of the veins beneath; stipulas ovate, acute-cuspidate; cymes pedunculate, trichotomous, spreading; flowers sessile, usually by threes; fruit ovate. ∎ S. Native of New Granada, in temperate places, near the cataract of Tocantams.

**Two-edged-branchled** Psychotria. Shrub.

68 P. ? indica (H. B. et Kunth, nov. gen. amer. 3. p. 371. t. 288. but not of Willd.) glabrous; branches 2-edged; leaves lanceolate-oblong, acuminate at both ends, coriaceous, shining above; stipulas ovate, acute, decussate; corymbs pedunculate, dichotomous, spreading; bracteoles and teeth of the calyx ciliated; fruit nearly globose. ∎ S. Native of New Granada, on the banks of the river Magdalena, near Honda. P. viburnoides, in Rom. et Schultes, syst. 5. p. 189. but not of Kunth. Flowers usually by threes, sessile, about the size of those of the privet.

**Shining-leaved** Psychotria. Tree 20 feet.

69 P. cornificola (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branchlets terete; leaves almost sessile, ovate-rhomboid, acuminate, cuneate at the base, membranous; corymbs pedunculate, terminal, bifid, divaricate; fruit roundish, compressed. ∎ S. Native on the banks of the Orinoco, near Maypures. Stipulas and flowers unknown. Perhaps a distinct genus.

**Dogwood-leaved** Psychotria. Shrub.

70 P. viburnoides (H. B. et Kunth, nov. gen. amer. 3. p. 361. but not of Willd.) glabrous; branchlets compressed; leaves oblong, acuminate at both ends, coriaceous, shining above; stipulas ovate, acute, deciduous; cymes pedunculate, of 4 rays, spreading; bracteoles and teeth of the calyx ciliated. ∎ S. Native on the banks of the Orinoco, near the cataract of Atures. Very like P. lucida.

**Viburnum-like** Psychotria. Shrub.

71 P. borjensis (H. B. et Kunth, nov. gen. amer. 3. p. 557.) smoothish; branchlets compressed; leaves lanceolate, acuminate at both ends, membranous, with undulated margins, shining a little; stipulas ovate, acute; cymes pedunculate of 5 rays, spreading, the rays clothed with powdery down. ∎ S. Native in woods, on the banks of the Orinoco, near San-Borja. P. lugistria, Willd. in Rœm. et Schultes, syst. 5. p. 188. Nearly allied to P. rugulosa, but the flowers are smaller, &c. Leaves glabrous on both surfaces according to Kunth, but according to Willdenow the leaves are downy underneath.

San-Borja Psychotria. Shrub.

72 P. glaucescens (H. B. et Kunth, nov. gen. amer. 3. p. 558.) branchlets terete, hairy; leaves oblong or lanceolate-oblong, acuminate, acute at the base, with sub-undulated margins, rather coriaceous, glabrous, glaucescent beneath, five-lobed in the axils of the veins beneath, and downy on the veins; cymes pedunculate of 5 spreading rays; pedicels hairy; fruit nearly globose-elliptic. ∎ S. Native on the banks of the Orinoco, and near the city of Angostura. P. divariata, Willd. in Rœm. et Schultes, syst. 3. p. 191.

**Glaucescens** Psychotria. Shrub 10 to 15 feet.

73 P. rufescens (Spreng. syst. 1. p. 741.) branchlets, stipulas, peduncles, petioles, and nerves of the leaves clothed with rusty hairs; leaves ovate-oblong, acuminate, narrow at the base; stipulas ovate, obtuse; cymes sessile, of 3-4 rays or branches, the rays bearing almost sessile, crowded flowers at their tops. ∎ S. Native of South America.

Var. a. ferruginea (D. C. prod. 4. p. 518.) branches sub-trigonal; flowers conglomerate; stipulas acutish, half an inch long. ∎ S. Native of New Andalusia, near Caripe. The corolla is said to be white, with a villous throat and reflexed lobes. Fruit unknown. P. rufescens, H. B. et Kunth, nov. gen. amer. 3. p. 364. but not of Willd. Bertiëra ferruginea, Willd. in Rœm. et Schultes, syst. 5. p. 287.

Var. c. Haenkea (D. C. l. c.) branchlets compressed; stipulas obtuse, hairy in the young stage, and glabrous in the adult stage; flowers conglomerate; corollas hairy outside; berries ovate-oblong. ∎ S. Native of Mexico. P. rufescens, Bartl. Rufescens Psychotria. Shrub.

74 P. diervilloides (H. B. et Kunth, nov. gen. amer. 3. p. 558.) clothed with fine hairy tomentum; branchlets compressed; leaves ovate-acuminate, rounded at the base, membranous, glabrous above; stipulas oblong, obtuse; cymes pedunculate of 4 spreading rays; pedicels and calyces hairy. ∎ S. Native of South America, near Angostura. Petioles glabrous. Stipulas equal. Lobes of the corolla revolutely reflexed. Fruit unknown.

**Diervilla-like** Psychotria. Shrub.

75 P. orinocensis (D. C. prod. 4. p. 512.) leaves on short petioles, roundish-ovate, acute, shining; stipulas 2-lobed; corymbs divaricate. ∎ S. Native on the banks of the Orinoco. P. cornificola, Willd. in Rœm. et Schultes, syst. 5. p. 191, but not of Kunth.

**Orinoco** Psychotria. Shrub.

76 P. latifolia (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves ovate, acute at both ends, ribbed; stipulas acutely bidentate; panicles terminal, elongated. ∎ S. Native on the banks of the Orinoco, in shady places. Humb. et Bonpl. Leaves a foot long, very broad, shining on both surfaces, downy on the veins beneath. Branches of the panicled crowed, erect, ex Spreng.-syst. 1. p. 745.

**Broad-leaved** Psychotria. Shrub.

77 P. levigata (Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves oblong-ovate, petiolate, tapering at the base, glabrous; stipulas bidentate; panicle terminal. ∎ S. Native of South
America, at the river Atabapo. Humb. et Bonpl. This is said to be the same as *Palicourea speciosa*, by Spreng.

Smooth Psychotria. Shrub.

78 P. Hundos (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves oblong, acuminate at both ends, rather membranous; stipulas oblong, obtuse; panicle trichotomously corymbose. 

* S. Native of New Granada, on the banks of the Magdalena, near Honda, or Hueno. *Palicourea mitis* is joined with this by Spreng, but for what reason we know not.

*Honda* Psychotria. Shrub.

79 Cumanus (Willd. in Rœm. et Schultes, syst. 5. p. 191.) leaves oblong; stipulas ovate, acute; cymes few-flowered. 

* S. Native of Cuman, Humb. et Bonpl.; and Trinidad, G. Don.

Flowers yellow.

*Cuman* Psychotria. Clt. 1824. Shrub 10 feet.

80 P. sessiliflora (Willd. in Rœm. et Schultes, syst. 5. p. 191.) herbaceous; leaves oblong, acuminate at both ends; stipulas emarginately bidentate; flowers terminal, crowded, sessile. 

* S. Native on the banks of the Orinoco, Humb. et Bonpl. Herb half a foot high. Flowers white.

*Sessile-flowered* Psychotria. Pl. half a foot.

* *** A species native of Panama.

81 P. furcata (D. C. prod. 4. p. 512.) smooth; branches bifurcate, terete; branchlets compressed; peduncles, pedicels, and nerves of the leaves roughish; leaves ovate-oblong, acuminate at both ends; stipulas bidentate, small, acute; heads on short peduncles; pedicels thick, very short; bracteae 4, linear, spreading. 

* S. Native of Panama, where it was collected by Hœnke. *Cephalis furcata*, Bartl. in herb. Hœnke. Fruit ovate-globose, compressed, furrowed. Flowers unknown. Habit of *Cephalis oblonga*, but the inflorescence and fruit are like that of *P. platypoda*.

Forked-branched Psychotria. Shrub.

* *** Species natives of Mexico.

82 P. biaristata (Bartl. in herb. Hœnke, ex D. C. prod. 4. p. 513.) glabrous; branchlets a little compressed; leaves oblong, or ovoblate-oblong; attenuated at both ends, coriaceous; stipulas short, broadly ovate, biaristate, deciduous; cymes on short peduncles of 3-6 rays, much shorter than the leaves; fruit nearly globose. 

* S. Native of Mexico. Leaves 2 inches long, and 9 lines broad. Petioles 1-2 lines long.

Two-awned-stipulated Psychotria. Shrub 1 to 2 feet.

83 P. molis (Poir. dict. 5. p. 702. ? Bartl. in herb. Hœnke, ex D. C. prod. 4. p. 513.) branchlets nearly terete; peduncles and nerves of leaves downy; leaves elliptic-oblong, acuminate at both ends, membranous, when young downy, but in the adult state glabrous above; stipulas ovate, acutely bidentate; panicle corymbose, crowded, pedunculate, shorter than the leaves; corolla with a short tube, blunt erect lobes, and a hairy throat. 

* S. Native of Mexico. Allied to *P. horizontalis* var. *P. molis*, Spreng. in herb. Balb. should be excluded from the present order. The plant of Poiret is probably distinct from that of Bartl.

Soft Psychotria. Shrub.

84 P. herbiclada (D. C. prod. 4. p. 513.) branchlets, pedicles, panicles, and nerves of leaves downy; leaves elliptic-oblong, acuminate at both ends; stipulas acutely bifid; panicles erect, ovate, with the rachis compressed, and the branches opposite. 

* S. Native of Mexico. *P. pubescens*, Bartl. in herb. Hœnke. It differs from *P. pubescens* in the stipulas being more acute, in the panicles not being corymbose, in the rachis of the panicles being compressed, and in the bracteoles being shorter. Flowers unknown. Berries globose, compressed, downy, crowned, striated in the dry state.

Hairy-branched Psychotria. Shrub.

85 P. aureola (Bartl. in herb. Hœnke, ex D. C. prod. 4. p. 513.) clothed with velvety down; branchlets from compressed to terete; leaves oblong-lanceolate, attenuated at both ends; veins parallel, and are as well as the nerved yellowish; stipulas broad, ovate, drawn out each into a septicete acumen at the apex, which is sometimes undivided, and sometimes biaristate; corymbs pedunculate, trichotomous; calyx 5-toothed, and are, as well as the corollas, downy. 

* S. Native of Mexico. Branches and leaves yellowish in the dried state. Leaves 2 or 2½ inches long, and 9-10 lines broad. Petiole a line long.

Golden Psychotria. Shrub.

86 P. scabriuscula (Bartl. in herb. Hœnke, ex D. C. prod. 4. p. 513.) branchlets a little compressed; young leaves and peduncles clothed with very fine down; leaves oblong-lanceolate, attenuated at both ends, and length glabrous on the upper surface; stipulas ovate, biaristate, shorter than the petioles; corymbs trichotomous, pedunculate, shorter than the leaves; fruit globose didymous. 

* S. Native of Mexico, about Acauleo. Allied to *P. auricula*. Peduncles often changed into lateral elongated pseudo-axillary branches.

Roughish Psychotria. Shrub.

87 P. Mexicana (Willd. in Rœm. et Schultes, syst. 5. p. 192.) leaves oblong, acuminate at both ends, rather membranous; stipulas bipartite, acute; panicles narrow, terminal. 

* S. Native of Mexico. Humb. et Bonpl. This plant is referred to *Palicourea fastigiata* by Sprengel, who is probably correct.

Mexican Psychotria. Shrub.

88 P. radiofolia (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves oblong, acuminated, pilose on the veins beneath; stipulas bipartite, linear-subulate; panicles corymbose, terminal. 

* S. Native of Mexico, about Xalappa. Humb. et Bonpl.

Bird-cherry-leaved Psychotria. Shrub.

* *** A species native of Florida.

89 P. lanceolata (Nutt. in Sill. amer. journ. 5. p. 290.) branches and under sides of leaves clothed with rusty down; leaves lanceolate, acuminated at both ends; stipulas stem-clasping, roundish, deciduous, spathulate; corymbs terminal, trichotomous from the base. 

* S. Native of Eastern Florida. Leaves 2-3 inches long. Berries ovate, red.

*Lanceolata-leaved* Psychotria. Shrub.

* *** A species native of the Bahamas.

90 P. undata (Jacq. hort. selcenhbr. 3. p. 5. t. 260. fragm. 101.) glabrous; leaves oval-lanceolate or oblong, acuminated at both ends, undulated; stipulas connate, ovate, deciduous, a little shorter than the pedioles; cymes terminal, sessile, tripartite, with trichotomous branches; corolla with a naked throat, but the tube is villous at the origin of the filaments. 

* S. Native of the Bahamas. Leaves acute at both ends, wavy, shining above, 3-4 inches long. Corollas white, with reflexed segments. Berries small, roundish, red.

* *** Species natives of the West India Islands.

91 P. floribunda (H. B. et Kunth. nov. gen. amer. 3. p. 359.) glabrous; branchlets compressed; leaves elliptic-oblong, acuminated at both ends, coriaceous; stipulas oblong, obtuse; cymes pedunculate, of 6 rays, much branched, diffuse; the rays again divided into 4-5 rays; bracteas and calycine teeth hairy; stamens length of the lobes of the corolla. 

* S. Native of South America, in the province of Carthagen near Turbaco? ex
Kunth; in the Island of Martinico, ex Sieb; and of Guadaloupe, ex Perrottet.

**Bundle-flowered Psychotria.** Shrub.

92 P. **tenuifolia** (Swartz, prod. p. 43. fl. ind. occ. 1. p. 402.) glabrous; leaves oblong, acuminate at both ends, membranous; stipulas ovate, deciduous, bifid, with acuminate lobes; panicles erect, almost sessile, shorter than the leaves; throat of corolla villous. ♂ S. Native of Hispaniola, among bushes. Leaves with an obtuse acumen, ex Swartz. Panicles trichoto- mous. Flowers small, white. Berries oblong, glabrous. — P. glabrata, Sieb. fl. mart. no. 73. does not differ from the plant of Swartz, unless in the leaves being acutely acuminate. P. laurifólia, Bertero, collected in Hispaniola, has the leaves acute at the apex, and the nerves of the leaves beset with rusty down underneath. In both, however, there are rufous cilia in the axils of the leaves and stipulas.

**Thin-leaved Psychotria.** Shrub 3 to 4 feet.

93 P. **nervosa** (Swartz, prod. p. 43. fl. ind. occ. 1. p. 403.) glabrous; leaves ovate, acute at the base, and acuminate at the apex, veined, a little undulate; stipulas oblong, acuminate, emarginate, deciduous; corymb terminal, tripartite from the base, trichotomously panicked branches; throat of corolla villous; berries oblong. ♂ S. Native of Jamaica, among bushes. P. stipulacea, Swartz, in herb. L’Her. Branches a little compressed. Panicles terminal and axillary, shorter than the leaves. Stipulas large, rusty.

**Nerved-leaved Psychotria.** Shrub 3 to 6 feet.

94 P. **la'na** (Swartz, fl. ind. occ. p. 407. but not of Ruiz et Pav.) glabrous; leaves ovate, acuminate, hardly nerved, on very short petioles; stipulas ovate, acuminate, deciduous; corymb terminal, tripartite from the base, trichotomous, having the branches and pedicles rather capillary and loose; berries oblong. ♂ S. Native of Jamaica, among bushes on the moun- tains. Stipulas small, subelliptic. Fruit oblong, acuminate at both ends. Branches terete. Leaves 1-2 inches long.

**Loose-corymbed Psychotria.** Shrub 4 to 6 feet.

95 P. **o'lo'o'trîcha** (D. C. prod. 4. p. 514.) glabrous; leaves elliptic, acuminate at both ends, membranous, hairy in the axils of the veins; stipulas ovate, membranous, rufous, deciduous; corymb sessile, tripartite, having the branches trichotomous; throat of corolla bearded. ♂ S. Native of Jamaica, Porto-Rico, Martinique, &c. P. **horizontalis**, Spreng. in herb. Balb. It differs from P. **horizontalis** in the nerves of the leaves being glabrous, in the throat of the corolla being bearded, not naked; and in the corymb being sessile, not pedunculate. Very nearly allied to P. undata and P. chimarrhoides.

**Few-haired Psychotria.** Shrub 4 to 6 feet.

96 P. **chimarrhoides** (D. C. prod. 4. p. 514.) glabrous; leaves oblong-lanceolate, acuminate at both ends, membranous; stipulas ovate, obtuse, rusty, deciduous, length of the petioles; cymes terminal, sessile, tripartite; with the branchlets 3 times shorter than the leaves. ♂ S. Native of Guadaloupe and Trinidad, ex Sieb. fl. trin. no. 256; and of Cuba. Fruit ovate, striated, crowned by the 5-toothed calyx. Leaves 3 or 3 1/2 inches long, and 7-9 lines broad. Very nearly allied to P. undata, but differs in the leaves being flat, and one-half narrower; and in the fruit being oval, not spherical.

**Chimarrhoid-like Psychotria.** Shrub 5 to 6 feet.

97 P. **capitellata** (D. C. prod. 4. p. 514.) branchlets compressed, glabrous; leaves elliptic, a little cuneate at the base, and acuminate at the apex, membranous, glabrous; stipulas drawn out into 2 setaceous ligulae; peduncles terminal, hairy, bearing three nearly sessile downy bracteate leads of flowers, one-half shorter than the leaves. ♂ S. Native of Trini- dad. Sieb. fl. trin. no. 236. Habit different from any other species.

**Capitellate-flowered Psychotria.** Shrub.

98 P. **oilo'antlta** (D. C. l. c.) leaves oblong, cuneate at the base, nervèd; nerves prominent beneath, rather roughish; stipulas bifid, with triangular acute lobes; peduncles terminal, shorter than the leaves, 2-flowered at the apex; fruit ovate. ♂ S. Native of St. Domingo. P. lineata, Spreng. in herb. Balb.; and in syst. 1. p. 746. exclusive of the synonyms. Leaves 2-3 inches long, and 9-10 lines broad. Pedicels 1/2 inch long. Flowers unknown. Berry striated a little.

**Few-flowered Psychotria.** Shrub 4 to 6 feet.

99 P. **postoronica** (D. C. prod. 4. p. 515.) branches, pedioles, nerves of leaves, and pedicules clothed with rusty hairs; leaves elliptic, acuminate at both ends, and clothed with velvety down on both surfaces; stipulas ovate, large, membranous, rufous, deciduous; cymes terminal, sessile, tripartite, with the branches trichotomous; throat of corolla villous. ♂ S. Native of Porto-Rico, in woods by the sea-side, where it was collected by Bertero. P. hirsuta from Porto-Rico, Spreng. syst. 1. p. 744. It differs from P. villosa and P. hirsuta in the inflorescence being a sessile cyme, not a pedunculate panicle.

**Porto-Rico Psychotria.** Shrub 5 to 6 feet.

100 P. **berteraiana** (D. C. prod. 4. p. 515.) leaves ovate-oblong, acuminate at both ends, glabrous above, downy on the nerves beneath, and branches of the panicle; stipulas twin on both sides, ovate, acute, hardly joined at the base; branches and branchlets of panicle opposite; tube of corolla short. ♂ S. Native of St. Domingo and Porto-Rico. Nonatélia pubescens, Spreng. syst. 1. p. 751. Leaves membranous, 7 inches long, and 3 inches broad. Petioles 9-10 lines long; axils of leaves somewhat ciliated. Fruit globose, pubescent.

**Bertero’s Psychotria.** Shrub.

101 P. **brachiat'a** (Swartz, prod. p. 45. fl. ind. occ. p. 415.) leaves ovate-oblong, acuminate at both ends, glabrous, downy on the nerves beneath, and branches of the panicle; stipulas twin on both sides, ovate, acute, hardly joined at the base; branches and branchlets of panicle opposite; tube of corolla short. ♂ S. Native of Porto-Rico, from high mountains, ex Swartz; and of St. Domingo, ex Bertero. Nonatélia officinalis, Spreng. in herb. Balb. Leaves downy on the veins beneath. Flowers dirty white. Fruit deep blue, oblong.

**Brachiate-panicled Psychotria.** Clt. 1793. Sh. 6 to 7 feet.

102 P. **rubescens** (Swartz, prod. p. 44. fl. ind. occ. 1. p. 424.) branches, petioles, leaves (especially underneath), and pedicules downy; leaves ovate, acuminate at both ends; stipulas with 2 short acute teeth; panicles cymose, spreading, length of leaves. ♂ S. Native of Jamaica and St. Domingo, in hedges and waste places. Psychotrophium, P. Browne, jam. 161. no. 5. Panicles trichotomous, with usually a sessile flower in each fork. Pedicels furnished with linear opposite bracteae. Flowers greenish yellow, downy outside; throat of corolla vil- lous. Berries downy, roundish, didymous, black, containing bluish juice.

**Downy Psychotria.** Clt. 1812. Shrub 5 to 6 feet.

103 P. **horizontalis** (Swartz, prod. p. 44. fl. ind. occ. p. 410.) branches terete, horizontal, smooth, leaves ovate-lanceolate, acute, downy beneath on the nerves, as well as the petioles and panicles; stipulas small, ovate, deciduous, minute; pedicules shorter than the leaves; panicles erect, with the branches horizontal, and tripartite at the apex; throat of corolla naked. ♂ S. Native of St. Domingo, in chalky dry places. The leaves are said by Swartz to be downy beneath, and villous on the petioles and nerves. Flowers small, dirty white; anthers white. Berries oblong.

**Var. **cuspidata** (D. C. prod. 4. p. 515.) stipulas broad, short, cuspitate, marcescent; throat of corolla hairy. ♂ S.
Native of St. Domingo, where it was collected by Bertero. Perhaps a proper species.  

**Horizontal-leaved Psychotria.** Shrub 3 to 4 feet.  

104 P. corymbosa (Swartz, prod. p. 44. fl. ind. occ. 1. p. 423.) glabrous; leaves ovate-lanceolate, acuminate, shining; stipulas bidentate; teeth lanceolate; corimbis trichotomous, erect, shorter than the leaves; peduncles and pedicels coloured; throat of corolla naked.  

105 P. nucifera (Swartz, prod. 4. p. 515.) glabrous; leaves lanceolate, acute, nerved; stipulas bidentate, marcescent, deciduous, acute; corymb terminal, pedunculate, trichotomous, shorter than the leaves, erect when bearing the flowers, but nutant when bearing the fruit.  

106 P. congesta (Spreng. in herb. Balb. ex D. C. prod. 4. p. 516.) glabrous; leaves lanceolate, acute at the base, and acuminate at the apex; stipulas deciduous; panicles pedunculate, trichotomous, loose; ultimate branches of the panicle bearing 3-4 flowers in a heap; throat of the corolla bearded; anthers inclosed.  

107 P. Weistrich (D. C. prod. 4. p. 516.) glabrous; leaves lanceolate-ovate, acute, roughish, membranous, denticulate; stipulas bidentate; pedicels shorter than the leaves; panicles second, with spreading branches; throat of the corolla naked.  

108 P. myrtiphylum (Swartz, prod. p. 44. fl. ind. occ. 1. p. 405.) glabrous; leaves lanceolate-ovate, nerveless, shining, stiff; stipulas ovate, deciduous; branches second; racemes compound, terminal; throat of the corolla villous; panicles oblong.  

109 P. Polyandra (Swartz, prod. p. 43. fl. ind. occ. 1. p. 398.) plant sarmentose, radicant, and glabrous; leaves ovate, acuminate, villous, rather succulent; stipulas stem-clasping, reniform, persistent; corollas terminal and axillary, pedunculate; throat of the corolla downy; panicles nearly globose.  

110 P. Margaritaria (Swartz, prod. p. 43. fl. ind. occ. p. 400.) glabrous; leaves lanceolate-ovate, acute, margined with cartilaginous bristles; stipulas ovate, acuminate, entire, deciduous, length of pedioles; panicles loose, pedunculate; anthers inclosed; berries ovate.  

111 P. hispida (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) branches, panicles, pedicels, and leaves clothed with rusty hairs; leaves lanceolate-ovate, acute; stipulas lanceolate, undivided, deciduous; panicles pedunculate, spreading; throat of corolla villous; berries ovate, downy.  

112 P. floribunda (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) glabrous; leaves lanceolate-ovate, acute; stipulas ovate, acuminate, deciduous, entire; panicles pedunculate, much spreading, with reflexed filiform divisions; throat of corolla villous; anthers oblong, among the villi in the throat; berries oblong.  

113 P. Weistein (D. C. prod. 4. p. 516.) glabrous; branches terete; leaves oblong-elliptic, attenuated at both ends, membranous; stipulas deciduous; corimby pedunculate, trichotomous, loose, diverging, having the ultimate branches 3-flowered; throat of corolla naked; corolla oblong; anthers linear; fruit nearly globose, crowned by the calyx.  

114 P. Weistric (D. C. prod. 4. p. 516.) glabrous; stipulas ovate, acuminate; leaves elliptic, acuminate at both ends, thick, membranous; panicles on long peduncles, trichotomously branched; throat of corolla bearded; stamens glabrous; anthers exerted.  

115 P. Citrirostris (Swartz, prod. p. 43. fl. ind. occ. 1. p. 398.) glabrous; leaves elliptic, acuminate, rather coriaceous; stipulas ovate, acuminate, permanent; pedicels short; branches of panicle opposite, trichotomously branched; throat of corolla villous; berries glabrous.  

116 P. Laurifolia (Swartz, prod. p. 43. fl. ind. occ. 1. p. 392.) glabrous; leaves lanceolate-ovate, thickish, shining; stipulas ovate, acuminate, deciduous; panicles cymose, erect, 4 G
trichotomous; filaments ciliated; anthers inclosed in the bearded throat; berries roundish. ])/ S. Native of Jamaica and Hispaniola. Corolla white, with acute lobes. Stipulas downy. Berries red, shining. Said to be allied to P. glabrata.

**Laurel-leaved Psychotria.** Fl. June, July. C1t. 1818. Shrub 4 to 5 feet.

117 P. BROWNIE (Spreng. syst. 3. p. 743.) glabrous; leaves elliptic, attenuated at both ends, rather coriaceous, paler beneath; stipulas ovate, hardly mucronate, caducous, length of petioles; panicles pedunculate, trichotomous, rising from the forks of the branches; berries ovate. ])/ S. Native of Porto-Rico, St. Thomas, and Jamaica. Browne, jam. p. 160. no. 17. f. 2. P. Asiatica, Lam. ill. t. 161. f. 1. Allied to P. Carthageniensis, but differs from it in the fruit being ovate, not oblong, and in the stamens being inclosed, and in the throat of the corolla being glabrous, ex icon. Browne.

**Browne's Psychotria.** Fl. July. C1t. 1806. Sh. 4 to 5 feet.

118 P. BALBISA (D. C. prod. 3. p. 517.) glabrous; leaves elliptic, acute at both ends, rather acuminated, stiffish; stipulas ovate, deciduous; peduncles rising from the forks of the branches or from their tops, equal in length to the leaves, corymbose and trichotomous at the apex; corolla with a villous throat, and having the lobes shorter than the tube. ])/ S. Native of Jamaica, where it was collected by Bertero. P. 1cida, Spreng. in herb. Balb. Leaves 3 inches long and 1½ broad. Corolla glabrous, except the throat, which is villous, 3 lines long. Berries ovate.

**Bals's Psychotria.** Shrub 4 to 6 feet.

119 P. REVOLUTA (D. C. prod. 3. p. 517.) glabrous; leaves elliptic, tapering to both ends, coriaceous, with revolute margins; stipulas oblong, rufous and membranous, deciduous; corollas terminal, pedunculate, trichotomous, hardly longer than the leaves; corolla with a subvillous throat, and having the lobes shorter than the tube. ])/ S. Native of St. Domingo, where it was collected by Bertero. P. glabra, ex Hispaniola, Spreng. syst. 1. p. 745. no. 65. Leaves 2 or 2½ inches long, and 12-15 lines broad. Petioles 3-4 lines long. Berries ovate.

**Revolute-leaved Psychotria.** Shrub 4 to 6 feet.

120 P. GLABRA (Swa7unt, prod. 3. p. 43. fl. ind. occ. 1. p. 390.) glabrous; leaves ovate, obtuse, shining; stipulas small, ovate, and acute, rusty, deciduous; panicle erect, with opposite branches; margin of calyx almost entire. ])/ S. Native of the interior of Jamaica, among rocks on the mountains. P. glabra, ex Jamaica, Spreng. P. Asiatica a, Poir. dict. 5. p. 696. but not of Lin. Allied to P. Asiatica, but is distinct according to Swartz. Corolla small, white, with a villous throat. Berries oblong.

**Glabrous Psychotria.** Fl. June, July. C1t. 1810. Shrub 4 to 6 feet.

121 P. EXSERTA (D. C. prod. 3. p. 517.) glabrous; leaves oblong, bluntish, cuneated at the base, coriaceous, shining above; stipulas lancelolate, acute, rather connate at the base, deciduous; corollas glabrous; anthers exerted. ])/ S. Native of St. Domingo, where it was collected by Bertero. P. coriacea ex Hispaniola, Spreng. syst. 1. p. 742. exclusive of the synonyms. Corolla tubular, 3 lines long, with very short bluntish lobes.

**Exserted-stamened Psychotria.** Shrub 3 to 4 feet.

122 P. PLATYPHYLLA (D. C. prod. 3. p. 517.) glabrous; stipulas bipartite, with triangular acute lobes; leaves elliptic, acuminate at both ends, membranous; branches tetragonal; panicles racemose, rather downy, one-half shorter than the leaves, with opposite branches; throat of corolla glabrous. ])/ S. Native of Porto-Rico. P. macrophylla, Vent. in herb. Deless. Leaves 8 inches long and 3 broad. Petioles 15-18 lines long. Flowers white.

**Broad-leaved Psychotria.** Shrub.

123 P. ORAPINIS (Swa7unt, prod. 3. p. 43. fl. ind. occ. 1. p. 471.) glabrous; leaves obovate, short-acuminate, cuneated at the base; stipulas deltoid, with revolute margins, subulate at the apex, permanent; branches angular; panicles large, pedunculate, with subverticillate branches. ])/ S. Native of Jamaica, in the interior and western parts of the island, among bushes on the mountains; and of Mexico, ex herb. Hamke. Leaves a foot and more long, and 3 inches broad. Branches of panicle compressed, usually ternately verticillate. Flowers numerous, small, white. Throat of corolla villous. Berries ovate.

**Great Psychotria.** Shrub 12 to 15 feet.

124 P. PEDUNCULATA (Swa7unt, prod. 3. p. 44. fl. ind. occ. 3. p. 427.) glabrous; leaves ovate-lanceolate, acute at the base, and acuminate at the apex, rather wrinkled; stipulas shorter than the petioles, bidenticate on both sides, permanent; peduncles longer than the leaves, cymose at the apex, dense-flowered. ])/ S. Native of the interior of Jamaica, in mountain woods. P. attenuata, Wild. Psychotropium, P. Browne, jam. p. 160. no. 4. Branches rather angular. Branches of panicle trichotomous, approximate. Corolla large, cylindrical, yellowish, with a naked throat. Berries glabrous, dark purple.

**Pedunculate Psychotria.** Fl. June, July. C1t. 1810. Tree 16 to 20 feet.

125 P. ANGUSTIFOLIA (Poir. dict. 5. p. 703.) glabrous; leaves narrow-lanceolate, usually obtuse at the base, and acuminate at the apex; stipulas bidenticate, acuminate; panicles erect, trichotomous at the apex, shorter than the leaves; berries glabre. ])/ S. Native of St. Domingo. Flowers unknown. Nerves of leaves and pedicels yellow. Leaves 2-3 inches long, and an inch broad. Border of calyx hardly toothed. Berries glabrous, dark purple.

**Narrow-leaved Psychotria.** Shrub 4 to 6 feet.

126 P. BARBATA (Poir. dict. 5. p. 704.) plant subherbaceous, glabrous; leaves ovate, acuminate, membranous; branches compressed, rather angular; panicles pedunculate, spreading; lobes of corolla obtuse; throat of corolla villous; anthers exerted. ])/ S. Native of Martinico. Leaves 2 inches long. Ramifications of panicle tern or dichotomous. Fruit unknown.

**Bearded-flowered Psychotria.** Shrub.

127 P. N'COLOR (Bredem. ex Wild. mss. in Rom. et Schultes, syst. 5. p. 191.) glabrous; leaves oblong-lanceolate, on short petioles; stipulas bidenticate, setose; flowers panicled; peduncles copper-coloured. ])/ S. Native of Martinico, on the banks of mountain streams. Perhaps the same as Psychotria cuneata.

**Two-coloured Psychotria.** Shrub.

* * * * * * * * * Species natives of South America, but in what particular localities is unknown.*

128 P. PHYTOLACCA (Poir. dict. 5. p. 704.) glabrous; leaves ovate, short-acuminate, petiolate, rather fleshy; panicles short, cymose; flowers crowded; fruit globose. ])/ S. Native of South America, ex Poir., St. Domingo, ex herb. Desf. Leaves like those of Phyto
caca. Flowers numerous, disposed in an irregular order.

**Phytolacca-leaved Psychotria.** Shrub.

129 P. CORIACEA (Poir. dict. 5. p. 703.) glabrous; leaves ovate-lanceolate, very coriaceous, shining; panicles few-flowered, much shorter than the leaves, dichotomous; corolla tubular; teeth of calyx and lobes of corolla obtuse. ])/ S. Native of South America. Stems blackish. Leaves 3-4 inches long, and 2 broad. Panicles yellowish, divided into 3-4 compressed branches, which are bifurcate at the apex. Perhaps a species of *Psychotria*.

**Coriaceous-leaved Psychotria.** Fl. June, Aug. C1t. 1810. Shrub 4 to 6 feet.

130 P. ARISTA (Wild. in Rom. et Schultes, syst. 5. p.
leaves oblong, acuminate at both ends, shining above, but downy on the veins beneath; stipulas connate, aristately dentate; panicles terminal, elongated; peduncles and pedicels hairy. \(? S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunth.

**Armed-stipuled Psychotria.** Shrub.

131 P. spe'rendens (Spreng. syst. 1. p. 747.) leaves lanceolate, narrowed at the base, bluntish, shining; stipulas deciduous; corymbbs few-flowered, pedunculate, terminal. \(? S. Native of South America, at the Rio Negro, where it was collected by Humb. and Bonpl., but is unknown to Kunth. P. lucida, Willd. in Rœm. et Schultes, syst. 5. p. 189.

**Glittering-leaved Psychotria.** Shrub.

132 P. lamprophy'lla (Spreng. syst. 1. p. 747.) leaves narrow-lanceolate, elongated, tapering to both ends, coriaceous, shining above, quite glabrous and veinless beneath; stipulas short, caducous; panicles terminal, tripartite. \(? S. Native of South America. P. salicifolia, Willd. in Rœm. et Schultes, syst. 5. p. 190. The rest unknown.

**Shining-leaved Psychotria.** Shrub.

133 P. atten'ua'ta (Willd. in Rœm. et Schultes, syst. 5. p. 192.) leaves ovate-elliptic, long-acuminate, membranous; stipulas bidentate; cymes terminal. \(? S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunth. It is joined with P. pedunculata by Sprengel, who is probably right.

**Attenuated-leaved Psychotria.** Shrub.

134 P. dich'o'toma (Willd. in Rœm. et Schultes, syst. 5. p. 518.) leaves ovate-oblong, acute; stipulas bifid; spikes dichotomous. \(? S. Native of South America, where it was collected by Humb. and Bonpl.

**Dichotomous-spiked Psychotria.** Shrub.

135 P. commu'na'ta (D. C. prod. 4. p. 518.) leaves elliptic, acute at both ends, rather membranous; stipulas oblong, obtuse, stem-clasping; cyme corymbose, terminal. \(? S. Native of South America. Humb. and Bonpl. P. elliptica, Willd. in Rœm. et Schultes, syst. 5. p. 189. but not of Ker.

**Changed Psychotria.** Shrub.

136 P. membrana'ce'a (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves obovate-oblong, acuminate, membranous; stipulas ovate, acute. \(? S. Native of South America, where it was collected by Humb. and Bonpl.

**Membranaceous-leaved Psychotria.** Shrub.

******* Species natives of Africa.********

137 P. nu'beca (Caill. et Delli. pl. afr. p. 66.) leaves elliptic, glabrous above, acutish at both ends, with the nerves on the under surface prominent and downy; stipulas triangular; cyme terminal, with trifid crowded branches, which are downy, as well as the corollas; style much exerted. \(? S. Native of the north of Africa, in Nubia, at Singue. Teeth of calyx 5, obtuse, very short. Stigma turbinate, bifid. Tube of corolla campanulate. Fruit unknown.

**Nubian Psychotria.** Shrub.

138 P. ? pa'tho'bo'des (D. C. prod. 4. p. 518.) glabrous; leaves oblong, acute at both ends, coriaceous, petiolate; stipulas ovate, obtuse, deciduous, 4 times shorter than the petioles; panicles terminal, shorter than the leaves, with opposite branches; calyx truncate; corolla divided beyond the middle. \(? S. Native of the Mauritius, where it was collected by Bory de St. Vincent. The flowers are not well known; and the fruit is perfectly unknown.

**Paithura-like Psychotria.** Shrub.

139 P. ? obtusif'o'lia (Lam. ill. t. 161. f. 4. Poir. dict. 5. p. 67.) glabrous; leaves obovate, cuneate, very blunt, tapering into the very short petioles; stipulas twin on both sides, some-what concrete at the base, ending in linear points; corymbbs trifid, pedunculate, much shorter than the leaves, with the branchlets bearing crowded sessile flowers at the apex. \(? S. Native of Madagascar, where it is called *Maron-Pontou*. Leaves 4-5 inches long and 2 broad. Berries ovate, striated.

**Blunt-leaved Psychotria.** Shrub.

140 P. angustif'o'lia; leaves erect, nearly simple; leaves oval-lanceolate, entire, acuminate; flowers panicled, terminal. \(? S. Native of Sierra Leone, on the banks of rivulets. Flowers pale red.

**Narrow-leaved Psychotria.** Shrub.

******* Species natives of Asia.********

141 P. se'rendens (Lin. mant. p. 204.) plant suffruticose, much branched, twisted, glabrous; branchlets rather compressed, but at length becoming terete; leaves ovate, acute at both ends, coriaceous; stipulas ovate, obtuse, undivided, brown, deciduous; corymbbs pedunculate, triehotonous, terminal, having the peduncles and branchlets 2-edged; berries ovate. \(? G. Native of China and the East Indies.

**Serpentine-branched Psychotria.** Shrub 2 to 6 feet.

142 P. roxbur'ghii (D. C. prod. 4. p. 519.) branchlets opposite, complanate, downy, but becoming smooth at length; leaves elliptic, acuminate at both ends, membranous, shining above, downy on the nerves beneath, which are parallel; stipulas oval, about equal in length to the petioles, recurved at the apex, acutely bifid; panicles terminal, on short peduncles; pedicels downy, compressed, umbellate; lobes of calyx ciliated. \(? S. Native of the Moluccas. P. Asiatica, Lin. spec.? exclusive of the synonyms. Roxb. fl. ind. 2. p. 160. Leaves 8-10 inches long. Flowers very small, greenish. Bracteas small, lanceolate. Throat of corolla villous; anthers inclosed. Berries oval, 10-nerved (conforming to that in the figures of *Gaertn. fruct. 1. t. 25*, and Browne, jam. t. 17. f. 2.), deep red.

**Roxburgh's Psychotria.** Shrub.

143 P. spheroca'rina (Wall. in Roxb. fl. ind. 2. p. 161.) glabrous; branchlets compressed; leaves ovate-elliptic, acuminate, coriaceous, with parallel veins; stipulas ovate, about equal in length to the petioles, recurved at the apex, and acutely bifid; corymbbs pedunculate, compact, villous; teeth of calyx subulate; berries globose, smooth. \(? S. Native of the East Indies, on the hills near Silhet. Leaves 8-12 inches long, shining above. Flowers very small, crowded. Corolla densely bearded at the throat. Berries pale red, without ribs.

**Round-fruited Psychotria.** Shrub.

144 P. tru'xuca'ta (Wall. in Roxb. fl. ind. 2. p. 162.) glabrous; axils of petioles pilose; branchlets somewhat compressed; leaves elliptic, acute, attenuated at the base, coriaceous, foveolate in the axils of the veins beneath; stipulas broad-ovate, undivided, coriaceous, deciduous; corymbbs terminal, small, pedunculate, fleshy, bracteolate; limb of calyx truncate; throat of corolla bearded. \(? S. Native of the East Indies. Leaves 6-8 inches long and 6 broad. Petioles submarginate. Backs of stipulas depressed. Flowers rather large, by threes, intermediate ones sessile.

**Truncate-calyced Psychotria.** Shrub.

145 P. connu'atta (Wall. in Roxb. fl. ind. 2. p. 163.) glabrous; branchlets compressed; leaves lanceolate, acuminate, tapering much at the base, almost sessile, coriaceous; stipulas ovate, acutely cuspidate, longer than the petals, rather recurved at the apex; corymbbs terminal, ovate, long peduncles, with the first ramifications umbellate, the rest trichotonous; bracteas connate at the base, ciliated, slightly lobed; flowers by threes, sessile; throat of corolla bearded. \(? S. Native of the East Indies. Leaves foveolate in the axils of the nerves beneath. Peduncles rather compressed. Berries ovate, almost black, angular when dried.
Rubiaceae. CLXXI. Psychotria.

Connette-bracteate Psychotria. Shrub.

146 P. stipulacea (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acuminate, coriaceous, nerved, tapering at the base, almost sessile, smooth; stipules broad, triangular, expanded into foliaceous lamina at the apex; petals terminal, trichotomous, shorter than the leaves; pedicels compressed; flowers by threes, sessile; lobes of calyx obtuse. S. Native of Pulo-Penang. Leaves 7-10 inches long, somewhat glandular in the axils of the veins beneath. On the inside of the base of the stipules there is a tuft of hairs, which remains some time after the stipules have fallen. Corolla with a very short tube, and a bearded throat. Stamens exerted.

Large-stipuled Psychotria. Shrub.

147 P. reevesii (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acute at both ends, smooth, glaucous, coriaceous; stipulas broad-ovate, adpressed, with a rounded apex; petals terminal, oval, small, with decussate branches; limb of calyx truncate; corolla short, with a densely bearded throat. S. Native of China, from which place it was sent to the botanic garden at Calcutta by Mr. Reeves. Branches beset with copious small whitish dots, having the upper extremities slightly compressed. Leaves 6-7 inches long, a little wrinkled, foveolate in the axils of the veins beneath. Petals almost sessile. Bracteas deciduous. Flowers small, by threes, pea-green. Stamens concealed among the hairs in the throat of the corolla.

Reeves's Psychotria. Shrub.

148 P. aurantiaca (Wall. in Roxb. fl. ind. 2. p. 165.) glabrous; branches flattened; leaves lanceolate, acuminate, smooth, on short petioles; stipulas ovate, acuminate, deciduous; petals terminal, pedunculate, erect, with whorled branches; flowers by threes, middle ones sessile; limb of calyx truncate; corolla with a long tube, and a villose throat. S. Native of Pulo-Penang, Java, and Nusa-Kambanga. Blum. bijdr. p. 962. Leaves 5-7 inches long, dotted beneath. Stipulas ending in a long subulate acumen each. Peduncles compressed. Stamens exerted. Berries obovate, as large as a cherry stone, orange-coloured, ex Wall, but ovate, and 10-ribbed according to specimens from Java.

Orange-coloured-fruited Psychotria. Shrub.

149 P. denticulata (Wall. in Roxb. fl. ind. 2. p. 520.) stem ascending, with a creeping base, compressed at the apex; leaves ovate, short-acuminate, coriaceous, shining; stipulas ovate, acuminate, deciduous; subulate, with a toothed apex, downy outside, about equal in length to the petioles; petiolar sheaths many flowered, downy; teeth of calyx subulate; corolla rather rotate. S. Native of Nepaul, in the forest of Sanko. Stem purplish, undivided, or sparingly dichotomous. Leaves from 6-10 inches long, upper surface dark green, under pallid. Stipulas villous within at the base. Petiolar sheaths, downy. Throat of corolla slightly hairy. Teeth of calyx subulate. Berries globular, purple, size of currants.

Denticulated-stipuled Psychotria. Shrub creeping.

150 P. adenophylla (Wall. in Roxb. fl. ind. 2. p. 166.) glabrous; leaves lanceolate, acuminate, shining, with parallel nerves, which are glandular in the axils; stipulas ovate, blunt, connate at the base, deciduous; racemes terminal, cylindrical, a little branched at the base; peduncles compressed; bracteas rather acuminate. S. Native of the East Indies, in Silhet. The uppermost branches, dichotomous, and a little compressed. Leaves 3-4 inches long, pallid beneath. Pedicels flattened. Flowers greenish, in heaps, almost sessile. Corolla with a short tube, a villose throat, and acute segments.

Glandular-leaved Psychotria. Shrub.

151 P.? curviflora (Wall. in Roxb. fl. ind. 2. p. 167.) glabrous; branchlets terete; leaves lanceolate-oblong, long-acuminated, tapering much to the base, on long petioles, membranous, shining above, and pubescent on the nerves beneath, and glandular in the axils; stipulas ovate, obtuse, connate at the base, sometimes furnished with 1-2 teeth at the apex, with a series of adpressed hairs within their insertion, deciduous; racemes small, terminal, oval, compact, on short peduncles, much shorter than the leaves; corolla long, slender, tubular, with an incurved border. S. Native of Pulo-Penang. Petioles long. Racemes smooth, consisting of opposite approximate more or less compound fascicles of long sessile flowers. Corollas nearly an inch long, with lanceolate acute lobes, and a naked throat. Antlers exerted. Filaments inserted near the middle of the corolline tube. Perhaps a species of Chasalia or Palicourea.

Cupular-flowered Psychotria. Shrub.

152 P. ohioxyloides (Wall. in Roxb. fl. ind. 2. p. 168.) smooth, climbing, dichotomous; leaves lanceolate, on short petioles, acuminate; stipulas ovate, drawn out at the apex into an acumen, which is often bifid; corollas terminal, deciduous; corollas long, slender, tubular, with incurved lobes. S. Native of Silhet, in the East Indies. Leaves smooth, acute at the base, about 5 inches long. Perhaps a species of Chasalia or Palicourea.

Snake-wood-like Psychotria. Shrub cl.

153 P. polynneura (D.C. prodr. 4. p. 520.) glabrous; branchlets and peduncles compressed; leaves elliptic-ovate, short-acuminate, coriaceous, with usually 2 pairs of opposite lateral nerves; stipulas ovate, drawn out into a long setaceous acumen, deciduous; corollas terminal, pedunculate, one half shorter than the leaves; limb of the calyx 5 short teeth; corolla short, with a smoothish throat. S. Native of Nepaul, where it was collected by Wallich. It agrees with P. aurantiaca in the stipulas, but differs from that plant in the short corollas, &c.; and from P. nervosa in the teeth of the calyx being acute, not obtuse, nor membranous.

Many-nerved-leaved Psychotria. Shrub.

154 P. Wallischiaca (Spreng. err. p. 79.) leaves ovate, acuminate, serrated, nervd, glabrous; corolla simple; teeth of the calyx rounded, membranous; petiolar sheaths, glomerate. S. Native of Nepaul, Wallich. P. nervosa, D. Don, prodr. fl. nep. p. 137, but not of Swartz.

Wallich's Psychotria. Shrub.

155 P. vaginatis (D.C. prodr. 4. p. 520.) glabrous; leaves ovate-oblong, cuspidate at the apex, attenuated at the base; stipulas entire, foliaceous, combined into a sheath-like tube, which is bifid at the apex, having the lobes bidentate at the apex, in front of the leaves; peduncles terminal, pedunculate, downy, with the rachis compressed, and the branchlets opposite; limb of the calyx broadly campanulate, truncate. S. Native of Ceylon. Ophioxyylon arboreum, Koen. in herb. Royen. Bracteas short, acuminate, spreading. Fruit unknown. Perhaps a species of Chioecica.

Sheathed-stipuled Psychotria. Shrub.

156 P. Malaya (Jack, in mal. misc. 1. no. 1. p. 3.) leaves broad-lanceolate, stipulas undivided; peduncles terminal, coriaceous; throat of the corolla bearded. S. Native of Pulo-Penang, where it is called Byunumba by the Malayas. Corolla white, with a greenish limb.

Malaya Psychotria. Shrub.

157 P. turritis (Blum. bijdr. p. 958.) stem herbaceous, creeping at the base; leaves ovate-oblong, attenuated, smooth above, reticulated beneath, and rather tomentose; stipulas ovate, bifid; cymes compound, pedunculate, axillary, rarely terminal; flowers secund; peduncles 1-ribbed. S. Native of Java, on the mountains, in humid places. Berries globose, ribbed. Perhaps belonging to the first section of the genus.
Twisted-stemmed Psychotria. Pl. creeping.

158 P. dicervis (Blum. bijdr. p. 95b.) leaves oblong-lanceolate, acuminate at both ends, coriaceous, glabrous above, pubescent below, and downy on the veins; stipulas bifid, ciliated, rather shorter than the petioles; corymb terminal, trichotomous; corollas funnel-shaped; drupes oval, dry, ribbed. S. Native of Java, on the higher mountains, in woods. P. divaricata, Blum. cat. hort. bult. p. 53. but not of Swartz.

Diverging Psychotria. Shrub.

159 P. le'aida (Blum. bijdr. p. 950.) leaves lanceolate-oblong, acuminate, rather membranous, glabrous; stipulas broad-ovate, short, bidentate, adpressed; corymb terminal, trichotomous; flowers densely crowded, sessile; calyxes obliquely 5-toothed, and are, as well as the peduncles, coloured; tube of the corolla elongated; drupes globose. S. Native of the West of Java, frequent in humid, shady places. Peduncles thickened at length. Pyrenea 1-ribbed on the back, and fenestrate inside. Newly allied to P. corymbosa and P. sphaerocarpa.—There is a variety of this with oblong-lanceolate leaves.

Lurid Psychotria. Shrub.

160 P. pandarussaefolia (Blum. bijdr. p. 960.) leaves on short petioles, linear-lanceolate, acuminate at both ends, membranous, glabrous; stipulas ovate, acute, bidentate; cymes terminal and axillary, dense, trifid. S. Native of the Island of Java, in the province of Bantam, among bushes. Leaves 5 inches long, and 6-7 lines broad.

Gandarussa-leaved Psychotria. Shrub.

161 P. montana (Blum. bijdr. p. 960.) leaves oblong, acuminate at both ends, membranous, glabrous; stipulas intraxillary, membranous, clasping the petioles; flowers terminal, umbellately corymbose; limb of the calyx urceolate, obliquely 5-toothed; corolla with a short sub-cylindrical tube; drupes elliptic-globose; pyrenea wrinkled, with one furrow on the back. S. Native of the Island of Java, in shady places, on Mount Salak. Allied to P. montana and P. tetrandra.

Beaked Psychotria. Shrub.

162 P. tetrandra (Blum. bijdr. p. 961.) leaves on short petioles, oblong-lanceolate, much acuminate, membranous, glabrous; stipulas short, rather connate; cymes pedunculate, terminal, 3-5 parted; flowers sub-umbellate; calyxes obliquely 5-toothed; tube of the corolla somewhat campanulate; drupes nearly globose, furrowed when dry. S. Native of Java, in mountains.

Mountain Psychotria. Shrub.

163 P. rostrata (Blum. bijdr. p. 961.) leaves on short petioles, oblong-lanceolate, much acuminate, membranous, glabrous; stipulas short, rather connate; cymes pedunculate, terminal, 3-5 parted; flowers sub-umbellate; calyxes obliquely 5-toothed; corolla with a short cylindrical tube; drupes nearly globose; pyrenea smooth, obliquely 1-ribbed. S. Native of Java, in shady places, on Mount Salak. Allied to P. montana and P. tetrandra.

Beaked Psychotria. Shrub.

164 P. tetrandra (Blum. bijdr. p. 961.) leaves on short petioles, oblong, acuminate at both ends, membranous, glabrous, reticulated beneath; stipulas short, acute; cymes pedunculate, terminal; flowers tetrandrous; drupes nearly globose, ribbed in the dry state. S. Native of Java, in woods on Mounts Salak and Seribu, &c. Sides of the leaves unequal.

Tetrandrous-flowered Psychotria. Shrub.

165 P. rhinoceros (Reinw. in Blum. bijdr. p. 961.) leaves cuneate-oblong, acute, coriaceous, glabrous above, tomentose beneath; corymb terminal, tomentose; stipulas bifid, or trifid; flowers capitate; tube of the corolla sub-campanulate; drupes ovate-globose, furrowed in the dried state. S. Native of Java and Nusa-Kambanga, in humid parts of woods.

Rhinoceros Psychotria. Shrub.

166 P. rostrata (Blum. bijdr. p. 962.) leaves obovate, or cuneate-oblong, acuminate, coriaceous, glabrous; stipulas intraxillary, acuminate, connate at the base, and clasping the petioles; panicles terminal, with whorled branches; limb of the calyx urceolate, obliquely 5-toothed; tube of the corolla short, cylindrical. S. Native of Java, on the mountains. P. latifolia, Blum. cat. hort. bult. p. 54. but not of Wild.

Robust Psychotria. Shrub.

167 P. viridiflora (Reinw. in Blum. bijdr. p. 963.) leaves oblong-lanceolate, acuminate at both ends, membranous, glabrous; stipulas ovate, obtuse, with membranous margins, ciliated at the base; corymb terminal, divaricately trichotomous; calyxes oblong; tube of the corolla short, cylindrical; drupes nearly globose, somewhat 10-ribbed in the dry state. S. Native of Java, in humid places among bushes. Allied to P. stipulacea, Wall.

Green-flowered Psychotria. Shrub.

168 P. expansa (Blum. bijdr. p. 963.) leaves elliptic-oblong, acuminate at both ends, membranous, connate at the base; cymes pedunculate, terminal, 3-5 parted; flowers sub-umbellate; calyxes obliquely 5-toothed; tube of the corolla short, cylindrical. S. Native of Java, at the foot of Mount Salak. Leaves rather large.

Expanded Psychotria. Shrub.

169 P. laxiflora (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, elliptic-oblong, attenuated at both ends, membranous, glabrous; stipulas connate; corymb terminal, divaricately, trichotomous; tube of the corolla funnel-shaped; drupes elliptic-globose, furrowed when dry. S. Native of Java, in mountain woods.

Lax-flowered Psychotria. Shrub.

170 P. sarmantosa (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, lanceolate, acuminate at both ends, finely veined, coriaceous, glabrous; stipulas connate; corymb terminal, divaricately, trichotomous; tube of the corolla funnel-shaped; drupes elliptic-globose, furrowed when dry. S. Native of Java, in woods on the higher mountains. Allied to P. parasitica, Swartz.

Sarmantino Psychotria. Shrub.

171 P. leucopappa (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, oblong-lanceolate, acuminate at both ends, coriaceous, glabrous, terminal ones verticillately approximate; stipulas connate; corymb terminal, trifid; flowers capitate; drupes globose; pyrenea smooth on the back. S. Native of Java, in woods on the mountains of Seribu. Allied to P. sarmantosa.

White-fruited Psychotria. Shrub.

172 P. parviflora (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves narrow-oblong, acute, tapering much at the base, rather coriaceous, glaucous; stipulas lanceolate, elongated, deciduous; corymb terminal, trifid to the base, having the branches bearing from 1 to 3 flowers; calyx truncate; fruit obovate. S. Native of the Island of Luzon. Colour of the leaves and habit almost of P. alba.

Few-flowered Psychotria. Shrub.

173 P. ixoroides (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves oblong, tapering much at the base, short-acuminate at the apex, glaucous, hardly veined beneath; stipulas triangularly ovate, acute, deciduous; corymb terminal, downy, pedunculate, trifid, with compact many-flowered branches; limb of the calyx with 5 short acute teeth; fruit globose. S. Native of the Island of Luzon.

Izora-like Psychotria. Shrub.
shorter than the leaves, twice trifid; flowers sessile in the forks, and on the tops of the branches of the cyme; limb of the calyx campanulate, truncate, or bluntly toothed, and at length cleft irregularly. Ê. S. Native of Marianne Island. Corolla short, campanulate, but obovate in the bud state. Fruit unknown. Marianne Psychotria. Shrub.

175 P. MEMBRANIFOLIA (Bartl. in herb. Henke, ex D. C. prod. 4. p. 522.) glabrous; leaves ovate-oblong and oval, short-acuminated, membranous, veiny beneath; stipulas membranous, acutely bidentate, erosive; panicles terminal, contracted, corymbiform, almost sessile, much shorter than the leaves; anthers exserted. Ê. S. Native of the Islands of Luzon and Sozogon, in the Philippine Archipelago. The leaves in the specimens from the Island of Luzon are more oblong and more acuminate at both ends than those from Sozogon.

Membrane-leaved Psychotria. Shrub.

176 P. LINEARIS (Bartl. in herb. Henke, ex D. C. prod. 4. p. 522.) branches terete, and are, as well as the panicles, petals, and leaves, especially on the nerves on the under surfaces, beset with rusty hairs; leaves long-linear, glabrous above; stipulas membranous, ovate, acuminate, caducous; flowers crowded in terminal fascicles, on short pedicels; calyx rather truncate; corolla villous, fruit obovate. Ê. S. Native of the Island of Manilla, near Sozogon.

Linear-leaved Psychotria. Shrub.

177 P. MANILLENSIS (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branches rather compressed; leaves elliptic-oblong; acuminate, attenuated at the base, rather coriaceous, of a different colour beneath; stipulas ovate; acute, combined into a short ring at the base, deciduous; corollas tripartite, hardly pedunculate, with elongated branches, which are twice trifid at the apex; fruit obovate-oblong. Ê. S. Native of the Island of Manilla, near Sozogon.

Manilla Psychotria. Shrub.

---

* * * * * * * * * Species natives of Australia.

178 P. COLLINA (Labill. sert. caled. p. 47. t. 47.) glabrous; branches nearly terete; leaves lanceolate-oblong, attenuated at both ends; stipulas ovate, caducous; corymbs terminal, on short peduncles, shorter than the leaves, trichotomous; peduncles compressed; style bifid beyond the middle; berries roundish. Ê. S. Native of New Caledonia.

Hill Psychotria. Shrub.

179 P. LONICEROIDES (Sieb. nov. holl. exsic. no. 263.) every part of the plant is clothed with rusty hairs; leaves elliptic or oblong, acutish at both ends; stipulas lanceolate, acuminate, deciduous; panicles terminal, a little shorter than the leaves, with opposite distant branches, which are trifid, or twice trifid at the apex, with a sessile flower in each fork; bracteas ovate, acute; berries ovate, crowned by the 5-toothed calyx. Ê. S. Native of New Holland. It is very like P. hissuta of Swartz, with which it is joined by Sprengel, in his cur. post., but is still very distinct.

Honeysuckle-like Psychotria. Shrub.

180 P. SPECIOSA (Först. prod. 89.) arborescent; leaves oblong-lanceolate, involucrum terminal, usually 3-flowered. Ê. S. Native of Otaheite. Cephalis especiosa, Spreng. syst. 1. p. 749.

Showy Psychotria. Shrub.

181 P. DAPHNOIDES (Cunningh. in bot. mag. 3228.) shrub dichotomous, glabrous; branches very leafy at ends; leaves ob-ovate; stipulas nearly orbicular, bidentate, small; corollas terminal, few-flowered; mouth of corolla villous. Ê. G. Native of New Holland. Flowers pure white.

Cult. All the species of Psychotria are of the most easy culture and propagation. They grow best in a mixture of loam, peat and sand; and cuttings will strike root readily, if planted in sand, with a hand-glass over them. Some of them bear handsome foliage, but the flowers of all are insignificant.

---

CLXII. ANTONIA (named in compliment to the Archduke Antony of Austria, a promoter of botany). Pohl, pl. bras. 2. p. 13. t. 109.

L. syn. PENTANDRIA, MONOGYNIA. Calyx with an oblong-cylindrical tube, which is covered by scales, and a 5-parted limb. Corolla funnel-shaped, with a bearded throat, and a 5-parted limb; segments lanceolate, acute, at length reflexed. Stamens 5, exserted, bearded at the base. Style long, filiform, thickened towards the apex; stigma bifid, obtuse. Berries oblong, 2-celled.—Shrub middle-sized. Leaves decussately opposite. Stipulas interpetiolar. Cymes terminal, many-flowered. Flowers by threes, white.

1 A. OVA'TA (Pohl, l. c. 2. p. 14. t. 109.) leaves ovate-elliptic, quite glabrous, as well as the branches. Ê. S. Native of Brazil, among bushes in dry places, about Joxe de Tocantins, in the province of Goiay.

Ovate-leaved Antonia. Shrub 5 feet.

Cult. For culture and propagation see Psychotria above.

---

L. syn. PENTANDRIA, MONOGYNIA. All as in Psychotria, but differing in the corolla being tubular, nearly cylindrical, curved or gibbous on one side at the base, shortly 5-cleft at the apex, and bearded beneath the middle inside. Teeth of the calyx and lobes of the corolla sometimes rather unequal.—Glabrous shrubs, all natives of America. Leaves opposite, rarely verticillate, usually large. Stipulas connected in various ways. Panicles terminal, sometimes elongated, sometimes thyrsoïd, and sometimes cymose, sessile, but usually pedunculate. Corollas yellow or white. Anthers exserted or inclosed, either inserted in the bottom, middle, or upper part of the tube of the corolla. Flowers variable, rarely with a 3-celled ovary and 3-lobed stigma.

§ 1. Flowers corymbose or cymose.

1 P. SELLOWIANA (D. C. prod. 4. p. 532.) glabrous; branches terete; leaves elliptic, acute at both ends, with undulated margins, on long pedios; stipulas bluntly bidentate, with a large blunt recess; panicles cymose, fastigiate, with angularly compressed branches; corollas glabrous; stamens inclosed; fruit roundish-ovate. Ê. S. Native of Brazil, about Rio Janeiro, where it was collected by Sello. P. fastigiata, Cham. et Schlcht. in Linnaea. 4. p. 16. but not of Kunth.

Sello's Palicourea. Shrub 6 to 8 feet.

2 P. FASTIGIATA (H. B. et Kunth, nov. gen. amer. 3. p. 368. but not of St. Hil.) glabrous; branches rather tetragonal; leaves elliptic, or ovate-oblong, acuminate, acute at the base, membranous; stipulas bidentate; corymbs pedunculate; flowers on long pedicels, somewhat fastigiate, glabrous; fruit ovate, nearly globose. Ê. S. Native on the banks of the Orinoco, near Aruas. Psychotria fastigiata, Spreng. syst. 1. p. 742. exclusive of the synonyme of Willd.

Fastigiate-flowered Palicourea. Shrub 6 to 8 feet.

3 P. TABERNFOLIA (D. C. prod. 4. p. 532.) glabrous; branches terete; leaves large, soft, lanceolate, acuminate, petiolate; stipulas unknown; panicles almost cymose, short; segments of the calyx subulate; tube of the corolla slender, with
lanceolate lobes. 7 S. Native of St. Domingo. Psychotria tabernaemontana. Poir. dict. 5. p. 704. Flowers cream-coloured, hardly half an inch long.

Tent-leaved Palicourea. Shrub 4 to 6 feet.

4 P. reevesiana (D. C. l. c.) glabrous; branches terete; leaves elliptic-oblong, acuminate, acute at the base; stipulas twin on both sides, acute, small, hardly joined by a ligula; pedicels pedunculate, terminal; peduncles trichotomous, compressed; corollas bluntly 4-cleft, clothed with powdery tomentum. 7 S. Native of Brazil.

Hairy-flowered Palicourea. Shrub.

5 P. margarettii (St. Hil. pl. rem. bras. p. 281. t. 122. f. A.) branches somewhat tetragonal; leaves oblong, acuminate, bluntest at the base, on short petioles; stipulas trifid?; cymes pedunculate, downy; racis and branches angular; corollas cylindrical, with 5 very short blunt teeth, clothed with papillose tomentum. 7 S. Native of Brazil, on the edges of woods. Ero da rato, Marcr. bras. 60. f. 2. Galvânia, no. 2. Vell. miss. ex St. Hil. Galvânia Velllosi, Rum. et Schultes, syst. 5. p. 193. Peduncles of a coppery scarlet colour. Corollas of a yellowish colour at the base, purple and at the apex.

Var. β, pubescens (D. C. prod. 4. p. 525.) leaves downy beneath. 7 S. Native along with the species. St. Hil. l. c. and Cham. et Schliecht. in Linnaea. vol. 4.

Marcgrav's Palicourea. Shrub 2 to 3 feet.

6 P. apicata (H. B. et Kunth, nov. gen. amer. 3. p. 367. t. 283.) glabrous; branches terete; leaves oblong, short-acuminate, narrow at the base, coriaceous; stipulas connate, binate, longer than the petioles; pedicels cymose, sessile; corollas glabrous; fruit rather turbinate, crowned by a permanent urceolus. 7 S. Native of Caracas, on Mount Silla de Caracas. Psychotria lineata, Willd. in Rum. et Schultes, syst. 5. p. 191. Corolla evidently venose at the base. Fruit sometimes 3-celled, and the stigma trifid.

7 P. pavetta (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves ovate-lanceolate, acuminate, thin, nervled; stipulas membranous, binate; corymbs terminal, pedunculate, with bracteate trichotomous branches; corolla funnel-shaped, curved a little; anthers inclosed; fruit roundish, didymous. 7 S. Native of Jamaica, on the mountains in woods. Psychotria pavetta, Swartz, prod. 45. Lam. ill. t. 161. f. 3. Pavetta pentandra, Swartz, fl. ind. occ. p. 1. 293. Ceitron nervosum, Mill. dict.—Sloane, hist. jam. 2. t. 202. f. 2.—Plum. ed. Burm. t. 156. f. 1. Flowers white, very sweet-scented, with spreading acute lobes. This is certainly not a species of Pavetta, from the style not being exserted, nor a Psychotria, from the tube of the corolla being elongated and a little curved.

Pavetta-like Palicourea. Shrub 2 to 3 feet.

8 P. tinctoria (Rum. et Schultes, syst. 5. p. 194.) glabrous; leaves oblong, acuminate, coriaceous, foveolate in the axils of the veins beneath; stipulas lanceolate, connate at the base; pedicels on short peduncles, sub-corymbose, bractiace, throat of the corolla bearded; filaments hairy, fruit roundish. 7 S. Native of Peru, in forests on the Andes, ex Ruiz et Pav.; and at Guayaquil, ex Henke. Psychotria tinctoria, Ruiz et Pav. fl. per. 2. p. 62. t. 211. f. a. Spreng. syst. 1. p. 745. exclusive of the synonyme of Burtli. in herb. Henke. Stipulas glandular at the base. Peduncles rather tetragonial. Bracteae small, acute. Flowers sessile, usually by threes. Calyx yellowish. Corollas white or cream-coloured, with a reflexed limb. Fruit globose, rufescent. This species yields a red dye.

Var. β; leaves ovate. 7 S. Native about Guayaquil, ex Henke.

Dyers' Palicourea. Tree 18 to 28 feet.

9 P. xanthina (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves ovate or oval-lanceolate, acute at the base, acuminate at the apex, membranous, on short petioles; stipulas very short, somewhat binate; corymbs pedunculate, terminal, rarely axillary, trichotomous, bracteless; corollas downy on the outside, curved; anthers a little exerted. 7 S. Native of French Guiana, where it was collected by Patris. Branches and peduncles yellow. Berries nearly globose, didymous, ribbed.

Yellow Palicourea. Shrub 5 to 6 feet.

10 P. fusca (D. C. prod. 4. p. 526.) glabrous; branches nearly terete, rufescent; leaves oblong-lanceolate, acute, shining on both surfaces; stipulas twin on both sides, subulate, connected by a short ligula; pedicels corymbose, pedunculate, of a scarlet colour; corollas urceolate; berries roundish, didymous. 7 S. Native of Peru, in forests on the Andes. Psychotria punicea, Ruiz et Pav. fl. per. 2. p. 62. t. 42. f. a. Leaves 9 inches long, undulated. Bracteae subulate. Flowers glomerate. Corolla of a purplish scarlet colour, with a short tube, and ovate acute segments.

Scarlet-corymbed Palicourea. Shrub 6 feet.

11 P. crocea (Rum. et Schultes, syst. 5. p. 193.) glabrous; leaves ovate or oval-lanceolate, acuminate, stiillus; stipulas connected by a short ligula, twin on both sides, linear, acuminate, one half shorter than the petioles; pedicels corymbose, terminal; corollas obconically tubular; anthers exserted from the tube, but shorter than the limb; berries rather didymous. 7 S. Native of Porto-Rico, Trinidad, Cuba, Guadaloupe, &c. Psychotria crocea, Swartz, fl. ind. occ. p. 429. Sieb. fl. trin. no. 28. Meyer, eseq. 1. p. 105.?—Browne, jam. t. 13. f. 1. Leaves with prominent veins. Pedicels and peduncles suffused salmon-colored.

12 P. pedunculosa (D. C. prod. 4. p. 526,) glabrous; leaves elliptic-oblong, acuminated at both ends, and somewhat cuspidate at the apex, stiillus; stipulas ovate, deciduous; pedicels corymbose, on long peduncles, with opposite branches; corolla funnel-shaped, glabrous, with revolute lobes; fruit ovate-globose. 7 S. Native of French Guiana, where it was collected by Patris. Psychotria pedunculosa, Rich. act. soc. hist. nat. par. 1792. p. 107.?—Pâlicéria Cayennennsis, Desv. in Ham. prod. fl. ind. occ. p. 29.?

Long-peduncled Palicourea. Shrub 4 to 6 feet.

13 P. chona'nta (D. C. l. c.) glabrous; leaves ovate, ending in a short point at the apex, hardly acute at the base, stiillus; stipulas ovate, at length deciduous; pedicels corymbose, pedunculate, shorter than the leaves, with opposite branches; corolla funnel-shaped, glabrous, on the outside; anthers exserted; fruit obovate, pear-shaped, ribbed. 7 S. Native of Brazil, about Bahia, where it was gathered by Saltmann, G. Don, &c. Corollas snow-white, tubular, with linear-lanceolate lobes, and a villoz throat. Stigma bifid. Lobes compressed.

Snow-flowered Palicourea. Shrub 4 to 6 feet.

14 P. umbellata (D. C. l. c.) glabrous; branches trigonal or tetragonal; leaves elliptic-oblong, acuminated, attenuated at the base, stiillus, nervled, on short petioles; stipulas connected, sheathing, short, coriaceous, with 2 short teeth on both sides; corymbs pedunculate, sub-umbellate, composed of 5-7 branches, which rise almost from the same point, and are corymbose branched at their tops; calyx acutely 5-toothed. 7 S. Native of French Guiana, where it was collected by Patris. On the same branch there is often opposite leaves, or 3-4 in a whorl. Stigma 3-cleft in many of the flowers.

Umbellate-corymbed Palicourea. Shrub 4 to 6 feet.
§ 2. Flowers panicled.  

* Leaves disposed in whorles.  

15 P. trifylla (D. C. prod. 4. p. 526.) glabrous; leaves in a whorl, elliptic-oblong, acuminate at both ends, hardly petiolate; stipulas twin on both sides, linear-subulate, hardly joined at the base, longer than the petioles; racemes terminal, pedunculate, downy, somewhat paniculate, longer than the leaves.  

* S. Native of French Guiana, where it was collected by Patris. Leaves 4-5 inches long, and ½ broad. Raceme, along with the peduncle, 6 inches long. Fruit rather compressed, coarsely ribbed. Corolla unknown, hence the genus is doubtful.  

Three-leaved Palicourea. Shrub.  

16 P. verticillata (D. C. l. c.) branchlets tetragonal, glabrous; leaves in a whorl, lanceolate-oblong, quite glabrous, on short petioles; stipulas bifid; panicles pedunculate, downy; rachis of the panicle triquetrous, and the branchlets are angularly compressed; corollas glabrous; fruit orbicular-oblong.  

Whorled-leaved Palicourea. Shrub 5 to 6 feet.  

17 P. quadrifolia (Rudge, pl. guian. p. 27. t. 42.) stem tetragonal; leaves in a whorl, oblong-lanceolate, acuminate; stipulas intratetraphyllous, sheathing; coriaceous many-flowered; peduncles a little shorter than the leaves.  

* S. Native of French Guiana.  

Four-leaved Palicourea. Shrub.  

18 P. tetrapterxa (Cham. et Schlecht. in Linnae. 4. p. 171.) branchlets bluntly tetragonal, smooth; leaves in a whorl, ovate, or lanceolate-oblong, attenuated at both ends, softish, on short petioles, glabrous above, and downy beneath; stipulas bifid, with the lobes lanceolate, acute, and ciliate; panicles terminal, pyramidal, large, pedunculate, downy; corollas glabrous on the outside.  

* S. Native of tropical Brazil.  

Tetraphyllous Palicourea. Shrub 4 to 6 feet.  

** Leaves opposite, more or less petiolate.  

19 P. macrobotrys (D. C. prod. 4. p. 527.) branchlets tetrate, glabrous; leaves long-lanceolate, acuminate, clothed with velvety down beneath; stipulas twin on both sides, hardly connected at the base, ovate-lanceolate; panicles elongated, much longer than the leaves, clothed with velvety down; rachis somewhat tetragonal.  

Long-racemed Palicourea. Shrub 10 to 12 feet.  

20 P. macrocarpa (H. B. et Kunth, nov. gen. amer. 3. p. 369.) branchlets tetrate, glabrous; leaves obovate-oblong, short-acuminated, cuneated at the base, rather coriaceous, glabrous above, and hairy on the veins beneath; stipulas bifid, glabrous; panicles pedunculate, spreading; corollas glabrous; fruit nearly globose.  

* S. Native of New Granada, in hot places. Psychotria anacardifolia, Willd. in Reem. et Schultes, syst. 5. p. 190. Distinct from P. macrobotrys, with which it is joined by Sprengel.  

Long-fruited Palicourea. Shrub 6 to 7 feet.  

21 P. amethystina (D. C. prod. 4. p. 527.) branchlets somewhat tetragonal, rather hairy; leaves oblong-lanceolate, acuminate, glabrous above, and villous on the nerves and veins beneath; stipulas connected together almost to the middle into a sheath, and drawn out into 2 subulate teeth on each side; panicles hairy, a little longer than the leaves; bracteoles subulate; fruit oval.  

Blue-berried Palicourea. Shrub 10 to 12 feet.  

22 P. longibracteata (D. C. prod. 4. p. 507.) branchlets slightly tetragonal, smoothish; leaves oblong, acuminate, on short petioles, clothed with villous down on both surfaces; stipulas connate at the base a little way, twin on both sides, linear, acuminate; panicles longer than the leaves, hairy; bracteoles elongated, rather foliaceous; berries roundish, compressed.  

* S. Native of Panama. Psychotria amethystina longibracteata, Bartl. in herb. Henke. Very like P. amethystina, but differs in the petals being 1-2 lines long, not 11-12; and in the stipules not being glandular at the base, and connected only a very short way. Berries glosseye, blue. Corollas blue?  

Long-bracteate Palicourea. Shrub 6 to 8 feet.  

23 P. obovata (D. C. l. c.) branchlets bluntly tetragonal; leaves obvolute, acuminate, large, veiny, downy on the nerves and veins beneath; stipulas connected, ovate, with 2 short blunt lobes on each side; panicles thyrsoid, downy, bractiate, longer than the leaves; calyx ciliatis; corolla tubular; berries glabrous.  

* S. Native of Peru, on the Andes in forests at Chincho and Pilião. Psychotria obovata, Ruíz et Pav. fl. per. 2. p. 58. t. 204. f. a. Leaves a foot long. Stipulas glabrous at the base. Corollas purple, villous inside. Berries purple, almost globular.  

Obovate-leaved Palicourea. Shrub 8 to 10 feet.  

24 P. sitris (D. C. l. c.) branchlets bluntly tetragonal; leaves lanceolate, acute at both ends, very soft and probably velvety above, and glabrous beneath; stipulas connate at the base, ovate, emarginate, with very blunt teeth; panicles divaricate, hardly longer than the leaves; corollas funneled-shaped.  

Mild-leaved Palicourea. Shrub.  

25 P. l½x (Reem. et Schultes, syst. 5. p. 195.) glabrous; branchlets tetragonal; leaves oblong, acuminate, shining above; stipulas smooth, bifid, with ovate obtuse lobes; panicles long, loose, when in flower erect, but when bearing the fruit pendulous; bracteas long, reflexed.  

Loose-flowered Palicourea. Shrub 8 to 10 feet.  

26 P. hyacinthiflora (Reem. et Schultes, syst. 5. p. 194.) glabrous; branchlets bluntly tetragonal; leaves large, obovate, acuminate; stipulas bifid, with the lobes ovate, obtuse; panicles length of leaves; peduncles bractiate; bracteas small, oval; corolla funnel-shaped, with long revolute lobes.  

Hyacinth-flowered Palicourea. Shrub 10 to 12 feet.  

27 P. ceure (Reem. et Schultes, syst. 5. p. 194.) glabrous;
leaves lanceolate, acuminate, spreadingly deflexed; stipulas ovate, undivided, one-half shorter than the petioles; branches of panicle opposite, lower and ultimate ones rising from the axils; flowers crowded at the tops of the branches of the panicle; corolla funnel-shaped, with revolute lobes; berries turbinate. 5. S. Native of Peru, on the Andes in forests at Vitoe. Psychotria bellflora., Ruiz et Pav. fl. per. 2. p. 56. t. 213. f. b. Branchlets terete. Leaves 8-9 inches long. Corollas yellowish. Stamens inserted below into the middle of the tube. Berries blue, pear-shaped, size of peas.

Blue-berryed Palicourea. Shrub 9 to 10 feet.

28 P. sulphurea (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves obovate-cuneated, terminating in a short blunt point, coriaceous, nerving, shining above; stipulas bluntly 2-lobed, somewhat connected at the base; panicle loose, rather longer than the leaves; corollas funnel-shaped; fruit roundish. 5. S. Native of Peru, on the Andes in forests. Psychotria sulphurea., Ruiz et Pav. fl. per. 2. p. 56. t. 203. f. a. Leaves yellowish, 6 inches long. Bractens subulate. Corolla sulphur-coloured, having the tube villous inside below the throat. The shrub is very villous, and affords a yellow dye, which is used by the natives in the places of its natural growth.

Sulphur-coloured-flowered Palicourea. Shrub 10 to 12 feet.

29 P. flavescens (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branchlets rather tetragonal, villous; leaves oblong, acuminate, narrowed at the base, rather coriaceous, downy or hairy above, and clothed with golden yellow hairy tomentum beneath, and particularly so on the nerves; stipulas villous, combined, terete; teeth subulate; panicles sessile; corolla hairy. 5. S. Native of Peru, in temperate places. Psychotria flavescens, Spreng. syst. 1. p. 744.

Yellowish Palicourea. Shrub 8 to 10 feet.

30 P. thyrsiflora (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves lanceolate, acute; stipulas twin on both sides, short, tooth-formed, connected by a ligula; panicles thyrsoid, brachiate, longer than the leaves; berries ovate. 5. S. Native of Peru, on the Andes in forests at Cuchero. Psychotria thyrsiflora., Ruiz et Pav. fl. per. 2. p. 57. t. 304. f. b. Leaves 5 inches long. Stipulas tridentate, the middle tooth ovate ciliated, and the lateral ones subulate. Calyxes yellowish. Corollas yellow, villous inside. Berries ovate, dark purple.

Thyrse-flowered Palicourea. Shrub 10 to 12 feet.

31 P. alpina (D. C. prod. 4. p. 528.) branchlets tetragonal; leaves ovate-lanceolate, membranous, reticulate, a little ciliated; petioles downy; stipulas twin on both sides, linear, rather ciliated, connected by a short ligula; panicles terminal, erect, usually shorter than the leaves; corollas terete, elongated, diaphanous; anthers inclosed in the throat. 5. S. Native of Jamaica, on the Blue Mountains. Psychotria alpina, Swartz, prod. p. 44. fl. ind. occ. p. 431. The leaves and branches are said to be glabrous. Peduncles rufescent. Corolla rather venetiose at the base, yellow, red, purple, and white. Berries nearly globose.

Alpine Palicourea. Shrub.

32 P. eriantha (D. C. prod. 4. p. 528.) branchlets terete; leaves elliptic, acute at the base, accumulated at the apex, glabrous above, hairy on the petioles and nerves beneath; stipulas twin on both sides, subulate, joined by a membrane; panicles terminal; calyx acutely 5-toothed, glabrous; corolla tubular, very hairy outside. 5. S. Native of St. Domingo. Psychotria alpina, Poir. dict. 5. p. 702. exclusive of the synonyme of Desf.

Wolly-flowered Palicourea. Shrub 8 to 10 feet.

33 P. speciosa (H. B. et Kunth, nov. gen. amer. 3. p. 368.) branches glabrous, terete; leaves oblong, acuminate, acute at the base, membranous, roughish, shining; stipulas glabrous; panicles pedunculate, with angular branches, which are as well

as the corollas downy. 5. S. Native of New Granada, near Santa Anna. Form of stipulas and fruit unknown. According to Sprengel, this is the same as Psychotria lavigata, Willd. but not of Kunth.

Showy Palicourea. Shrub 6 to 8 feet.

34 P. elliptica (H. B. et Kunth, nov. gen. amer. 3. p. 369.) branchlets tetragonal, smoothish; leaves roundish-elliptic, acute, rounded at the base, coriaceous, stiff, glabrous above, and hairy or downy beneath; panicles on short peduncles, with short dichotomous smoothish branches; corollas glabrous. 5. S. Native on the banks of the Orinoco. Psychotria circumetiata, Willd. in Rœm. et Schultes, syst. 5. p. 190, ex Spreng. syst. 1. p. 744. Distinct from Psychotria elliptica of Ker. and Willd.

Elliptic-leaved Palicourea. Shrub.

35 P. longiflora (D. C. prod. 4. p. 528.) branches terete, smooth; leaves ovate-lanceolate, acuminate, large, coriaceous, rather downy beneath, on short petioles; panicles one-half shorter than the leaves, with alternate horizontal branches; corolla with a very long tube, which is attenuated at the base, and short straightish lobes. 5. S. Native of Cayenne. Psychotria longiflora, Poir. dict. 5. p. 194. but not of Willd. Nerves of leaves and branches of panicle yellowish. Stipulas unknown. In the specimens of the museum preserved at the royal museum at Paris, the leaves appear to be quite glabrous on both surfaces. Leaves 6-8 inches long.

Long-flowered Palicourea. Shrub.

36 P. domingensis (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves ovate-lanceolate, acute, shining, petiole; panicles terminal, usually with flowers sessile, cylindrical, incurved; berries shining. 5. S. Native of St. Domingo, on the banks of the mountain streams in shady humid places. Psychotria Domingensis, Jacq. amer. p. 66. Leaves 5 inches long. Corollas white. Berries dark, shining, with a watery pulp.

St. Domingo Palicourea. Shrub 5 to 6 feet.

37 P. tinifolia (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves obovate-oblong, acute, reticulately veined beneath, rather coriaceous, shining; stipulas bifid, obtuse; panicles stiff, with angular thickened branches; corollas salver-shaped; stamens inclosed. 5. S. Native of South America. Psychotria tinifolia, Willd. in Rœm. et Schultes, syst. 5. p. 190. Colladonia tinifolia, Spreng. syst. 1. p. 516. and 757. Berries 3-celled, 3-seeded, probably from the same cause as those of Palicourea pimpina.
glabrous; branches terete; leaves lanceolate-oblong, acuminate, acute at the base, membranous, shining; stipulas cadu-
cous; panicles sessile; corollas smoothish. \( \text{S.} \) Native of New Granada, near Santa Anna. This is a very distinct plant
from Psychotria longifolia, Willd., with which it has been con
founded by Sprengel in his syst. 1. p. 744.

**Long-leaved Psychotria.** Shrub.

41. \textit{P. Angustifolia} (H. B. et Kunth, nov. gen. amer. 3. p. 367.) branches hairy; leaves oblong-lanceolate, acuminate, acute at the base, membranous, stiff, discoloured, glabrous, rather hairy on the nerves and veins; stipulas glabrous, biden
tate; teeth subulate; panicles pedunculate, hairy; corollas hairy; fruit nearly globose, didymous. \( \text{S.} \) Native of South America, on the banks of the Orinoco or Rio Negro. Psychot
ria stenophylla, Spreng. syst. 1. p. 744.

**Narrow-leaved Palicourea.** Shrub.

42. \textit{P. Nicotianæfolia} (Cham. et Schlecht. in Linneaa. 4. p. 18.) branches, panicles, stipulas, and under surfaces of leaves clothed with minute down; leaves ovate-lanceolate, acuminate at both ends, membranous, glabrous above; stipulas truncate, drawn out into 1 lanceolate-linear teeth each; panicles elongated, contracted; corollas tubular, downy on the outside while young. \( \text{S.} \) Native of equinoxxial Brazil. Segments of the corolla rather unequal, pilose at the apex. There are also 5 fascicles of hairs in the tube of the corolla. Berries nearly orbic
ular, flattened.

**Tobacco-leaved Palicourea.** Shrub 6 to 8 feet.

43. \textit{P. Calophylllum} (D. C. prod. 4. p. 520.) glabrous; branches terete; leaves oblong, acute at the base, acuminate at the apex, on short petioles; stipulas combined at the base, tine on both sides, lanceolate, acuminate; panicles erect, contracted, shorter than the leaves, with very short few-flowered downy branches; corollas clothed with powdery tomentum. \( \text{S.} \) Native of French Guiana, where it was collected by Patris. Leaves 6-8 inches long, and 2 or 2 1/2 broad. Nearly allied to \textit{P. nicotianæfolia}, but differs in the leaves being glabrous be
neath, in the different form of the stipulas. The lobes of the stipulas appear as if they were verticillate, 2 being axillary, and the other 2 between the petioles.

**Beautiful-leaved Palicourea.** Shrub 5 to 6 feet.

44. \textit{P. Petiolæris} (H. B. et Kunth, nov. gen. amer. 3. p. 370.) glabrous; leaves elliptic-oblong, acuminate, cuneated at the base, membranous, on long petioles; stipulas connate, acutely bifid at the apex; panicles erect, clothed with very minute down; calyx glabrous, with acutish lobes. \( \text{S.} \) Native of New Andalusia, on Mount Tumiriqui. Psychotria petiolæris, Spreng. syst. 1. p. 745. Corolla unknown. Leaves 6-7 inches long. Petioles 1 or 1 1/2 inch long. Panicles 3-4 inches long. Said to be nearly allied to \textit{P. Guianænæs}.

**Petiolær Palicourea.** Tree 60 feet.

45. \textit{P. Guianænæs} (Aubl. guian. 1. p. 173. t. 66.) glabrous; leaves oval, short-acuminate, hardly acute at the base, mem

**Guiana Palicourea.** Shrub 7 to 8 feet.

46. \textit{P. Hænkeæna} (D. C. prod. 4. p. 530.) branches bluntly tetragonal; leaves petiolate, elliptic, acute at the base, and very blunt at the apex, or hardly cuspidate, glabrous, velutine beneath on the middle nerve and veins; stipulas triangular, acute; pa
nicles terminal, pedunculate, much branched, equal in length to the leaves, with opposite or alternate spreading branches; corollas glabrous. \( \text{S.} \) Native of Peru, on the mountains about the Guanoco, where it was collected by Hænke. Cincéhna Hæn
keæna, Bartl. in herb. Hænke. Corollas purplish, 4 lines long. Fruit unknown. Habit very like that of \textit{P. Guianænæs}.

**Hænkeæ’s Palicourea.** Shrub 6 to 8 feet.

47. \textit{P. Barbinæævia} (D. C. prod. 4. p. 530.) branches terete, glabrous; leaves oval, acute at the base, cuspitate at the apex, stiltish, glabrous, with the nerves rather prominent beneath, and bearded on both sides; stipulas intransilience, adpressed, very blunt, somewhat 2-lobed; panicles pedunculate, rather longer than the leaves, large, much branched, having the rachis angular, and the branches somewhat verticillate, spreading, and many
flowered; corollas clothed with powdery tomentum. \( \text{S.} \) Native of Porto-Rico, and probably of St. Domingo. Psychot
ria macrophylla and Psych. lutea, Spreng. in herb. Balb. A very beautiful species, nearly allied to \textit{P. Guianænæs}, but very distinct.

The nerves of the leaves become naked at length.

**Bearded-nerved Palicourea.** Shrub 6 to 7 feet.

48. \textit{P. Costata} (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branches villous; leaves oblong, acuminate, acute at the base, membranous, glabrous, discoloured beneath, and hairy on the nerves and veins; stipulas hairy, bifid, with the segments linear, and about equal in length to the petioles; panicles pedunculate, hairy; corollas hairy on the outside, and bearded inside. \( \text{S.} \) Native of South America, on the banks of the Orinoco and Rio Negro. Said to be nearly allied to \textit{Psychotria reticulata}. Perhaps the same as \textit{Psychotria aristata}, Willd. in Kzem. et Scheultes. syst. vol. 5. to which it is referred by Sprengel.

**Ribbed-leaved Palicourea.** Shrub.

49. \textit{P. Noxia} (Mart. réis. ex Linneæa. 5. p. 39.) glabrous; leaves membranous, oblong, acuminated, rounded at the base on short petioles; panicles divaricate; pedicels usually trifid; cor
ollas velvety. \( \text{S.} \) Native of Brazil. The rest unknown, as in the following species.

**Poisonous Palicourea.** Shrub.

50. \textit{P. Sönans} (Mart. l. c.) glabrous; leaves coriaceous, ob
long, attenuated at both ends, acuminated or retuse; racemes subcorimbosus, disposed into a large pyramidal panicle. \( \text{S.} \) Native of Brazil. Corollas velvety.

**Sounding Palicourea.** Shrub.

51. \textit{P. Durëticæ} (Mart. l. c.) leaves with thickened revolute margins, velvety beneath between the ribs and veins; racemes disposed into a subcorimbosus panicule; flowers clothed with fine velvety down. \( \text{S.} \) Native of Brazil.

**Duretic Palicourea.** Shrub.

52. \textit{P. Officinaæris} (Mart. l. c.) shrub clothed with harsh yellow down in every part; leaves narrow-elliptic, on short petioles, acute or rounded at the apex, with a murone, tapering a little at the base; corollas disposed into a coarctate panicule. \( \text{S.} \) Native of Brazil.

**Official Palicourea.** Shrub.

53. \textit{P. Abruææta} (Mart. l. c. p. 40.) leaves \( \frac{4}{4} \) in a whorl, mem
branous, stiltish, oblong or obovate, on long petioles, bluntish, glabrous, of a golden yellow colour beneath; racemes disposed in a coarctate panicule; corollas clothed with fine velvety down. \( \text{S.} \) Native of Brazil.

**Swallow-tailed Palicourea.** Shrub.

54. \textit{P. Streæææns} (Mart. l. c.) bark corky; leaves coriaceous, stiff, glabrous on both surfaces, almost sessile, broad-ovate, obtuse at both ends, with thickened revolute margins, yellowish beneath; corollas disposed into a pyramidal panicule; corollas clothed with fine velvety down. \( \text{S.} \) Native of Brazil. Perhaps the same as \textit{P. rigida}.
RUBIACEÆ. CLXXIV. CLALICOURÆA. CLXXV. CHASALIA. 603

LIN. SYST. Pentändria, Monoçymia. Calyx with an ovate tube, and an urceolate rather tubular limb, with an entire or 5-toothed border; lobes or teeth joined together at length. Corolla with an elongated terete equal tube, and 3 short acutish erect or spreading lobes, which are usually callyus at the apex, and vate in aestivation. Anthers 5, inserted in the middle or top of the tube of the corolla, inclosed or sometimes a little exserted. Stigmas 2, linear. Berries ovate, crowded by the limb of the calyx, containing 2 pyrene, hardly ribbed even in the dry state; pyrene coriaceously-chartaceous or horny, oblong, marked by a furrow inside, convex on the outside, and furnished by a longitudinal crest in the middle, which is extended beyond the base, 1-seeded. Seed erect, with the transverse section arched, lunate, and compressed. Embryo at the base of a horny albumen.—Glabrous shrubs, all natives of the Mauritius. Leaves opposite or 3 in a whorl. Stipulas ovate, undivided or combined into a 4-cleft sheath. Flowers tubular, crowded and sessile on the tops of the branches, or disposed in terminal panicked corymbs. This genus differs from Psychotria in the corolla being elongated, and from Palicouræa in the corolla not being gibbous at the base, and from both in the urceolate or campulate calyx. The habit is that of Garriniæ, but the characters are very different.

* Flowers sessile, and crowded on the tops of the branches. Leaves opposite.—Chasalía, Juss. 1 C. capitata (D. C. prod. 4. p. 531.) leaves opposite, oval, or obovate, terminating in a very short point; stipulas ovate, acuminate, permanent, longer than the petioles; flowers disposed in spicate heads at the tops of the branches, fascicled, sessile. J. S. Native of the Mauritius. Psychotria capitata, Sieb. fl. maui. no. 56. Corolla tubular, 8-10 lines long, with acute hardly open lobes. Leaves 2 inches long, and 12-15 lines broad. Stipulas 8-9 lines long. Fruit unknown. Perhaps the same as Chasalia Commersoni described by Jussieu.

Capitate-flowered Chasalía. Shrub. ** Flowers disposed in terminal panicked corymbs. Leaves opposite.

2 C. psychotrioides (D. C. prod. 4. p. 531.) leaves opposite, obovate-oblong, bluish, coriaceous, cuneate at the base, on very short petioles; stipulas ovate, obtuse, about equal in length to the petioles; panicles corymbose, pedunculate: rachis and branches compressed, opposite. J. S. Native of the Mauritius. Psychotria? Sieb. fl. maui. 2. no. 57. Internodes half an inch long. Leaves 3/4 to 3 inches long, and 15 lines broad. Corolla in the unexpanded state 7 lines long. Calyx bluntly 5-toothed.

Psychotria-like Chasalía. Shrub. 3 C. coffeoides (D. C. l. c.) leaves opposite, oblong, bluish, cuneate at the base; stipulas ovate, acute, a little longer than the petioles; panicles terminal, pedunculate, somewhat corymbose, with the rachi and peduncles compressed, and the branches opposite. J. S. Native of the Mauritius. Coffea capitata, Sieb. fl. maui. exsic. no. 335. Leaves 33 to 4 inches long, and 12-15 lines broad. Stipulas 5 lines long. Calyx with 5 acute short teeth. Corolla in the unexpanded state 5 lines long.

Coffee-like Chasalía. Shrub. 4 C. Fontanesii (D. C. l. c.) leaves opposite, obobo-oblong, bluish, attenuated at the base; stipulas oval, obtuse, deciduous, shorter than the petioles; panicles terminal, pedunculate, rather corymbous, with the rachi and branches compressed. J. S. Native of the Mauritius, and probably of the island of Bourbon. Coffea cymbosa, Willd. in Rœm. et Schultes, syst. 5. p. 201. Very nearly allied to C. coffeoides, but the stipulas are different. Petioles 4-6 lines long. Fruit ovate, crowned by the calyx. Flowers unknown.

Desfontainei's Chasalía. Shrub. 5 C. stipulaecea (D. C. prod. 4. p. 532.) leaves opposite, obovate, acutish, cuneate at the base; stipulas combined in the middle into a 4-cleft sheath, equal in length to the petioles or longer than them; lobes acuminate, 2 of which are within the leaves, and 2 between the leaves; corymbs terminal, trichotomous, with elongated branches, which bear a head of the flowers each at their tops. J. S. Native of the Mauritius. Psychotria, Sieb. fl. maui. 2. no. 271. Leaves 6 inches long. Corolla 6-7 lines long. Limb of calyx short, 5-toothed.

Large-stipulated Chasalía. Shrub. 6 C. divaricata (D. C. l. c.) leaves opposite, obobo-oblong, acutish, cuneate a long way at the base, and petiole; stipulas ovate, obtuse, membranous, deciduous, 2 or 3 times shorter than the leaves; panicles corymbose, one-half shorter than the leaves; lobes of corolla short, acute, straight. J. S. Native of the Mauritius. Coffea divaricata, Tausch. ex Sieb. fl. maui. 2. p. 271. in herb. Dunant. Missæ'nda lanceolata, Poir. dict. 4. p. 392.? and hence the Chasalía Bourbonnii, Comm. ? Leaves 6 inches long, and 15 lines broad. Petioles about an inch long. Calyx urceolate, bluntingly and shortly 5-toothed. Corola 6 lines long.

Divaricate Chasalía. Shrub. ** Flowers disposed in terminal panicked corymbs. Leaves 3 in a whorl.

7 C. Boryana (D. C. prod. 4. p. 532.) leaves 3 in a whorl, elliptic, acute at both ends, on long petioles; stipulas deciduous; panicles trichotomous, a little shorter than the leaves; lobes of corolla short, ovate, spreading; anthers exerted a little from the throat; calyx subtruncate. J. S. Native of the Mauritius and the Island of Bourbon, where it was collected by Bory de St. Vincent. Sieb. fl. maui. 2. no. 253. Petioles 12-16 lines long. Leaves 4 inches long and 2 broad, with the nerves often white. Corolla 6 lines long.

Bory de St. Vincent's Chasalía. Shrub. 8 C. grandifolia (D. C. l. c.) leaves 3 in a whorl, elliptic, acuminate at both ends, rather membranous, on long petioles; stipulas ovate, acuminate, rather longer than the petals; panicles thyrsoid, terminal, on short peduncles. J. S. Native of the Mauritius. Psychotria grandifolia, Sieb. fl. maui. 2. no. 55. but not of Rœm. et Schultes. Branchlets bluntly trigonal. Petioles 7-10 lines long. Leaves 5 inches long and 1 1/4 broad. 4 and 2.
Limb of calyx short, hardly 5-toothed. Corolla 10-12 lines long. Anthers at the throat.

**Great-leaved Chasalia. Shrub.**

9 C. clusiæfolia (D. C. 1. c.) leaves 3 in a whorl, obovate-oblong, obtuse, coriaceous, attenuated at the base; stipulas twin on both sides, ovate, obtuse, adpressed, shorter than the petals; peduncles arising by threes from the tops of the branches, angularly compressed, and densely coriaceous at the apex; bracteac numerous, short. L. S. Native of the Mauritius. Nona-tellia clusiæfolia, Reich. in Sieb. fl. mär. no. 89. Branchlets angular. Leaves 2-3 inches long and 1 or 1 3/4 broad. Petioles nerves long. Bracteas one at the base of each pedicle, and 2 on each. Corolla 5 lines long in the unexpanded state. **Var. β**; leaves opposite. L. S. Growing along with the species.

**Clusia-leaved Chasalia. Shrub.**

**Cult.** For culture and propagation see Psychotria, p. 599.

---

**CLXXV. JACKIA (named in memory of the late William Jack, a surgeon in the service of the East India Company, whose well known indefatigable labours in natural history have long ago entitled him to the highest respect).** Wall. in Roxb. fl. ind. 2. p. 321. D. C. prod. 4. p. 621.

**Lin. syst. Pentändria, Monogynia.** Limb of calyx unilateral, trifid. Corolla funnel-shaped, with a filiform tube, and a campanulate 5-cleft border; segments lanceolate, valvate in activation. Anthers filiform, sessile in the throat of the corolla, semi-exserted. Style long, hairy in the middle; stigma 2-lobed. Capsule crowned by 3 unequal unilaterals, 1-celled, and 1-seeded.—Tree tall. Leaves large, opposite, on short petioles, elliptic-obovate, cuspidate, clothed with rustly hairs beneath, as well as the branches, which are obscurely quadrangular. Stipulas combined, sheathing, fringed, interpetiolar. Panicles large, axillary, opposite, pendulous, on very long peduncles, hairy, and villous, with spreading opposite slender branches, each terminated by a corymb of crowded subdichotomous spikes. Peduncles slender, compressed, partial ones each supported by a pair of ample fringed conuate bracteas, which sometimes grow out at the margins into opposite small floral leaves. Flowers white, inodorous, sessile, alternate, distributed in short unilateral spikes, and each flower is supported by an oval densely villous toothed permanent bractea, and these bracteae are somewhat imbricated on the back of the spikes.

1 J. oina'ta (Wall. in Roxb. fl. ind. 2. p. 321. pl. asiatic. rar. 3. p. 68. t. 293.) L. S. Native of the East Indies, in several of the small islands in the immediate vicinity of Singapore. A very large branching unbranched tree. Leaves 6 to 10 or even 14 inches long, crowded at the tops of the branches.

**Decked Jackia.**—Tree large.

**Cult.** See Psychotria, p. 599, for culture and propagation.

---

**SUBTRIBE II. CEPHAELIDAE (the plants contained in this subtribe agree with the genus Cephaelis in the flowers being disposed in involucrated heads).** D. C. prod. 4. p. 532.—Cephaelidæ, Cham. et Schlcht. in Linn.æa. 4. p. 139. Flowers disposed in fasciculate heads; the heads involucrated by bracteas.

**Lin. syst. Pentändria, Monogynia.** Calyx with an obovate tube, and a very short 5-toothed limb. Corolla funnel-shaped, with 5 small bluntish lobes. Anthers inclosed. Stigma bifid, usually exerted. Berries obovate, oblong, 2-celled, 2-seeded, crowned by the vestiges of the calyx.—Shrubs and herbs, natives of America. Leaves ovate, acute, petiolate. Stipulas twin on both sides, free or combined, and sometimes bidentate or bipartite. Heads of flowers terminal or axillary, sessile or pedunculate, involucrated by 2-8 bracteas, which are disposed in a cruciately opposite manner; there are also bracteoles or pales among the flowers.—Perhaps the species with dry berries, and those with fleshy berries, ought to be separated into distinct genera. Perhaps Evea is properly joined with this genus, not withstanding its tetrandrous flowers. Probably Callicocca might be joined with this genus, but for its exerted stamens.

**SECT. I. TAPAGOMEA (Tapogomea is the Guiana name of the first species).** D. C. prod. 4. p. 533. Heads of flowers involucrated by 2 large spreading connate coloured bracteas.

1 C. tomentosa (Willd. spec. 1. p. 977.) branches, petioles, peduncle, leaves, and involucra hairy; stipulas acuminate, villous; heads of flowers on long peduncles; leaves of involucre broad, ovate-cordate, wide at the apex.—L. S. Native of Guiana, Trinidad, and probably of Mexico (if C. cyanocarpa, Moc. et Sesse, fl. mex. icon. ined. be the same), in open spaces of woods, and about way sides. Tapogomea tomentosa, Aubl. guian. 1. p. 160. t. 61. Cephaelis tomentosa, Vahl, ecol. 1. p. 19. Callicocca tomentosa, Gmel. syst. 1. p. 371. Peduncles axillary and terminal. Bracteas or involucrum scarlet, or of a vermilion-colour, large, sometimes long-acuminate, and sometimes only cuspidate. Branches obscurely tetragonal. Berries striated, ex Aubl., but blue and smooth according to the fig. in fl. mex. There are therefore 2 species probably confused. In Trinidad we have seen this shrub growing in great abundance, and where it makes a very elegant appearance from its scarlet bracteas; the flowers, as far as we can remember, are brownish, and the berries bluish.

**Woolly Cephaelis.** Fl. June, Sept. Clt. 1825. Sh. 4 feet.

**Tall Cephaelis.** Clt. 1793. Shrub 12 to 15 feet.

4 C. ruelliefolia (Cham. et Schlcht. in Linnæa. 4. p. 134.) every part of the plant is clothed with short hairs; leaves broad-lanceolate, acute, attenuated at both ends, on short petioles, membranous; stipulas triangular, bifid at the apex; heads of flowers terminal, almost sessile, solitary or by threes; floral leaves connate and dilated; bracteae recticulately nerved, lanceo-
late, longer than the calyx.  7. S. Native of equinoctial Brazil.

* Rubellia-leaved Cephalis. Shrubs 4 to 5 feet.

** Sect. II. Callioco'eca (from καλλίστος, kallistes, the most beautiful, and κοκκός, kokkos, a berry; the berries are blue or purplish). D. C. prod. 4. p. 533. Heads of flowers involucred by distinct ovate or oblong erectly adpressed bracteas.

* Shrubs. Heads of flowers pedunculate.

5 C. Justice'fola (Rudge, pl. guian, 1. p. 28. t. 43.) glabrous; branches dependent, knotted; leaves oval-lanceolate; stipulas truncate, bidentate; heads on long peduncules, involucred by broad-lanceolate bracteas; calyx nearly entire. 8. S. Native of Guiana, on the banks of rivers. Peduncules downy. Bracteas fulvous. Corolla with a bearded throat. Flowers sessile on a disk formed by the bases of the bracteas.

Justice'ica-leaved Cephalis. Shrubs 6 to 8 feet.

6 C. stipula'cea (Blum, bijdr. p. 1005.) stem suffruticose, nearly simple; leaves cuneate-oblong, acuminate, glabrous; stipulas semiorbiculate; heads on very short peduncules, axillary, and terminal, involucred by roundish bracteas. 8. S. Native of Java, on the mountains. Stipulas large, membranous. Margin of calyx truncate, entire. Berries dry, 2-celled, compressed, the commissure drawn out into a prominent angle on both sides.

Stipulaceous Cephalis. Shrubs 1 to 2 feet.

7 C. lil'garis (Rich. miss. ex D. C. prod. 4. p. 533.) glabrous; leaves petiolate, oval, acutish; stipulas broad, emarginate; pedunules compressed, solitary, involucred by 9-10 ligulate bracteas; calyx hardly 4-toothed. 8. S. Native of French Guiana. Schardera lilgaris, Rudge, pl. guian. 1. p. 29. t. 815. Tratt. tab. t. 84. According to Richard, the ovum is 2-celled, and the cells 1-seeded, and therefore it is a true species of Cephalis.

Ligular-bracteate Cephalis. Shrubs.

8 C. salicif'o'lia (H. B. et Kunth, nov. gen. amer. 3. p. 376.) glabrous; leaves almost sessile, lanceolate, acuminate. shining; stipulas subulate, combined at the base; heads of flowers pedunculate, terminal, involucred by 4 ovalecordate leaves or bracteas. 8. S. Native of New Andalusia, in arid places on Mount Cocoliar. Involucre green. Branches compressed while young.

Willow-leaved Cephalis. Tree 20 feet.

Glabrous Cephalis. Shrubs 2 to 3 feet.

10 C. bran'ceocar'dia (D. C. prod. 4. p. 534.) branches terete, clothed with velvety down while young, but glabrous in the adult state; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined a little way at the base; heads of flowers pedunculate, terminal, downy, involucred by 4-6 acute bracteas, which are cordate at the base. 8. S. Native of French Guiana, where it was collected by Patris; and of Brazil, in the province of Bahia by Salzmann.

Var. a; bracteas acuminate, purplish.—Native of Guiana.

Var. b; bracteas pale, less acuminate. Native of Brazil at Bahia. Corollas flesh-coloured.

Var. c; bracteas pale, hardly acuminate, rather ovate at the base.—Native of Guiana.

Heart-bracteate Cephalis. Shrubs 2 to 3 feet.

11 C. amb'gua (D. C. prod. 4. p. 534.) branches terete, downy, compressed while young; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined together a little way at the base; heads pedunculate, terminal, smoothish, involucred by 4-6 bracteas, which are hardly cordate at the base, and very blunt at the apex. 8. S. Native of Brazil, near Bahia, in shady valleys, where it was collected by Salzmann. Involucre violaceous.

Ambiguous Cephalis. Shrubs 2 to 3 feet.

12 C. cr'oece (Meyer, essq. p. 107.) glabrous; branches rather tetragonal; leaves ovate, short-acuminate at both ends; stipulas linear, twin; heads terminal, globose, on short peduncules, involucred by 8 oblong-linear bracteas, and without any paleae among the flowers. 8. S. Native of Dutch Guiana, at Essequibo. Corolla saffron-coloured, villus outside. Leaves of involucre ciliated, yellowish.

Saffron-coloured-flowered Cephalis. Shrubs.

13 C. Humboldt'ia (Cham. et S. et Schlcht. in Linneus. 4. p. 156.) glabrous; leaves elliptic-lanceolate, tapering to both ends, on short petioles, firm and shining; stipulas tooth-formed on both sides at the base of the petioles; heads terminal, pedunculate, nearly globose, loose; bracteas membranous, nerved: outer ones roundish-ovate: inner ones more acute. 8. S. Native of South America, at Jativa, in shady places.

Humboldt's Cephalis. Shrubs.

14 C. dich'ota (Rudge, pl. guian. 1. p. 29. t. 44.) glabrous; branches dichotomous; leaves on short petioles, ovate-lanceolate; stipulas bidentate; heads terminal, on short peduncules, involucred by nearly orbicular bracteas. 8. S. Native of French Guiana, and of Brazil, near the river Ilheos, if C. dich'ota, Nees et Mart. nov. act. horn. 12. p. 17. be the same. Bracteas fulvous. Calyx obsolutely 5-cleft. Fruit furrowed, as in the genus Psychotria.

Dichotomous Cephalis. Shrubs 6 to 8 feet.

15 C. Swartz'zi (D. C. prod. 4. p. 534.) glabrous; branchlets rather tetragonal; leaves ovate-lanceolate, acuminate, nerved, petiolate; stipulas broad, combined, acuminate, at length ciliated; heads terminal, globose, pedunculate, involucred by 5 ovate-concave bracteas; paleae among the flowers obtuse. 8. S. Native of the West India Islands, and of St. Lucia, &c. C. violacea, Swartz, prod. p. 45. fl. ind. ascra. 439. exclusive of the synonyms. Peduncules an inch long, quadrangular. Corollas bluish. Berries blue. Bracteas violaceous. It differs from the true C. violacea in the heads of the flowers being pedunculated, in the stipulas being ciliated, and in the paleae among the flowers being obtuse.

Swartz's Cephalis. Shrubs 4 to 6 feet?

16 C. Marah'ma'nesis; leaves broad-oblong, acuminate, membranous, glabrous; heads of flowers terminal and axillary. 8. S. Native of Maranham, on the banks of rivulets. Shrubs branched. Flowers violaceous.

Maranham Cephalis. Shrubs 4 feet.

17 C. ferrugine'a; climbing, villous; leaves oblong-lanceolate, acuminate, rusty beneath, petiolate; peduncles axillary, elongated, villous; heads involucred by many leaves. 8. S. Native of Sierra Leone, on the banks of rivulets.

Rusty Cephalis. Shrubs cl.

18 C. pendul'u'ca (Salisb. cr. Lond. 2. t. 99.) stem terete, swelling below the joints; leaves oblong-lanceolate, glabrous, tapering to both ends; stipulas twin on both sides, combined almost to the top, keeled; heads of flowers pedunculate, terminal, or in the forks of the branches; outer bracteas reductly toothed; calyx bearded; segments of calyx horns on the back. 8. S. Native of Sierra Leone. Flowers white.

Rubiaceæ. CLXXVI. Cephalis.

19. C. coriacea; leaves oblong, coriaceous, dark green; heads on long peduncles, involucred by many leaves. Ӿ. S. Native of Sicra Leone, on the edges of woods.

Coriaceæ-leaved Cephalis. Shrub 2 to 3 feet.

* * Shrubs. Heads of flowers sessile.

20. C. violacea (Willd. spec. 1. p. 977. exclusive of the synonyme of Swartz.) glabrous; branches nearly terete; leaves oval, acuminate, on short pedioles; stipulas broad, somewhat concrenct, obtuse, rather scarious at the apex; heads of flowers terminal, globose, sessile, declinate, involucrated by 5 ovate, roundish bracteas; paleæ among the flowers acute. Ӿ. S. Native of French Guiana, in woods, where it is called Eve by the natives. Évea Guianensis, one of the Society Islands. It seems to approach C. speciosa, Sprengel, from Ota- hiti. Corollas red.

Fragrant Cephalis. Tree 20 feet.

27. C. Eve'a (D. C. prod. 4. p. 535.) glabrous; branchlets rather tetragonal; leaves oval-oblong, on short pedioles; stipulas oblong, undivided; heads axillary, sessile, involucrated by 4 ovate, obtuse, dilatate bracteas; flowers tetramerous and tetradromous.

Ӿ. S. Native of French Guiana, in woods, where it is called Eve by the natives. Évea Guianensis, one of the Society Islands. It seems to approach C. speciosa, Sprengel, from Ota- hiti. Corollas red.

28. C. purpura (Willd. spec. 1. p. 978.) stems creeping, ascending, hispid from rufescent hairs at the tops; leaves oblong, acuminate, hispid on the nerves beneath, and ciliated on the edges; stipulas twin, hispid; heads terminal, almost sessile, involucrated by 2 oblong bracteas, which are, as well as the paleæ among the flowers, ciliated. Ӿ. S. Native of French Guiana, in woods, and of Maranham. Tapogomea purpura, Aubl. guian. 1. p. 106. t. 99. Lam. ill. t. 39. Cephalis triandra, Willd. spec. 1. p. 979. Paleæ among the flowers acute. Corollas white.

Évea Cephalis. Shrub.

* * * Herbaceous plants.

Purple-flowered Cephalis. Fl. April, June. Pl. creeping.

30. C. Ipecacuanha (A. Rich, bull. fac. med. 1818. pol. 4. p. 92. dict. sc. med. vol. 26. with a figure) stems ascending at first, but at length becoming erect, rather downy at the apex; leaves oblong-obovate, scabrous above, and clothed with fine down beneath; stipulas setaceous clefts; heads terminal, pendentulate, erect at first, but at length becoming pendulous, involucrated by 4 subordinate bracteas. Ӿ. S. Native of Brazil, in woods and valleys on the mountains. Tuss. in Desv. journ. bot. 4. p. 247. Mart. mat. med. bras. 1. p. 4. t. 1. St. Hil. pl. usuol. bras. t. 6. Steph. et Church. 2. t. 62. C. emetica, Pers. encl. 1. p. 203. exclusive of the synonyme Callicocca Ipecacuanha, Brotn. in Lin. trans. 6. p. 137. t. 11. Ipecacuanha officinalis, Arrud. disc. p. 44. ex. St. Hil.—Pis. bras. 291.—Maregr., brs. 17. Root creeping, annular, brown or grayish, and is the Ipecacuanha of the shops of Europe, and the Pojas of those of Brazil. Leaves crowded at the tops of the stems, which are simple, and obscurely tetragonal. Flowers white, downy outside.

Although the root of ipecacuanha has been long employed as a valuable article of the Mater Medica, yet the botanical characters of the plant which produced it remained unknown till Professor Brotero, of Coimbra, determined the genus to which it ought to be referred, with the assistance of observations made in Brazil, on living plants, by Bernardino Gomez, a resident medical botanist. The plant is a native of moist woods near Pernambuco, Bahia, Rio Janeiro, and other provinces of Brazil. It is called Ipecacuanha by the natives of some parts of Brazil;
Poia do Matto by those of the southern provinces; and Cipo by others, which is the name often given to it by the Portuguese settlers. The root is simple, or a little branched, and furnished with a few short radicles, irregularly bent, externally brown, wrinkled from rings.

It appears to be a native of Brazil, whose name was Michael Tristan, was the first who brought ipecacuanha into use. He speaks of it as a remedy for dysentery. Piso afterwards describes it, and speaks of two sorts (hist. nat. bras. p. 101.), the white and brown, which he says were given for fluxes, and as vomits. But we are indebted to Helvetius for bringing it into general use, under the patronage of Louis XIV., from whom he received a thousand pounds, to reveal the secret medicine with which he so successfully treated dysentery. Besides the brown ipecacuanha, there is another sort, brought from Brazil, which varies in appearance from the former; and some have supposed that these differences are owing to accidental circumstances, such as the place of growth, the kind of soil, &c.; but, on the authority of M. Gomez, the common brown ipecacuanha of the shops, is yielded to be *Cephaëlis ipecacuana*, while the white is the root of *Richardsonia scabra* and *R. rosea*, which is exported largely to Portugal. Besides these, the name of ipecacuanha, which, in the language of South America, means vomiting root, is given to various species of *Cynanchum, Asclepias, Euphorbia, Drasena*, and *Ruella*; and with regard to their comparative power, De Candolle says that vomiting is produced by 22 grains of *Cynanchum*; by 24 of *Physostigma emetica*; by from 60 to 72 of *Viola calceolaria*; and by from 1 to 3 drachms of *C. ipecacuana*. Linneus, in a paper published in the third volume of "Amenitates Academicae," gave ipecacuanha, as a trivial name, to a species of *Euphorbia*, a native of Virginia and Carolina, the root of which is there used as an emetic. But this was soon discovered not to be real ipecacuanha. In his second "Mantissa" he gave the trivial name to a species of *Viola*, a native of Brazil, the root of which he supposed to be the white ipecacuana of the shops. De Candolle, in a paper published in "Bulletin des Sciences par la Société Philomatique," and re-published entire in the "Nouveau Dictionnaire d' Histoire Naturelle," says there are three species of *Viola* which produce the white ipecacuana; the *V. calceolaria*, a native of Guiana and the Antilles; the *V. ipecacuana*, and the *V. parviflora*, both natives of Brazil. The roots of these, and especially the last, are sometimes mingled in common with the true, or brown, ipecacuana; but they are a fraudulent adulteration, and do not possess its active properties. They may be distinguished by their colour, but most certainly by the size of the woody part, which in these is always considerably thicker than the bark; whereas in the true ipecacuana it is much less, and, as described by Brotero, is only a fibre.

The black or striated *Ipecacuanha* (*Physostigma emeticum*) is exported from Carthagena to Cadiz, and is also said to be the Peruvian *grey ipecacuana*. The root is black within and without, fusiform, articulated, striated, and not annulated. The white *ipecacuana* is described by Gomez to be the root of *Richardsonia scabra*; it is of a dirty white, and turns brown by drying; it is simple, or a little branched, often 5 or 6 lines thick, 3 inches long and upwards, variously twisted, and tapering at its extremities, with transverse annular rugosities, larger than those of the brown *ipecacuana*. The common *brown ipecacuana* is exported from Rio Janeiro to Portugal. Its colour varies from different degrees of grey and brown; but it is characterized by being contorted, wrinkled, and unequal in thickness; having a thick brittle bark, deeply fissured transversely, covering a central, very small white wood, so as to give the idea of a number of rings strung upon a thread.

Qualities and chemical properties.—Powdered ipecacuana has a sickly odour, and a bitterish acid taste; and on those who pulverize it, sometimes excites such powerful effects as to produce nausea, faintings, and spitting of blood. It has been subjected to various chemical investigations, and Dr. Irvine ascertained that it contains a gum resin. MM. Pelliot and Magendie, while pursuing their investigation on ipecacuana, discovered that the power of the various kinds of ipecacuana depended on a peculiar principle, to which the name emetine has been given; and they think that it might upon all occasions be substituted with advantage, being much more active than ipecacuana itself, without possessing its disagreeable taste and smell. The latter quality resides in a gummy substance, quite distinct from its emetine virtue; for M. Caventon swallowed it with impunity to the extent of 6 grains.—All vegetable astringents, as infusion of galls and vegetable acids, weaken or destroy the power of ipecacuana; and Dr. Irving found that half a dram, administered in 2 ounces of vinegar, had little effect.

Medical properties and uses.—The utility of ipecacuana is generally known, and properly appreciated. As an emetic, it operates in doses of from 5 to 30 grains, surely and efficiently, without depressing the system at large, like many other emetics, or injuring the mucous membrane of the stomach; it is therefore to be preferred as a mere evacuant of that organ; and it can be given in the fullest doses with perfect safety, and without exciting much nausea. Its power as an emetic has been rather undervalued in one particular view; for if opium be taken, recourse is generally had to violent remedies, which, by simple contact with the stomach, when in a torpid condition, cannot fail to produce injurious results. Ipecacuana is sometimes employed in a full dose after the accession of a paroxysm of intermittent fever; and, by destroying the link which held the chain of diseased sympathies together, it has often succeeded in cutting short the disease. Paroxysms of spasmatic asthma also often yield to the same treatment; and in the more chronic form of that disease, small doses advantageously produce both expectation and perspiration. In chronic dysentery and diarrhoea, it is a most useful medicine in small doses. Given in doses of half a grain, it promotes secretion in the lining membrane of the bowels, whereby a healthy condition is eventually re-established, and is, therefore, frequently prescribed in cases of dyspepsia, attended by a foul tongue. Small nauseating doses are advantageously given to subdue uterine and pulmonary hemorrhages; and combined with opium, the effects of both appear to be modified; so that under the name of Dover's powders, doses of from 5 to 10 grains form one of the most powerful and useful sublunaries that can be employed for acute or chronic rheumatism, and for eruptive diseases that are disposed to recede. Nauseating doses of ipecacuana are also useful for hooping-cough, epilepsy and aneurisma. Two kinds of emetine are obtained from ipecacuana—the coloured emetine and pure emetine; the latter is white and powdery, not acted on by the air, whereas coloured emetine is deliquescent. The cases in which emetine may be given, are the same as those in which ipecacuana is indicated. Pure emetine is much more powerful than the coloured. Two grains are sufficient to kill a large dog. The official preparations are Pulvis ipecacuanha, Compositu and Vinum ipecacuanha. Pectoral lozenges of emetine are useful in chronic pulmonary catarrh, hooping-cough, obstinate diarrhoea, &c.

*Ipecacuana Cephas.* Pl. ½ to 1 foot.

31 C. ruβra (Hoffm. ex Wild. mss. in Rom. et Schultes. syst. 5. p. 214.) stem dichotomous, kneed; leaves ovate, acuminate, petiolate, glabrous above, and downy beneath; stipulas sheathing, bidentate; heads terminal, on short peduncles, involuted by 6 unequal bracteas.

Red-veined-leaved Cephaelis. Pl. 1 foot.

33 C. colorata (Hoffm. ex Willd. mss. in Rœm. et Schultes, syst. 5. p. 213.) stems herbaceous, simple, glabrous; leaves oblong, tapering at both ends, roughish beneath; stipules furnished with 2 bristles on either side; heads terminal, on short peduncles. ½. S. Native of Brazil. Stems thickened at the joints.

Coloured Cephaelis. Pl. 1 foot.

33 C. tubeaeus (Hoffm. 1. c.) stem simple, herbaceous, downy; leaves elliptic, acute at both ends, downy at the veins; heads pedunculate, involucrated by many leaves. ½. S. Native of Brazil, at Bahia.

Downy Cephaelis. Pl. ½ to 1 foot.

34 C. hoffmannseggiana (Rœm. et Schultes, syst. 5. p. 214.) stem herbaceous, branched; branches dichotomous or trichotomous; leaves oblong, narrowed at both ends, acuminate; heads terminal, surrounded by a 4-leaved involucre. ½. S. Native of Brazil. C. dichotoma, Willd. rel. but not of Rudge. Nearly allied to C. rubra, but the stems are much taller.

Hoffmannsegg's Cephaelis. Pl. 2 feet.

† Species not sufficiently known.

35 C. gemmiflora (Willd. rel. and Schultes, syst. 5. p. 213.) leaves obovate, tapering at both ends, glabrous; heads globose, twined on long peduncles, involucrated. ½. S. Native country unknown.

Bud-flowered Cephaelis. Shrub.

36 C. bidentata (Humb. ex Willd. rel. in Rœm. et Schultes, syst. 5. p. 214.) leaves oblong, acuminate, glabrous; heads globose, terminal, involucrum 2-leaved, bidentate. ½. S. Native of Sierra Leone.

Bidentate-involucrated Cephaelis. Pl. ?

Cult. See Psychotria, p. 599. For the culture and propagation of the shrubby species; and Geophila, p. 609. For those of the herbaceous kinds.

Lin. syst. Pentandria, Monogynia. All as in Cephalis, except in the anthers and stigmas, which are a little exerted. Berries dry, bipartite, angularly furrowed, crowned by the small limb of the calyx; seeds or pyrene 1-seeded, smooth on the outside, not striated, as in Cephalis.—Glabrous shrubs, with rather nodose branches. Leaves petiolate, oval, acuminated. Stipulas twin on both sides, combined at the base, and therefore bidentate. Heads of the flowers rising from the axils of the upper leaves, on short peduncles, deflexed, girded by 4 acute bracteas. Corollas white. According to Willdenow, Jussieu, and Richard, this genus should only form a section of Cephælis.

2 C. Patrasii (D. C. prod. 4. p. 536.) stipulas combined, bidentate at the apex; bracteas of the heads of the flowers nearly equal, ovate, acute. ½. S. Native of French Guiana, where it was collected by Patras. Heads terete, dichotomous. Leaves oval-lanceolate, acute at the base, and acuminated at the apex. Heads on very short peduncles, hardly larger than peas. Corolla white, hairy on the inner part of the limb. Anthers linear, exerted.

Patras's Carapichea. Shrub 5 to 6 feet.

Cult. See Psychotria, p. 599. For culture and propagation.

CLXXVIII. SUTERIA (named after John Rudolph Suter, a professor at Bern in Switzerland; author of Flora Helvetica, &c.). D. C. prod. 4. p. 536.—Cephalis species of Lindl.

Linn. Syst. Pentandria, Monogynia. Calyx with an ovate tube, and a tubular angular limb, which is 5 times longer than the ovary, having an unequally 5-toothed border. Corolla salver-slaped, with a terete tube, a naked throat, and 5 ovlobong oblong lobes. Anthers sessile, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded.—A glabrous shining shrub, with terete branches. Leaves almost sessile, oblong-lanceolate. Stipulas ovate, deciduous. Heads of flowers axillary, almost sessile, usually 6-flowered, surrounded by ovate-foliate bracteas. Paleæ among the flowers linear. Corollas white, almost like those of jasmine, sweet-scented.—This genus differs from Cephalis in the form of the calyx.

Cult. For culture and propagation see Psychotria, p. 599.

CLXXIX. GEOPHILA (from γη, ge, the earth, and φιλειο, to love; the species creep on the surface of the earth, and the stems never rise beyond it). D. Don, prod. fl. nep. p. 136. but not of Berg. D. C. prod. 4. p. 537.—Psychotria species. Lin.—Cephalis species, Kuntl.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a 5-parted limb; segments linear, spreading recurved. Corolla tubular, with a pilose throat, and 5 oval somewhat recurved lobes. Anthers 5, inclosed. Stigma bifid. Berry ovoid, angularly ribbed, crowned by the calyx, 2-celled, 2-seeded.—Perennial depressed creeping herbs. Leaves petiolate, cordate, similar to those of some species of Viola. Stipulas staminal on both sides, undivided. Peduncles rising from the axis of the ultimate leaves, terminal, solitary, bearing many flowers at the apex. Flowers almost sessile, umbellate, involucrated by bracteas, which are shorter than the flowers.

1 G. Reniformis (Cham. et Schlecht. in Linnaea. 4. p. 137.) petioles hairy above; leaves reniform, obtuse, with the lobes at the base approximate; bracteae linear; peduncles 4-6-flowered, shorter than the leaves. ½. S. Native of South America, in shady places; as of Jamaica, Porto-Rico, Cuba, about the Orinocoe, Brazil, Guiana, Society Islands, &c. Psychotria herbaecæ, Lin. spec. p. 245. Jaqc. amer. t. 46. Tuss. ant. t. 8. Psychotrophum herbaecæm, Browne, jan. p. 161. Cephalis reniformis, H. & B. et Kuntl. nov. gen. amer. 3. p. 377. Flowers white. Berries red. There are varieties of this with downy or glabrous stems and leaves. Leaves always glabrous beneath.

2 G. violacea (D. C. prod. 4. p. 537.) petioles hairy above; leaves cordate-reniform, obtuse, glabrous, with the lobes approximate at the base; umbels few-flowered, almost sessile between the ultimate pair of leaves; bracteas linear-lanceolate. ½. S. Native of Cayenne and Guiana, in woods (Aubl.); and of the Isthmus of Panama (Hænke). Psychotria violacea, Aubl. guian.
1. p. 145. t. 55. Bartl. in herb. Haecke, but not of Willd. Very nearly allied to G. reiifórmis, but the petioles are shorter, the umbels are hardly pedunculate, the corollas violaceous, and the berries blue.

**Violaecae-flowered Geophila.** Pl. creeping.

3 G. diversifólia (D. C. prod. 4. p. 587.) petioles and peduncles clothed with short hairs or down; leaves reniformly cordate, rounded or acute, glabrous on both surfaces, paler beneath, with the lobes at the base disarticulate; peduncles about four to five times longer than the calyx. 2. S. Native of Java, on the mountains; and probably of Malabar and Sihet, &c., if the Karinta-Tali, Rheed. Hist. 10. t. 21. be the same. Psychótria herbarécé, Roxb. fl. ind. 2. p. 161. and therefore G. reiifórmis, D. Don, prod. fl. nep. p. 136. Cephalis diversi-fólia, Blum. biol. p. 1004. Flowers white? Berries red?

**Diverse-leaved Geophila.** Pl. creeping.

4 G. violófólia (D. C. l. c.) petioles hairy above; leaves roundish-cordate, acutish, glabrous on both surfaces, with the lobes at the base disarticulate; peduncles about equal in length to the petals; bracteas lanceolate; umbels 6-9-flowered. 2. S. Native of New Granada, on the banks of the river Magdalena, in humid places. Cephalis violófólia, H. B. et Kunth, nov. gen. amer. 3. p. 379. Psychótria hedrácées, Willd. in Rœm. et Schult. syst. 5. p. 191. Corella white, glabrous, 4 times longer than the calyx.

**Violet-leaved Geophila.** Pl. creeping.

5 G. macróphóda (D. Don, prod. fl. nep. p. 136.) petioles roughish; leaves cordate, acute, glabrous; peduncles length of leaves; bracteas linear-lanceolate; umbrellas 3-6-flowered. 2. S. Native of Peru, in groves, along the tract of Pillao to Icazutina. Psychótria macróphióda, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. b. Psych. cordófólia, Dietr. geot. lex. 1. p. 618. Berries dark purple. Seeds smooth.

**Long-peduncled Geophila.** Pl. creeping.

6 G. grácilis (D. Don, l. c.) petioles striated, beset with retrograde hairs at top; leaves cordate, acute, rather pilose above; peduncles length of petals; bracteas subulate; umbels 6-9-flowered. 2. S. Native of Peru, in forests at Pillao and Pueblo-Nuevo. Psychótria grácilis, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. c. Corollas pale-violaceous, glabrous inside. Berries ovate, blackish. Seeds trisulate.

**Slender Geophila.** Pl. creeping.

**Cult.** A mixture of vegetable mould and sand, or peat and sand, is the best soil for the species of Geophila; and they are easily increased by detaching their creeping stems.

**Lin. syst.** Tetra-Hexándria, Monogénia. Calyx with an obovate-globose tube, and a very short entire or 4-toothed limb, rarely 5-6-toothed. Corolla with a short nearly terete tube, and 4-6 oblong spreading lobes. Stamens 4-6; anthers sessile within the corolla, and 4-6 anthers; stamens 4-6; anthers sessile within the corolla, and 4-6 anthers. Bilateral, globose, crowned by the nearly closed calyx, smooth, 2-celled, or 2-seeded.

**Glabrous shrubs.** Natives of South America. Leaves on short petioles, oval or ovate, acuminate at the apex. Stipulas broad at the base, and subulate at the apex. Flowers sessile, crowded into heads in the axils of the leaves or tops of the branches. Heads propped by 4 small bimatically opposite bracteas. This genus differs from Psychótria in the capitate inflorescence, in the smooth berries, and in the number of the floral parts being usually quaternary.

1 P. cocánnea (Aubl. l. c.) stipulas undivided; leaves oval, acute at the base; heads of flowers sessile; flowers tetramerous; throat of corolla naked. 2. S. Native of French Guiana, in the woods of Orapu. Lam. ill. no. 1464. t. 65. Cephalís sálzmannii, Willd. spec. 1. p. 979. Flowers red.

**Scarlet Patabea.** Shrub 4 to 5 feet.

2 P. tenuíspéru (D. C. prod. 4. p. 538.) leaves oblong, acute at both ends, membranous; stipulas 4, lanceolate-linear, connate at the base; heads of flowers some sessile, and others pedunculate; corolla with a naked throat, linear lobes, and a slender tube; limb of calyx truncate. 2. S. Native of French Guiana, where it was collected by Patris. Leaves 5-6 inches long and ½ broad. Bracteas small. Fruit unknown.

**Slender-flowered Patabea.** Shrub 4 to 5 feet.

3 P. alba (H. B. et Kunth, nov. gen. amer. 3. p. 375.) leaves ovate, rounded at the base; stipulas bifid at the apex; cymes pedunculate; flowers pentamerous and hexamorous; throat of corolla villous. 2. S. Native of South America, on the banks of the Orinoco, near Maypures, and San Fernando. Cephalís cymósa, Spreng. syst. 1. p. 749. Psychótria Maypunesí, Willd. rel. in Rœm. et Schult. syst. 5. p. 190.? ex Spreng. Calyx violaceous. Corollas white.

**White-flowered Patabea.** Shrub.

**Cult.** See Psychótria. p. 599. for culture and propagation.

**CLXXXI. SALZMANNIA** (named after M. Salzmann, a collector of plants in Mauritius, and afterwards in Brazil). D. C. prod. 4. p. 617.

**Lin. syst.** Tetra-Ándria, Monogénia. Calyx with an oval tube, and a cupularly bluntly 4-toothed or situationally pedunculate. Corolla with a short tube, and 4 oblong lobes. Alabaster tetragonal. Stamens with very short filaments, and very long anthers. Style 1, undivided, or the lobes are combined. Berry dry, crowned by the limb of the calyx, 1-celled in the adult state by abortion, compressed, oval, 1-seeded. Seed compressed.—A glabrous Brazilian shrub. Branches at first tetragonal, but terete in the adult state. Stipulas truncate, very short. Leaves opposite, ovate, on short petioles, shining above, and as if they were varnished. Peduncles axillary, opposite, very short, bearing dense heads composed of 10-12 flowers, girded by 2-4 ovate foliaceous bracteas. Flowers sessile within the bracteas, ovate. This genus appears to come nearest to Cephalís, from which it differs in the very long anthers, in the compressed fruit, and in habit.

1 S. weída (D. C. prod. 4. p. 617.) 2. S. Native of Brazil, about Bahia on arid hills. Corella a line and a half long. Leaves ⅞ inch long and 1 broad, obtuse. Stipulas subulate. Salzmannia. Shrub 5 to 6 feet.

**Cult.** See Psychótria. p. 599. for culture and propagation.

** Tribe X.**

**SPERMACOCŒÆ (this tribe contains plants agreeing with the genus Spermacoce in particular characters).** Cham. et Schlecht. in Linnææ. 3. p. 369. A. Rich. mem. soc. hist. nat. Par. 5. p. 147. D. C. prod. 4. p. 538. Spermacoce bilamellate (f. 100. b.). Fruit dry or hardly fleshy, usually of 2, rarely of 3-4 1-seeded mericarps or nuts, which are sometimes combined, and sometimes separating from each other, indehiscent or dehiscing in various ways. Allumens between fleshy and horny.

—Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually of many bristles at the apex.

**Subtribe I. CEPHALANTHEÆ (this subtribe only contains the genus Cephalanthus).** D. C. prod. 4. p. 538. Flowers and fruit crowded and sessile, upon globose receptacles. Fruit divisible into 2 parts.

Lin. syst. Tetrándria, Monogynia. Calyx with an obversely pyramidal tube, and an angular 4-tonged limb. Corolla with a slender tube, and a 4-cleft limb; lobes erectish. Stamens 4, short, inserted in the upper part of the tube, hardly exerted. Style much exerted; stigma capitate. Fruit inversely pyramidal, crowned by the limb of the calyx, 2-4-celled, and separating into 2-4 parts; cells or parts 1-seeded, indehiscent, and sometimes empty by abortion. Seeds oblong, terminating in a little callous bladder. Albumen somewhat cartilaginous. Embryo inverted in the albumen, with a superior radicle.—Shrubs, with terete branches. Leaves opposite or 3 in a whorl. Stipulas short, distinct, or a little combined. Peduncles naked, rising from the axis of the upper leaves, or from the tops of the branches. Heads globose, in consequence of the flowers being sessile, and seated on a spherical piliferous receptacle.—This genus is badly defined, and should probably be reduced to the American species, which have the fruit 2-celled and 2-seeded, and the rest should probably be thrown back into the genus *Spermacoceae*.

Sect. I. Platanocéphalus (from πλατάνος, platanos, the plane-tree, and κεφαλή, kephele, a head; the heads of flowers resemble those of the plane-tree). D. C. prod. 4. p. 538.—Platanocéphalus, Sálv. act. acad. par. 1722. Glands none in the calyx nor corolla.—American species.

1 C. occidentalis (Lin. spec. 139.) leaves opposite or 3 in a whorl, ovate or oval, acuminated; peduncles much longer than the heads, usually by three at the tops of the branches. S. S. Native of North America, from Canada to Florida, in marshy places. Dus. arb. 1. t. 54. Schkuhr, handb. t. 21. and t. 5. b. fruit. Lois. herb. amat. t. 272.—Plu.s. alm. 336. t. 77. f. 4. C. oppositifolius, Ménéch. math. p. 487. Petioles reddish next the branches. Heads of flowers globular, size of a marble. Flowers whitish-yellow. There are varieties of this species having the branchlets and young leaves either glabrous or downy.

*For. β, brachycéphalus* (D. C. prod. 4. p. 539.) leaves elliptic-oblong, 3 in a whorl, on short petioles. G. G. Native of the North of Mexico, near Rio de la Trinité and Bejar, where it was collected by Berlandier. Petioles 3-4 lines long. There are varieties of this with either glabrous or downy branches.

2 C. Sárdi (Cham. et Schlécht. in Linnaea. 2. p. 610. and 4. p. 147.) leaves opposite or 3 in a whorl, oblong, acuminate, on very short petioles; peduncles hardly longer than the heads, 3-5-together at the tops of the branches. S. S. Native of the south of Brazil, where it is called *Sarandi* by the natives, and where it was collected by Sello; common on the coasts of La Plata and Caraccas; and of Peru, ex Hænke. Búblíea glabrata, Spreng. syst. 1. p. 491. ex Cham. et Schlécht. in Linnaea. Glabrous. Leaves lanceolate or ovate-lanceolate, red beneath while young, and hairy in the axis of the secondary veins. Heads of flowers verticillate in the axis of the upper leaves, and umbellate at the tops of the branches, much smaller than those of the first species.

*Sarandi* Button-wood. Shrub 10 to 15 feet.

3 C. salicifólius (Humb. et Bonpl. pl. equin. 2. p. 63. t. 98.) leaves opposite or 3 in a whorl, linear-lanceolate, on very short petioles; heads of flowers on long peduncles, terminal, solitary. S. S. Native of Mexico, near Acapulco. Stipulas linear-subulate, permanent, twin on both sides. Heads of flowers white.

Willow-leaved Button-wood. Shrub 10 feet.

Sect. II. Naucloïdes (from *Nauclea* and *idea*, like; the species resemble species of the genus *Nauclea*). D. C. prod. 4. p. 539. Glands in the recesses between the lobes of the calyx and corolla.—Indian species.

4 C. naucloïdes (D. C. prod. 4. p. 539.) leaves opposite or 3-7 in a whorl, ovate-lanceolate, acuminate, on short petioles, villos beneath, and on the branchlets; stipulas intrapilose, acuminate; heads terminal, subverticillate. S. S. Native of the East Indies, in Silhet. Nauclea tetrándria, Roxb. fl. ind. 2. p. 195. Peduncles terminal, from 3 to 4 in whorled panicles. Flowers yellow, intermixed with filiform elevate scales. Capsules turbinate, 2-celled, 2-seeded; the cells 2-valved. According to Cham. et Schlécht. in Linnaea. 4. p. 147. this species is more nearly allied to *Cephalanthus* than to *Nauclea*, from the tetrameres flowers, and single seeded cells of the fruit.

Nauclea-like Button-wood. Tree 10 to 20 feet.

† Asiatic species not sufficiently known, and probably ought to be excluded from the genus altogether.

5 C. ? pilu'ifer (Lam. dict. 1. p. 679.) leaves opposite, approximate, ovate, bluntly acuminate, smooth on very short petioles; peduncles axillary, leafy, a little shorter than the leaves. S. S. Native of the East Indies. Fruit and number of the parts of the flowers unknown. Leaves hardly 2 inches long. Heads of flowers hardly the size of peas.

6 C. ? pilu'/íflorus (Wildl. mss. in Räem. et Schultes, syst. 3. p. 525.) leaves elliptic, tapering to both ends, bluntish; heads of flowers terminal and axillary, numerous. S. S. Native of Asia. The rest unknown.

7 C. ? orientalis (Räem. et Schultes, syst. 3. p. 105. but not of Lin.) arborescent; leaves opposite or 3 in a whorl, ovate, acuminate, reflexed, glabrous; peduncles terminal, divided; fruit baccate. S. S. Native of China. C. occidentalis, Lour. coch. p. 67. but not of Lin. Acródryon orientális, Spreng. syst. 1. p. 386. A large tree. Flowers white, tetrameres, and tetrandroso. Berries 1-seeded, red, edible. Perhaps a species of *Morinda*. According to Sprengel, this with the following species will constitute a distinct genus, which he has called *Acródryon*.

Eastern Button-wood. Tree large.

8 C. ? angustifólius (Lour. coch. p. 67.) arborescent; leaves opposite, lanceolate-linear; heads of flowers terminal; lobes of calyx subulate, beset with glandular hairs; fruit baccate. S. G. Native of Cochin-china. Acródryon angustifólius, Spreng. syst. 1. p. 386. Receptacle of flowers villous. Flowers pale, tetramerous and tetrandroso. Berries roundish, crowned, 2-celled, 1-seeded, aggregate into a globose head. Perhaps a species of *Morinda*, or perhaps will form a distinct genus along with the preceding species.

Narrow-leaved Button-wood. Tree.

† † The following two species should be removed from the order altogether.

9 C. ? procum'bens (Lour. coch. p. 67.) stem procumbent; leaves alternate, ovate-lanceolate, tomentose; racemes terminal, interrupted; flowers 5-cleft, dioecious. S. G. Native of Cochin-china. Stílele procumbens, Spreng. syst. 1. p. 418. Flowers violaceous. The female flowers on a naked globular receptacle. Flowers numerous, on long peduncles, forming a ball or head. Stigma simple. This plant ought evidently to be excluded from the order, but it is hardly a species of *Stílele*.

Procumbent Button-wood. Shrub procumbent.
10 C. ? Monan (Lour. coch. 67.) arboreous; leaves alternate, ovate, acuminate, rough above, and tomentose beneath; peduncles axillary, solitary; flowers apetalous, dioecious, 4-cleft; seeds or fruit papose. f. G. Native of China. Flowers green, on solitary axillary peduncles, forming round heads, on naked globular receptacles. Mountain Button-wood. Tree large.

Cult. The first species, C. occidentalis, being hardy, is a very proper plant for the fronts of shrubberies. It thrives best in a peat soil; and is readily increased by layering, or by ripened cuttings under a hand-glass. The rest of the species being tender, their culture and propagation are the same as that recommended for Psychotria, p. 599.

Subtr. II. EUSPERMACOCEÆ (the genera contained in this subtribe agree with Spermacoeae in the distinct flowers, and divisible fruit). D. C. prod. 4. p. 540.—Spermacocea, H. B. et Kunth, nov. gen. am. 3. p. 341. Flowers distinct. Fruit dry, usually separable into 2 parts, rarely into 3 or 4 parts.

CLXXXIII. DEMOCRITAE (so named from Democritos, an ancient philosopher). D. C. prod. 4. p. 540.

Lin. syst. Pentändria, Monogyinia. Calyx with a turbinate rather angular tube, and 5 lanceolate acute stiff lobes. Corolla, stamens, and stigma unknown. Fruit adnate to the tube of the calyx and membranous pericarp at first, but at length becoming ruptured, 2-seeded, 2-celled while young, but at length only 1-celled from the dissepiment having vanished. Seeds free within the pericarp, flat inside, and convex outside. Albumen fleshy. Embryo erect, central.—A Chinese shrub, with the habit of Serissa. Flowers unknown; but the calyx and fruit are very different from those of Serissa. Branches terete, white, when young rather downy. Leaves opposite. Sheaths short, combined with the petioles a little, and bearing each 3 stiff bristles. Flowers in fascicles at the tops of the branches.

1 D. Serrisoides (D. C. prod. 4. p. 540.) f. G. Native of China, where it was collected by Sir George Staunton. Serisaa-like Decidua. Shrub 1 to 2 feet.

Cult. A mixture of loam, peat, and sand will be the best soil for this little shrub; and cuttings will be easily rooted in sand under a hand-glass.

CLXXXIV. OCTODON (from octo, octo, eight, and oöcos oöcos, edos edontos, a tooth; in allusion to the limb of the calyx, which is 8-toothed). Thonn. in Schum. pl. guin. p. 74. D C. prod. 4. p. 540.

Lin. syst. Tetrándria, Monogyinia. Calyx with a clavately obovate tube, and an 8-toothed limb; teeth very short, obtuse. Corolla campanulate, 4-cleft; lobes acute, beset with a few glandular hairs inside. Stamens inserted in the bottom of the tube of the corolla. Stigma globose, obsoletely bifid. Capsule turbinate, obsoletely tetragonal, 2-celled, 2-valved, dehiscing at the dissepiment; cells 1-seeded; valves semi-bifid inside. Seeds oblong.—An erect branched glabrous herb, about a foot high. Stems tetragonal. Leaves filiform, elongated, acute. Stipules sheathing, furnished with 3-4 bristles on each side, which are shorter than the sheath. Heads of flowers verticillate, terminal and axillary ones nearly equal, roundish.—Very nearly allied to Borreria; but differs from it in the calyx being 8-toothed, and in the other characters indicated above.

1 O. filiform (Thonn. l. c.)—Native of Guinea, where it was collected by Thonnion, and in the waters of the Senegambia and Gola by Leprieur and Perrottet. Spermacoea filifolia, Perr. et Lepr. ms.

Thread-leaved Octodon. Pl. 1 foot.

Cult. See Spermacoea for culture and propagation.

Lin. syst. Tetrándria, Monogyinia. Calyx with an ovate tube, and a permanent limb, which is parted into 2-4 teeth. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamens 4, exerted or inclosed. Stigma bifid or unidivided. Capsule crowned by the limb of the calyx, 2-celled, opening from the apex at the dissepiment when mature, but without any free dissepiment; cocce or nuts 1-seeded, opening by a longitudinal chink inside. Seeds ovate-oblong, marked in front by a longitudinal furrow.—Herbs or shrubs; nearly all natives of the hotter parts of America. Stems and branches usually tetragonal. Leaves opposite, or the young ones are disposed in fascicles in the axils of the old ones, and therefore appearing verticillate. Stipulas joined with the petioles, more or less sheathing, fringed by many bristles. Flowers disposed in verticillate heads in the axils of the leaves, or on the tops of the branches, rarely cymose or corymbose, small, white, rarely blue.

§ 1. Flowers disposed in axillary and terminal verticillate heads: the terminal heads are girded by floral leaves, which are longer than them.

* Teeth of calyx only 2.

1 B. globularoides (Cham. et Schlecht. in Linnaea. 3. p. 312.) plant shrubby, erect, glabrous; branches somewhat tetragonal; leaves narrow-lanceolate, acuminate, with scabrous margins, paler beneath; bristles of stipulas longer than the sheath; heads of flowers globose, terminal or lateral; calyx bidentate; genitals exerted. f. S. Native of equinoctial Brazil. Spermacoea fruticosa, Pohl, in litt. Heads of flowers a little larger than peas. Flowers 3 times the size of those of B. verticillata, white. Capsule glabrous; nuts opening but slowly.

Globularia-leaved Borreria. Shrub 1 to 1½ foot.

3 B. houauiquina (Cham. et Schlecht. in Linnaea. 3. p. 311.) plant suffruticoso, glabrous; branchlets tetragonal; leaves oblong-linear, bluntish, mucronate, opposite, but appearing verticillate from clusters of young ones in their axils; bristles of stipulas shorter than the sheath; whorles of flowers globose, terminal, and axillary; capsule downy, crowned by the bidentate calyx. f. S. Native of Senegal and Gambia; and probably

4 B. stricta (Meyer, essq. p. 83. t. 1. f. 1-3. fr.) stems herbaceous, suffruticoso at the base, twiggly, glabrous, smooth, tetragonal at the apex; leaves linear, acute, petiolate, opposite or falsely verticillate; bristles of stipulae shorter than the sheath, which is downy; whorls of flowers globose, terminal, and axillary; capsule glabrous, oblong, crowned by the 2 subulate teeth of the calyx. \& S. Native of Porto-Rico, where it was collected by Ledru and Wydler. Flowers white. Nearly allied to B. verticillata, but differs in the capsule being twice longer. Lower leaves almost lancelolate-linear, rather scabrous on the margins at the top: upper ones usually with revolute margins.

Straight Borreria. Shrub \frac{1}{2} to 1 foot.

5 B. dichotoma (Cham. et Schlecht. in Linnaea. 3. p. 348.) stem suffruticoso, rather compressed, tetragonal; branchlets dichotomous; leaves lancelolate, acutely mucronate, glabrous, with serrulate margins; stipulae hairy, ciliated, with bristles at the apex; heads or whorls of flowers terminal and axillary; capsule scabrous from dots, glabrous, obovate, crowned by the 2 ovate-lanceolate teeth of the calyx. \& S. Native of Peru, near Ayavaca, (Diódia glabra, Willd. herb.), and on Mount Tanqueragua (Knöxía dichotoma, Willd. herb.). Spermacoce dichotoma, H. B. et Kunth, nov. gen. amer. 3. p. 348. Flowers white.

Dichoto-mous-branched Borreria. Shrub 1 to 2 feet.

6 B. podophila (D. C. prod. 4. p. 542.) stem branched, tetragonal, glabrous, rather downy at the nodi; leaves linear, glabrous, opposite, or falsely verticillate, almost veinless, with revolute margins; bristles of stipulae 5-7, longer than the sheath, which is downy; heads of flowers globose, and as if they were pedunculate, in consequence of the lateral branches being naked, except the 4 floral leaves surrounding each head; capsule oblong, glabrous, crowned by the 2 subulate calyceal teeth. \& S. Native of Mexico or of Cuba. This species differs from all the others in the heads of flowers being on long tetragonal peduncules, which are 1-2 inches long, naked and glabrous, sometimes rising from the forks of the branches, then solitary, and sometimes from the axils of the leaves, then opposite.

Stalked-headed Borreria. Pl. 1 foot.

7 B. distans (Cham. et Schlecht. in Linnaea. 3. p. 340.) stems herbaceous, erect, tetragonal, having the angles beset with retrograde prickles; leaves lancelolate, glabrous, with serrulate scabrous margins; stipulae hairy, ciliated with bristles; whorls of flowers capitulate, remote; capsule oblong, villous at the top, crowned by the 2 subulate teeth of the calyx. \& S. Native of Mexico. Spermacoce distans, H. B. et Kunth, nov. gen. amer. p. 344. Spermacoce aequale, Willd. herb. Spermacoce aequalea, Schlecht. in Schultes, syst. 3. p. 531. Flowers white. Very nearly allied to B. verticillata. Corolla funnel-shaped, a little longer than the calyx.

Distant-branched Borreria. Pl. 1 foot.

8 B. densiflora (D. C. prod. 4. p. 542.) stem erect, tetragonal, glabrous; leaves linear, with revolute margins, 1-nerved, glabrous; bristles of stipulae 7-9, longer than the sheath; whorls of flowers dense, sessile, 2-3 axillary, and the terminal one globose, and larger than the axillary ones; floral leaves 4-6, reflexed; capsule linear-oblong, villous at the apex, crowned by the 3 subulate calyceal teeth. \& S. Native of Jamaica. Spermacoce longifolia, L'Her. herb. but not of Auhl. Superior leaves 2 inches long, and 1-2 lines broad. Corollas small, glabrous.

Dense-flowered Borreria. Shrub 1 to 2 feet.

9 B. spinosa (Cham. et Schlecht. in Linnaea. 3. p. 310.) stem erect, herbaceous, simple, glabrous, somewhat tetragonal, with the angles a little mucrticaded; leaves lanceolate-linear, acuminate, attenuated at the base, glabrous, with roughish margins; the mid-rib drawn out into a prickly-formed tubercle at the apex; stipulae membranous, bristly; whorles of flowers capitulate, axillary ones 2-3, and the terminal one surrounded by an 8-leaved involucre; capsule oblong, downy at the apex, crowned by the 2 subulate teeth of the calyx. \& S. Native of the south of Jamaica, in fields; and of Martinique and Mexico. Spermacoce spinosa, Lin. spec. 148. exclusive of the syn. of Jacq. Swartz, obs. p. 45. Flowers white.

Spiny-leaved Borreria. Pl. 1 ft.

10 B. neesiana (D. C. prod. 4. p. 542.) glabrous, erect; stems herbaceous, tetragonal; leaves lanceolate, acute, scabrous on the mid-rib and margins; bristles of the stipulae 5, ciliated; whorles of flowers twin, one of them terminal; calyceal teeth 2, setaceous; throat of the corolla closed with hairs. \& S. Native of Brazil. Spermacoce linifolia, Nees. hor. berl. p. 49 but not of Vahl. Spermacoce Neesiana, Schultes, mant. 3. p. 209. Flowers white. The same as B. Bogotensis, according to Sprengel, but doubtful according to Cham. et Schlecht. in Linnaea. 3. p. 311.

Nees's Borreria. Pl. 1 foot.

11 B. repens (D. C. prod. 4. p. 542.) stems herbaceous, creeping, dichotomous, low, tetragonal, with the angles winged and pilose, and the sides striated; leaves oblong, acute, attenuated at the base, glabrous; bristles of stipulae shorter than the sheath, which is villous; heads of flowers roundish, sessile in the forks, and at the tops of the branches, and nearly in the axils of all the leaves; capsule ovate, rather villous, crowned by the 2 acute teeth of the calyx. \& S. Native of the Mauritius. Bigelovia parviflora, Sieb. fl. maur. exsic. no. 144. but not of Spreng. Flowers white.

Creeping Borreria. Pl. creeping.

12 B. minima (D. C. prod. 4. p. 542.) plant glabrous, herbaceous, small, sparingly branched; stems tetragonal; leaves oblong-linear, acuminate at both ends; bristles of the stipulae rather shorter than the sheath; heads of flowers terminal, involucrated by 4 leaves; calyceal teeth 2, subulate. \& S. Native of Brazil, where it was collected by Pohl. Herb a finger high, erect, or ascending. Corolla and mature fruit unknown.

Least Borreria. Pl. \frac{1}{2} foot.

** Teeth of the calyx 4.

13 B. radiata (D. C. prod. 4. p. 542.) stem herbaceous, erect, branched, terete, hispid from spreading hairs; leaves oblong-linear, acuminate, glabrous, glaucous, smooth, margined by a vein, 1-nerved; bristles of the stipulae longer than the sheath, which is villous; heads of flowers terminal, depressed, girded by 12-16 radiant floral leaves; capsule oblong, downy at the apex, crowned by the 4 short, linear-subulate teeth of the calyx. \& S. Native of Senegal, in sandy places, at Gula and Wala. Spermacoce radiata, Sieb. fl. sen. exsic. no. 8. Flowers white. A very distinct species, agreeing in habit with B. spinosa. Keel or mid-rib of the leaves smooth, and much exserted.

Ray-involved Borreria. Pl. 1 foot.

14 B. asperula (D. C. prod. 4. p. 543.) stem herbaceous, erect, glabrous, rather tetragonal; leaves oblong-linear, acute, glabrous; having the keel rather prickly from small stilt teeth; bristles of the stipulae longer than the sheath, which is membranous; heads of flowers many; verticillate; calyceal teeth 4, 1 or 2 of which are often deciduous, shorter than the ovaryum, which is rather pilose. \& S. Native of Brazil, about Bahia, in dry pastures, where it was collected by Salzmann.

Roughish Borreria. Pl. 1 foot.

15 B. subulata (D. C. prod. 4. p. 543.) plant herbaceous,
glabrous, erect, sparingly branched; stem tetragonal; leaves linear-subulate, with rather scabrous margins; bristles of the stipulas the length of the sheath; heads of flowers terminal, girded each by an erect 8-leaved involucrum; corolla tubular, glabrous; anthers exerted; teeth of the calyx 4, lanceolate, unequal, 2 of which are one half smaller than the other 2.  ○ S. Native of Mexico. Spermacoe subulata, Pav. ined. Flowers white.

**Subulate-leaved Borreria.** Pl. 1 foot.

16 B. gracilima (D. C. prod. 4. p. 543.) plant glabrous, herbaceous, slender, sparingly branched; branches rather tetragonal; leaves linear-subulate; stipulas lanceolate, undivided, or furnished with 3 bristles; heads of flowers terminal, on long peduncles, girded by 2-leaved involucra.  ○ S. Native of Brazil, where it was collected by Pohl. Flowers and fruit hardly known. Habit very much like that of B. subulata.

**Very slender Borreria.** Pl. ½ to 1 foot.

17 B. pusilla (D. C. prod. 4. p. 543.) stem herbaceous, slender, simple or branched, tetragonal, with the angles hairy and winged; leaves ovate, tapering into the petioles at the base, acute, glabrous; bristles of the stipulas few, rather shorter than the sheath; whorles of flowers axillary, sessile, dense; capsule small, ovate, crowned by the 2-3 small teeth of the calyx.  ○ H. Native of the East Indies. Spermacoe ocyrnoides, Burm. fl. ind. 34. t. 13. f. 1. but the angles of the stems are said to be glabrous.

**Basil-like Borreria.** Pl. ½ foot.

20 B. ramisparsa (D. C. prod. 4. p. 543.) smooth-stem; herbaceous, dichotomous, tetragonal; leaves oval-oblong, acute at both ends; bristles of the stipulas membranous, pale, longer than the sheath; whorles of flowers capitate in nearly all the axes, and on the tops of the branches, equal in size, sessile, girded by 2-4 leaves; capsule small-ovate, smooth, crowned by the teeth of the calyx, of which 2 are larger and subulate, and 2 small.  ○ F. Native of Brazil, where it was collected by Pohl. Angles of the stems, nerves of the leaves, and the base of the calyces downy, the rest of the herb glabrous.

**Flowers white.**

**Scattered-branched Borreria.** Pl. ½ to 3 foot.

23 B. parviflora (Meyer, cseq. p. 83. t. 1.) stem herbaceous, erect, tetragonal, with the angles usually hairy, and a little winged below; leaves oval-oblong, tapering to both ends, rather hairy beneath while young, and at length scabrous on the margins; bristles of the stipulas longer than the sheath; whorles of flowers axillary and terminal, dense, small, involucrated by 2-4 leaves; capsule ovate, crowned by the 4 short subulate calycine teeth.  ○ F. Native of the West Indies, as of Porto Rico, Guadaloupe, St. Domingo, &c.; and of Peru. Spermacoe aspera, Vahl, eel. p. 10. but not of Aublet. Spermacoe laevis from Guadaloupe, and Sperm. aspera from Hispaniola, Spreng. syst. 1. p. 401. ex herb. Balu. Perhaps Spermacoe levis, Lam. It differs from B. aspera, Aublet, in the much less scabrous stem, in the shorter leaves, and in the smaller whorles of flowers. Flowers white. Bigelovia alspera, Sieb. is a distinct plant from this. Bristles of the stipulas piliose.

**Small-flowered Borreria.** Pl. 1 to 2 feet.

25 B. alata (D. C. prod. 4. p. 544.) stems herbaceous, diffusely, radicant, branched, glabrous, tetragonal, with winged angles; leaves smooth oval, acuminate; bristles of the stipulas longer than the sheath; heads of flowers terminal, girded by 4 leaves; style bifid to the middle.  ○ F. Native of French Guiana, at the river Aroura. Spermacoe alata, Aubl. guian. 1. p. 60. t. 22. f. 7. Flowers white. Fruit divisible into 2, 1-seeded, dehiscens nuts. It is nearly allied to B. Bartlingiana, but the structure of the fruit and flowers is doubtful. Superior leaves sessile, rather cordate at the base. Stamens didymous, 2 of which are shorter than the corolla. Corollas rather large, blue.

**Winged-stemmed Borreria.** Pl. creeping.

26 B. Bartlingiana (D. C. prod. 4. p. 544.) stem herbaceous, diffuse, radicant, tetragonal, with winged pilose angles,
and the sides between the wings are lined with parallel veins; leaves oval, acutish, beset with bristle-like hairs on both surfaces; whorles of flowers sessile, glomerate, axillary ones numerous, and one terminal, girded by 4 leaves; capsule nearly globose, pilose, crowned by the 4 lanceolate teeth of the calyx.

C. F. Native of Mexico. Bigelovia alata, Bartl. in Herb. Hänke, but differs from B. alata in the wings of the stem being hispid, in the leaves being hispid and much less acute, in the axillary whorls, &c.

_Barling's Borreria._ Pl. creeping.

27 _B. Tampicae (D. C. l. c.)_ plant glabrous, diffuse, branched, herbaceous; branches tetragonal, with smooth angles; leaves oblong-linear, acute, 1-nerved, scabrous on the mid-rib, but not on the margins; whorls of leaves capitate from nearly all the axils, and from the tops of the stems, sessile, involucreted by 4-8 leaves; capsules small, ovate, glabrous, crowned by the 4 short subulate teeth of the calyx. _P. F._ Native of Mexico, at Tampico de Tamaulipas, where it was collected by Berlandier. Very nearly allied to _B. parejiflora_, but the nuts of the fruit are dissimilar, one of them bearing 3 of the calycine teeth, and the other 1.

_Tampico Borreria._ Pl. 1 foot.

28 _B. difflusa (D. C. l. c.)_ glabrous; stem diffuse, dichotomous, rather tetragonal; leaves linear, with revolute margins; stipules setiferous; whorles of flowers capitate, axillary, and terminal, globose, rather compound; floral leaves 4-8, reflexed; capsule oval, smoothish, crowned by the 4 short, subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. _Spermacoea diffusa_, Pohl, in litt. but not of Kunth. Corollas small, smoothish, white. Capsule small, membranous, white.

_Diffuse Borreria._ Pl. diffuse.

29 _B. nematifolia (D. C. l. c.)_ stem slender, tetragonal, rather hairy; leaves oblong-linear, almost sessile, acute, scabrous above and on the margins, but downy beneath; bristles of the stipulas downy, a little longer than the sheath, which is villous; whorles of flowers capitate, terminal ones on long peduncles, a very few axillary; lobes of the calyx 4, narrow, acute, unequal, glabrous.—Native of Brazil, where it was collected by Pohl, in litt. but not of Ruiz et Pav.

_Remote-leaved Borreria._ Pl. 1½ to 2 feet.

30 _B. discolor (Bartl. in herb. Hänke, under Bigelowia, ex D. C. prod. 4. p. 545.)_ stem herbaceous, branched, quite glabrous, tetragonal, having the angles winged a little; leaves oval-oblong, or oblong-lanceolate, acute, scabrous above, and clothed with yellowish down beneath; bristles of the stipulas many, longer than the leaves; whorles of flowers axillary, and terminal, small, girded by 2 leaves; capsule nearly globose, rather downy, crowned by the 4 lanceolate teeth of the calyx.—Native of the Island of Manilla, near Sorzogon, where it was collected by Hänke.

_Discorded-leaved Borreria._ Pl. 1 to 2 feet.

31 _B. cornifolia (D. C. prod. 4. p. 545.)_ stem herbaceous, erect, tetragonal, tomentose; leaves petiolate, oblong, acute, with scabrous margins, and having the veins downy beneath; stipulas villous, of many bristles; whorles of flowers dense, 1 axillary, and 1 terminal, the latter girded by 4 leaves; calyx villous, with 4 equal teeth; anthers exserted. _P. F._ Native of Brazil. Spermacoea cornifolia, Fisch. in Nees. Hort. berl. p. 50. Link. Enum. Hort. berl. 1. p. 132. Cham. et Schlecht. Linnaea. 3. p. 313. Allied to _B. brachystemonoides_, but the fruit is unknown.

32 _B. Wyderhi (D. C. l. c.)_ stem herbaceous, ascending, elongated, rather tetragonal, with the angles rather hairy; leaves elliptic-oblong, attenuated at both ends, glabrous above, and downy on the nerves beneath; bristles of the stipulas 7, shorter than the sheath; whorls of flowers 2-3, axillary, distant, almost immersed in the stipular sheaths, and terminal, pedunculate, larger than the axillary ones; involucreted of 4 spreading leaves.—Native of Porto Rico, where it was collected by Wyder. Flowers white or yellow, densely crowded, intermixed with a number of bristles. Very like the following and preceding.

_Wyder's Borreria._ Pl. ascending.

33 _Brachystemonoides (Cham. et Schlecht. in Linnaea. 3. p. 314.)_ stems suffruticose at the base, erect, tetragonal, scabrous from retrograde hairs; leaves elliptic-lanceolate, acute, scabrous on both surfaces, and on the margins white, but glabrous above in the adult state; bristles of the stipulas longer than the sheath, which is villous; heads of flowers terminal, girded by 4 leaves; capsule oblong-conical, villous upwards, crowned by the 2 acute teeth of the calyx, and 1-2 accessory ones. _P. F._ Native of the south of Brazil. Flowers white.

_Brachystemon-like Borreria._ Shrub 1 to 2 feet.

34 _B. capitellata (Cham. et Schlecht. in Linnaea. 3. p. 319.)_ stems fistular; leaves petiolate, ovate, lined, acuminate, rather pilose on both surfaces; bristles of the stipulas 5-7; whorls of flowers axillary and terminal; capsules oblong, elliptic, hairy at the top, crowned by the teeth of the calyx, which are 3 times shorter than it.—Native of New Granada, near Santa Fe de Bogota. Spermacoea capitellata, Willd. in Rom. et Schultes, syst. 3. p. 530. H. B. et Kunth, nov. gen. amer. 3. p. 349, but not of Sprengel. Flowers white? Said to be allied to _B. scabiosoides_. Involucrum clothed with pili.

_Small-leaved Borreria._ Pl. 1 foot.

35 _B. scabiosoides (Cham. et Schlecht. in Linnaea. 3. p. 318.)_ stems fistular, terete, glabrous; leaves lanceolate, acute, on short petioles, with a few oblique veins, and scabrous margins; teeth of the stipulas 3-5, ending in a bristle each, shorter than sheath; heads of the flowers terminal, hemispherical, involucreted by 2-6 leaves; capsule glabrous, oblong, crowned by the 2-4 hairy teeth of the calyx.—Native of equinoctial Brazil. The part of the involucrum girding the flowers is pilose both inside and outside.

_Scabious-like Borreria._ Pl. ½ foot.

36 _B. capitata (D. C. prod. 4. p. 545.)_ stems shrubby at the base, prostrate; branches ascending, rather tetragonal, villous; leaves lanceolate, with scabrous margins, smoothish on both surfaces; bristles of the stipulas longer than the sheath; heads of the flowers terminal, hemispherical, involucreted by 2-6 leaves; corolla glabrous, tubular; anthers exserted; capsule glabrous, turbinate, crowned by the 4 lanceolate teeth of the calyx. _P. F._ Native of Peru, on the declivities of the mountains. Spermacoea capitata, Ruiz et Pav. Fl. per. 1. p. 61. t. 91. f. b. Branches purplish. Leaves sessile. Flowers white; anthers reddish.

_Capitate-flowered Borreria._ Shrub 1 foot.

37 _B. aturensis (Cham. et Schlecht. in Linnaea. 3. p. 345.)_ plant shrubby, erect; branches ascending, rather tetragonal, roughish; leaves narrow-linear, glabrous, with serrulate margins; stipula hairy, ciliated with bristles; heads of flowers terminal, rarely lateral; capsule hairy, oblong, crowned by the 4 linear-subsutrate, ciliated teeth of the calyx. _P. F._ Native on the banks of the Orinoco, near Ature. Spermacoea Aturensis, H. B. et Kunth, nov. gen. amer. 3. p. 345. Flowers white. Allied to _B. verticillata._ Corolla funnel-shaped, a little longer than the calyx.

_At ure Borreria._ Shrub 1 to 2 feet.

38 _B. erythrodes (Cham. et Schlecht. in Linnaea. 3. p. 316.)_ glabrous; stems herbaceous, erect, tetragonal, almost simple; leaves linear, acute, with revolute margins; bristles of the stipula 5, longer than the sheath; whorls of flowers nearly globose, terminal and axillary; capsule downy, elliptic, crowned
by the 4 nearly equal teeth of the calyx, and with a small accessory tooth between each of these. \( \text{S.} \) Native of the south of Brazil and Buenos Ayres. Heads small. Leaves an inch long, and a line broad. Seed oblong, granular.

**Eryngo-like Borreria.** Pl. 1 foot.

39 B. satuellefolia (Cham. et Schlecht. in Linnae. 3. p. 318.) stem shrubby, erect, smoothish; branchlets tetragonal; leaves linear-lanceolate, acute, glabrous, with somewhat revolute edges; bristles of the stipulas rather downy, longer than the sheath; whorles of flowers semi-globose, axillary, and terminal, the latter the largest; capsule glabrous, crowned by the 4 elongated calycine teeth, which are furnished with short papil in the recesses. \( \text{S.} \) Native of equinoctial Brazil. Said to be allied to *B. suaveolens*, but the flowers are smaller, the involucral leaves are larger, and the stature is smaller, &c.

**Savory-leaved Borreria.** Shrub 1 foot.

40 B. suaveolens (Meyer, essq. p. 81. t. 1.) glabrous; stem shrubby, erect, much branched; branchlets slightly tetragonal; leaves linear, pungent, opposite, and falsely verticillate; bristles of the stipulas stiff, rather shorter than the sheath; whorles of flowers globose, a few axillary, and a larger terminal one, which is involucrated by 8 leaves; corolla glabrous, with acuminate lobes; capsule ovate, glabrous, crowned by the 4 teeth of the calyx, and 4 small accessory ones in the recesses between the others. \( \text{S.} \) Native of Dutch Guiana, in shady places, at Arrowbackcreck. Bigelovia suaveolens, Spreng. syst. 1. p. 404. exclusive of the variety from Porto Rico, and probably that from Brazil. Corolla funnelformed, ex Meyer. Stamines exerted.

**Sweet-scented Borreria.** Shrub 1 to 2 feet.

41 sideritis (Cham. et Schlecht. in Linnae. 3. p. 291.) plant scabrous from hairs; stem tetragonal, having the angles a little winged; leaves ovate-oblong, sessile, marked by 4 nerves on both sides; bristles of the stipulas shorter than the sheath, which is pilose; whorles of flowers axillary, at length globose; lobes of the corolla bearded outside; capsule pilose, ovate, crowned by the 4 teeth of the calyx. \( \text{S.} \) Native of equinoctial Brazil. Plant probably procumbent.

**Sideritis-like Borreria.** Pl. procumbent.

42 B. scadens (D. C. prod. 4. p. 546.) stem shrubby at the base, ascending, weak, rather scandent, branched; branchlets tetragonal, striated, rather scabrous along the angles; leaves ovate, glabrous, glabrous, tapering into the petioles a little; bristles of the stipulas few, shorter than the sheath; heads of flowers small, terminal, girded by 4 leaves; capsule oval, glabrous, crowned by the 4 teeth of the calyx. \( \text{S.} \) Native of Guadaloupe, where it was collected by Bertero. Diódia sarmentosa, from Guadaloupe, Spreng. syst. 1. p. 405. Spermacéce scandens, Gmel. syst. 235.—Sloan. jam. hist. 1. t. 28. f. 4. A. It differs from *Diódia sarmentosa*, in the leaves being glabrous and more ovate, in the heads being terminal, and in the fruit being dehiscent.

**Climbing Borreria.** Shrub 1.

43 B. affinis (D. C. prod. 4. p. 546.) stems herbaceous, tetragonal, having the angles scabrous from pilis; leaves oblong-lanceolate, acuminate, tapering to the base, scabrous from scattered pilosities, and more so along the veins beneath; bristles of the stipulas yellow, 7-9, longer than the sheath; whorles of flowers sessile, axillary, and terminal, the latter involucrated by 2-4 leaves; capsule oval, glabrous, crowned by the 4 subulate teeth of the calyx, and 4 smaller subulate accessory ones in the recesses between the others.—Native of Brazil, where it was collected by Pohl. Spermacéce affinis, Pohl, in litt.

**Allied Borreria.** Pl. 1 foot.

44 B. microphylla (D. C. prod. 4. p. 456.) glabrous; stems herbaceous, ascending, tetragonal; leaves lanceolate-linear, acute; bristles of the stipulas 7-9, longer than the sheath; whorles 10-12-flowered in nearly all the axils, and at the tops of the stem and branches, all equal in size, the latter girded by 4-6 leaves; capsule oval, downy, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacéce microphylla, Pohl, in litt.

**Small-leaved Borreria.** Pl. ascending.

45 B. rubro-stipulata (D. C. i. c.) stem herbaceous, branched; branches elongated, hairy, terete; leaves oblong-lanceolate, acuminate, downy on both surfaces; bristles of the stipulas longer than the sheath, which is villous; whorles of flowers capitiate, 3-4 axillary, and one terminal, the latter the largest, and girded by 4 leaves; teeth of the calyx 4; stamens exerted. \( \text{S.} \) Native of Brazil, where it was collected by Pohl. Spermacéce rubro-stipulata, and Sperm. fascículata, Pohl, in litt. Spermacéce Brasilienis, Spreng. syst. 1. p. 402. Fruit unknown.

**Red-stipled Borreria.** Pl. \( \frac{1}{2} \) to 1 foot.

46 B. elongata (D. C. prod. 4. p. 547.) stem herbaceous, branched; branches elongated, hairy, terete; leaves oblong-lanceolate, acuminate, downy on both surfaces; bristles of the stipulas longer than the sheath, which is villous; whorles of flowers capitulate, 1-2 axillary, and a nearly globose terminal one, which is involucrated by 5-6 leaves; teeth of the calyx 4, acute, short.—Native of Brazil, where it was collected by Pohl. Spermacéce verticillata, Pohl, in litt. Branches a foot high. Leaves usually in fascicles in the axils. Fruit unknown, and therefore the plant is referred to *Borreria* from habit only.

**Elongated-branched Borreria.** Pl. 1 to 2 feet.

47 B. ferruginea (D. C. prod. 4. p. 547.) stem herbaceous, hard, erect, branched; branches tetragonal, hairy; leaves oblong-acute, obliquely 3-4-nerved, scabrous above, and pale beneath and scabrous on the nerves from hairs; bristles of the stipulas the length of the sheath; whorles of flowers globose, terminal, and axillary; capsule downy, crowned by the 4 subulate teeth of the calyx. \( \text{S.} \) Native of Brazil, in elevated pastures in the provinces of Minas Geraes and St. Paul. Spermacéce ferruginea, St. Hil. pl. usucl. bras. no. 13. t. 13. Spermacéce globsa, Pohl, in litt. The hairs on the branches and nerves of the leaves are rust coloured. Corollas rose-coloured, violaceous, or white, with the lobes pilose at the apex. Heads of flowers one half larger than those of *B. verticillata*, which is it very like. The plant is called Poaya and Poaya do praya at Cape Frio. The roots are of a brown colour, and are used as *Ipecacuanha*.

**Rusty Borreria.** Pl. 1 to 2 feet.

48 B. splic'era (D. C. i. c.) stem suffruticoso at the base? branched, terete, glabrous; leaves oblong-linear, acute, scabrous above, pale and villous beneath; bristles of the stipulas longer than the sheath, which is villous; heads of flowers globose, terminal, and axillary; capsule oblong, glabrous, crowned by the 4 subulate ciliated teeth of the calyx. \( \text{S.} \) Native of Cayenne. Very like *B. ferruginea*, but differs from it in the branches being smoothish, in the leaves being less nerved, in the involucral leaves being 4, larger and reflexed, and in the capsules being twice the length.

**Spherical-headed Borreria.** Shrub 1 to 2 feet.

49 B. lute'egnea (D. C. prod. 4. p. 547.) stem terete, simple, clothed with dense soft hairs, but with retrograde down at the apex; leaves sessile, lanceolate, acuminate, villous on both surfaces, furnished with 4 oblique nerves on each side; bristles of the stipulas stiff, rufous, much longer than the sheath, which is almost obsolete; whorles of flowers dense, sessile,
1-2 axillary, and a terminal globose one, which is involucred by reflexed bracteas; capsule oblong, villous at the apex, crowned by the 4 subulate, glabrous teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacéce lacteis, Pohl, in litt. Allied to B. ferruginea.

L'escott's Borrieia. Pl. 1 foot.

50. B. HENKEÁNA (D. C. l. c.) stem erect, sub-herbaceous, straight, branched, tetragonal, with the angles hairy at the apex; leaves linear, acute, rather scabrous, with rather revolute edges; bristles of the stipulas longer than the sheath; heads of flowers globose, terminal, girded by 4-leaved reflexed involucra; capsule obovate, roughish, crowned by the 4 lanceolate teeth of the calyx.—Native of Mexico and Peru. Bigelovia psyllioides, Bartl. in herb. Hænke. Spermacéce tenió, Pav. ined. but not of Lin. It differs from B. psyllioides in the involucrum being reflexed, in the heads being one half larger, in the limb of the calyx being divided into 4 lobes to the base, not to the middle.

Henke's Borrieia. Pl. 1 foot.

51. B. strictissima (D. C. l. c.) stem and branches straight, tetragonal, clothed with powdery down under the nodi; leaves linear, acute, glabrous, almost veinless, opposite, and in axillary fascicles; bristles of the stipulas 3-7, stiff, longer than the sheath; whorles of flowers capitate, sessile, 1½ to which are axillary, and a larger terminal globose one, which is girded by 2-4 leaves; capsule oblong, glabrous, crowned by the 4 short subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacéce strictissima, Pohl, in litt. Allied to B. suavolensa, but differs from that species in the calyx being without accessory teeth. Corolla unknown.

Very straight Borrieia. Pl. 1 to 2 feet.

52. B. tenéélla (Cham. et Schlecht. in Linnaea. 3. p. 317.) stem suffruticos at the base, erect, nearly terete, clothed with retrograde adpressed villi; leaves oblong-linear, acuminated, clothed with small down above, and scabrous on the nerves and margins, having a few oblique nerves on both sides; bristles of the stipulas longer than the sheath, which is downy; heads of flowers globose, terminal, surrounded by 4 reflexed leaves; capsules oblong, hairy at top, crowned by the hairy 4-toothed calyx.  7 S. Native of equinociti Brazil.

Var. 8, angustifólia (D. C. prod. 4. p. 547.) plant weak; leaves narrow-linear; head size of peas; floral leaves spreading.  7 S. Native of Brazil, where it was collected by Pohl; and along the banks of the Orinoco, by Humboldt and Bonpland. Spermacéce longíseta, Pohl, in litt. Spermacéce teniéla, H. B. et Kunth, nov. gen. amer. 3. p. 345. Sperm. capítata, Willd. herb. Sperm. Orinocénis, Willd. in Rœm. et Schultes, syst. 3. p. 531.

Var. γ, lavandulafoía (D. C. prod. 4. p. 548.) stem at first clothed with fine velvety down, but at length becoming glabrous; leaves linear, with rather revolute margins; bristles of the stipulas very long; heads of the flowers hemispherical, depressed, involucrated by 4 spreading leaves.  7 S. Native of Brazil, where it was collected by Pohl. Spermacéce lavandulafoía, Pohl, in litt.

Weak Borrieia. Shrub ½ to 1 foot.

53. liníoides (D. C. prod. 4. p. 458.) quite glabrous; stem suffruticos at the base, erect; branches tetragonal; leaves linear, acute, with revolute edges; stipulas ending in 1-3 stiff, setaceous points; axillary heads few, or wanting, and 1 terminal and sub-globose, the latter involucrated by 2-4 reflexed floral leaves; corolla glabrous; capsule oval, glabrous, crowned by the 4 short teeth of the calyx.  7 S. Native of Brazil, where it was collected by Pohl. Spermacéce liníoides, Pohl, in litt. Anthers exerted.

Flax-like Borrieia. Shrub 1 foot.

54. B. ? psyllioides (H. B. et Kunth, nov. gen. amer. 3. p. 346. t. 278. under Spermacéce) stem suffruticos, erect, tetragonal, branched, scabrous from retrograde bristles; leaves linear-lanceolate, hairy on both surfaces, with serrulate scabrous edges; bristles of stipulas longer than the sheath; heads of flowers terminal, involucrated by 6-8 radiant floral leaves; calyx funnel-shaped, 4-cleft to the middle.  7 S. Native of Mexico, near Ario. Fruit unknown, but from habit it is evidently a species of Borrieia. Very nearly allied to B. strictissima and B. Henkeána. It differs from all the rest of the species in the calyx being divided to the middle.

Pleuwort-like Borrieia. Shrub 1 to 2 feet.

55. B. flaveósens (D. C. prod. 4. p. 548.) plant diffuse, quite glabrous, suffruticos at the base; branchlets tetragonal; leaves oblong, acute, attenuated at the base; bristles of stipulas 2-3, longer than the sheath; axillary whorles of flowers few, and one terminal and larger than the axillary ones, the latter involucrated by 2-4 floral leaves; capsule oval, crowned by the lanceolate teeth of the calyx. 7 S. Native of Brazil, where it was collected by Pohl. Spermacéce flavescentis, Pohl, in litt. The whole herb is yellowish. The nuts of the immature fruit appear almost indehiscent; it is, therefore, perhaps a species of Diosia, with the habit of Borrieia.

Yellowish Borrieia. Shrub diffuse.

56. B. scábrida (D. C. l. c.) stem erect, tetragonal, scabrous on the angles; leaves lanceolate, acute, with 4 oblique nerves on both sides, scabrous above, and pilose on the nerves beneath; bristles of stipulas 5, stiffish, longer than the sheath; whorles of flowers capitate, sessile, terminal, and axillary, apiculate; corolla glabrous; capsule oblong, glabrous, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacéce scábrida, Pohl, in litt. Corollas one half smaller than in B. ascélpiaédea.

Scabrous Borrieia. Pl. 1 to 2 feet.

57. B. ascélpiaédea (Cham. et Schlecht. in Linnaea. 3. p. 330. under Bigelovia) plant smoothish, suffruticos at the base; stems erect, tetragonal, glabrous, but downy at the apex, having the angles winged; leaves lanceolate, acute, glabrous, obliquely 4-nerved on both sides; bristles of stipulas 5, longer than the sheath, the middle one the longest; whorles of flowers loosely capitate, terminal, and axillary; lobes of corolla lanceolate, bearded a little; capsule elliptic, crowned by the 4 elongated, acuminated teeth of the calyx. 7 S. Native of the south of Brazil. Stipulas 2, revoltate.

Var. 8, glábermmá (D. C. prod. 4. p. 548.) stems and corollas glabrous; stipulas furnished with one bristle each.  7 S. Native of equinociti Brazil.

Asécélpia-like Borrieia. Shrub 1 to 2 feet.

58. B. perrotteáth (D. C. l. c.) stem herbaceous, tetragonal, with rather rough angles; leaves oblong-lanceolate, acuminated at both ends, scabrous above, and downy beneath, obliquely nerved; bristles of stipulas 9, hispid, longer than the sheath; flowers axillary, verticillate, sessile; capsule oblong, compressed, crowned by the 4 lanceolate acute connivent teeth of the calyx.—Native of French Guiana, where it was collected by Perrottet. Perhaps Sperm. áspera, Aubl. guian. 1. p. 59. t. 22. f. 6. not of Vail, but in the present plant the branches are nearly glabrous.

Perrotteá's Borrieia. Pl. 1 foot.

59. B. nervósá (Pohl, in litt. under Chlorophytm, ex D. C. prod. 4. p. 548,) the whole plant clothed with scabrous pubescence; stems erect, tetragonal, striated; leaves lanceolate, or oval-lanceolate, acute, obliquely 4-5-nerved on both sides; stipulas cleft into 3-5 linear, acute ligulae; whorles of flowers axillary and terminal, sessile; lobes of calyx 3-4, longer than the ovary, lanceolate, acuminated, scabrous, a little toothed at
the apex.  2. S. Native of Brazil, where it was collected by Pohl. Perhaps the same as Spermacoce Poáya, var. pubescens, St. Hil. &c.

_Nerved-leaved Borreria._ Pl. 1 foot.

60. _B. pratesis_ (Pohl. in litt. under Chlorophyllum, ex D. C. prod. 4. p. 548.) quite glabrous; stem tetragonal, erect, almost simple, with the angles a little winged; leaves sessile, oblong-acute, with 6-7 prominent veins on each side; stipulas triangular, 3-4-toothed at the apex: teeth acute, middle one the largest; heads of flowers axillary and terminal: lower ones on short peduncles, the rest sessile; lobes of calyx 4, lanceolate-linear; lobes of corolla smooth; stamens exserted. 2. S. Native of Brazil, where it was collected by Pohl. Corolla very like that of _B. Poáya_ when dry. Perhaps the same as _Spermacoce ganianoides_, St. Hil. pl. us. bras. no. 12. in a note.

_Meadow Borreria._ Pl. 1 foot.

61. _B. Poáya_ (D. C. prod. 4. p. 549.) quite glabrous; stem herbaceous, simple, tetragonal; leaves sessile, oblong-elliptic, acute, obliquely 6-nerved on both sides; stipulas cleft into many long bristles; whorls of flowers capitulate, sessile, few axillary, and a larger terminal one; lobes of calyx 4, lanceolate-linear, acute, longer than the ovary; corolla smooth; anthers exserted. 2. S. Native of Brazil, in elevated pastures, in the mine provinces frequent. _Spermacoce Poáya_, var. 4, St. Hil. pl. us. bras. no. 12. t. 12. Corolla blue, with the lobes rather hairy above. The roots are white, and are substituted with success in place of Ipecacuanha. The leaves are at first sweet, but afterwards acid, and a decoction of them is used in the cure of cholics.

_Poáya_ Borreria.  Pl. ½ to 1 foot.

62. _B. platyphylla_ (D. C. prod. 4. p. 549.) the whole plant is scabrous from stiff hairs; stem herbaceous, erect, simple, tetragonal, having the angles a little winged; leaves lanceolate, acute, attenuated at the base, obliquely 4-5-nerved on both sides; stipulas ending in 5-7 very long scabrous bristles; whorls of flowers sessile, capitulate, many axillary, and one terminal, which is hardly larger than the rest; lobes of calyx 4, lanceolate-linear, subulate, scabrous, longer than the ovary. 2. S. Native of Brazil, where it was collected by Pohl. _Spermacoce latifolia_, Pohl. in litt. but not of Aubb. Bristles of stipulas 6-9 long. Very nearly allied to _B. Poáya_, but differs in being hispid. Corolla unknown.

_Broad-leaved Borreria._ Pl. ¾ to 1 foot.

63. _B. cymosœphala_ (D. C. prod. 4. p. 549.) stem branched, tetragonal, striated, furrowed, and glabrous between the angles: and the angles are winged a little, and rough from being serrated; leaves ovate, acute, attenuated at the base, glabrous, obliquely nerved; bristles of stipulas 7-9, longer than the sheath; whorls of flowers nearly globose, many axillary, and one terminal, which is naked from the abortion of the floral leaves; teeth of calyx 2-3, conically subulate.—Native of Brazil. This plant is probably generically distinct from _Borreria_. Stem tetragonal and smooth between the heads. Corollas small, Anthoes incised.

_Naked-headed Borreria._ Pl. 1 foot.

64. _B. cymosa_ (Cham. et Schlecht. in Linneae. 3. p. 323.) shrubby, glabrous; branches flexuous, tetragonal; leaves elliptic-lanceolate, acuminate, coriaceous, on short petioles; stipulas interpetiolar, connate, drawn out on both sides into 5 linear segments, the middle segment the longest; heads of flowers 3 at the top of each stem, and the lateral ones pedunculated and almost leafless; capsule smooth, crowned by the 4 lanceolate-linear teeth of the calyx. ½. S. Native of Brazil, in the province of Rio Janeiro. _Spermacoce cymosa_, Spreng. syst. 1. p. 403. Leaves 3 inches long, and one broad. Corollas hairy outside. Inflorescence rather panicked.

_Cymose-headed Borreria._ Shrub 2 to 3 feet.

§ 2. Flowers solitary, or in axillary fascicles.

65. _B. virgata_ (Cham. et Schlecht. in Linneae. 3. p. 324.) branches fistular, tetragonal, with downy angles; leaves lanceolate-tapering to both ends, glabrous on the margins, and scabrous at the nerves beneath; upper stipulas undivided, the rest downy, and furnished with 5-9 bristles; flowers glomerate in every other axil; capsules downy, elliptic, crowned by the irregularly 2-6-toothed calyx. 2. S. Native of Brazil, about Rio Janeiro.

_Twiggly Borreria._ Pl. 1½ foot.

66. _B.aponariaefolia_ (Cham. et Schlecht. in Linneae. 3. p. 325.) glabrous; stem prostrate, tetragonal, fistular, branched; leaves sessile, acuminated, with scabrous margins; lower ones obovate, upper ones lanceolate: bristles of stipulas 1-3, hairy, the middle one the largest; flowers solitary in every axil; capsule glabrous, oblong-elliptic, crowned by the 2 primary and the 2 accessory teeth of the calyx.—Native of Brazil.

Soap-wort-leaved Borreria. Pl. prostrate.

67. _B. aúda_ (D. C. prod. 4. p. 549.) stems simple, erectish, tetragonal, downy, glabrous at the apex; leaves linear, acute, scabrous on the nerve beneath at the apex, with revolute serrately scabrous edges; bristles of stipulas 5-7, stiffish, longer than the sheath; flowers 2-3 together, axillary, sessile; capsule ovoblong, rather downy, crowned by the 2 subulate teeth of the calyx.—Native of Porto Rico, in arid places by the sea side, where it was collected by Bertero. _Bigelovia suaveolens_, from Porto Rico, Spreng. syst. 1. p. 416. but is very distinct from the true _B. suaveolens_.

_Arid Borreria._ Pl. 1 foot.

§ 3. Flowers disposed in cymes, or corymbose-cymes. Floral leaves small. Corollas campanulately funnel-shaped. Seeds marked by a crest inside, probably in all. Perhaps a proper genus.

68. _B. ericoides_ (Cham. et Schlecht. in Linneae. 3. p. 326.) shrubby, erect, glabrous; branchlets tetragonal; leaves linear, bluntish, 1-nerved, opposite, or in whorled fascicles: bristles of stipulas 3-5, shorter than the sheath; cymes terminal, 3-4-forked; floral leaves small; capsule cylindrically turbinate, crowned by the 4 elliptic teeth of the calyx. ½. S. Native of equinoctial Brazil. Corolla short, funnel-shaped, glabrous outside, and villous in the throat. Habit of a heath.

_Heath-like Borreria._ Shrub ½ to 1 foot.

69. _B. anthospermoides_ (D. C. prod. 4. p. 550.) glabrous; branches twiggy, tetragonal; leaves linear, acutish, nerveless; bristles of stipulas many, stiff, longer than the sheath; corymbose small, terminal, crowded; lobes of calyx 4, narrow, acute. ½. S. Native of South America, near Santa Fe de Bogota. Habit of _B. stipulifera_, with the inflorescence of _B. ericoides_. Mature fruit unknown.

_Anthospermum-like Borreria._ Pl. 1 foot.

70. _B. equatorisorum_ (Cham. et Schlecht. in Linneae. 3. p. 327.) shrubby, downy; branches bluntly tetragonal; leaves obovate-oblong, acute, lined; bristles of stipulas equal in length to the sheath; cymes terminal, compact, trichotomous; floral leaves small; capsule oblong, downy, crowned by the 4 ovoid teeth of the calyx. ½. S. Native of Equinoctial Brazil. Corolla campanulately funnel-shaped, downy outside.

_Equatorium-like Borreria._ Shrub 1 foot.

71. _B. centranthoides_ (Cham. et Schlecht. in Linneae. 3. p. 328.) plant herbaceous, smoothish; stem ascending, fistular, bluntly tetragonal; leaves elliptic-lanceolate, attenuated at both ends, rather scabrous; bristles of stipulas 5-7, hardly longer than the sheath; cymes terminal, fastigiate, pedunculate; floral leaves small; capsule hairy, obconically cylindrical, crowned by 4 K.
the 4 ovate teeth of the calyx.  \( \mathfrak{Z.} \)  S.  Native of the south of Brazil.

**Var. \( \beta \), angustifolia** (Cham. et Schlecht. l. c.) the whole plant canescent from hairs; leaves oblong-lanceolate, much more nerved than those of the species.  \( \mathfrak{Z.} \)  S.  Native of the south of Brazil.

**Centranthus-like Borreilia.**  Pl. 1 to 2 feet.

72  B.  **Pohlia**na (D. C. prod. 4. p. 550.) branches hairy, compressed; leaves lanceolate, acuminate, lined, downy above, and rather hairy on the nerves beneath; bristles of stipulae length of sheath, which is villous; corymbs trichotomous, terminal, crowded; tube of calyx canescent from hairs; lobes of calyx 4, lanceolate; corolla hairy inside.—Native of Brazil, where it was collected by Pohl.  Hydrophyllax pusillum, Pohl, in litt.  Fruit unknown, but the plant has a habit very different from *Hydrophyllax*, and appears to be nearly allied to **B. eupatorioides** and **B. centranthoides**.

**Pohlia's Borreilia.**  Pl. 1 foot.

73  **B. angustifolia** (Cham. et Schlecht. in Linnaea. 3. p. 330.) plant herbaceous, erect, glabrous; stem tetragonal; leaves lanceolate-linear, with revolute edges, having 2-3 veins on each side of the mid-rib; bristles of stipulae twice the length of the sheath, which is downy; cymes trichotomous, contracted; floral leaves bristles of calyx oblong-lanceolate, membranous, with scabrous edges; bristles of stipulae glabrous, length of the sheath, which is downy; cymes terminal, somewhat trichotomous; floral leaves small; capsule elliptic, rather truncate, crowned by the 4, ovate, acute teeth of the calyx.  \( \mathfrak{Z.} \)  S.  Native of the south of Brazil.

**Loose-leaved Borreilia.**  Pl. 2 feet.

78  **B. ? squisitoides** (Cham. et Schlecht. l. c. p. 338.) glabrous; root woody; stems herbaceous, erect, contracted at the nodi, bluntly tetragonal? leaves narrow-linear, straight, almost filiform, with revolute, scabrous edges; stipules fusescence, ciliated with bristles; cymes terminal and axillary, crowded.  \( \mathfrak{Z.} \)  S.  Native of the south of Brazil.  Habit of the plant elegant; but the fruit being unknown, it is very doubtful whether it belongs to the present genus.

**Horse-tail-like Borreilia.**  Pl. 3 feet.

\[ \S \] 4.  **Flowers umbellate; umbels cymose or capitulate.**

79  **B. umbellata** (Spreng. neu. entd. 2. p. 144.) stem herbaceous, branched, somewhat tetragonal, shining; leaves lanceolate, tapering to both ends, glabrous; stipules setose, connate at the base; umbels pedunculate, semi-globose, axillary, and terminal; capsule obconical, downy, crowned by the 4 acute teeth of the calyx.  \( \mathfrak{Z.} \)  S.  Native of Brazil, within the tropic.  Cham. et Schlecht. in Linnaea. 3. p. 353.  Bigelowia umbellata, Spreng. syst. 1. p. 405.  Corolla small, white.  Herb clothed with very fine down while young.

**Umbellate-Flowered Borreilia.**  Pl.

80  **B. ? alaloides** (Cham. et Schlecht. in Linnaea. 3. p. 339.) glabrous; stem herbaceous, erect, fustular, tetragonal, branched at the top; leaves lanceolate, acuminate, on short petioles, rather coriaceous; bristles of stipulas few, shorter than the sheath; cymes umbellate, terminal, downy, with tetragonal branchlets; calyx glabrous, acutely 4-toothed; anthers exerted.—Native of Equinoctial Brazil.  Allied to *B. umbellata*, but is twice the size in all its parts.  Fruit unknown, therefore the genus is doubtful.

**Aralia-like Borreilia.**  Pl. 2 feet.

\[ \dagger \]  Species not sufficiently known.

81  **B. adscendens** (Cham. et Schlecht. in Linnaea. 3. p. 340.) glabrous; stems ascending; leaves linear-lanceolate, acute; stipulas toothed; teeth bristly.—Native of Madagascar.  Spermacoce adscendens, Wildl. in Rœm. et Schultes, syst. 3. p. 533.

**Ascending Borreilia.**  Pl.

82  **B. vaginata** (Cham. et Schlecht. l. c. p. 340.) stem suffrutescent, and is as well as the branches, terete and glabrous; leaves lanceolate; stipulas connate; lower ones sheathed; fruit hispid.—Native of St. Domingo.  Spermacoce vaginata, Wildl. in Rœm. et Schultes, syst. 3. p. 531.  Bigelowia vaginata, Spreng. syst. 1. p. 405.

**Sheathed Borreilia.**  Shrub 1 foot.

83  **B. sinifolia** (D. C. prod. 4. p. 551.) stem herbaceous, tetragonal, rather villous on the angles; leaves linear-lanceolate, acute, on short petioles, villous, with scabrous margins; bristles of stipulae rather shorter than the flowers; whorls of flowers axillary and terminal; the latter globose, and girded by 4 leaves; anthers exerted; calyxes clothed with cinereous villi.—Native of Cayenne.  Spermacoe sinifolia, Wohl, eel. 1. p. 8. but not of Nee.  Bigelowia sinifolia, Spreng. syst. 1. p. 404.

**Flax-leaved Borreilia.**  Pl. 1 foot.

**Cult.**  The species of *Borreria* are of most easy culture.  A light soil suits them best; and cuttings of the perennial and shrubby kinds strike root readily in the same kind of soil, in heat.  The annual kinds require the treatment of other tender annuals.

1

Lin. syst. Tetrandria, Monogynia. Calyx with an ovate or turbinate tube, and a 2-4-lobed limb (f. 108. a. b.), and sometimes accessory teeth in the recesses of the primary lobes. Corolla salver-shaped, or funnel-shaped, 4-lobed (f. 108. c.). Stigma bifid or undivided. Capsule crowned by the limb of the calyx (f. 108. f.), which is often obliterated, 2-seeded; nuts 1-seeded, dividing into 2 parts from the apex : the one part closed by the adnate sepiments, and the other open. Seed oval-oblong, marked inside by a longitudinal furrow.—Herbs or subshrubs. Branches or stems usually tetragonal. Leaves opposite. Stipulas combined with the petioles, sheathing, fringed by numerous bristles. Flowers axillary, sessile, crowded, verticillate, or semi-verticillate, white, red, or blue.—The fruit of this genus is drawn with great character in Gærtn. fruct. 1. t. 25.—The fruit of a great number of the plants still preserved in this genus being unknown, many of them will yet be expelled, when proper specimens can be procured.

* Species natives of America.*

1 S. tenor (Lin. spec. p. 147.) stems herbaceous, branch- ed; branches tetragonal, with the angles smooth or scabrous; leaves lanceolate, on very short petioles, rather scabrous above and on the margins; bristles of stipulas hardly longer than the sheath; flowers disposed in sessile axillary fascicles, semi-ver- ticillate; stamens inclosed; capsule oval, usually hairy, crowned by the 4 short, acute calycine teeth. O. F. Native of the West India Islands, as of Jamaica, Martinico, Porto-Rico, Cuba, St. Domingo, &c., as well as of Peru, Panama, Carolina, very frequent. Š. lanceolata and Š. dichotoma, Willd. in herb. S. parviflora, Salisb. prod. p. 60.—Dill. elth. p. 370. t. 359. Lam. ill. t. 62. f. 1. There are varieties of this species (ex Swartz, obs. p. 43.) with smooth, pubescent, and straight or ascending stems; narrow and broader leaves; whorled or solitary flowers; smooth or hispid fruit, having one of the parts or nuts bearing 3 of the calycine teeth, and the other bearing only one. The varieties are so numerous, and run so gradually into each other, as hardly to be distinguished, many speci- mens of which are to be found in herbaria, under various names, from their different habits; as P. assúrgens, Spreng. syst. 1. p. 402. a native of Porto-Rico, but not of the fl. per.; and Sperm. longifólia, Bartl. in herb. Hænke, &c. Some specimens are suffruticoso at the base, and others are herbaceous. Perhaps the whole form in congersies of species, of which some may be ultimately distinguished from each other. The flowers in most of the varieties are of a white or pink colour, and one is said to have yellow flowers.

Slender Spermacoce. Fl. June, Aug. Clt. 1792. Pl. 1 to 2 ft. 2 S. Portorícense (Balb. in herb. Bert. ex D. C. prod. 4. p. 552.) stems herbaceous, glabrous, tetragonal; leaves elliptic-oblong, acuminate at both ends, on very short petioles, gla- brous; stipulas rather downy, having the bristles longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, rather downy, somewhat truncate at the apex.—Native of Porto-Rico, where it was collected by Bertero. Perhaps sufficiently distinct from S. tenor.

Porto-Rico Button-weed. Pl. 1 to 2 feet.

3 Š. loxífrólia (Aubl. guian. 1. p. 59. t. 21.) stems herba- ceous, glabrous, dichotomous, and are, as well as the branches, acutely tetragonal; leaves oval-oblong, tapering to both ends, on short petioles, scabrous above between the nerves and on the margins, and pilose on the nerves beneath; stipulas downy, bearing each 5-7 bristles, and short hairs between these bristles; whorles axillary, few-flowered; fruit ovate, downy, crowned by the 4 short teeth of the calyx. Š. Native of French Guiana. S. fruticósa, Poir. Flowers white. Stems reddish.

Long-leaved Button-weed. Shrub.

4 Š. cerúlea (Pohl. in litt. ex D. C. prod. 4. p. 552.) stems herbaceous, almost tetragonal, downy; leaves elliptic-oblong, acute, petiolar, glabrous, downy on the nerves beneath; stipulas downy, bearing 5-7 bristles, which are a little longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, truncate at the apex.—Native of Brazil, where it was collected by Pohl. Flowers blue. Very nearly allied to S. tenor, but is very distinct.

Blue-flowered Button-weed. Pl. 1 to 2 feet.

5 Š. rípaíra (Cham. et Schlecht. in Linn. 3. p. 355.) quite glabrous; stems loose, fistular, tetragonal, suffrutescence at the base; leaves lanceolate, acute, with scabrous margins; bristles of stipulas, longer than the sheath; flowers terminal in the upper axils, disposed in whorled heads; stamens almost inclosed; capsule ovate, glabrous; teeth of calyx 6-7, acute, at length obliterated. Š. Native of Brazil, on the banks of the Rio Negro.

River-side Button-weed. Pl. 1 foot.

6 Š. herbeára (D. C. prod. 4. p. 553.) stems herbaceous, tetragonal, nearly naked, downy; the rest of the plant smooth- ish: leaves ovate, acute, tapering to the base, glabrous above, but downy on the nerves beneath while young; bristles of sti- pulsas many, rather shorter than the sheath, which is downy: heads of flowers verticillate, 1-2 axillary, and one terminal; the latter girded by 4 very unequal leaves: fruit downy, truncate at the apex.—Native of South America, about Caracas, where it was collected by Vargues. Both the nuts of the fruit being dehiscent, it is therefore rather an ambiguous species.

Var. β, angústior (D. C. prod. 4. p. 553.) leaves lanceolate, and are, as well as the stems, glabrous.—Native of St. Domingo, where it was collected by Bertero.

Downy-fruited Button-weed. Pl. 1 foot.

7 Š. diffussá (H. B. et Kunth, nov. gen. amer. 3. p. 343.) stems suffruticoso, procumbent, terete, hairy; leaves lanceolate, scabrous from retrograde hairs on both surfaces, with the margins serrately scabrous; stipulas hairy, ciliated with bristles; whorles of flowers axillary, sessile, and one larger terminal; the latter girded by 4 leaves: capsule smoothish, globose, crowded by the 4 teeth of the calyx, 2 of which are linear-subulate, and longer than the other 2. Š. Native of South America, in the province of Varino, at the river Atures. Flowers white. Said to be allied to S. tenor, and therefore it is probably a true species of Spermacoce.

Diffuse Button-weed. Shrub procumbent.

8 Š. sfrutíceá (Jacq. schoenbr. t. 322.) stems suffrut- tescent at the base, rather diff- use, branched, tetragonal, gla- bros; leaves ovate-lanceolate, acuminate, lined, with scab- rosus margins; stipulas fur- nished with bristles; whorles of flowers dense, sessile, axillary, and terminal; the latter girded by 4 leaves: lobes of corolla villous at the apex; genitals exserted; stigma capitulate; fruit turbinate, hispid, crowned by the 4-cleft calyx. Š. Na- tive country unknown. S. suf- frutícosá, Spreng. syst. 1.

**9 S. linearis** (H. B. et Kuntz, nov. gen. amer. 3. p. 343.) stem suffruticose, obsolete tetragonal, clothed with hairy down; leaves linear, scalabrous above and on the margins, hairy beneath; stipulas hairy, ciliated with bristles; whorls many-flowered, sessile, axillary; corollas glabrous; stigma rather capitate, exserted; capsule oblong, hispid at top; teeth of calyx 4, ovate-lanceolate. 

10 S. *palmatum* (D. C. prod. 4. p. 553.) plant herbaceous, ascending, branched; stem tetragonal, hairy; branchlets compressed; leaves oval-lanceolate, scalabrous above and lined, hairy beneath and nerved; stipulas villous, with the bristles shorter than the sheath; flowers 5-6 together on both sides, sessile, axillary, verticillate; fruit rather hairy, obovate; teeth of calyx 4, short, subulate, at length deciduous.—Native everywhere about the Gambia, at the roots of palm-trees, in humid places, where it was collected by Leprieur and Perrottet. Allied to *S. tenax.* Perhaps Diódia scabra, Schum. pl. guin. p. 76. ?

*Palm-tree* Button-weed. Pl. 1 foot.

11 S. ? *pilo*a (D. C. prod. 4. p. 553.) stem herbaceous, tetragonal, with blunt, pilose angles; leaves ovate, acute, scabrous on both surfaces; bristles of stipulas distant, longer than the sheath; whorls sessile, many-flowered; fruit ovate, crowned by the 4 reflexed, acute lobes of the calyx.—Native of Guinea. Diódia pilosa, Schum. pl. guin. p. 76.

*Plisole* Button-weed. Pl. 1 foot.

12 S. *phyllodéphala* (D. C. l. c.) plant erect, glabrous, sparingly branched; stems tetragonal; leaves linear, 1-nerved; floral ones dilated at the base; bristles of stipulas 5-5 on each side, longer than the sheath; heads of flowers axillary, verticillate, very few, and a large terminal one, the latter surrounded by long, squarrose leaves; fruit solitary in the axils of the floral leaves, crowded from the floral leaves being clustered; seeds large, shining. **Native** of the west coast of Africa, at Kouma and Walo, where it was collected by Perrottet and Leprieur. Seeds 2 lines long, almost like those of *Psyllium.*

*Leaf-headed* Button-weed. Pl. 1 foot.

13 S. *stachydeíne* (D. C. prod. 4. p. 554.) plant erect, nearly simple, villous; stem tetragonal; branchlets compressed; leaves linear, acute, floral ones dilated at the base; bristles of stipulas 5-7, longer than the sheath, which is velvety; heads of flowers verticillate, numerous, surrounded by 6-8 aggregate, squarrose leaves; flowers solitary in the axils of the leaves, and aggregate only from the leaves being crowded; lobes of calyx linear-subulate, nearly the length of the fruit; seeds large, shining. **Native** of the west coast of Africa, among stones, at Bakel, where it was collected by Leprieur. Plant about a foot high. Leaves 3 inches long, and nearly 4 lines broad. Bristles of stipulas blackish. Seed 2 or 2½ lines long, larger than any other of the genus.

*Stachys*-like Button-weed. Pl. 1 foot.

14 S. *galeópsidis* (D. C. prod. 4. p. 554.) erect, branched; stem tetragonal, hairy; leaves lanceolate-linear, rather scabrous on both surfaces; bristles of stipulas longer than the sheath, which is velvety; flowers axillary, few, sub-verticillate; fruit large, velvety, longer than the subulate, calyceine lobes. **Native** of Senegambia, at Dagana, in sandy places. Allied to *S. Ruélliae*, but very distinct. Herb about a foot high. Leaves 15-16 lines long, and 3 broad, pale beneath. Stipulas yellowish. Fruit larger than in any other species of the genus, almost like that of a species of *Diodia*, but is membranous and deliscent. Seeds large.

*Galeopis-like* Button-weed. Pl. 1 foot.

15 S. *Ruélle* (D. C. l. c.) erect, branched; stem tetragonal, hispid; leaves lanceolate-linear, acuminate, clothed with rough down on both surfaces; heads many, verticillate, axillary; bristles of stipulas many, 3 times longer than the sheath, which is downy; valves of fruit at length opening widely at the apex; lobes of calyx subulate, rather longer than the fruit. **Native** of Equinoctial Africa, in sandy places at Bakel, where it was collected by Leprieur. Stem a foot high. Leaves 3 inches long, and 5-6 lines broad. Mature fruit nearly as in the genus *Ruélle.* Seed a line long and a half long.

*Ruélle*-like Button-weed. Pl. 1 foot.

16 S. *clérocephala* (D. C. l. c.) stem erect, simple, terete at the base and glabrous, and tetragonal at the apex, with the angles scabrous; leaves linear-longated, acuminate, glabrous; bristles of stipulas 5-7, subulate, longer than the sheath, which is villous; heads verticillate, surrounded by many leaves, and the many bristles of the stipulas; fruit pale, membranous, downy at the apex; lobes of calyx subulate, shorter than the fruit. **Native** of Equinoctial Africa, in Gala, among rough stones at Bakel, where it was collected by Leprieur. Plant 1½ foot high. Leaves 3 inches long, and 5-6 lines broad. Bristles of stipulas rufous. Capsules whitish. Seeds a line long.

*Bristly-headed* Button-weed. Pl. 1½ foot.

**Species natives of the Mauritius and Madagascar.**

17 S. *flagelliformis* (Poir. dict. 7. p. 314.) stem herbaceous, terete, glabrous, simple, erectish; leaves glabrous, oblong-lanceolate, acute, revolute on the margins at the base, and therefore petiole-formed; stipulas broad-cupshaped, having the bristles rather shorter than the sheath; flowers axillary, few, sessile, verticillate; capsule ovate, puberulous, crowned by the 4 slender acute teeth of the calyx. **Native** of the Mauritius and Bourbon. S. flagellaris, Willd. in Röem. et Schultes, syst. 3. p. 532. ex Cham. et Schlecht. in Linn. 1804. p. 357. Hedyotis verticillata, Lám. ill. no. 1423. exclusive of the synonyms of *Desf.*

18 S. *murcula* (D. C. prod. 4. p. 554.) glabrous; stem herbaceous, tetragonal, having the angles just under the nodi, from small tubercles; leaves elliptic-lanceolate, acuminate at both ends, scabrous above; bristles of stipulas longer than the sheath, which is very short; flowers disposed in sessile, glomerate whorles in the axils of the leaves; fruit ovate, downy, crowned by the 2-4 very short, acute, calyceine teeth, but is at length nearly naked.—**Native** of the Mauritius and Bourbon. Allied to *S. tenax*; but the angles of the stem are not downy, but scabrous from tubercles.

*Muriculata*-stemmed Button-weed. Pl. 1 to 1½ foot.

19 S. *serrifilifolia* (Willd. in Röem. et Schultes, syst. 3. p. 532.) plant diffuse, scabrous; leaves elliptic, with revolute margins; whorls few-flowered.—**Native** of Madagascar. A true species of *Spermacoce* ex Cham. et Schlecht. in Linn. 3. p. 357. but the rest is unknown.

**Species natives of India.**

20 S. *stríca* (Lin. fil. suppl. p. 120.) stem herbaceous, straight, erect, scabrous at the angles; leaves linear-lanceolate, lined, scabrous; stipulas ciliate fringed; whorles of flowers axillary, remote, globose; fruit obovate-globose, rather membranous at the base, and hispid at the apex, crowned by the 4

*Var. β, latifolia* (D. C. prod. 4. p. 555.) leaves ovate-lanceolate, rather scabrous above.—Native of Java, about Tugu. Bigelovia stricta, Blum. bijdr. p. 945.

21 S. Burmanni (D. C. prod. 4. p. 555.) stem tetragonal, branched, slender, rather pilose on the leaves; leaves oblong-linear, acuminated at both ends, scabrous above, and on the margins; bristles of stipulas glabrous, about the length of the sheath, which is villous; flowers axillary, sessile, few, somewhat verticillate, almost inclosed in the stipular sheaths; fruit ovate, rather hairy, crowned by the 4 acute teeth of the calyx.—Native of the East Indies. S. corymbosa, Burm. fl. ind. p. 34. but not of Lin. Allied to *S. flagelliformis*. Flowers white.

Burmann's Button-weed. Pl.

22 S. scabra (Blum. bijdr. p. 946.) stem herbaceous, branched, climbing; branches quadrangular, having the angles beset with retrograde down; leaves oval-lanceolate, rough above, and on the veins beneath; stipulas pubescent, furnished with bristles, which are a little longer than the sheath; stamens exerted; fruit glabrous, crowned by the 4 lobes of the calyx.—Native of Java, in humble places about Buitenzorg. Habit of *S. tetrandrum.*

23 S. hispida (Lin. mant. p. 558.) plant herbaceous, erect, hoary; stem tetragonal, hispid; leaves obvate, a little mucronate, hispid on both surfaces, and on the margins; bristles of stipulas longer or longer than the sheath; flowers 1-3-together, axillary, sessile, opposite or somewhat verticillate; stamens length of corolla; capsule ellipsoid, hairy, crowned by the 4 teeth of the calyx. — O. F. Native of the East Indies.—Murr. comm. goett. 3. p. 77. t. 5. Cham. et Schlecht. in Linnaea. 3. p. 355. S. rigid, Salisb. prod. p. 60.—Burm. zeyl. t. 20. f. 3. Corollas turbinate, violaceous. Stamens purplish.

24 S. scabra (Wildl. spec. 1. p. 572.) stem herbaceous, diffuse, terete, or slightly tetragonal, scabrous from pili; leaves obvate, obtuse or acute, undulated, scabrous on both surfaces, and on the margins; bristles of stipulas rather longer than the sheath, which is downy; flowers few, axillary, verticillate; stamens exerted; capsule ovate, rather hairy, crowned by the 4 lanceolate teeth of the calyx. — O. F. Native of Coromandel, ex Roxb.; of Malabar, ex Rheed. mal. 9. t. 76.; and of the Island of Timor. Roxb. fl. ind. 1. p. 377. S. hirta, Rottl. in nov. act. nat. cur. berl. 1803. p. 95. Flowers small, purple.

25 S. articulata (Lin. fl. suppl. p. 119. exclusive of the synonyms,) plant herbaceous, diffuse; stems tetragonal, pilose above at the angles; leaves elliptic-lanceolate, hardly acute, clothed with rough pubescence on both surfaces, and on the margins; bristles of stipulas longer than the sheath, which is downy; flowers 2-4, axillary, sessile; capsule oval, downy, crowned by the 4 teeth of the calyx. — O. F. Native in sandy places on the shores of Coromandel. Roxb. fl. ind. 1. p. 378. Allied to *S. hispida.* Stem reddish. Flowers white. Branches procumbent.

26 S. Brunnonis (Wall. cat. no. 882.) stems herbaceous, erect, tetragonal, glabrous; leaves lanceolate, acute, sessile, glabrous, with serrated scabrous edges; stipulas bifid and trifid, or multifid; heads of flowers terminal, rarely axillary: the former inclosed by 2 long leaves, and sometimes also 2 small ones. — S. Native of Kamaon. Flowers white. Perhaps a species of *Borriéria*.

*Brown's Button-weed.* Pl. 1 to 2 feet.

27 S. longiarcuflis (R. Br. in Wall. cat. no. 826.) plant scabrous; stem elongated, tetragonal, with scabrous angles; leaves oblong and obvate-oblong, opposite, and falsely verticillate, scabrous; bristles of stipulas longer than the sheath; flowers axillary, few, verticillate. — S. Native of the Burmese Empire, at Prome; and of Singapore.

Long-stemmed Button-weed. Pl. 2 to 3 feet, diffuse.

28 S. Avana (R. Br. in Wall. cat. no. 828.) stems tetragonal, scabrous on the angles; leaves elliptic or obvate-elliptic, acute, attenuated at the base, rather scabrous, serrulate on the margins; bristles of stipulas longer than the sheath; flowers axillary, sessile, somewhat verticillate. — S. Native of the Burmese Empire, at Ava. Very nearly allied to the preceding.

*Ava* Button-weed. Pl. 1 to 2 feet.

29 S. tenesma (R. Br. in Wall. cat. no. 833.) plant glabrous, diffuse; leaves lanceolate, tapering to both ends, petiolate, smooth; flowers axillary, verticillate; bristles of stipulas longer than the sheath. — O. F. Native of the East Indies. *S. cymooides,* Heyne, but not of Burm.

30 S. compressa (Wall. cat. no. 6187.) plant diffuse, densely clothed in every part with woolly scabrous hairs; leaves ovate or oblong, acute; stipulas bristly; heads of flowers axillary and terminal, verticillate; fruit compressed, crowned by the teeth of the calyx. — S. Native of Silhet, in the East Indies.

†Species not sufficiently known.

* Species natives of Asia.

31 S. flexuosa (Lour. coch. p. 79.) stem shrubby, flexuous, nearly terete, procumbent; leaves ovate-lanceolate, obliquely-nerved, thick; stipulas bristly; whorles of flowers globose; capsule of 2 2-horned nuts. — G. Native of Cochinchina, in hedges and among bushes. Corollas white, with revolute segments.

Flexuosa Button-weed. Shrub procumbent.

32 S. Hedyotisacea (D. C. prod. 4. p. 555.) stem tetragonal, glabrous; leaves lanceolate; stipulas rhomboid; thyrse brachit; bracteas subulate; corolla tomentose inside; anthers linear; stigma capitulate; capsule ovate, crowned by the 4-toothed calyx; cells 1-seeded. — S. Native of the East Indies. Hedyotis fruticosa, Retz. obs. 2. p. 8. and probably also of Lin. If the cells of the fruit are truly 1-seeded, it is a true *Spermacoce*. All the synonyms cited by authors for this plant are very doubtful.

Hedyotis-like Button-weed. Pl.

33 S. procumbens (Lin. syst. veg. p. 124.) stems herbaceous, procumbent, angular; leaves linear; corymb lateral, opposite, pedunculate, surrounded by many-leaved involucra; stamens exerted.—Native of the East Indies. S. corymbosa, Lin. spec. p. 149. but not of others. Stamens longer than the corolla.

Procumbent Button-weed. Pl. procumbent.

34 S. ? semieíreta (Roxb. fl. ind. 1. p. 377.) stems tetragonal, ascending, bent in various ways, with rather hispid angles; branches brachiate, alternately smaller; leaves ovate, acuminate, on short petioles, scabrous; stipulas of many bristles; whorles of flowers small, compact; genitils inclosed; capsule turbinate, pilose.—Flowers small, white. Native of Sumatra. S. Roxburghiana, Wall. cat. no. 6186. Fruit not sufficiently known.

35 S. ? costata (Roxb. fl. ind. 1. p. 376.) plant diffuse, very villous; leaves broad-lanceolate or oblong, nervet; stipulas
usuually furnished with 3 bristles; flowers axillary, disposed in small prolifeating, crowded umbels; stamens protruding beyond the corolline tube. S. Native of the Moluccas. Perhaps the same as S. cristata, Wild. in R¢m. et Schultes, syst. 3, p. 530.2. Flowers pale, pink.

**Ribbed-leaved Button-weed.** Pl. diffuse.

36 S. ? *Rubiacea* (Roxb. fl. ind. 1, p. 375.) stem erect, simple, nearly terete, smooth; leaves petiolate, lanceolate, smooth; flowers axillary or terminal, sessile, crowded.—Native of the Island of Hominoa. Plant hardly a foot high.

**Dwarf Button-weed.** Pl. ½ foot.

37 S. ? *LINEA* (Roxb. fl. ind. 1, p. 375. but not of Blume) plant erect, branched, pilose; leaves on short petiolo, lanceolate-linear, acuminate, lined; stipulas triangular, furnished with bristles; peduncles axillary, trichotomous; flowers capit; stamens exerted.—Native of the Moluccas. The rest unknown.

**Lined-leaved Button-weed.** Pl. 1 foot.

38 S. ? *PHILIPPEN* (Spreng. syst. 1, p. 401.) stem erect, and as well as the leaves rough; stipulas toothed; stamens exerted; fruit glabrous.—Native of the Philippines.

**Smoot Hall.** Pl. May, July. Clt. 1820. Pl. 1 foot.

40 S. ? *STELLATA* (R¢m. et Schultes, syst. 3, p. 530.) flowers terminal, capitate; leaves linear, verticillate.—Native of St. Domingo, where it was collected by Martin. Sloane, hist. 1, p. 94. f. 2. Said to be nearly allied to S. teniour. Flowers numerous.

41 S. ? *ROTA* (Poit. in R¢m. et Schultes, syst. 3, p. 275.) glabrous; stems diffuse, ascending, quadrangular; leaves ovate, mucronate; bristles of stipulas few, naked, short; flowers in capitulate whorls; teeth of calyx villous.—Native of St. Domingo, where it was collected by Martin. Poit. dict. 7, p. 312. Whorles of flowers the size of a pea.

**Rota Hall.** Pl. diffuse.

42 S. ? *REMOTA* (Lam. ill. no. 1435.) stems straight, rather tetragonal, and downy; leaves linear-lanceolate, very rough, canescent beneath, shorter than the internodes; whorles of flowers dense, distant; capsules obtuse, villous.—Native of St. Domingo, where it was collected by Martin. Poit. dict. 7, p. 312. Leaves more than an inch long.

**Remote-whorled Button-weed.** Pl. 1 foot.

43 S. ? *OCYMIOPIA* (Wildl. in R¢m. et Schultes, syst. 3, p. 530.) branchlets and under sides of leaves downy; bristles of flowers longer than the whorls of flowers; stamens inclosed.—Native of the West Indies. S. decidua, Bosc. The rest unknown.

**Brazil-leaved Button-weed.** Pl. 1 foot.

44 S. ? *OBSCURA* (D. C. prod. 4, p. 556.) glabrous; stem herboeuse, tetragonal; leaves ovate-oblong, attenuated at both ends, lined; stipulas connate, ciliated with bristles; flowers of flowers globose; corollae villous inside; stamens exerted.—Native of Cuba and Hispaniola. S. capitellata, Spreng. neu. entd. 3, p. 46. exclusive of the synonyms. Fruit unknown.

**Obcord Button-weed.** Pl. 1 foot.

* * * *Species natives of Brazil.

45 S. ? *STRIGOSA* (Thunb. et Otto, pl. bras. no. 23. ex flora, 1821. p. 602. but not of Sims.) stem branched, pilose; leaves ovate, hairy; flowers verticillate.—Native of Brazil.

**Strigose Button-weed.** Pl. 1 foot.

46 S. ? *ELLIPTRICIA* (Thunb. et Otto, pl. bras. no. 22. ex flora, 1821. p. 602.) stem simple, glabrous; leaves elliptic, glabrous; flowers axillary.—Native of Brazil.

**Elliptic-leaved Button-weed.** Pl. 1 foot.

47 S. ? *CEPHALOTES* (Wildl. in R¢m. et Schultes, syst. 3, p. 531.) stem herbaceous, scabrous, branched; leaves lanceolate, acuminate, tapering to the base, veiny; heads of flowers terminal, involucre, hairy; stamens exerted.—Native of Brazil. Leaves quite glabrous, ex Spreng. neu. entd. 2, p. 144. but rough, ex Spreng. syst. 1, p. 402. Fruit unknown.

**Headed Button-weed.** Pl. 1 foot.

48 S. *ASSURGENS* (Ruiz et Pav. fl. per. 1, p. 60, t. 92.) stem ascending, branched, tetragonal, having the angles rough; leaves lanceolate, lined, with rough margins; stipulas with ciliate, ciliated; whorls of flowers axillary, small, sessile and terminal; the latter about equal in size to the axillary ones, and girded by a 2-leaved involucrum. S. Native of Peru, about Lima and Huanaco, in waste places, ex Ruiz et Pav.; and of Brazil, on the road to Felisbert, ex Nees et Mart. nov. act. brn. 12, p. 11. Stem purplish. Leaves ovate, lanceolate. Calyx purplish. Corollas white or reddish. Said to be allied to S. Portoricensis.

**Compare Fuculi, per. 3, p. 23, t. 40.**

**Assurgent Button-weed.** Pl. 1 to ½ foot.

* * * *Species natives of Peru, Bogota, and Chili.

49 S. ? *INCONSCAMIA* (Bartl. in herb. Heinke, ex D. C. prod. 4, p. 557.) plant suffrutescent; branches ascending, somewhat hexagonal, glabrous at bottom, but clothed with powdery down at top; leaves linear-oblong, acuminate at both ends, glabrous, with scabrous edges; bristles of stipulas longer than the sheath; heads of flowers terminal, girded by 4-leaved involucrum; teeth of calyx 4, nearly equal, acuminate. S. Native of Peru, on the mountains. Branches truly tetragonal, but 2 of the sides are very narrow, and the other 2 are broader, convex, and almost keeled in the center of the convex part; therefore they are said to be somewhat hexagonal. The habit is that of Borreria, but the fruit is unknown.

**Inconspicuous Button-weed.** Shrub ascending.

50 S. ? *GRACILIS* (Ruiz et Pav. fl. per. 1, p. 61, t. 92, f. a.) plant herbaceous, glabrous; stem erect, tetraogal, slender branched; leaves lanceolate, acuminate, with scabrous margins; stipulas with ciliated, ciliated; whorls of flowers axillary and terminal, small, sessile; fruit hispid. S. Native of Chili, in humid places and about springs. Oldenlandia unifólia, Ruiz et Pav. fl. per. 1, p. 57. but not of Lim. Perhaps a true species of Spermáceae from the cells of fruit being 1-seeded.

**Slender-branched Button-wood.** Pl. ½ foot.

51 S. ? *OLDENLANDIA* (D. C. prod. 4, p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petiolo, shining; peduncles 1-flowered, solitary, fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia unifólia, Ruiz et Pav. fl. per. 1, p. 57. but not of Lim. Perhaps a true species of Spermáceae from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-wood.** Pl. creeping.

52 S. ? *MACRÓPHYLLA* (Wildl. in R¢m. et Schultes, syst. 3, p. 530. H. B. et Kunth, nov. gen. amer. 3, p. 349.) stem suffrutesce, procumbent, tetragonal, glabrous, with ciliately-arranged margins; stipulas downy, ciliated by bristles; heads of flowers lateral and axillary, pedunculate; limb of calyx tetragonally-
urceolate, sinuately-quadrifid. t. S. Native near Santa Fe de Bogota. Corolla, genitals, and fruit unknown.

Trailing Button-weed. Shrub procumbent. 53 S. ? ericióclada (D. C. prod. 4. p. 557.) plant suffruticeous, ascending; branches rather angular, clothed with hairy tomentum; leaves oblong, acuminate, very scabrous on both surfaces, almost veinless, with serrately scabrous edges, and sometimes mucronate at the apex; bristles of stipular glabrous, length of sheath, which is villous; heads of flowers terminal, girded by 4 leaves; teeth of calyx 4, equal; stamens exerted. t. S. Native of Peru. S. scabéríma, Bartl. in herb. Hsken, but not of Blume. Fruit unknown, and therefore the genus is doubtful.

The habit is that of Borréria.

Var. β. lineafólia (D. C. prod. 4. p. 557.) leaves linear, distinctly mucronate. t. S. Native of Peru.

***** Species natives of Guiana.

54 S. ? sexangula’ris (Aubl. guian. 1. p. 61. t. 22. f. 8.) plant glabrous, prostrate; stem flexuous, prostrate, hexagonal; leaves ovate, acute, petiolate; heads of flowers terminal; anthers in the throat.—Native of Guiana, on the banks of rivers. A hexágona, Willd. spec. 1. p. 569. Flowers small, blue. Perhaps a species of Borréria nearly allied to B. alátia.

Prostrate Button-weed. Pl. prostrate. 56 S. ? ran’táns (Aubl. guian. 1. p. 58. t. 20. f. 4.) glabrous; stem herbaceous, alternately branched, prostrate, radiant; leaves almost sessile, lanceolate, acute; flowers verticillate. t. S. Native of Guiana, on the banks of the river Oropu. The rest unknown.

57 S. ? coréle’xens (Aubl. guian. 1. p. 57. t. 19. f. 2.) stem simple, straight, tetragonal; leaves ovate, acute, rather hairy, smooth; bristles of stipular about equal in length to the flowers; flowers verticillate; stamens exerted.—Native of Guiana and Cayenne, on the edges of fields. Vahl. edcog. 1. p. 9. Corollas blue. Fruit unknown.

Bluish-flowered Button-weed. Pl. 1 to 2 feet. 58 S. ? latifólia (Aubl. guian. 1. p. 56. t. 19. f. 1.) glabrous; stem, erect, herbaceous, tetragonal; leaves ovate, acuminate, petiolate, short; bristles of stipular hispid, a little longer than the sheath; flowers axillary, verticillate; limb of calyx 4-toothed, rather villous, as well as the capsules, which are ovate.—Native of Guiana and Cayenne by way sides. Lam. ill. t. 62. f. 2. Probably a species of Borréria or Mitracárum. Flowers white.

***** Species natives of Mexico.

59 S. ? solo’cphala (Bartl. in herb. Henke, ex D. C. prod. 4. p. 558.) stem herbaceous, erect, branched, quadrangular, villous; leaves ovate-lanceolate, acuminate, pilose on both surfaces, veins with veins beneath; bristles of stipular longer than the sheath, hairy; heads of flowers terminal, nearly globose, girded by 4-leaved involucra; teeth of calyx subulate, nearly equal; stamens exerted.—Native of Mexico. Perhaps a species of Borréria.

Many-headed Button-weed. Pl. 2 to 3 feet. 60 S. ? echo’ides (H. B. et Kunth, nov. gen. amer. 3. p. 344.) stem herbaceous, tetragonal, erect, hispid; leaves lanceolate, acuminate, petiolate, hispid on both surfaces; stipular hispid, cilated by bristles; whorles of flowers nearly globose, axillary and terminal. t. S. Native of Mexico, near Campeche. There is a variety of this with glabrous stems, and narrower less hispid leaves.

Bugsés-like Button-weed. Pl. 61 S. ? diversifólia (H. B. et Kunth, nov. gen. amer. 3. p. 341.) plant glabrous, erect, with tetragonal branches, which are scabrous from retrograde bristles; leaves linear, with remotely scabrous serrated margins: the lower ones minute and oblong-elliptic; stipulas smoothish, fringed by bristles; heads of flowers terminal, calyx 2-4-toothed; capsules hispid. t. F. Native of Mexico. Knöxia simplex, Willd. in Ræm. et Schultes, syst. 3. p. 553. Perhaps a species of Borréria. Flowers white.

Diverse-leaved Button-weed. Pl. 62 S. ? reclína’ta (Nees, hor. berl. p. 50.) plant glabrous, ascending, herbaceous; leaves lanceolate, acute, smooth, veinless; stipulas downy, furnished with 5 bristles each; heads terminal, dense, hemispherical, supported by 2 leaves; calyx and fruit glabrous. t. S. Native of Mexico. Fruit unknown.

Reclinate Button-weed. Pl. ascending.

***** Species natives of North America.

63 S. ? las’a’ntha (Rafin. fl. lud. p. 76.) stem weak; branches diffuse; leaves sessile, oblong, acute, nerved; nerves scabrous; flowers verticillate; corolla woolly inside.—Native of Louisiana.

Woolly-flowered Button-weed. Pl. diffuse.

65 S. ? involúcrá’ta (Pursh, fl. amer. sept. 1. p. 105.) plant very hispid, herbaceous, erect; stem alternately branched; leaves ovate-lanceolate, acuminate, hairy on both surfaces; stipulas of many bristles; heads terminal, involucrated; tube of corolla very long; stamens exerted.—Native of Carolina. Flowers white. Leaves rather broad. According to Sprengel this is a variety of Crésea ribra. Fruit unknown.

Involutcrated-flowered Button-weed. Pl. 1 foot.

Cult. See Borréria, p. 618. for culture and propagation.

CLXXXVII. HEXASEPALUM. (from ié, hex, six, and σπαρτος, sepaton, an alteration of περαλος, a sepals; in reference to the limb of the calyx being 6-parted, indicating its being composed of six sepals). Bartl. in herb. Henke, ex D. C. prod. 4. p. 561. Lin. syst. Tétrándria, Monogy’nya. Calyx with an oblong obpyramidal tube, and a 6-parted limb; lobes narrow, nearly equal, acute, permanent. Corolla campanulate funnel-shaped, with an obconical tube, and 4 lanceolate acute lobes, which are valvate in aestivation. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, ribbed, divisible into 2 parts at the dissepiments: the dissepiment being double, both the parts of the fruit or nuts are closed, and 1-seeded.—A small ascending much branched glabrous shrub, with diffuse flexuous compressed branches. Leaves opposite, long-linear, acute, with the margins hardly scabrous. Stipulas sheathing, furnished with many bristles, which are equal in length to the sheath, intermixed with very short cilia. Flowers axillary, solitary, sessile, larger than in any other genus belonging to the tribe Spermáccceae.

1 H. angústífrólium (Bartl. l. c.) t. S. Native of Mexico,
in Real del Monte, where it was collected by Häneke. Leaves 1½ to 2 inches long, and a line broad. Corolla 6 lines long. Ovarium 3 lines long.

**Narrow-leaved Hexasepalum.** Shrub 2 to 3 feet.

Cult. See **Borreria**, p. 618. for culture and propagation.

**CLXXXVIII. DIOÉDIA** (from dǐos, dídōs, a passage; the greater part of the species grow by water sides, hence the name). **Lin. gen. no. 122.** Gartn. fruct. 1. p. 121. t. 25. Meyer, ess. p. 81. Cham. et Schlecht. in Linnæa. 3. p. 341. D. C. prod. 4. p. 561.—Diodia and Spermacoece species of authors.

**Linn. syst. Tetrandria, Monogynia.** Calyx with an obovate or ovate tube, which is usually 8-nerved; limb dentately parted; teeth sometimes 2, sometimes 4, equal or unequal, crassely disposed, rarely more than 4. Corolla funnel-shaped, with a 4-lobed limb. Stamens 4, exerted or inclosed. Style bifid or undivided. Fruit 2-celled, crowned by the calyx, divisible into 2 1-seeded indischant parts or nuts. Seeds erect in the cells, furrowed in the front.—Herbs or shrubs, all natives of America except one species. Branches terete or tetragonal. Leaves opposite, or falsely verticillate from axillary fascicles. Flowers small, white, disposed in various ways in the different sections.

**Sect. I. Eudiodia** (from eu, well, and Diodia; this section is considered to contain the true species of the genus). **D. C. prod. 4. p. 561.** Capsules crustaceous or somewhat fleshy; having the mericarps or nuts separate, without any dissepiment between them.—Flowers axillary, sessile, opposite; or 2 or more on each side verticillate.

1 **D. virginica** (Lin. spec. 151.) glabrous in every part; stems procumbent, nearly terete; leaves lanceolate; lobes of stipulas linear-subulate; corolla less hairy inside; fruit ovate-oblong, glabrous, crowned by the 2 lanceolate lobes of the calyx. *F.* Native from Virginia to Carolina, in humid sandy places. Jacq. icon. rar. 1. t. 29. Lam. ill. t. 63. Pursh, fl. sept. amer. 1. p. 105. Stems reddish, smooth. Flowers white.

**Hairly Diodia.** Fl. procumbent. 4 **D. simplex** (Swartz, fl. ind. occ. 1. p. 226.) stems herbageous, erectish, smooth, simple; leaves oblong-lanceolate, glabrous; lobes of stipulas linear-subulate; fruit ovate-oblong; limb of calyx bidentate: teeth linear. *F.* Native of Jamaica, on the higher mountains. Leaves ciliated on the margins while young. Flowers sessile, solitary, axillary, white.

**Simple-stemmed Diodia.** Fl. 1 to 1½ foot. 5 **D. verticillata** (Vahl. symb. 2. p. 28.) glabrous; stem herbageous, simple, erect, smooth; leaves lanceolate, attenuated at both ends, with scabrous margins; stipulas ciliated; flowers verticillate; fruit linear, crowned by the 2 calyceal teeth.—

Native of the Island of Santa Cruz. The leaves are said to be in whorles within the stipulas, hence they are probably in axillary fascicles. Flowers white, in axillary and terminal whorls: the latter the largest. It is probably a species of **Borreria** from the terminal whorl of flowers being larger than the axillary ones.

6 **D. villosa** (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 562.) stem herbaceous, deinate, tetragonal, villous; leaves lanceolate, acuminate, scabrous above and on the margins, hairy beneath, and obliquely nerved; bristles of stipulas scabrous, longer than the sheath; whorles axillary, sessile, 10-12-flowered; fruit ovate, easily separated into 2 parts, crowned by the 2 teeth of the calyx.—Native of New Spain. Spermacoece declinita, Pavon, ined. Habit of *Spermacoece tenuior*, but the fruit is composed of 2 indehiscent nuts, each crowned by one calyceal tooth.

**Villos Diodia.** Fl. procumbent.

**Vilous Diodia.** Fl. procumbent.

**Calyx 4-toothed.**

7 **D. teres** (Walt. cart. p. 87.) stem terete, velvety, procumbent; leaves linear-lanceolate, clothed with velvety down; lobes of stipulas setaceous, longer than the fruit; corolla bearded inside; fruit ovate, downy, crowned by the 4 lanceolate calycine lobes. *F.* S. Native of the banks of the Orinoco, near San Borja in hot places. Spermacoece hyssopifolia, H. B. et Kunth, nov. gen. amer. 3. p. 342. Wild, in Rœm. et Schultes, syst. 3. p. 533. Said to be allied to **D. teres**. Flowers white.

**Hyssop-leaved Diodia.** Shrub.

8 **D. hyssopus-dioidea** (Cham. et Schlecht. in Linnæa. 3. p. 342.) plant suffruticose, branched; branches nearly terete, hairy; leaves linear, acute, glabrous, glaucenscent; bristles of stipulas equal in length to the fruit; whorles usually 6-flowered; fruit ovate-turbinate, downy. *F.* Native on the banks of the Orinoco, near San Borja in hot places. Spermacoece hyssopifolia, H. B. et Kunth, nov. gen. amer. 3. p. 342. Wild, in Rœm. et Schultes, syst. 3. p. 533. Said to be allied to **D. teres**. Flowers white.

**Var. β, longitesta** (D. C. prod. 4. p. 562.) bristles of stipulas longer than the sheath; branches hispid. *F.* S. Native of Mexico. D. prostrata, Bartl. in herb. Häneke, ex D. C. l. c. **Prostrate Diodia.** Fl. June, July. Clt. 1818. Sh. prostrate. 9 **D. Domíngos-sis** (D. C. prod. 4. p. 563.) glabrous; branches and stems procumbent, tetragonal, filiform; leaves linear, with revolute margins; bristles of stipulas stiff.—Native of St. Domingo, where it was collected by Bertero. Diodia prostrata, ex Hispaniola, Spreng. syst. 1. p. 406. Flowers and fruit unknown, and therefore the genus to which it belongs is doubtful. Nearly allied to **D. prostrata**.

**St. Domingo Diodia.** Shrub procumbent.

10 **D. Domíngos-sis** (D. C. prod. 4. p. 563.) glabrous; branches and stems procumbent, tetragonal, filiform; leaves linear, with revolute margins; bristles of stipulas stiff.—Native of St. Domingo, where it was collected by Bertero. Diodia prostrata, ex Hispaniola, Spreng. syst. 1. p. 406. Flowers and fruit unknown, and therefore the genus to which it belongs is doubtful. Nearly allied to **D. prostrata**.

**Climbing Diodia.** Shrub el. 8 to 10 feet.
12 D. sarmentosa (Swartz, fl. ind. occ. 1. p. 231.) stem climbing, suffruticulose, tetragonal, villous, particularly on the angles; leaves oval-oblong, acute, seafurrows from muricia, rugosely nerved in the adult state; bristles of stipulas stiffish; fruit oval, rather tetragonal, crowned by the 4 lanceolate teeth of the calyx. ʃ. S. Native of Jamaica, Porto-Rico. Many-bristled Diodia.

19 D. martima (Schum. pl. guin. p. 75.) stems prostrate, tetragonal, with furrowed sides, and seafurrows angles; leaves oval or oblong, having the margins seafurrows from serratulations, rather downy or hairy on both surfaces; bristles of stipulas stiffish; fruit oval-oblong, crowned by the 4 lanceolate teeth of the calyx. ʃ. S. Native of Guinea, along the coast in the sand. Flowers white.

Var. β. commutata (D. C. prod. 4. p. 564.) leaves glabrous on both surfaces. ʃ. S. Native of Porto-Rico, in the sand by the sea side, where it was collected by Bertero and Wydler. Spermacoce commutata, Schultes, mant. 3. p. 208. There are varieties of this plant with either elongated or tufted branches, and having the axils of the leaves naked, or bearing fascicles of leaves or branches, and with the leaves flat, or nervously furrowed.

Sea-side Diodia. Pl. prostrate.

20 D. rigida (Cham. et Schlecht. in Linnaea. 3. p. 341.) stem suffruticulose, creeping, quadrangular, hairy; leaves lanceolate, piliferous at the apex, stiff, with serratulated margins, hairy beneath; stipulas hairy, ciliated at the apex; fruit obovate, glabrous, crowned by the 4 linear-subsatile teeth of the calyx. ʃ. S. Native of the Spanish Main, near Caraccas; of St. Domingo; Brazil, in the province of Para, and of the Society Islands. Spermacoce rigida, H. B. et Kuntz, nov. gen. am. 3. p. 342. Sperm. apiculata and Sperm. rigida, Willd. in Schultes, syst. 3. p. 531. Sperm. setosa, Willd. herb. but not of Schultes. Flowers white.

Stiff Diodia. Shrub creeping.

21 D. articulata (D. C. prod. 4. p. 564.) glabrous; stem shrubby, terete, nodose; leaves linear, acute at both ends, with rather revolute edges, also smooth on the margin and mid-rib; bristles of stipulas stiff, shorter than the sheath; whorles 6-8-flowered; fruit obovate-oblong, crowned by the 4 calyceal teeth. ʃ. S. Native of Brazil, where it was collected by Pohl. Spermacoce articulata, Pohl, in litt. Leaves in axillary fascicles, hence they appear in whorles, very like those of Hipparis.

Jointed-stemmed Diodia. Shrub.

22 D. rosmarinifolia (Pohl, in litt. ex D. C. prod. 4. p. 564.) stem herbaceous, erect, simple, terete, hairy; leaves linear, ending in a long hair each, with rather revolute edges, glabrous, but seafurrows from serratulations on the margins and nerve below; bristles of stipulas very long; fruit oval, crowned by the 4 calyceal teeth. O. F. Native of Brazil, where it was collected by Pohl. This is a very distinct species, having the ciliate of the stipulas half an inch long, about half the length of the leaves.

Rosemary-leaved Diodia. Pl. ʃ to ʃ feet?

23 D. arenosa (D. C. prod. 4. p. 564.) stem decumbent, branched, tetragonal, rather seafurrows above; leaves lanceolate-linear, sessile, acuminate, with revolute edges, rather seafurrows on both surfaces; bristles or cilia of stipulas longer than the sheath; whorles 8-10-flowered; fruit obovate-globose, seafurrows from down, crowned by the 4 calyceal teeth. ʃ. S. Native of Brazil. Spermacoce arenosa, Pohl, in litt. Nuts of fruit in-destitute. If Spermacoce ciliaris, Pav. in herb. Moric, be the same it is also a native of New Spain.

Sand Diodia. Pl. decumbent.

24 D. multiflora (D. C. prod. 4. p. 564.) stem and branches long and twiggy, compressely tetragonal, hairy; leaves lanceolate, sessile, acute, lined, beset with stiff villi on both sur-
faces; bristles of stipulas longer than the sheath, reflected under the heads of flowers; whorles 15-20-flowered, nearly in all the axis; fruit obovate, rather downy, crowned by the 4 calicyc
teeth. —Native of Brazil. Fruit easily separated into 2 parts; the parts or nuts closed.

Many-flowered Diodia. Pl. 25 D. muriculata (D. C. prod. 4. p. 564.) stem ascending; branches tetragonal, hairy; leaves sessile, ovate, cuspidate, re
flexed below the whorles of flowers, beset with strigae above, and vili on the nerves beneath; bristles of stipulas longer than the sheath; fruit nearly globose, downy, crowned by the 4 calicyc
teeth. ñ. S. Native of Brazil, about Bahia, in dry places. Allied to D. multiflora.

Muriculata Diodia. Pl. ascending.

26 D. discolor (D. C. l. c.) stem suffruticoso, downy, rather ascending, tetragonal; leaves lanceolate, acuminate at both ends, glabrous, rough, canescent beneath; bristles of stipulas 7-11, ciliated; fruit hairy, brittle, crowned by the 4-5 hispid teeth of the calyx. ñ. S. Native of Surinam. Spermacoea discolor, E. Meyer, nov. act. bonn. 12. p. 786. Flowers white. Allied to D. râdula, but distinct, ex Cham. et Schlecht. in Linnæa. 3. p. 342.

Discoloured-leaved Diodia. Shrub 1 to 1½ feet.

27 D. hispidula (A. Rich. in herb. mus. Par. ex D. C. prod. 4. p. 565.) stem erect, tetragonal, glabrous; leaves oblong-lanceolate, acute, glabrous; bristles of stipulas 7, stiff, straight, longer than the sheath; spikes many, interrupted, at the tops of the branches, with hardly any leaves; flowers 2-4 in a kind of whorl, sessile at the stipules; tube of calyx scabrous from bristles; lobes of calyx 4, 2 of them longer than the other 2; nuts or mericarps rather membranous, closed, one of which bears 3 of the calyceal lobes, and the other only one. —Native of Brazil.

Hispid Diodia. Pl. 1 to 2 feet?

28 D. radicans (Cham. et Schlecht. in Linnæa. 3. p. 350.) stem radicant, oppositely branched, tetragonal, glabrous; leaves lanceolate, acute, obliquely nerved, smoothish, pale beneath; fruit ovate, sessile, crowned by the 4 lanceolate lobes of the calyx. ñ. S. Native of St. Domingo, where it was collected by Poiteau. Spermacoe radicans, Willd. herb. but not of Aubl. Flowers large, axillary, solitary, white?

Rooting Diodia. Shrub creeping.

*** Calyx 5-10-toothed.

29 D. râdula (Cham. et Schlecht. in Linnæa. 3. p. 342.) stem herbaceous, weak, tetragonal, smoothish; leaves ovate-lanceolate, acute, lined, scabrous above, and downy on the nerves beneath; stipulas downy, ciliated; whorles 6-10-flowered; calyx unequally 5-10-toothed, ciliated; fruit didymous. ñ. S. Native of Brazil, in the provinces of Para and Rio Janeiro. Spermacoe râdula, Willd. in Röm. et Schultes, syst. 3. p. 531. This probably belongs to a different genus from the calyx.

Râsp-leaved Diodia. Pl. 3 feet.

Sect. II. Dasycephala (from òasè, dasys, thick, and kephale, kephale, a head; the flowers are disposed in dense thick heads). D. C. prod. 4. p. 565. Capsules membranous, having the mericarps or nuts probably subdehiscent inside at length. Flowers disposed in heads. —This is probably a section of the genus Borrêria, or a proper genus.

30 D. falustris (Cham. et Schlecht. in Linnæa. 3. p. 347.) stem herbaceous, glabrous, erect, simple, tetragonal, with winged scabrous angles; leaves elliptic, rather cuneate, obtuse, but apiculate; bristles of stipulas 7-9, long; heads of flowers axillary, rather pedunculate; limb of calyx 4-toothed. ñ. S. Native of Brazil. Flowers white.

Marsh Diodia. Pl. 1 to 2 feet.

31 D. dasycéphala (Cham. et Schlecht. l. c. p. 348.) plant glabrous, herbaceous, ascending, rather woody at the base; branches tetragonal; leaves lanceolate, on short petioles, rather glaucescent, with scabrous margins; bristles of stipulas 5-7, hardly longer than the sheath; heads terminal, globose, girdled by 4 leaves; calyx hairy, bidentate. ñ. S. Native of the south of Brazil. Flowers white.

Thick-headed Diodia. Pl. ñ. S. 1 to 1 foot.

32 D. alta (Nees et Mart. nov. act. bonn. 12. p. 11.) stem erect, glabrous, dichotomous at the base, tetragonal; angles membranous, spinulose; leaves ovate, cuspidate, glabrous, with scabrous edges; bristles of stipulas 7-8, long; whorles of flowers terminal, naked, globose; fruit obvolute, crowned by the 2 ob-long-lanceolate teeth of the calyx. ñ. S. Native of Brazil, about the river Ilheos. Probably a species of Borrêria.

Winged-stemmed Diodia. Pl. ñ. S. 1½ foot.

33 D. bocone (Cham. et Schlecht. in Linnæa. 3. p. 347.) plant suffruticoso; branches quadrangular, scabrous; leaves oblong-lanceolate, glabrous, serrulate on the margins, and on the middle nerve beneath; heads of flowers terminal, rarely nearly axillary; fruit glabrous, obovate, crowned by the 4 scabrous teeth of the calyx. ñ. S. Native near the town of Santa Fe de Bogota. Spermacoe Bogotensis, H. B. et Kunth, nov. gen. amer. 3. p. 347. Willd. in Röm. et Schultes, syst. 3. p. 530. Corolla white, having the throat, and upper part of the tube bearded.

Bogéle Diodia. Shrub procumbent.

34 D. jenneri (D. C. prod. 4. p. 565.) plant decumbent or ascending, much branched; glabrous; stem tetragonal, scabrous along the angles; leaves oblong-linear, acuminated, glabrous, opposite, or falsely verticillate; bristles of stipulas longer than the sheath; heads of flowers terminal, girdled by 4 leaves; fruit oval-oblong, glabrous, crowned by the 4 teeth of the calyx.

—Native of Mexico, at the Cordillera de Cuchilagua, where it was collected by Berlandier. Perhaps the immature fruit is indehiscent. Probably a species of Borrêria.

Indecorous Diodia. Pl. decumbent.

Cult. —For culture and propagation see Borrêria, p. 618.

CLXXXIX. TRIODON (from òrêcès, treis, three, and circuit oòct ores, odou odontos, a tooth; the axis remains after the nuts of the fruit have fallen, and is tridentate at top). D. C. prod. 4. p. 566. —Diodia species. Cham. et Schlecht. in Linnæa. 3. p. 343.

Lin. syst. Tetrândria, Monogy'nia. Calyx with a turbinated tube, and a 2-4-toothed limb, and sometimes with accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bifid. Capsule characeeous, 2-celled, crowned by the calyx, containing 2 indehiscent 1-seeded nuts; having the axis, along with the lateral nerves, remaining after the nuts have fallen, and therefore the axis appears tridentate.—Much branched glabrous shrubs, natives of Brazil, with acutely tetragonal branches. Leaves opposite and falsely verticillate, oblong or linear; floral ones small. Flowers axillary or terminal at the tops of the branches, small, disposed in spikes or fascicles. It differs from Diodia in the axis of fruit being permanent and tridentate; and in habit.

1 T. Anthospermoïdes (Cham. et Schlecht. in Linnæa. 3. p. 343. under Diodia) shrubby, much branched, glabrous, downy at top while young; branches acutely tetragonal; leaves sessile, linear, acute, opposite, or falsely verticillate; bristles of stipulas longer than the sheath; flowers usually by threes in the axis of the upper leaves, and appear almost spicate from the upper leaves being nearly abortive; calyx hairy, with many teeth. ñ. S. Native of Equinoctial Brazil.

Anthospernum-like Triodon. Shrub.
2 T. GLOMERATUS (D. C. prod. 4. p. 566.) shrubby, much branched, glabrous; branches acutely tetragonal; leaves oblong-linear, opposite, and falsely verticillate; bristles of stipulas short; flowers disposed in fascicles at the tops of the branches; teeth of calyx 4, on the top of the fruit, 2 large, and 2 nearly obliterated. ☞ S. Native of Brazil. Diodia Brasilensis, Sprague, s. 1. p. 406. Rubia glomerata, Pohl, in litt. Nearly allied to T. polymorpha, var. a., but differs in the bristles of the stipulas being one-half short, in the branches being glabrous, and in the flowers being in terminal fascicles.

Glosemated-flowered Triodon. Shrub.

3 T. POLYMORPHA (Cham. et Schlecht. in Linnaea. 3. p. 344. under Diodia) shrubby, much branched, glabrous; branches tetragonal; leaves petiolate, oblong-linear, opposite, and falsely verticillate; bristles of stipulas rather longer than the sheath; flowers axillary and terminal, few; calyx bidentate, and sometimes with 2 accessory teeth. ☞ S. Native of Brazil. Fruit as in T. anthospermoïdes, to which it is very nearly allied.

Var. a, microphyllus (Cham. et Schlecht. l. c.) tops of plant downy; leaves smaller and firmer; calyx hairy, 4-toothed. ☞ S. Native of Brazil, in the province of Rio Janeiro, in dry, exposed places.

Var. b, intermedius (Cham. et Schlecht. l. c.) smoothish; leaves flat, softish; calyx glabrous, 4-toothed. ☞ S. Native of the south of Brazil.

Var. γ, macrophyllus (Cham. et Schlecht. l. c.) glabrous; internodes elongated; leaves flat, thinner and larger; calyx glabrous, bidentate. ☞ S. Native of the south of Brazil.

Polyrmorphus Triodon. Shrub 1½ foot.

Cult. The species of Triodon will grow in any good, light soil; and cuttings of them will strike root readily in the same kind of soil, under a hand-glass in heat.

Lin. syn. Tetrandria, Monogynia. Calyx with a didymous, ovate tube, and with the limb contracted at the base, and profoundly cleft at the apex, but not parted; lobes 4, linear-subulate, elongated, hairy, and 4 small accessory ones between these. Corolla salver-shaped, with a long tube, which is oboconical at the apex; a naked throat, and a 4-lobed limb. Stamens exerted. Style longer than the stamens, bifid at the apex. Fruit composed of 2 indehiscent, 1-seeded nuts, which at length separate from the axis, which is permanent, flat, membranous, and retaining the calyx at its apex.—Herbs which are sometimes suffruticose at the base, erect or ascending. Leaves opposite, ovate-lanceolate. Stipulas sheathing, ciliated with bristles. Flowers red, disposed in capitately terminal umbels, which are girded by involucra.

1 C.CALEOPHILA (D. C. prod. 4. p. 567.) stem terete, herbaceous, villous; leaves oblong-lanceolate, acuminate, with rather oblique nerves, of which 2 rise near the base on both sides; bristles of stipulas 7-9, hispid. ☞ H. Native of Mexico. Spermacoce capitata, Mol. et Sesse. fl. mex. icon. ined. but not of fl. per. Spermacoe hirta, Pav. ined. but not of Lin. Stamens longer than the lobes of the corolla. Corolla 4 lines long, red.

Beautiful-headed Crusea. Pl. 2 feet.

2 C. RUBRA (Cham. et Schlecht. in Linnaea. 5. p. 165.) stem tetragonal, herbaceous, hispid; branches opposite; leaves ovate, acuminate, hairy, with the nerves oblique on both sides of the mid-rib; bristles of stipulas 7-9, hispid. ☞ H. Native of Vera Cruz and Cuba. Crucianella hispida, Mill. dict. no. 4. Spermacoe rubra, Jacq. horst. schonbr. 3. p. 3. t. 256. Spermacoe longiflora, H. B. et Kunth, nov. gen. amer. 3. p. 271. Spermacoe strigosa, Sims, bot. mag. t. 1558. but not of Thumb. Spermacoe rubra and S. strigosa, Poir. Schultes. Flowers red or purple.

3 C. cocinea (D. C. prod. 4. p. 567.) stem tetragonal, suffruticos at the base, glabrous; leaves ovate-lanceolate, acuminate, petiolar, glabrous, with 3 nerves on both sides of the mid-rib; bristles of stipulas 3, glabrous, the middle one the longest. ☞ S. Native of New Spain. Spermacoe cocinea, Pavon, in herb. Dunant. Corollas scarlet, larger than in any other plant belonging to the tribe Spermacoeæ; it is even an inch long. Alabastra and lobes of the corolla beset with bristles on the outside; the rest of the corolla glabrous. Style exerted beyond the tube of the corolla. Fruit unknown; but the plant agrees in habit with the other species of the genus.

Sertis-flowered Crusea. Pl. 1 to 2 feet.

4 C. BRACHYPHYLLA (Cham. et Schlecht. in Linnaea. 5. p. 165.) stem nearly terete, fustular, clothed with rather retrogade hairs; leaves broad-ovate, on short petioles, of a different colour beneath, beset with scattered hairs above, and along the nerves beneath; heads of flowers terminal, involucrated by leaves; lobes of calyx triangular.—Native of Mexico, on Serra Colorado, where it was collected by Schiede and Deppe. Nearly allied to C. rubra, but differs in the characters indicated above, and in the fruit being much smaller, and nearly terete, not glosose. Flowers red, smaller and shorter than in C. rubra.

Short-leaved Crusea. Pl. 2 feet.

Cult. The annual species should be treated as other tender annuals, by being raised in a frame, and afterwards planted out in the open ground in May. The shrubby species should be treated in the manner recommended for Triodon above.

Lin. syn. Tri-HEXANDRIA, Monogynia. Calyx with a subglobose tube, and a 6-7-parted limb; teeth or lobes unequal, without any accessory ones. Corolla funnel-shaped, with an obconical tube, and a spreading, 3-6-lobed limb; lobes valvate in aestivation. Stamens equal in number to the lobes of the corolla; filaments exerted. Style 3-4-cleft at the apex. Stigmas rather capitate. Capsule containing 3-4 indehiscent, membranous, 1-seeded nuts, crowned by the permanent calyx, which at length becomes circumseised at the base, and falls off, leaving the nuts naked. Seeds peltate. Albumen between fleshy and horny.—Diffuse, decumbent herbs, natives of America. Roots almost simple, rather woody, with thick bark, which is wrinkled transversely; those of many of the species are used in various parts of the world as substitutes for Ipecacuanha. Leaves opposite, ovate. Stipulas of many bristles. Flowers capitate at the tops of the branches, each head involucrated by the 4 uppermost leaves.

§ 1. Calyx 6-7-lobed.

1 R. SCA'BRA (St. Hil. pl. us. bras. 8. t. 8. Mart. spec. med. bras. p. 10. t. 9. f. 13. root.) stems hairy; leaves ovate, or ovate-lanceolate, rarely oblong, acutish, with scabrous margins; bristles of stipulas shorter than the sheath; heads many-flowered; lobes of calyx triangular, ciliated; segments of 4 l 2.

2 R. rosea (St. Hil. pl. us. bras. no. 7. t. 7.) stems hispid, very hairy at the tops; leaves ovate-lanceolate, acumenately acute, with scabrous margins; bristles of stipulae longer than the sheath; heads few-flowered; lobes of calyx 6, linear, rather hispid; corolla ventricose, having the segments pilose on the outside.  

3. S. Native of Brazil, in dry, sandy places. R. emetica, Mart. spec. med. bras. p. 11. t. 9. f. 19. Cham. et Schlecht. in Linnæa. 3. p. 331. R. rosea and R. emetica, Schultes, syst. 7. p. 87. Corolla rose-coloured, 3 times longer than the lobes of the calyx. Roots black, twisted, and are used as a substitute for Ipecacuanha in the neighbourhood of Joao del Rey, in Brazil, where it is cultivated in great quantities for that purpose, under the name of Poaya do Campo, and are, along with the roots of R. scabra, imported into Europe.

Rose-flowered Richardsonia. Pl. procumbent.

3 R. grandiflorà (Cham. et Schlecht. in Linnæa. 3. p. 351.) plant ascending; stems hispid from bristles; leaves lanceolate, acute, scabrous from bristles; bristles of stipulae rather longer than the sheath; heads few-flowered; segments of the calyx lanceolate, acuminate; corolla glabrous.  

Great-flowered Richardsonia. Pl. procumbent.

5 R. lateráalis (D. C. prod. 4. p. 568.) erect, stem hispid from spreading hairs; leaves oblong-lanceolate, mucrinated above, and pilose beneath; bristles of stipulae longer than the sheath; heads of flowers small, 3 times shorter than the bracteas, which are ovate-lanceolate, and hispid beneath the base; lobes of calyx 6, subulate, longer than the tube.  

6. S. Native of Brazil, where it was collected by Pohl. Spermacéce late- rális, Pohl, in litt. Very nearly allied to R. divérgens, but the fruit is unknown, and is therefore a doubtful species of the genus.

Lateral Richardsonia. Pl. 1 to 2 feet.

5 R. divérgens (D. C. prod. 4. p. 568.) plant erect, hispid from bristles in every part; leaves linear-lanceolate, acuminate; bristles of stipulae longer than the sheath; heads small, 3 times shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly mucrinated nuts.  

7. S. Native of Brazil, Pohl; and near Bahia, in cultivated places, Salzmann. Spermacéce divérgens, Pohl, in litt. Corolla white.

Divérgens Richardsonia. Pl. 1 to 2 feet.

6 R. spársa (D. C. prod. 4. p. 568.) the whole plant hispid from bristles; branches trichotomous; leaves linear-lanceolate, acuminate; bristles of stipulae equal in length to the sheath; heads either from the forks of the branches or from their tops; the latter one-half shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly mucrinated nuts.  

7. S. Native of Brazil, Pohl; at Bahia, in dry pastures, Salzmann. Spermacéce spársa, Pohl, in litt. Flowers white.

Scattered Richardsonia. Pl. 1 to 2 feet.

§ 2. Calyx 4-lobed, very rarely 3-5-lobed.

7 R. stella’ris (Cham. et Schlecht. in Linnæa. 3. p. 352.) plant decumbent, twisted; stem hairy; leaves lanceolate, acuminate, hairy; bristles of stipula 5, much longer than the sheath; heads hemispherical; segments of the calyx 4, oblong; corolla glabrous, about equal in length to the calycine teeth.  

8. S. Native of Brazil, in the province of Cisplatine. Flowers 3-4-petalled, white?

Starry Richardsonia. Pl. decumbent.

9 R. adscéndens (D. C. prod. 4. p. 549.) stems ascending, villous; leaves oblong, attenuated at both ends, scabrous from pubescence on both surfaces; heads terminal, on long peduncles; leaves of involucre ovate, hardly exceeding the flowers; calycine segments 5, acute; corolla tubular, oblong lanceolate, shorter than the lobes of the calyx.  

10. S. Native of Mexico. Spermacéce adscéndens, Pav. in herb. Moric. Richárdia villosa, Moc. et Sesse. Pl. mex. icon. ined., in which the corolla is more coloured.

Trailing Richardsonia. Pl. trailing.

11 R. alsénse (D. C. prod. 4. p. 569.) stems trailing, flexuosus; stems clothed with canescent hairs; leaves ovate-lanceolate, acute, clothed also with canescent hairs; bristles of stipulae 3-6, equal in length to the sheath; heads hemispherical; segments of calyx 4, oval; corolla glabrous, rather longer than the lobes of the calyx.  

12. S. Native of Brazil, in the province of Monte Video. Flowers small, tetramerous and pentamerous.

Ascending Richardsonia. Pl. ascending.

10 R. Henkea’na (D. C. prod. 4. p. 569.) stems trailing, tufted, twisted, creeping, suffrutescous, hairy; leaves oblong, villous; bristles of stipulae shorter than the sheath; heads of flowers flat-topped; lobes of calyx 4, ovate, acutish; corolla subrotate.  

13. S. Native of Mexico, where it was collected by Kunth. Schielea mexicana, Bartl. in herb. Henke.

Henke’s Richardsonia. Pl. trailing.

Cult. The species of this genus will thrive in any light soil; and cuttings of them strike root readily in the same kind of soil, under a hand-glass, in a little heat.

Lin. syst. Tétrandria, Monogynia. Calyx with an ovate, rather ribbed tube, and 4 small unequal teeth, which are permanent, and erectly coniverted on the fruit. Corolla salver-spatulate, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stigma 2-lobed. Fruit 2-celled, usually separated from the base to the apex at the dissepiment into 2 pendulous, 1-seeded nuts, which are oblong, 2-angled, united at the base, and separating slowly, having the axis filiform, and remaining as in umbeliferous plants. Seeds ovate, triquetrous, erect. Albumen fleshy. Embryo erect—Herbs or sub-subspecies, natives of the East Indies. Stems terete or tetragonal. Leaves opposite, and falsely verticillate from axillary fascicles. Stipulas undivided, or of few bristles, joints with the base of the petioles. Cymes as in the plants belonging
to the order Valerianaceae, terminal, sessile, or pedunculate, having their branches becoming elongated and spike-formed, after flowering.

1. **K. Zeltiana** (Lin. spec. p. 151.) stem erect, glabrous, nearly terete; leaves lanceolate, almost sessile, glabrous; branches of cyme 1-2, very long, spicate, erect; tube of corolla much longer than the calycine tooth; throat of corollas bearded; stigmas exserted.—Native of Ceylon. Burn. fl. ind. 34. t. 13. f. 2. Lam. ill. t. 59. f. 1. Corolla 6 lines long. Fruit easily separated into 2 parts from the base.

2 **K. Sumatranes** (D. C. prod. 4. p. 569.) stem suffruticoso, erect, tetragonal, tomentose; leaves lanceolate, remote, villous, on short petioles; corollas terminal, compound; tube of corolla gibbous, short. ́S. Native of the East Indies, among the Circars, and probably of Sumatra and Velore, as well as of Nipal and Kamaon. Spermacoce Sumatrensis, Retz., obs. 4. p. 23. Rxb. fl. ind. 1. p. 372. Knoxia stricta, Garr. f. 1. p. 122. t. 25. Knoxia corymbosa, Wildl. spec. 1. p. 582. but the fruit is not separable into 2 parts as in the following. Knoxia mollis, R. Br. in Wall. cat. no. 820. Flowers small, white.

**Sumatra Knoxia.** Fl. July, Aug. Clt. 1818. Sh. 2 to 3 ft.

3 **K. Tereus** (D. C. l. c.) stem suffruticoso, erect, branched, terete, villous; leaves lanceolate, villous; corollas terminal, compound, with opposite branches, which at length become spike-formed; tube of corolla terete, straight, with the throat very villous, and hiding the anthers; style twice the length of the corolla. ́S. Native of the East Indies, in woods at Koorg. Spermacoce tereus, Rxb. fl. ind. 1. p. 375. K. umbellata, Banks, herb. ex Rxb.

4 **K. Excelsa** (D. C. l. c.) stem suffruticoso, stiff, villous in the younger parts; leaves lanceolate, petioleate, remote; corollas terminal, compound; stamens exserted; style bifid, exserted; fruit ovate, hardly separable into 2 parts. ́S. Native of the East Indies, on the Circaems, and of Nipal. Spermacoce excelsa, Rxb. fl. ind. 1. p. 374. This is only, perhaps, a var. of K. tereus, according to Rxb.

**Excelsa-stemmed Knoxia.** Shrub 1 foot.

**Glabrous Knoxia.** Shrub 1 foot.

7 **K. Heyneana** (D. C. prod. 4. p. 570.) stem absolutely tetragonal, rather rough; leaves lanceolate, ribbed, with secedod margins, rough from dots on both surfaces; corollas terminal, trichotomous.—Native of the East Indies. Knoxia species, Heyne. Spermacoce corymbosa, Roth, nov. spec. p. 98. Ræm. et Schultes, syst. 3. p. 278. but not of Lin. nor Burn. Very nearly allied to **K. Sumatrensis.**

**Heyne’s Knoxia.** Pl. 1 foot.

8 **K. Lineata** (D. C. l. c.) downy; stem herbaceous, branched a little, erect, villous; leaves ovate-lanceolate, with parallel veins; bristles of stipulas pilose; cymes corymbose, pedunculate, tripartite, axillary, and terminal; stamens inclosed. ́O.? ́S. Native of Java, among grass, about Ropmien. Spermacoe lineata, Blum. bijdr. p. 947. but not of Rxb.

**Lined-leaved Knoxia.** Pl. 1 foot.

9 **K. Wightiana** (Wall. cat. no. 6184.) plant glabrous; stem and branches slightly tetragonal; leaves lanceolate, mucronate, almost sessile; corollas terminal, compound, with spike-formed branches. ́S. Native of the East Indies. Spermacoce, Wight, herb.

**Wight’s Knoxia.** Shrub 2 to 3 feet.

10 **K. Plantaginea** (Wall. pl. rar. asiat. 1. t. 22.) stems herbaceous, almost simple, rising in numbers from the root, which is fusiform: radical leaves long-lanceolate, pilose; calyces one-lined, narrower; flowers terminal, sub-capitate; one or two of the calycine teeth are elongated; tube of corolla very long. ́S. Native of the Burmese Empire, on the mountains. Flowers blue.

**Plantain-like Knoxia.** Pl. 1 to 2 feet.

**Cult.** For culture and propagation see Græse, p. 627.

**CXCIII.** **PSYLLOCARPUS.** (from ψυλλος, πεύλος, a flea, and κορπος, καρπος, a fruit; in allusion to the colour and shape of the seeds.) Mart. nov. gen. et spec. bras. 1. p. 44. t. 28. D. C. prod. 4. p. 570. but of Pohl.

**Lin. syst.** Tetrandria, Monogyne. Calyx with a tubular tube, and an 8-toothed limb; teeth subulate, 6 of which are very short, and the other 2 opposite, linear, and elongated. Corolla funnel-shaped, with a bearded throat, and a 4-lobed achene limb. Anthers 4, inclosed. Stigma emarginately 2-lobed. Capsule crowned by the teeth of the calyx, compressed from the back of the carpels, 2-celled, having the dissepiment parallel with the valves; cells 1-seeded. Seeds oval, or orbicular, winged, much compressed, fixed to the centre of the dissepiment. Embryo straight, in the axis of thin albumen.—Small Brazilian shrubs, with twiggy, tetragonal branches. Leaves opposite, and often fasciculately verticillate from clusters of the leaves in the axis of the opposite ones. Stipulas joined with the petioles, forming a sheath, ciliate with bristles. Flowers axillary or terminal.

1 **P. Ericoides** (Mart. l. c. p. 45. t. 28. f. 1.) suffruticoso, almost simple at the bottom, glabrous; leaves 8-12, verticillate, shorter than the internodes; flowers terminal, sub-capitate. ́S. Native of Brazil, in the province of Minas Geraes, at Bandeinha, near Tejucu. Branches slender, twiggy. Corollas pale blue. Calyx glabrous.

**Heath-like Psychocarpus.** Shrub 1 to 2 feet.

2 **P. Laricoides** (Mart. l. c. p. 45. t. 28. f. 2.) a much-branched, glabrous shrub; leaves opposite, approximate, setaceous, clustered in the axis, and therefore falsely verticillate; flowers terminal, disposed in something like spikes. ́S. Native of Brazil, in the provinces of Minas Geraes and Bahia, in dry mountainous places. Cham. et Schlecht. in Linnaea. 3. p. 557. P. laricinum, Spreng. curr. post. p. 39. Branches erectly spreading. Corollas pale blue. Calyx glabrous.

**Var. β. densiflora** (Mart. l. c.). ́S. Native of Brazil, on Serra de Itambe.

**Larch-like Psychocarpus.** Shrub 1½ to 2 feet.

3 **P. Asparagoides** (Mart. l. c. p. 46.) a glabrous shrub, with twiggy branches; leaves disposed in verticillate fascicles, very slender, and setaceous; peduncles terminal, elongated, naked; flowers capitate. ́S. Native of Brazil, in the province of Minas Geraes, near Piedade. Branches twiggy. Corollas small, white. Calyx glabrous.
Asparagus-like Psyllocarpus. Shrubs 1 to 2 feet.

4 P. thymbroides (Mart. 1. c. p. 46.) shrub much branched; branches squarrose, downy; leaves downy, in fascicles; flowers terminal, somewhat spicate; calyxes hairy. S. S. Native of Brazil, in the province of Minas Geracs, on Serra de Gran Mogol. Flowers azure blue.

Thymbra-like Psyllocarpus. Shrubs 1 to 2 feet.

Cult. See Richardsii, p. 628. for culture and propagation.

Lin. Syst. Tetrandra, Monogynia. Calyx with an ovate tube, and a 4-toothed, permanent limb; 2 of the teeth are usually larger than the other 2, which are always small, or nearly obsolete. Corolla salver-shaped, with a terete tube, which is furnished near the base inside with a circular line of hairs, a glabrous throat, and a 4-lobed limb. Anthers exerted, or inclosed. Stigma bifi. Capsule membranous, crowned by the calyx, 2-celled, encircled round the middle. Seeds solitary in the cells, basilar, partly fixed to the dissepiment.—Herbs or sub-shrubs, with the habitat of Spermacoeae, all natives of America, except some species from Africa. Leaves opposite. Stipulas combined with the petioles a little long, and ending in many bristles. Flowers in dense, verticillate, axillary and terminal heads, the latter always involucrated by 4 leaves. Corollas white.

§ 1. Two of the calycine teeth are large, and two small.

* Spermacoeae and herbaceous perennial plants.

1 M. Humboldtia (Cham. et Schlecht. in Linnaea. 3. p. 358. t. 3. f. 1.) erect; branches nearly terete, downy while young, but glabrous in the adult state; leaves linear-oblong, or lanceolate, pubescent or hairy on both surfaces; stipulas with 5 stiff bristles on each side, naked at the apex; flowers disposed in dense verticillate heads; heads numerous, distant, terminal and axillary alike; the two large teeth of the calyx are subulate, and ciliated. S. S. Native of New Granada, from Silla de Caracas; and of Brazil, in sand by the sea-side, at Rio Janeiro. The specimens from Caracas are more hairy than the Brazil plant, which is trailing. Spermacoeae frigida, Wildt. in Rm. et Schultes. 3. p. 531. Kunth, nov. gen. 3. p. 349. Flowers white.

Humboldt’s Mitracarpum. Pl. 2 to 3 feet.

2 M. Sellowiana (Cham. et Schlecht. in Linnaea. 3. p. 361.) stem diffuse, much branched, clothed more or less with white hairs; leaves oblong or lanceolate, sessile, cuspidate, scabrous on both surfaces; stipulas cleft into many stiff bristles, membranous and villous at the base; leaves terminal, dense, involucrated by 4 leaves, which are 2 or 3 times longer than the head.

—Native of Brazil, about Rio Grande do Sul, Monte Video, &c.; in the Pampas of Buenos Ayres and Cordova. Capsule glabrous. The 2 larger teeth of the calyx are scabrous, erect, and subulate, with a very few additional denticles. Flowers white. Leaves varying from 2 to 4 lines broad. Stem usually very villous, but sometimes almost glabrous, as well as the leaves.

Sello’s Mitracarpum. Pl. diffuse.

3 M. Salzmanniana (D. C. pro. 4. p. 571.) stems diffuse, much branched, hispid from spreading stiffish hairs; leaves ovate-lanceolate, scabrous on both surfaces, setigerous at the apex; stipulas villous, membranous at the base, cleft into many stiffish bristles; flowers disposed in dense, verticillate heads, the ultimate or terminal head round, and involucrated by 2-4 leaves, which are hardly longer than the head.

—Native of Brazil, in sand by the sea-side, at Bahia, where it was collected by Salzmann. Very much like M. Selomii, but differs in the characters indicated, as well as in the seeds being paler and one-half smaller. Flowers white.

Salzmann’s Mitracarpum. Pl. diffuse.

4 M. schizan’giun (D. C. pro. 4. p. 572.) suffruticose; branches sub-tetragonal, downy; leaves oblong-lanceolate, acuminate, scabrous on both surfaces, and on the margins; stipulas villous and membranous at the base, cleft in many stiff bristles: heads of flowers terminal and axillary, verticillate; the former involucrated by 4 leaves.

—Native of Mexico, where it was collected by Henke. Schizangiun dumur, Bartl. in herb. Henke. Leaves 24-27 lines long, and 4 broad. Teeth of calyx acuminate, scabrous. Flowers white.

Cut-capped Mitracarpum. Shrub diffuse.

5 M. cuspidat’un (D. C. pro. 4. p. 572.) stems ascending, branched, downy; leaves linear, cuspidate by a straight margin, almost villous, glabrous; bristles of stipulas 3-5, stiff, longer than the sheath; heads of flowers terminal, axillary, 3-4 times shorter than the bracteas; calyx with 2 stipulate teeth, and 3-4 nearly abortive ones.

—Native of Monte Video; and of Chili, at Maldanado, in the Banda Oriental. Stem hardly a hand high, suffruticose at the base. Heads of flowers 4 lines in diameter. Floral leaves 9 lines long, and a line broad. Tube of the corolla almost double the length of the calycine teeth. Flowers white.

Cuspidate-leaved Mitracarpum. Pl. ascending.

6 M. virgatu’m (Cham. et Schlecht. in Linnaea. 3. p. 363.) stem suffruticose, erect, and are, as well as the branches, terete and glabrous; leaves linear, very narrow, glabrous; stipulas of two colours, ciliated; corollas long, tubular; stems exserted. S. S. Native of Brazil. Spermacoeae virgata, Willd. in Rm. et Schultes, syst. 3. p. 581. and 551. mant. 3. p. 295. Spreng. syst. 1. p. 401. Flowers white. Leaves 6-8 in a whorl, according to Link, but are probably only in axillary fascicles.

Twiggy Mitracarpum. Shrub 1 foot.

7 M. diffu’sum (Cham. et Schlecht. in Linnaea. 3. p. 363.) stem suffruticose, procumbent, terete, hairy; leaves lanceolate, exserted; heads of flowers axillary and terminal, the latter girded by 4 leaves; lobes of calyx 4, 2 large and acute, and 2 small. S. S. Native of Cuba, near the Havana, where it was collected by Ramon de La Sagra. Flowers white. Seeds brown, hollow in front, and marked by 4 small rays.

Ramon de La Sagra’s Mitracarpum. Shrub tufted.

8 M. sagre’a’nun (D. C. pro. 4. p. 572.) plant suffruticose, twisted and tufted, clothed with fine down; leaves oblong; heads of flowers axillary and terminal, the latter girded by 4 leaves; lobes of calyx 4, 2 large concave and blunt, and 2 small.

—Native of Senegal, on the banks of the river at Walo, where it was collected by Bacle, Perron, and Leprieur, and in other parts of Guinea, by Thonn. Oldenlandia verticillata, Bacle, in litt. Stauropspermum verticillatum, Thonn. in Schum. pl. guin. p. 73. Flowers white. Seeds small, nearly globose, pale, umbilicate in
front, and marked by 4 rays. Perhaps the same as M. scabra, Zuccar. in Röm. et Schultes, syst. 3. p. 210. which was found about Fort Louis.

Gasteranthus. Shrub.

** Annual plants.**

10 M. Toreresi'anum (Cham. et Schlecht. in Linne. 3. p. 360. t. 3. f. 2.) stem erect, simple, somewhat tetragonal, rather pilose on the angles; leaves elliptic-lanceolate, attenuated at the base, membranous, rather downy on both surfaces; stipulas membranous, with white villous bristles; flowers disposed in capitate whorles, the terminal one usually formed of 2 combined heads, and girded by 4 leaves. O. F. Native of Guajau and Marianne Islands. Flowers white.

11 M. villo'sum (Cham. et Schlecht. in Linne. 3. p. 363.) stem erect, sparingly branched, slightly tetragonal, villous; leaves ovate-lanceolate, downy; stipulas membranous, clefth into many bristles; heads of flowers axillary, verticillate, and terminal, the latter girded by 4 leaves; anthers inclosed. O. F. Native of Jamaica. Spermacoce hirta, Jacq. icon. rar. t. 308. and probably of Linn. Spermacoce villosa, Swartz, obs. p. 45. Corolla white. Anthers yellow. Seeds pale, somewhat tubercular on the back, and marked by a cruciate furrow in front.

Villous Mitracarpum. Fl. June, July. Clt. 1816. Pl. 1 1/2 to 1 foot.

12 M. hirtum (D. C. prod. 4. p. 572.) stem erect, branched, scabrous, tetragonal; leaves ovate-lanceolate, clothed with hairy pubescence; stipulas membranous, with many bristles: axillary heads of flowers verticillate; terminal ones girded by 4 leaves; anthers exerted. O. F. Native of Jamaica. Spermacoce hirta, Jacq. icon. rar. t. 308. and probably of Linn. Spermacoce villosa, Swartz, obs. p. 45. Very like M. villosa, but differs in being more branched, in the anthers being exerted and blue, and in the seeds being smaller, blacker, and concave in front, not with 4 rays.

13 M. Fishe'ri (Cham. et Schlecht. 3. p. 363.) stem erect, hairy, tetragonal; leaves oblong, attenuated at the base, acute, downy from very short hairs; stipulas ciliolate; flowers densely capitulate; terminal; teeth of calyx 4, lanceolate, acute, a little shorter than the corolla. O. F. Native of Jamaica. Spermacoce Fishe'ri, Link. enum. 1. p. 132. Spermacoce adscendens, Fisch. ined. Corollas white. Habit of Spermacoce aspera, Aubl.

14 M. stylo'sum (Cham. et Schlecht. in Linne. 3. p. 363.) stem decumbent, terete, glabrous; leaves oblong-lanceolate, attenuated at the base; bristles of stipulas long; flowers disposed in dense whorles; the two large teeth of the calyx are subulate at the apex; style exerted. O. F. Native of Manilla. Spermacoce stylo'sa, Link. enum. 1. p. 132. Spermacoce crassifolia, Hortul. Capsule membranous, glabrous. Corollas white. Seed orbicular, with a mark like the letter x engraved on the front, somewhat 4-lobed, of a pale, dirty colour.

§ 2. Calyx with 4 nearly equal acute teeth.

15 M. neale'etum (D. C. prod. 4. p. 573.) plant glabrous, dichotomous; leaves oblong-linear, acute, almost veinless; bristles of stipulas 3, stiff, longer than the sheath; heads of flowers terminal, 3 times shorter than the bracteae; calyx glabrous, with 4, hardly acute teeth, which are a little shorter than the corolla. —Native of Brazil, where it was collected by Pohl. Spermacoce neglécta, Schott ex Pohl, in litt. Heads of flowers 5 lines in diameter. Floral leaves about an inch long, and 2 lines broad. Neglected Mitracarpum. Pl. ?

† Species not sufficiently known.

16 M. squarro'sum (Cham. et Schlecht. in Linne. 3. p. 363.)—Native of Cuba, on rocks about Havana. Spermacoce squarro'sa, Poepp. Nearly allied to M. Seltonia, but differs in its smoothness.

Squarrose Mitracarpum. Pl.

Cult. See Borrer'ia, p. 618. for culture and propagation.

**CXCVI. STAEelia.** (this genus is dedicated to the illustrious Baron Augustus de Stael Holstein). Cham. et Schlecht. 3. p. 364. t. 3. f. 3. D. C. prod. 4. p. 573.

Lin. syst. Tetra'dria, Monog'nya. Calyx with an ovate tube, and only 2 subulate teeth, with hardly any accessory ones. Corolla funnel-shaped, with a slender tube, and a 4-lobed acute limb. Stamens 4, exerted. Stigma 2-lobed. Capsule membranous, 2-celled, 2-valved, with an entire permanent dissepiment; valves concave, crowned each by a calycine tooth, cut at the
base by a line from the disseipment, and therefore falling asunder. Seed solitary, fixed to the disseipment.—Brazilian herbs, with terete stems. Leaves glabrous, linear, opposite, and in axillary fascicles. Stipulas membranous, narrow, of many bristles, or acutely 3-lobed. Axillary heads of flowers verticillate, and the terminal ones globose. Allied to *Mitracarpum*.

1 *T. thyoides* (Cham. l. c.) stem much branched, ascending, puberulous; stipulas acutely 3-lobed; whorles of flowers few. 2. S. Native of the south of Brazil. Leaves 5 lines long, and hardly a line broad. Corolla purple. Heads of flowers size of small peas.

*Thyme-like* *Staelia*. Pl. $\frac{1}{2}$ to $\frac{1}{2}$ foot.

2 *S. galoides* (D. C. prod. 4. p. 573.) stems glabrous, sparingly branched, twiggy, elongated; stipulas of many bristles; whorles of flowers few.—Native of Brazil, where it was collected by Pohl. Spermacoce *galoides*, ex Pohl, in litt. Leaves an inch long, and half a line broad. Whorles of flowers distant at the top of the stem.

*Galium-like* *Staelia*. Pl. $\frac{1}{2}$ foot.

3 *S. reflexa* (D. C. l. c.) stems smoothish, much branched; branches twiggy; leaves linear, with rather revolute margins; stipulas tridentate; whorles in nearly all the axes; floral leaves reflexed.—Native of Brazil, where it was collected by Pohl. Spermacoce *reflexa*, Pohl, in litt. Whorles 20-30 on each branch. Leaves 4 lines long.

*Reflexed-leaved* *Staelia*. Pl. $\frac{1}{2}$ to 1 foot.

Cult. See *Richardsonia*, p. 628. for culture and propagation.

**CXC VII. TESSIERA** (named after M. Tessier, who has written on the diseases of wheat, and the effects of light upon plants, &c.). D. C. prod. 4. p. 574.

**Lin. syst. Tetrandria, Monogy'nia.** Calyx with an ovate tube, and a 4-lobed limb; lobes nearly equal, without any accessory ones. Corolla funnel-shaped, with a glabrous throat, and a 4-lobed limb. Stamens hardly exerted. Stigma 2-lobed. Capsule 2-celled, 2-valved, with an entire oval deciduous disseipment; valves concave, crowned by the teeth of the calyx, falling asunder from being cut vertically along the disseipment. Seeds solitary in the cells, fixed to the middle disseipment.—American herbs, clothed in every part, except the corollas, withomentum or wool. Leaves opposite, sessile, lined by the nerves. Stipulas eleft into many bristles. Flowers axillary, sessile, few, verticillate, bracteolate.—This genus is nearly allied to *Staelia* from the structure of the fruit, but to *Borréria* or *Diódia* from habit.

1 *T. lanifera* (D. C. prod. 4. p. 574.) plant clothed with long white wool; stem or branches twiggy, terete.—Native of Brazil, where it was collected by Pohl. *Diódia* or Spermacoce *lanifera*, Pohl, in litt.

*Wool-bearing* *Tessiera*. Pl.

2 *T. lithospermoïdes* (D. C. prod. 4. p. 574.) plant suffruti-
cose, erectish, branched, grey in every part from crowded short velvety down; fruit at length glabrous. 1. 2. S. Native of Mexico, where it was collected by Hanke. Spermacoce *lithospermoïdes*, Bartl. in herb. Hanke.

*Lithospermum-like* *Tessiera*. Pl. 1 foot.

Cult. For culture and propagation, see *Richardsonia*, p. 628.

**CXC VIII. GAILLONIA** (evidently named after some person of the name of Gaillion, of whom we know nothing). A. Rich. mem. soc. hist. nat. par. 5. p. 153. t. 15. f. 34. D. C. prod. 4. p. 574.

**Lin. syst. Pent-Heptádria, Monogy'nia.** Calyx with an ovate tube, and a 5-7-lobed permanent limb; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb; lobes oblong. Stamens 5-7, exerted from the throat, but shorter than the corolline lobes. Style filiform, thickened at the apex; stigma 2-lobed. Fruit egg-shaped, almost naked at the apex, containing 2 separable, 1-seeded, indehiscent nuts.—Hard, oppositely-branched herbs, velvety from fine down in every part, as also on the corollas. Leaves linear, ending in a caly-

lus mucrone, opposite, bearing twin stipulas on both sides, which are sometimes short and truly stipula-formed, and sometimes long and foliaceous, and in the latter case appearing like those of *Galium*. Flowers some in the forks of the branches, sessile, solitary, and naked, and others sessile at the tops of the branches, between the 2 superior leaves.—Habit of *Aspérula*, with a velvety aspect. This genus ought probably to be placed among *Rubiacées*, sect. *Stellátæ*.

1 *G. olivério* (Rich. l. c.) stem multiple, bracteate, and as if it was articulated; branches opposite; leaves distinct at the base, linear-subulate, spinosent at the apex; stipulas leaf-

formed, distinct from the leaves. 1. 2. S. Native of Persia, between Teheran and Isphahan, where it was collected by Olivier and Brugruere.

Olivier’s *Gaillonia*. Pl. $\frac{1}{2}$ foot.

2 *G. Bruguière* (A. Rich. l. c.) stem multiple; leaves linear-

lanceolate. 1. 2. S. Native alongside with the preceding, and probably only a broad-leaved variety of it.

*Bruguière’s Gaillonia*. Pl. $\frac{1}{2}$ foot.

3 *G. Szovitzii* (D. C. prod. 4. p. 574.) stem branched at top; branches erect; leaves subulate; upper ones conate at the base, and adhering to the stipulas, and therefore appearing tri-

furcate and trispinose at the apex. 1. S. Native of Persia, in very arid, stony places near Nekhæthus, where it was collected by Szovitz.—A very distinct species.

Szovitz’s *Gaillonia*. Pl. $\frac{1}{2}$ foot.

Cult. The species of *Gaillonia* should be grown in pots, half filled with pot-shers, in a mixture of sand and peat, and placed among other alpine plants. They may be increased either by cuttings or seeds.

**Lin. syst. Pentàdria, Monogy'nia.** Calyx with an obovate tube, and a small 5-parted limb. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 4, inserted in the throat, exerted; anther rather coriace. Stigma bispinose. Capsule oblong-cuneate, rather tetragonal, crowned by the limb of the calyx, celled, separable into 2, 1-seeded, indehis-

cent, ligneous-coriaceous, trignial nuts, which are fixed internally to the linear axis beneath its apex. Seeds solitary in the cells, pendulous. Radicle superior. Albumen fleshy.—Shrubs or trees natives of South America. Leaves opposite, petiolate, acuminate. Stipulas interpetiolar, solitary on both sides. Panicles sub-corymbose, terminal. Flowers white, hardly larger than those of *Aspérula*.

1 *M. acuminata* (Humb. et Bonpl. pl. equin. t. 29.) unarmed; leaves ovate-elliptic, short-acuminated, downy on both surfaces. 1. S. Native in the town of Guayaquil, by way of sides, where it is called *Ceiba blanca* by the natives. H. B. et Kunth, nov. gen. amer. 3. p. 550. Flowers white.

Acuminated-leaved Machaonia. Tree 25 feet.

2 *M. Brasiliës* (Cham. et Schlecht. in Linne. 4. p. 2.) unarmed; leaves oblong-lanceolate, acuminate, having the veins downy beneath. 1. S. Native on the north of the Amazon, about Gran-Para. Cinchona Brasiliës, Hoffmannseg. ex Wild. ms. in Humb. berl. mag. p. 119. Ræm. et Schultes.
Flowers linear, S. the plant lobes Native. is, the straight A. The T? lobes FIG. 169. 4-6-parted Native keeper, S. the but Schreb. stigma rarely C. Dysoda Thymelae'a, 5. about branches which fruit). 575. 196. 2-celled, 2-seeded, exserted, and parted Thunb. in fruit. 146. 1-0. Thunb. with cuttings 109. 3. leafy, whitish. 115. 2-celled, 2-seeded, crowded by the calyx, ex. Rich.—A small shrub, glabrous in every part except the young branches, which are whitish. Leaves small, almost sessile, opposite, and generally in axillary fascicles, having an ungrateful scent when bruised. Stipulas combined with the petioles, and ciliately fringed on the margins. Flowers terminal, in fascicles, almost sessile, white.—The fruit is described by Blume and Jussieu as many-seeded.

1 S. FLORIDA (Comm. l. c.). G. Native of China, Japan, Cochin-china, and other places of the East. Lycium Japonicum, Thunb. fl. jap. p. 17. Curt. bot. mag. 361. Lycium fo'tidum, Lin. fl. suppl. 150. Lycium Indicum, Rez. obs. 2 p. 12. Dysoda fasciculata, Lour. fl. 146. Dysoda fœ'tida, Salisb. prod. p. 60. Spermacoce fruticosa, Desf. Hort. Par. A small bushy shrub, with small dark-green, shining, myrtle-like leaves, and white single or double flowers, which are reddish outside. The plant from Japan differs from that of China, according to Blume, in the hairs on the inside of the throat of the corolla being geniculated, not clavate.

Cult. This little shrub grows well in a mixture of loam, peat, and sand; and cuttings root readily in sand, with a hand-glass over them.

Lin. Syst. Tetra-Hexandra, Monogynia. Calyx with an ovate tube, and a 4-5-parted limb; lobes oblong-linear, acute, erect, permanent. Corolla salver-shaped, with a terete, somewhat tetragonal tube, a naked throat, and 4-6 lanceolate, revolute lobes, ex Rich; but circinately convolute according to others. Stamens with the filaments free from the upper part of the tube, longer than the corolla; anthers acute, erect. Style longer than the stamens; stigma emarginate. Berry roundish, crowned by the calyx, bilocular, 2-celled, containing two 1-seeded pyrenes, or nits. Seeds peltate, ex Rich, fixed by a longitudinal chink in the middle. Albumen cartilaginous. Embryo erect, with foliaceous cotyledons.—A deciduous shrub, native of America. Leaves opposite, almost sessile, lanceolate or elliptic. Flowers axillary, pale yellow, sessile.

1 E. littoral's (Swartz, l. c.). G. Native of Jamaica, Porto Rico, Guadaloupe, and others of the West Indies Islands, on the sea shore, Vahl, symb. 2 p. 28. —Knötz. Browne, jam. 140. no. 1. Thymela'a, Sloane, hist. jam. 2 p. 93. t. 169. f. 1-2. Berries yellow. In fl. mex. the flowers are painted white, and the berries red; it is, therefore, perhaps a distinct species. Stipulas surrounding the branch ciliated.

Sea-shore Ernodea. Shrub decumbent.

Cult. See Richardsiida, p. 628. for culture and propagation.

1 C. ta'ifá (Hamilt. l. c.). 3. F. Native of Nipal. Trifid-bracted Cuncea. Pl. 1 1/2 foot.

Cult. For culture and propagation, see Richardsiida, p. 628.

—This genus is very nearly allied to Diódia, but differs in the fruit not being divisible into 2 parts, and in the stipulas not being cut into many bristles.

1 H. maritima (Lin. fil. suppl. p. 126.). 2. $ S. Native of Malabar and Coromandel, in the sand by the sea side, Roxb. 4 M
Gaertn. l. c. Flowers of a lilac colour. Habit of Arenária
peploides, but larger (f. 109.).

Sea-side Hydrophilax. Pl. creeping.

† A species not sufficiently known.

2 H. MADAGASCARICUS (Willd. herb. ex Ræm. et Schultes,
syst. 3. p. 527.) leaves lanceolate, acute, sessile, closely imbrici-
cated, sheathed; flowers terminal.—Native of Madagascar,
where it was collected by Commerson.

Madagascar Hydrophilax. Pl. creeping.

Cult. This plant should be grown in a pot filled with small
gravel, and watered from time to time with salted water. It
will be easily increased by separating the rooted stems, or by
seeds.

CCIV. SCYPHIPOHORA (from συϕης, skyphos, a bowl or
cup, and φηρο, phero, to bear; application not evident). Gaertn.
soc. hist. nat. par. 5. p. 159. t. 14. f. 1. D. C. prod. 4. p. 577.—
Hydrophilax species, Juss.

Linn. syst. Tétrandra, Monogynia. Calyx with an ovate
tube, and a short tubular truncate nearly entire limb. Corolla
funnel-shaped, having the tube hairy inside, and the limb with 4
lanceolate spreading segments. Stamens 4, exserted; filaments
short; anthers incumbent inwardly. Stigma bifid, with approxi-
mate lobes. Drupe baccate, crowned, 8-furrowed, containing 2
bony oblong 1-seeded pyrenæ or nuts, which are flat inside, and
furrowed on the back. Albumen fleshy. Embryo central,
erek, with obtuse cotyledons, and a somewhat incurved radicle.

—A shrub native of the Moluccas. Leaves opposite, veinless.
Flowers subcrenose, axillary.

1 S. HYDROPHILACEA (Gaertn. and Blum. l. c.). 7. S. Nat-
ive of the Moluccas, by the sea side. Hydrophilax, Banks,
herb.

Hydrophilax-like Scyphiphora. Shrub.

Cult. For culture and propagation see Hydrophilax above.

CCV. PLOCAMA (from πλοκάμος, plokamos, bent or twisted
hairs; in reference to the numerous slender, pendulous branches).
Barlingia, Richb. in flora 1824. p. 241. icon. exot. 1. t. 11. but
not of Brongn.—Plocama and Barlingia, Spreng. syst.—Plocama
and Plocama, Gmel. syst.

Linn. syst. Penta-Hexándria, Monogynia. Calyx with an
ovate-globose tube, and a small sinuate toothed limb. Corolla
campanulate funnel-shaped, 5-cleft; rarely 6-cleft. An-
thers inserted between the lobes of the corolla, sessile at the
throat, linear. Stigma thickish, slightly 2-lobed, or undivided.
Fruit almost baccate, areolate at the apex, and crowned by the
small inflexed calyx, 2-3-celled. Endocarp membranous. Seeds
solitary in the cells, erect, with thin albumen. Embryo
with a terete radicle, and flat cotyledons.—A small, glabrous,
much-branched shrub, with the branches terete, slender, and
pendulous. Leaves linear-filiform, opposite. Stipulas com-
bined, with the petioles short, bluntly toothed, membranous.
Flowers solitary or by threes in the axils of the upper leaves,
and on the tops of the branches, white, on short peduncles.

1 P. PÉNDULA (Ait. l. c.). 7. G. Native of the Canary
Islands. Plêcama péndula, Poir. suppl. 4. p. 441. Barlingia
scoparia, Richb. icon. exot. t. 11. and Plêcama péndula, Richb.
p. 9. with a good description and figure. Habit of Gûltum.

Cult. See Serissa, p. 653. For culture and propagation.

CCVI. PUTORIA (from puto, rankeness; in reference to the
mem. soc. hist. nat. Par. 5. p. 160. D. C. prod. 4. p. 577.—
Aspécula species, Lin. fil.—Sherária species, Cy.—Pavétta
species, Cy.—Ernôdea species, Smith.

Linn. syst. Pentatândria, Monogynia. Calyx with an ovate
tube, and a short tubular, 5-toothed limb. Corolla salver-
shaped, with a long terete tube, a glabrous throat, and 4 spread-
ing, acutus lobes. Filaments of stamens short, rising from the
root of the tube of the corolla, hardly exserted. Anthers oblong-
linear, ex Rich. Stigma bifid. Berry nearly dry, ovate-oblong,
umbilicate, 2-celled. Seeds oblong, solitary in the cells.—Shrubs
stiff. Leaves opposite, feitd when bruised, oblong-linear, obtu-
se. Stipulas solitary on both sides. Flowers sessile on the
top of the branch, divided. Habitat of Dèphine Gnéoum.

1 P. CALAÐRICA (Pers. l. c.) stem shrubby, much branched;
branches clothed with velvety down; leaves oblong, obtuse,
smoothish; stipulas solitary on both sides. 7. F. Native of
Calabria, Candia, Syria, Atlas, Sicily, &c. on calcareous rocks.
Aspècula Calabria, Lin. fil. suppl. p. 120. L’Hér. stipr. nov. 1.
p. 65. t. 32. Sherária fo'tida, Lam. dict. 4. p. 326. Pavétta
fettidissima, Cyr. pl. neap. 1. p. 8. t. 1. Ernôdea montâna,
Lo-nicèra Sicula, Ueria, pl. add. p. 249. ex Guss. Sherária fett-
dissima, Cyr. char. 69. t. 3. f. 7. Pavétta fettidissima, Cyr. neap.
fasc. 1. t. 1. Flowers red. Habit of ïspra. Leaves pale
yellowish, scabrous on the edges and keel.

2 P. ? TÉDECA (D. C. prod. 4. p. 577.) stem herbaceous,
sparingly branched, rather radicant at the base; branches hispid
from villi; leaves ovate, acute, villous; stipulas twin on both
sides, subulate. 7. F. Native of the East Indies, on the Nel-
ligyher mountains, in humid places, where it was collected by
Leschenault, who has called it Aspècula from habit, in his herba-
riums. Style corkscrew-like, divided at the apex into 2 thickish,
hispid, short stigmata. The flowers are much like those of the first
species, but the fruit being unknown, the genus to which it propre
belongs is still doubtful.

Indian Putoria. Pl. ½ to 1 foot.

Cult. A mixture of chalk, sand, and peat will be the best
soil for the species of Putória; and they may be readily increased
by cuttings or seeds.

Tribe XI.

ANTHOSPERMEÆ (the plants contained in this tribe agree
with the genus Anthôspèrnum in particular characters). Cham.
Par. 5. p. 136. D. C. prod. 4. p. 578. Flowers dioecious, or
hermaphroditic. Corolla rotate (f. 110. b.). Styles separate to
the base, ending in an elongated, hispid, or plumose stigma
each (f. 110. c.). Fruit constantly of 2 indehiscent, 1-seeded
mericarps or nuts (f. 110. g, f.), which are easily separated
at maturity. Albumen fleshy.—Small shrubs or herbs. Leaves
opposite or verticillate. Stipulas small, 1-3-toothed, adnate to
both sides of the petioles.

CCVII. CAPROSA (from καρπός, karpos, a wild fruit,
and οίμη, osime, a smell; in allusion to the species having a
t Finding a smell) Forst. gen. t. 69. Lam. ill. t. 186. and 854. Juss. mem.
D. C. prod. 4. p. 578.

Linn. syst. Tetra-Heptándria, DIGY'NIA. Calyx with an ovate
tube, and a 5-7-lobed short limb (f. 110. a.). Corolla cam-

Glabrous shrubs, with terete branches. Leaves opposite, or 3-4 in a whorl, acuminate. Stipulas membranous, adnate to the petioles, and cleft into many filiform bristles. Panicles terminal, compound. Flowers small, greenish white, but changing to brownish as they fade. According to Cruse, ex Linnaea. 6. p. 20. The fruit is shining, and the nuts are fixed by the base, not hanging from a central filiform axis.

Var. \( \beta \), pauciflora (D. C. prod. 4. p. 579.) peduncles 1-3-flowered, shorter than the leaves. G. Native of the Canary Islands. P. pauciflora, A. Rich. mem. soc. hist. nat. par. 5. p. 141.

Noble Bastard Hare's-ear. Fl. June, July. Clt. 1699. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand is a good soil for this shrub; and cuttings root freely, if planted in a pot of sand, with a hand-glass over them.

Lin. syst. Tetràndria, Digy'nia. Flowers hermaphrodite. Calyx with an obovate tube, and a very minute, nearly equal limb. Corolla subrotate, 4-parted, almost cleft to the base. Stamens 4, inserted in the bottom of the corolla. Anthers oblong. Styles 2, very short, each ending in a long hairy stigma. Fruit obvolute, rather didymous, somewhat compressed from the back, and elegantly and gyroscopically worted on the back, composed of two 1-seeded, indescent mericarps, joined by a concave commissure, but at length separating from each other.—A glabrous herb, with the habit of Circe'a. Stem rather angular from 2 elevated lines which run from the stipulas, branched. Leaves opposite, 1 to 3 inches long, ovate-lanceolate, acuminate, tapering into the petioles, paler beneath, with serrately-scabrous margins. Stipulas trifidate. Peduncles terminal and axillary, the whole forming a large terminal, trichotomous panicle, which is nearly a foot in diameter. Flowers small. Fruit dark brown.

Enchantress's Nightshade-like Galopina. Pl. 2 feet.
Cult. See Phyllis above for culture and propagation.

CCX. ANTHOSPER'MUM (from \( \alpha \nu \theta \omega \sigma \), anthis, a flower, and \( \sigma \pi \mu \rho \alpha \mu \), sperma, a seed). Lin. gen. no. 1164. Juss. gen. 178. Gaertn. fil. carp. 3. p. 37. t. 195. Cruse, rub. cap. p. 1. A. Rich. mem. soc. hist. nat. par. 5. p. 138. D. C. prod. 4. p. 579. Schlecht. and Cruse, in Linneea. 6. p. 7.—Tournefortia, Ponted. epistl. 11. ex Gaertn.—Ambra'ria, Heist. but not of Cruse.

Lin. syst. Tetra-Pentàndria, Digy'nia, or Die'cia Tetra-Pentàndria. Flowers dioecious or hermaphrodite. Calyx with an obovate tube, and a 4-5-toothed deciduous limb (f. 110. a.). Corolla funnel-shaped, with a short tube, and a 4-5-parted limb (f. 110. b.); lobes linear or ovate-lanceolate, revolute, valvate in activation. Stamens 4-5, inserted in the base of the tube of the corolla (f. 110. c.). Anthers oblong, sub-tetragonal, exserted. Styles 2, very short, connate? ending each in a long

4 m 2
hairy stigma (f. 110, f. g.). Fruit composed of 2 easily-separa-
ted, indehiscent, 1-seeded mericarps, which are a little com-
pressed at the raphe, and joined together by a flattish commis-
sure. Albumen sub-carillaginous. Embryo dorsal, erect.—
Small shrubs or herbs, natives of the Cape of Good Hope.

1 A. BERGIAIUM (Cruse, rub. cap. p. 8.) leaves linear-lanceo-
late, 3 in a whorl, imbricated, and connately perfoliate, ciliat;
flowers pentandrous, disposed in a verticillate spike. ἅ. G. Native of the Cape of Good Hope. Stem branched, terete or
obliquely angular, glabrous at the base, but clothed with long white hairs above. Leaves pale green, having the margins and keel ciliated with long white hairs, half an inch long. Whorles 3-flowered.

Bergius's Amber-tree. Shrub 1 foot.

2 A. ÉTHIOPICEM (Lin. spec. 1511.) leaves linear-lanceolate,
3 in a whorl, glabrous; stipulas simple, short, acute; flowers
tetrandrous, disposed in verticillate spikes; mericarps elliptic,
clothed with white tubercles, crowned by the calycine teeth. ἅ. G. Native of the Cape of Good Hope, Crus. rub. cap. p. 10.

G. Native of the Cape of Good Hope. Stems branched, terete
or obliquely angular, glabrous at the base, but clothed with long white hairs above. Leaves pale green, having the margins and keel ciliated with long white hairs, half an inch long. Whorles 3-flowered.

2 to 3 feet.

3 A. SPATULATUM (Spreng. neu. entr. 3. p. 45. syst. 1. p.
399.) leaves opposite, linear-spatulate, bluntest; flowers axil-
ary, sub-verticillate; mericarps oblong, warty; branches
twiggy, erectly spreading, downy. ἅ. G. Native of the Cape
of Good Hope, Cruse, rub. cap. p. 9. and p. 13. A. Éthiopi-
cicum, var. β. oppositifolium, Schlecht. and Crus., in Linnaea. 6.
p. 10. It differs from A. Éthiopicum in the opposite, linear-
spatulate leaves, and in the more lobed habit. A. Éthiopicum,

4 A. CILAVER (Lin. spec. 1521.) leaves opposite, lanceolate,
acute, ciliate; stipulas short, simple; flowers axillary, tetran-
drous; mericarps obvate, glabrous, shining, destitute of the
calyx limb. ἅ. G. Native of the Cape of Good Hope, Gern.

5 A. G. Native of the Cape of Good Hope, Gerni.

A.ギャリウス, Rechb. in Spreng. syst. 4. p. 338.—Pluk. mant. t.
344. f. 5. Stem usually decumbent, much branched; branches
ergular, downy. Leaves glabrous, and green above, but white
beneath, connate at the base. Lobes of the corolla hairy outside.
Anthers white.—The A.ギャリウス, Rechb. differs from this
in the leaves being rusty beneath.

Ciliated-leaved Amber-tree. Shrub decumbent.

6 A. lanceolatum (Thunb. prod. 32. fl. cap. p. 157.) leaves
opposite, lanceolate, acute, glabrous, spreading; stipulas
profundely bifid; flowers axillary, sub-verticillate, tetrandrous,
and often pentandrous; mericarps ovate-oblong, glabrous. ἅ. G.
Native of the Cape of Good Hope, Cruse, rub. cap. p. 12.

Ciliated-leaved Amber-tree. Shrub procumbent.

7 A. STELLATUM (Cruse, rub. cap. p. 11.) leaves opposite, lanceo-
late, acute, ciliate while young, hairy at the base; stipulas sim-
ple, subulate, hairy; flowers axillary, pentandrous; mericarps
unknown. ἅ. G. Native of the Cape of Good Hope, on
A. lanceolatum, Sieb. fl. cap. no. 90. A. hisrotum, D. C. prod.
4. p. 580. Stem purplish brown, branched, beset with white
hairs about the axis of the leaves. Branches purple, hairy.
Leaves an inch long, connate at the base. Stipulas hairy, of
a shining green colour above, but whitish beneath.

Lanceolate-leaved Amber-tree. Shrub procumbent.

8 A. PANICULATUM (Cruse, rub. cap. p. 9. and p. 15. t. 1.
.) leaves opposite, linear-subspatulate; stipulas short, sim-
ple; flowers panicked, tetrandrous; mericarps glabrous, with 3
ribs. ἅ. G. Native of the Cape of Good Hope. Stem
fuscescent, branched from the base; branches downy.
Leaves glabrous, bluntish, pale on the lower surface, hardly ½
an inch long. Panicle terminal, narrow, elongated. Fruit crowned
by the calycine teeth.

Panicled-flowered Amber-tree. Shrub 1 to 2½ feet.

9 A. LICHTENSTEINI (Crus. rub. cap. p. 15.) leaves opposite,
linear, keeled, glabrous, ciliat; stipulas simple, ciliated;
flowers axillary, verticillate; mericarps hairy. ἅ. G. Native
of the Cape of Good Hope, Spermacoce ericetfolia, Licht. in
Rem. et Schultes, syst. 3. p. 281. Stem branched, glabrous
at bottom, and downy at top. Branches naked at the base.
Leaves connate at the base, mucronate. Flowers tetrandrous.

Lichtenstein's Amber-tree. Shrub 1 to 2 feet.

10 A. SPERMACEAE (Rechb. in Spreng. syst. 4. p. 338.
leaves opposite, oblong-lanceolate, with scabrous margins; sti-
plas entire; flowers axillary, solitary, pedicellate, pentandrous;
calyx 5-toothed. ἅ. G. Native of the Cape of Good Hope.

Spermaceae-like Amber-tree. Pl. 1 foot.

Lanceolate-leaved Amber-tree. Shrub procumbent.

** Flowers dioecious, panicled.

** Flowers gynodioecious, panicled.

** Flowers hermaphrodite.

Spermacoce-like Amber-tree. Pl. 1 foot.

Cult. See Phylitis, p. 635. for culture and propagation.

CCXI. AMBRAARIA (a name formerly applied to the genus
Anthospermum by Heister, and is probably derived from Cape
hist. nat. Par. 5. p. 199. t. 12. f. 2.

L. syst. Diecia, Tetrandra. Flowers dioecious, of the
same structure as those of Anthospermum, but differs from that
genus in the capsule being 3-celled, the intermediate cell vacant,
and the lateral ones 1-seeded. The rest as in Anthospermum.

** A. hiuktA (Cruse, rub. cap. p. 17. t. 1. f. 2.) leaves 3 in
a whorl, connately perfoliate; fruit tomentosely hairy. ἅ. G.
Native of the Cape of Good Hope. Shrub much branched
from the base, hairy at the top. Leaves linear, subtriangular,
glabrous, connate at the base, with the margins and keel ciliated,
at length imbricated and deciduous. Stipulas hardly prominent, ciliated. Flowers axillary, verticillate. According to Cham. et Schlecht. Clffortia cinerea, Lin. is a synonyme of this.

**Hairy Ambriaria.** Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 A. **Olabra** (Cruse, rub. cap. p. 17. t. 1. f. 3.) leaves 3 in a whorl, connately perfoliate; fruit obovately subglabose, glabrous. $\frac{3}{2}$ G. Native of the Cape of Good Hope. Nénax aeroësa, Gaertn. fruct. t. 32. f. 7. Young branches reddish. Leaves linear, subtriquetrous, glabrous, serrately ciliated on the margin and keel, 3-6 lines long, and $\frac{1}{2}$ to 1 broad. Flowers axillary, verticillate.

**Glabrous Ambriaria.** Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. See *Phyllis*, p. 655. for culture and propagation.

**Tribe XII.**

**STELLATAE.** (from stellatus, starry; the leaves and stipulas form whorls, resembling the rays of a star.) Ray, syn. p. 223. Cham. et Schlecht. in Linnaea. 3. p. 220. D. C. prod. 4. p. 580.—Aparnnee, Link, (1809).—Galea, Kunth, nov. gen. amer. (1818) 3. p. 255.—Asperuleae, A. Rich. mem. soc. hist. nat. Par, (1850) 5. p. 126. Flowers hermaphrodite, rarely of different sexes. Corolla rotate or funnel-shaped; lobes valvate in activation. Styles 2, almost distinct from the base, or more or less combined in one. Stigmas capitate. Fruit constantly of 2 indehiscent 1-seeded mericarps. Seeds hardly distinct, from the pericarp and calyx. Albumen horny.—Usually herbs, rarely small shrubs. Leaves opposite, bearing each a bud in the axis, furnished with 1-2 or 3 leaf-formed stipulas between the leaves on both sides, which are destitute of buds, and form whorles along with them. Roots usually red, furnishing a red dye, as the madder.—The leaves are only to be distinguished from the stipulas in having buds in their axis.

**Linn. syst. Tetrándria, Monogynia.** Calyx with an ovate tube, and a 4-6-toothed permanent limb. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stamens 4. Style 1, 2-lobed at the apex; stigma capitellate. Fruit dry, crowned by the calyx, divisible into two mericarps; mericarps 1-seeded, indehiscent, flat on one side, and convex on the other.—An annual herb, native of Europe. Leaves opposite, with 1-2 stipulas on each side, ovate, obtuse, scabrous, forming whorles. Flowers small, red, capitate, almost sessile, girdled or involutely by the uppermost whorl of leaves.

1 S. **Arbyes** (Lin. spec. p. 149.) O. H. Native of Europe and Tauria, very common in fields in sandy soil; plentiful in many parts of Britain in fallow fields and among corn. Fl. dan. t. 439. Curt. lond. 5. t. 13. Smith, engl. bot. t. 891. Schkuhr, handb. t. 22.—Barrel, icon. t. 541. Root with many reddish brown fibres. The whole plant rough and hairy. Leaves rough along the edges and keel, 4-6 in a whorl.

**Corn Field-madder.** Fl. April, Sept. Britain. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

N. B. **Sherárda fruticósa** (Lin. spec. 149.) stem shrubby; leaves 4 in a whorl, equal; flowers axillary. $\frac{3}{2}$ G. Native of the island of Ascension. Stipulas very short, subulate, interfollicous. Corolla white. Fruit unknown. This plant appears to be intermediate between *Diódia* and *Spermáceae.**

Cult. The seeds only require to be sown in the open ground in a dry situation.

**Linn. syst. Tetrándria, Monogynia.** Calyx with an ovate didymous tube, and a very short 4-toothed deciduous or obsolete limb. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined together at the base, and nearly to the apex. Fruit didymous, not crowned by the calyx, dry, or hardly fleshy; mericarps easily separated, indehiscent, 1-seeded,—Herbs, rarely small shrubs. Stems and branches usually teregal. Leaves opposite, with 1-2-3 stipulas on each side; they are therefore called 4 to 8 in a whorl, but between the uppermost leaves there are no stipulas. Flowers terminal and axillary, in fascicles.

§ 1. **Sherárdaíá** (this section only contains plants with the habit of *Sherárdaïa*). D. C. prod. 4. p. 581. **Annual plants.**

**Corollas tubularly funnel-shaped.**

1 A. **Arbyés** (Lin. spec. p. 149.) plant erect, smoothish; leaves 6-10 in a whorl, lanceolate-linear, a little ciliated; lower ones obovate: floral ones ciliated with long hairs; coryumbs fascicled, terminal, many flowered; flowers sessile; fruit glabrous. O. H. Native of Europe and Caucasus, in fields and arid stony places. A. coréula, Dand. pempt. p. 385. Lob. icon. t. 801. f. 2. A. cílìàta, Mnœch. mæth. p. 484. A. débía, Willd. her. ex Spreng. Roots yellow. Under surface of leaves whitish from adpressed hairs. This differs from all the other species of *Aspérala* in the flowers being blue. It differs from *Sherárdaïa* in the capsule not being crowned by the calyx, in the blunter leaves, and in the floral leaves being ciliated. Anthers yellow.

**Cornfield Woodroof.** Fl. July. Clt. 1596. Pl. $\frac{1}{2}$ to 1 foot.

2 A. **Cilla's** (D. C. prod. 4. p. 582.) stems ascending, angular, glabrous; leaves 6-9 in a whorl, lanceolate-linear, acute, and are as well as the bracteas, serrated by stiff cilia; flowers almost sessile, disposed in a terminal subumbellate corymb, pendant; style exserted.—Native of Persia, where it was collected by Geimlein. Corollas glabrous, 5-6 lines long. Stamens 5.

**Ciliated-leaved Woodroof.** Pl. ascending.

3 A. **Arbyés** (Gay, in lit. 1829. ex D. C. prod. 4. p. 582.) stems erect, simple at the base, branched at the apex, glabrous; leaves glabrous, subulate, filiform, equal in length to the internodes: cauline ones 10-16 in a whorl, and the rameal ones 2-6 in a whorl; pedicels solitary, almost axillary; corollas small, downy outside, trifid; fruit obovate, clothed with very short down. O. H. Native of the north of Persia. Stem very smooth, white, 7-10 inches high. Leaves an inch long, searcor. Corolla greenish-white, with a slender terete tube, and oblong awnless lobes. Stamens 3.

**Hairy Woodroof.** Pl. $\frac{1}{2}$ to 1 foot.

§ 2. **Cynadáceæ** (this section agrees with *A. cynadáceæ* in the corollas being funnel-shaped). D. C. prod. 4. p. 582. **Plants perennial.**

**Corollas tubularly funnel-shaped.**

4 A. **Taurína** (Lin. spec. 150.) plant smoothish, erect; leaves 4 in a whorl, ovate-lanceolate, 3-nerved, with finely ciliated margins; coryumbs pedunculate, axillary, fasciculately umbellate, involucrately; bracteas ciliated; fruit glabrous, and rather scabrous. O. H. Native of Dauphiny, Piedmont, Switzerland, Carniola, Italy, &c. on hills in shady places. A. triérwa, Lam. fl. fr. 3. p. 376. Gallíum Taurinum, Scop. carn. no. 148.—Lob. icon. t. 800. f. 1.—Moris, hist. sect. 9. t. 21. f. 1.—Hall. helv. no. 732. Leaves broad. Corolla white, elongated. Anthers violaceous, exserted.

**Bull Woodroof.** Fl. April, July. Clt. 1739. Pl. 1 foot.

5 A. **Leviga'ta** (Lin. mant. p. 38.) plant glabrous, ascending; leaves 4 in a whorl, elliptic, nervèd, with finely scabrous margins; cymes corymbose, pedunculate, axillary or nearly terminal; corolla with a short tube; fruit glabrous, scabrous from elevated
Rubiaceae. CCXIII. Asperula.

6 A. hexaphylla (All. ped. no. 48. t. 77. f. 3.) plant ascending, glabrous; leaves 6 in a whorl, linear, spreading, acute, with revolute scabrous margins; cymes terminal; flowers aggregate, umbelate; bracteas glabrous, acute, shorter than the flowers. 2. H. Native of Piedmont, on the lower Alps about Tende and Saorgio. A. Allioni, Baumg. enum. trans. 1. p. 80. Corolla purple outside, but white within.

Var. β, rigidula (D. C. prod. 4. p. 582.) leaves stiffer and blunter than those of the species, and the floral ones are obovate. 2. H. Native of Sicily, in the fissures of calcareous rocks by the sea side. A. hexaphylla, Guss. prod. fl. sic. 1. p. 166. There are glabrous and downy variations of this plant.

Six-leaved Woodroof. Pl. 3/2 foot.

7 A. cracca (Meyer, ver. plf. 52.) plant perennial, smooth, glabrous; stems filiform, much branched, diffuse; leaves 4 in a whorl, equal, elliptic, bluntish, with rather scabrous margins: upper ones opposite; umbel terminal, few-flowered; corolla 4-5-cleft, almost glabrous, with obtuse segments; style semidis; mericarps smooth, glabrous. 2. H. Native of Caucasus, in alpine places at the river Malka.

Slender Woodroof. Pl. diffuse.

8 A. hybrida (Ramond, bull. phil. no. 41. p. 131. t. 9. f. 1. 2-3.) plant tufted, erect, glabrous; leaves 6 in a whorl, linear, acute, hairy, longer than the internodes; flowers aggregate umbelate, terminal, sessile, exceeding the bracteas; fruit glabrous. 2. H. Native of the central Pyrenees, on the higher ranges on dry banks. A. nov. spec. St. Amans, trav. ppyr. 194. Corollas white, purplish outside. In cultivation the plant becomes smooth, and is then referrible to A. hexaphylla.

9 A. trinervia (Lin. spec. 150.) plant erect, glabrous; leaves linear: lower ones 6 in a whorl: middle ones 4, and the uppermost ones opposite; floral leaves ovate; flowers usually triphid. 2. H. Native of Europe, on hills in arid stony places. A. rubella β, Lam. fl. fr. 8. p. 375. Gállium tincinòrium, Scop. carn. no. 149.—Tabern. icon. t. 733. f. 2. Roots large, creeping, reddish, and are used in Gothland instead of snedder for dyeing red. Plant procumbent, unless supported. Stem 1-2 feet long, purplish. Flowers usually by threes. Corollas white, reddish on the outside. Very like A. cynánchica.

Dyers' Woodroof. Fl. June, July. Cll. 1764. Pl. 1 to 2 feet.

10 A. cynánchica (Lin. spec. p. 151.) plant glabrous, erectish; leaves 4 in a whorl, linear: lower ones small, oblong, upper ones opposite; floral ones lanceolate-linear, acuminate awned; flowers terminal, quadrifid; fruit granulated. 2. H. Native of Europe, in dry gravelly places; abundant in many parts of England on chalky downes. Smith, engl. bot. t. 33. Berg. phyt. t. 81. Rubiá cynánchica, J. Bauh. hist. 3. p. 723. with a figure. Asp. rubéola a, Lam. fl. fr. 3. p. 375. A. tinctória var. β, Lam. dict. 1. p. 298. Gállium cynánchicum, Scop. carn. no. 147. Herb variable in habit. Stems prostrate, dichotomously branched. The flowers grow on erect branches, forming a fastigiate corymb, white or blush-coloured, elegantly marked with red lines, and sometimes they are pure white. Dalechamp seems to be the chief authority for the reputation this plant formerly acquired in the cure of quinines. He says it should be applied externally, as well as taken internally, but it is now entirely out of use.

Var. β, heterophylla (D. C. prod. 4. p. 583.) decumbent;

Var. δ, elongáta (Stev. in litt. ex D. C. prod. 4. p. 583.) plant elongated, erect; leaves linear, shorter than the internodes. 2. H. Native of Tauria and Caucasus. A. cynánchica, Bieb. fl. taur.

11 A. supína (Bieb. fl. taur. 1. p. 101.) glabrous; stem much branched at the base, procumbent; leaves 4 in a whorl, linear, acute; lower ones imbricately crowded; peduncles 5-flowered, axillary, and terminal; rather panicked; corolla with a terete tube, and 4 oblong lobes; fruit glabrous. 2. H. Native of Tauria and Caucasus, in the fissures of calcareous rocks, and in gravelly places. A. cynánchica β, Meyer, ver. plf. p. 406. Very nearly allied to A. cynánchica, but the flowers are white, not as in it, blush-coloured. Internodes of the stem short.

12 A. longifílora (Waldst. et Kit. pl. rarr. hung. 2. t. 150) stems numerous from the same neck, erectish, glabrous; leaves 4 in a whorl, linear: lower ones small, obovate; upper ones opposite; fascicles of flowers terminal, pedunculately; bracteas small, subtulate; tube of corolla elongated; fruit glabrous, smooth. 2. H. Native of Croatia, Carniola, and Carinthia, in mountainous places, and on rocks. A. suávélens, Schrad. in litt. 1815. Corolla whitish, yellowish inside, and reddish outside. Stems weak.

13 A. brevífílora (Vent. hort. cels. p. 65. t. 65.) plant glabrous, decumbent; leaves 4 in a whorl, very short, distant: uppermost ones opposite; flowers axillary, solitary on short pedicels, and in terminal fascicles; corolla 4-cleft; style bipartite to the base. 2. H. Native of Caramania, near Çydrine on mountains. Stem much branched. Corollas at first yellowish-green, but at length becoming purplish.

14 A. luťeá (Smith, fl. græc. t. 120.) stems erect; leaves 4 in a whorl, linear, glabrous, mucronate; flowers in fascicles, downy, awned. 2. H. Native of Mount Parnassus. Rubéola Crética saxátílis frutescens flore luteo, Tourn. cor. p. 5. Flowers yellow. Fascicles of flowers spicate.

Yellow-flowered Woodroof. Pl. 1 foot.

15 A. arista'á (Lin. fil. suppl. 120.) plant erect, glabrous; leaves 4 in a whorl, linear, acute; upper ones opposite; the floral ones like the rest, but smaller; flowers in terminal fascicles; lobes of corolla bluntly awned. 2. H. Native of the south of Europe, Sicily, &c. Flowers usually by threes, pale yellow.

16 A. montána (Willd. emend. p. 151.) glabrous; stem flácid; leaves linear; lower ones 6 in a whorl: middle ones 4, upper ones opposite; floral leaves linear; flowers in fascicles; corollas 4-cleft, scabrous externally. 2. H. Native of Hun-
gamy, on hills in woods. Link, enum. 1. p. 134. Corolla blush.

17 A. Hirsuta (Desf. fl. atl. 1. p. 127.) plant erect or ascending; leaves 6 in a whorl, linear, acute, with revolute margins; lower ones and tops of stems glabrous; flowers in fascicled umbels, rising from the tops of the stem or branches; bractees hardly exceeding the ovaries; fruit glabrous. 2. H. Native of Algiers and Algarves, on chalky and sandy hills. Ruboela Lusitanica, &c. Tourn. inst. p. 130. A. repens, Brot. prot. phys. lus. 1. no. 10. t. 10. A. Algérica, Pers. ench. 1. p. 124. Rábia repens, &c. Gris. ir. no. 1244. Stem hairy at bottom. Leaves glaucous. Flowers subcapitate, red. In cultivation this plant becomes smooth.

18 A. Tomentosa (Ten. prod. xii. fl. neap. t. 9.) plant ascending or diffuse, clothed with velvety tomentum; leaves 4 in a whorl, linear, with revolute margins; lower ones obovate; flowers terminal or axillary, 8-10 in a fascicle; bractees rather shorter than the flowers. 2. H. Native of Goats' Island, near Naples, in arid places. Herb branched from the base. Stem tetragonal. Stipular leaves the longest. Tube of corolla longish. Corolla red. A. crus-fimbria, Lin. mant. p. 37. does not seem to differ from the present plant. Perhaps A. scabra, Link, enum. 1. p. 134. is also the same.

19 A. Incana (Smith, fl. greec. t. 119.) stems villous at the base, and smooth at top; leaves 6 in a whorl, linear, hoary; flowers downy, in terminal fascicles. 2. H. Native of Candia, on the Spaccotic mountains. Flowers pale red.

Hoary Woodroof. Pl. ½ to 3/16 foot.

20 A. Arcadinensis (Sims, bot. mag. t. 2446.) plant hoary, decumbent; leaves 6 in a whorl, oblong-ovate, acute, with revolute edges; flowers terminal and axillary, aggregate, sessile; style bifid at top. 2. F. Native of Arcadia, on Mount Tyria. A small hoary plant, with rose-coloured flowers. Gálum Graecum, Hort.

21 A. de'bullis (Led. hort. dorp. suppl. 1824. p. 2.) plant hispid from pili; leaves 6 in a whorl: upper 4 in a whorl, linear-lanceolate, scabrous above, and keel smooth; umbels lateral, pedunculate; 3-flowered; corolla funnel-shaped; fruit granular. 2. H. Native of Tauria, near Bachtischariar.

Weak Woodroof. Pl. ½ foot.

22 A. Xiridia (Smith, fl. greec. t. 124.) glabrous; stems diffuse, densely tufted, as well as the leaves; leaves 4 in a whorl, shining, glaucescent; lower ones oval, the rest linear, acute, awned, revolute; fascicles terminal, 3-4-flowered, length of leaves; lobes of corolla awned; tube terete, wide; fruit glabrous, rather rugose. 2. H. Native of Sicily, on rocky and gravelly mountains, and on Mount Olympus, in Bithynia. Guss. prod. fl. sic. 1. p. 168. Flowers purplish. Very like A. hexaphillum.

Nitid Woodroof. Pl. tufted, ½ foot.

23 A. scabra (Presl. del. prag. p. 124. but not of Link.) stem scabrous, diffused, kneed; leaves 4 in a whorl: lower ones oblong downy: upper ones glabrous, linear, unequal, opposite, small, awned; flowers in fascicles; corollas scabrous, with the

lobes mucronate; style bipartite to the base. 2. H. Native of Sicily, on dry mountains; of Spain, in arid places; and of Portugal, on the banks of the Tagus and Douro. Guss. prod. fl. sic. 1. p. 167. A. rigida, Dufour, ann. gen. sc. phys. 7. p. 295. A. macrolepis, Link. fl. port. 2. p. 41. t. 84. Stems exactly quadrangular. Flowers purplish white. Habit of A. longiflora, but differs from it in the lower leaves and flowers being downy.

Scabrous Woodroof. Pl. 1 to 2 feet.

24 A. Alpina (Bieb. fl. taur. suppl. p. 103.) the whole plant, as well as the corollas and ovaries are downy; stems procumbent, much branched, tetragonali; leaves 4 in a whorl, linear, acute; upper ones nearly equal, spreading; cymes terminal, crowded, 5-7-flowered; lobes of corolla 4. 2. H. Native of Eastern Caucasus, on the Alps. A. cynanchica, var. Stev. in mem. soc. mosc. 3. p. 253. Meyer, verz. pl. p. 406. Flowers white, or tinged with red. Leaves shorter and broader than in A. cynanchica, and the lower ones blunter.

25 A. cretica (Willd. in Roem. et Schultes, syst. 3. p. 529.) stems tufted, prostrate; leaves 6 in a whorl, lanceolate; the whorles so close as to be imbricated; flowers terminal, aggregate. 2. H. Native of Siberia, in alpine places.

Crassulaceous Woodroof. Pl. prostrate.

26 A. littoralis (Smith, fl. greec. t. 122.) stem downy; leaves linear, 4 in a whorl, scabrous on the margins and stem (almost hoary, according to D'Urville): floral ones opposite; flowers quadripetall, pilose; fruit hispid. 2. H. Native on the shores of the Euxine Sea, on hills. Flowers pale red. Fascicles of flowers disposed in terminal panicles.

Sca-shore Woodroof. Pl. procumbent.

27 A. neglecta (Guss. pl. rar. 69. t. 13. f. 1.) stems numerous, hairy, ascending; leaves 4 in a whorl, hairy, acute, longer than the internodes: lower ones obtuse; flowers in terminal fascicles; mericarps globose, hispid. 2. H. Native of Abruzzo and Sardinia, in alpine places. Corolla white inside, and reddish outside, and downy. Bracteae ovate. Said to be allied to A. littoralis.

Neglected Woodroof. Pl. decumbent.

28 A. nitens (Guss. pl. rar. 70. t. 13. f. 2.) plant smooth; stems tufted, decumbent; leaves 4 in a whorl, awned, longer than the internodes; shining, quite glabrous; lower ones the broadest; flowers in terminal fascicles; lobes of corolla awned; mericarps tubercularly muricate. 2. H. Native of Abruzzo, in arid, alpine situations. Flowers white inside, and purplish outside. Very like A. neglecta, and probably only a variety of it.

Shining Woodroof. Pl. deciduous.

29 A. albida (Sibth. et Smith, fl. greec. t. 121.) stems diffuse, downy; leaves linear, 4 in a whorl, superior ones opposite; flowers scattered; fruit glabrous. 2. H. Native of Candia, on hills and in fields, Roem. et Schultes, syst. 3. p. 270. exclusive of the syn. of Lois. Leaves rather scabrous. Flowers pale red, disposed in terminal and lateral few-flowered fascicles.

Stiff Woodroof. Pl. ½ to 1 foot.

30 A. suberoba (Smith, fl. greec. t. 129.) stems tufted, ascending; root corky; leaves 4 in a whorl, linear, rather hoary; lobes of the corolla awned. 2. H. Native of Greece, on high rocks. Stems downy. Flowers rose-coloured, disposed in subsipicate fascicles.

Corky-rooted Woodroof. Pl. ½ to 3/16 foot.

31 A. longifolia (Smith, fl. greec. t. 118.) stems smooth;

32 A. odorata (Dodd. pempt. p. 355.) plant glabrous, erect, or ascending; stems simple; leaves 8 in a whorl, lanceolate, smooth, with serrately scabrous edges; corollas terminal, pedunculate; fruit hispid. 2. H. Native of Europe, Siberia, and Caucasus, in shady places and woods; plentiful in Britain. Od. fl. d. t. 562. Lam. ill. t. 61. Mill. fig. t. 55. Smith, eng. bot. t. 755. Blackw. t. 60. Galium odoratum, Scop. carn. no. 158. Root creeping a little below the surface of the soil. Stems tetragonal. Corollas usually trifid, each division bearing about 4 flowers. Flowers snowy white. The plant is without scent when fresh, but when dried diffuses an odour like that of vernal grass. It is said to give a gratifying flavour to wine, and when kept among clothes, not only to impart an agreeable perfume to them, but to preserve them from insects. Turner calls the plant Wood-rose, or Wood-rowel. Gerard, Woodroo, Woodrowell, and Woodrooffe; and Parkinson, Woodroof. In modern times it is called Woodroof, or Woodruff. These names are derived from the place of its natural growth, in woods, and from the whorls, ruffs, or rows of leaves.

Sweet-scented or common Woodroof. Fl. May, June, Britain. Pl. ½ to ¾ foot.

33 A. aparine (Bieb. fl. taur. p. 102. and suppl. 105. Bess. fl. gall. 1. p. 114.) branches diffuse, straggling, with scabrous angles; leaves 6-8 in a whorl, oblong or lanceolate, scabrous, having the keel and margins beset with small retrograde prickles; peduncles axillary, branched, disposed in a loose fasciculate panicle; corolla short, tubular; fruit granular. 2. H. Native of Galicia, Tauria, Caucasus, Volhynia, Russia at Moscow, Siberia, and Greece, in boggy, grassy places. Rchb. pl. crit. 1. t. 93. f. 198. Galium uliginosum, Pall. ind. taur. Asp. rivialis, Sibth. and Smith, fl. græc. t. 117. Angles of stems scabrous from retrograde prickles. Flowers white, campanulately funnel-shaped. Very much the habit of Galium aparine, but stronger. Herb scabrous all over.

34 A. panicula (Bunge in Ledeb. fl. alt. ill. t. 301. fl. alt. 1. p. 140.) stems tetragonal, glabrous; lower leaves 4 in a whorl: the rest 6, oblong-lanceolate, acuminate, with scabrous margins; flowers terminal and axillary, panicled; panicle diffuse; corollas campaspanule; fruit smooth. 2. H. Native of Siberia, in grassy parts of mountains at the rivers Tscharysch and Sentelek, and in sandy places at the river Katunja. Leaves rather glaucous beneath. Corollas white, with obtuse segments.

Panicled-flowered Woodroof. Pl. 1 foot.

35 A. subvelutina (D. C. prod. 4. p. 585.) stems many, branched, erect, velvety from small down; leaves 5-8 in a whorl, broad-linear, obtuse, rather velvety; flowers verticillate, and capitate at the tops of the branches; floral leaves small; corollas campaspanule; fruit glabrous. 2. H. Native of Persia, on Mount Elwend, where it was collected by Olivier and Bruquiére. Old stems permanent, white, and glabrous. Leaves 6 lines long, and a line broad.

Rather-velvety Woodroof. Pl. ½ to 1 foot.

36 A. calloides (Bieb. fl. taur. 1. p. 101. and suppl. p. 104.) plant glabrous; stems terete, ascending; leaves 6-8 in a whorl, linear, glaucous; peduncles dichotomous, terminal, corolline; corollas campaspanule; fruit glabrous, smooth. 2. H. Native of Middle and South Europe, even to Tauria and Caucasus, in stony places. Galium glaucum, and probably Galium montanum, var. Lin. spec. 156. Asp. glauca, Bess. Galium Haleri, Sut. fl. helv. t. 60. Galium campanulatum, Vill. dauph. 2. p. 326. Galium involdiflorum, Clairv. var. p. 41. Flowers white. Plant glaucous.—This is a very variable plant, and is intermediate between Galium and Aspērula. Stems, either terete or bluntly sub-tetragonal, erectish or diffuse, smooth or scabrous at the base. Leaves with revolute or flat margins, obtuse or mucronulate.—See Jacq. fl. austr. t. 54. Vill. dauph. t. 7. Bosc. mus. 2. t. 116.

† Species not sufficiently known.

38 A. Tournefortii (Sieb. ex Spreng. syst. 1. p. 395.) stems suffruticosae; leaves obvolute-oblong, quite glabrous, glaucous; whorles of flowers approximate; flowers sub-fasciculate, hispid. 2. H. Native of Candia.

Tournefort's Woodroof. Pl. suffruticosae.

39 A. umbellata (Willd. herb. ex D. C. prod. 4. p. 586.) 2. H. Native of Hungary. This is the same as A. hexapylalla, ex Spreng. syst. but according to Stevens, obs. ms. it differs in the flowers being shorter.

Umbellate-flowered Woodroof. Pl.

40 A. involucrata (Bergr. et Wahl. in isis. 1828. vol. 2. p. 971.) leaves 4 in a whorl, obvolute, elongated, obtuse, glabrous; stems decumbent; peduncles lateral and terminal; flowers umbellate; corolla sub-fasciculate; fruit glabrous. 2. H. Native of the Levant, among bushes on the sides of hills. Leaves like those of Galium palustre.

Involucrated Woodroof. Pl. decumbent.

Cult. Most of the species of Woodroof are very pretty when in flower, and are therefore well adapted for decorating flower-borders or rock-work. They will grow in any common garden-soil, and are easily increased by parting at the root. A. odorata will thrive under the shade of trees, where hardly any thing else will grow. The seeds of annual species only require to be sown where the plants are intended to remain.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an ovate tube, and a hardly distinct limb. Corolla tubular, elongated, funnel-shaped, 4-5 lobed; lobes usually drawn out into a slender, inflexed appendage each. Stamens 4-5, inclosed; anthers linear. Style 2-lobed at the apex, shorter than the tube of the corolla. Fruit divisible into 2 parts, but not crowned by
the calyx; mericarps semi-ovate or oblong, indeliscent.—Herbs, sometimes suffrutescence at the base, but usually annual. Leaves truly opposite, furnished with from 1 to 3 stipulas on each side. Flowers furnished with 3 bracteas each, the exterior bractea representing a calyce leaf, and the 2 lateral ones opposite, all longer than the ovary, and appearing like a calyx. Spikes sometimes elongated and continuous, sometimes capitmate, and sometimes interrupted from being formed of pedunculate fascicles of flowers.

§ 1. Flowers disposed in continuous spikes.

Var. ß, monstáchya, (D. C. fl. fr. no. 3345.) stem simple, bearing only one spike at the apex.

Var. ð, malarónata, (Roth, cat. 1. p. 27.) leaves 4 in a whorl, mucronate.

3. C. glaúca (A. Rich. in mem. soc. hist. nat. par. 5. p. 131.) plant suffruticose at the base, erect, glaucous; leaves 6 in a whorl, linear, with revolute edges; spikes slender, pedunculate, somewhat interrupted at the base; bracteas ciliated; flowers pentamorous. Þ. H. Native of Persia.

Var. a, Bruguierí (D. C. prod. 4. p. 587.) leaves rough; bracteas and brachteoes rather velvety from fine down. Þ. H. Native of Persia, between Kermanchá and Amadan, where it was collected by Olivier and Bruguier.

Var. ß, Michánzii (D. C. l. c.) stem glabrous; leaves smoothish; bracteas a little smaller. Þ. H. Native of Persia, where it was collected by Michaux.

Glaucous Crosswort. Pl. 1 foot.

4. C. ciliáta (Lam. dict. 2. p. 217.) plant diffuse; leaves 4 in a whorl, or opposite; spikes hardly interrupted at the base; bracteas ciliated, unequal, rather loose; flowers tetramorous; fruit beset with blunt tubercles. Ó. H. Native of the Levant, about Aleppo, where it was collected by Michaux. C. diffusa, Roth, in Úst. neu. ann. 4. p. 40. cat. 1. p. 26. C. tuberculosa, VOL. III.

5. C. Pá'tana (Lin. spec. p. 602.) erect; branches spreading; leaves 6 in a whorl, linear, rather scabrous; flowers 1-2 in the axis of the bractea, on short peticels, pentamorous; fruit smoothish. Ó. H. Native of Spain, on rocks at Aranjuez, Tulela, and Navarre, and in the kingdom of Valencia. Loefl. itia. p. 68. C. pentánta, Dufour, in Rœm. et Schultes, syst. 3. p. 532. Corolla yellowish.

6. C. suave'veoles (Meycr, verz. pfl. p. 406.) plant perennial, glabrous; stem herbaceous, erect, branched; leaves linear, mucronate, with prickly, revolute edges, 8 in a whorl, but the upper ones are 6 in a whorl; flowers opposite, disposed in dense spikes: floral leaves and bracteas lanceolate, ciliated, a little shorter than the corollas, which are glabrous, and 5-cleft; stamens inclosed; mericarps glabrous, smooth. ß. H. Native of Caucasus, in dry, stony places on the Talusch mountains.

Sweet-scented Crosswort. Pl. 1 foot.

7. C. Égépy'aca (Lin. mant. p. 38.) plant diffuse; leaves 4 in a whorl, linear, with revolute edges, glabrous above, and on the margins: lower ones ovate; spikes terminal; bracteas lanceolate, with the keel and margins rather scabrous. Ó. H. Native about Alexandria, in Egypt. C. herbéaca, Forik fl. egypt. p. 30. Flowers pentamorous, pale yellow, awned.

8. C. Gilá'sca (Triin. in mem. act. petersb. 1818. p. 493. t. 12.) stems erectish, branched; leaves 4 in a whorl, linear, mucronate, with prickly revolute edges; flowers remotely spicate; bracteas and floral leaves ovate, ciliated, 4 times shorter than the corolla, which is glabrous. ß. H. Native of Persia, in the province of Ghilan, on the mountains; and of Caucasus, in dry, stony places on the Talusch mountains. Root slender, creeping. Flowers pentamorous. Lobes of the corolla mucronate. Fruit and stamens glabrous. Style inclosed.

Ghilan Crosswort. Pl. procumbent.

§ 2. Flowers capitulate.

10. C. capità'ta (Labill. pl. sur. dec. 1. p. 12. t. 5.) plant suffruticose, procumbent, branched, glaucous, glabrous; leaves 6 in a whorl, almost linear; spikes capitate, ovate; bracteas membranous, lanceolate, longer than the leaves, trifid, girding 2 flowers each; corollas 5-parted. ß. F. Native on the top of Mount Lebanon. Corolla blackish in the dried state. Bracteas trifid. Brachteoes linear.

Capitate-flowered Crosswort. Shrub procumbent.

11. C. stylíosa (Triin. mem. act. petersb. 1818. p. 485. no. 3. t. 11. ex Spreng. neu. entl. 1. p. 98.) plant procumbent; leaves 8-9 in a whorl, and are, as well as the stems, hispid; heads terminal, pedunculate; flowers pentamorous; style clavate, much exerted, bifid at the apex.—Native of Persia, in the province of Ghilan, among rocks; and of Caucasus, among bushes in the province of Lenkeran, from the Caspian Sea even to the Talusch 4 N.
mountains. Laxmannia fasciculata, S. G. Gmel. Said to be nearly allied to C. mollugo-oides.

Long-styled Crosswort. Pl. procumbent.

§ 3. Flowers in fascicles; fascicles opposite, on short peduncles; the whole forming an interrupted raceme.

13 C. mollugo-oides (Bieb. cent. 2. t. 65. ex fl. taur. 1. p. 106. suppl. 110.) erect; leaves 8-12 in a whorl; linear-lanceolate, with revolute, scabrous edges, and a villous keel; fascicles of flowers opposite, disposed in an interrupted spike; bracteas ovate-lanceolate, acuminate, villous, much shorter than the flowers; fruit glabrous, smoothish; corollas pentamers. H. Native of Caucasus, in subalpine places, Armenia, and Hungary. C. anoma, Balb. herb. taur. Aespélula tubiflora, Hortul.—Buxb. cent. 2. t. 30. f. 1. Corollas greenish yellow. Stamens 5. Mericarps nearly globose. Angles of the stem scabrous.

14 C. aspera (Bieb. fl. taur. 1. p. 107.) plant procumbent or ascending; leaves usually 6 in a whorl, linear, blunting, with revolute edges, and are, as well as the stem, scabrous; fascicles of flowers opposite, pedunculate, disposed in interrupted spikes; bracteas ovate, acute, ciliated, much shorter than the flowers; flowers pentamers; fruit glabrous. H. Native of Caucasus, about Tiflis. C. prostrata, Adams. in Web. et Mohr. cat. 1. p. 46. Flowers greenish yellow.

Rough Crosswort. Pl. procumbent.

† Plants referred to the genus which ought to be excluded from it.

16 C. ? americana (Mill. dict. no. 5.) stem erect, villous; leaves opposite, linear-lanceolate, hairy; flowers solitary, axillary. H. S. Native of Vera Cruz. Flowers pale blue. Fruit didymous. Probably a species of Spermacoce.

17 C. ? hispida (Mill. dict. no. 4.) stem hispid; leaves opposite, lanceolate, hairy; flowers umbellate, terminal. H. S. Native of Vera Cruz. Stems quadrangular, rough, prickly. Flowers blue, tetramers. Fruit didymous.

Hispid Crosswort. Shrub 2 feet.

Cult. The seeds of annual species should be sown in the open ground where the plants are intended to remain. The perennial, herbaceous, and shrubby species being rather tender, should be grown in pots, in a mixture of peat, sand, and a little loam; and they will be easily increased by dividing at the root, or by cuttings.

CCXV. RU'BIA (from ruber, red; in allusion to the red colour of the roots). Tourn. inst. 115. t. 38. Lin. gen. no. 127.
RUBIACEÆ. CCXV. RUBIA. 613

6 R. angustissima (Wall. cat. no. 6207.) stems quadrangular, almost winged, serrated from retrograde prickles; leaves ½ in a whorl, long, linear, with scabrous edges, sessile; peduncles dichotomously divided. 2. S. Native of the Burmese Empire, on Mount Taong Dong, near Ava. Root like that of R. Mun-fista.

Very-narrow-leaved Madder. Pl. straggling.

7 R. chardeyi (Wall. cat. no. 6210.) stems quadrangular, angles beset with retrograde, prickly denticulations; leaves 8-10 in a whorl, linear, sessile, scabrous on the margins and keel; corymbs terminal. 2. F. Native of Nipaul.

Chara-leaved Madder. Pl. straggling.

**S. S. Succulentia. Stems shrubby. Leaves on short petioles, oblong or lanceolate.

8 R. fruticosa (Ait. hort. kew. 1. p. 147.) stem shrubby, smooth; leaves 2-6 in a whorl; the uppermost ones opposite, elliptic, on short petioles, having the margins and keel scabrous from prickles; flowers pentamorous; corymbs axillary, short, few-flowered. 2. G. Native of Tenerife, among bushes, Jacc. icon. rar. t. 25. R. fruticosa, and R. Canariensis, Poir. suppl. 2. p. 707. Leaves varying from oval to oblong-lanceolate, with distant retrograde prickles on the margins. Corollas yellowish. Peduncles usually 3-flowered.

Var. β. galoides (D. C. prod. 4. p. 589.) stem shrubby, terete, smooth; leaves 6 in a whorl, petiolate, ovate-lanceolate, having the nerve beneath and the margins furnished with retrograde prickles; corymbs axillary, trichotomous, bibracteate; flowers pentamorous. 2. G. Native of Madras, where it is called Tasaygo. Leaves 7-9 in a whorl, but on the branches only 3 in a whorl. Flowers yellowish. Teeth of calyx not perspicuous, as in many other species of the genus. Very nearly allied to R. fruticosa.

Ecalyculate-flowered Madder. Suppl. 2. p. 705.

9 R. acalycula (Cav. icon. 2. p. 75. t. 195.) stems rather herbaceous, smooth, hexagonal; leaves petiolate, ovate-lanceolate, having the nerve beneath and the margins furnished with retrograde prickles; corymbs axillary, trichotomous, bibracteate; flowers pentamorous. 2. G. Native of Barbary, on the sea-shore near Lacalle. Perhaps a species of Gálum. Flowers white, tetramous.

Swooth Madder. Shrub.

** Tinctoria (from tinctorum, for dyeing; the roots of most of the plants are used for dyeing). D. C. prod. 4. p. 589. Stems herbaceous. Leaves sessile, or on short petioles, never cordate.

11 R. angustifolia (Lin. mant. p. 39.) plant herbaceous; leaves 4 in a whorl, linear, scabrous above, and also along the margins and nerve; angles of stems prickly; corymbs axillary, 3-flowered; lobes of corolla bluntish, apiculate. 2. F. Native of Gibraltar, Portugal, and Balearic Islands. Lam. ill. t. 60. f. 2. Leaves evergreen. Flowers pale yellow. Perhaps this and the 6 following are only variations of R. tinctoria.

13 R. longifolia (Poir. suppl. 2. p. 703. 7.) herbaceous; leaves 4-6 in a whorl, linear-lanceolate, elongated, acuminate, almost sessile, smooth above, but with the margins and nerve scabrous from prickles, as well as the angles of the stem; peduncles trichotomous; lobes of corolla acutish, acuminate, not abruptly cuspidate. 2. H. Native of Corsica and at Mogo-

Long-leaved Madder. Pl. straggling.

13 R. tinctorum (Lin. spec. p. 158.) herbaceous; leaves 4-6 in a whorl, on short petioles, lanceolate, smooth above, scabrous from prickles on the margins and keel, and along the angles of the stem; peduncles axillary, trichotomous; lobes of corolla gradually acuminate, not cuspidate. 2. H. Native of the Levant and south of Europe; and also of Caucasus, on Mount Beschharmark, and plentiful near Dervent, and in the province of Baku; but cultivated in many parts for the sake of its roots. Lam. ill. t. 60. f. 1. Heyne, arzwn. gew. xi. t. 5. Schkuhr. Handb. t. 28. Mill. fig. t. 195. Very-narrow-leaved Madder. Pl. straggling.

13 R. angustissima (Wall. cat. no. 6207.) stems quadrangular, almost winged, serrated from retrograde prickles; leaves ½ in a whorl, long, linear, with scabrous edges, sessile; peduncles dichotomously divided. 2. S. Native of the Burmese Empire, on Mount Taong Dong, near Ava. Root like that of R. Mun-fista.
ground is ploughed over with a shallow furrow, and in the course of the operation the sets are deposited in each furrow, leaning on and pressed against the furrow-slice. This, however, is a bad mode, as there is no opportunity of firming the plants at the roots, and as some of the sets are apt to be buried, and others not sufficiently covered.

The after culture consists in hoeing and weeding, with stirring by pronged hoes, either of the horse or hand kind. Some earth up, but this is unnecessary, and even injurious, as tearing the surface roots.

The Madder crop is taken at the end of the third autumn after planting, and generally in the month of October. By far the best mode is that of trenching over the ground, which not only clears it effectually, but fits it at once for another crop. But where madder has been grown on land prepared by the plough, that implement may be used in removing it. Previously to trenching, the haumn may be removed with an old scythe, and carted to the farmyard, to be used as litter to spread in the straw-yards.

Drying the roots is the next process, which, in very fine seasons, may sometimes be effected on the soil, by simply laying the plants on it as they are taken up; but in most seasons they require to be dried on a kiln, like that used for malt or hops. They are dried till they become brittle, and then packed up in bags for sale to the dyer.

The difference from the root of this plant is different according to the difference of the soil, but mostly from 10 to 15 or 20 hundred weight, where it is suitable to its cultivation.

In judging of the quality of Madder roots, the best is that which, on being broken in two, has a brightish red or purplish appearance, without any yellow cast being exhibited.

The use of the Madder roots is chiefly in dyeing and calico printing. The haumn which accumulates on the surface of the field in the course of 3 years, may be carted to the farm-yard, and fermented along with horse-dung. It has the singular property of dyeing the horns of the animals who eat it of a red colour.

Madder seed in abundance may be collected from the plants in September of the second and third years, but it is never so propagated.—Madder is sometimes blighted, but in general it has but few diseases.

Madder is cultivated in Holland only on the very best soils, and with plenty of manure. At the end of May or April, according as the young plants are large enough to be transplanted, the land must be ploughed in beds of 2 feet, and 3½ feet wide; the beds are then harrowed and raked, and the young suckers of the roots or plants are to be put down in rows, at intervals of a foot or a foot and a half, and at 6 or 8 inches distant in the row. During the entire summer the land should be frequently stirred, and kept free from weeds. In the month of November, when the leaves are faded, the plants are covered with 2 inches of earth, by a plough, having the point of the coulter a little raised or rounded, so as not to injure the young plants. In the following spring, when the young roots are 4 or 5 inches long, they are gathered or torn off, and planted in new beds, in the same manner as above stated; and then, in the month of September or October, after the faded leaves have been removed, the old roots are taken up. The madder thus taken up should be deposited under cover, to protect it from the rain, and after 10 or 12 days, placed in an oven moderately heated. When dried sufficiently it is gently beaten with a flail, to get rid of the clay that may adhere to the plants; and by means of a small wind-mill, is ground and sifted, to separate it from any remaining earth or dirt. It is then replaced in the oven for a short time, and when taken out, is spread upon a hair cloth to cool; after which it is ground and cleaned once more. It is then carried to a bruising mill, and reduced to fine powder, and then packed in casks or barrels for the market.

Var. β, Iberica (Fisch. in litt. ex D.C. prod. 4. p. 589.) leaves on longer petioles, downy on the veins and nerves beneath. 2. H. Native of Iberia. The roots of this variety are said to be better for the purposes of dyeing than those of the species.

Var. β, augustifolia (Guss. prod. fl. sic. 1. p. 183.) stem smoothish; leaves elliptic-oblong or lanceolate. 2. H. Native of Sicily and the south of France.

17 R. splendens (Hoffm. et Link, fl. port. 2. p. 67. t. 85.) herbaceous; leaves 4-6 in a whorl, obversely oblong, acute, having the nerve on both surfaces and margins scabrous from prickles, as well as the angles of the stems; peduncles axillary; lobes of corolla prickly. 2. H. Native of Portugal, in hedges about Lisbon. R. stelliferis, Broth. fl. lus. 1. p. 153. but not of Mill. Flowers yellow, pentameres.

18 R. intricata (Hook. et Arn. in bot. misc. 3. p. 362.) glabrous, smoothish; stems diffuse, herbaceous, divaricately branched, intricate, acutely 4-angled; leaves small, oblong-linear, hardly acute, almost nerveless; branches of panicle divericate; flowers pedunculate, bractless; berries globose.—Native of Chile, among hedges of Cacti at San Isidro.

Intricate-branched Rubia. Pl. diffuse.

19 R. Oliveri (A. Rich. in mem. soc. hist. nat. Par. 5. p. 132.) stems suffruticose, rather hexagonal, scabrous from retrograde prickles or bristles; branches powdery, downy; leaves usually 6 in a whorl, oboval, mucronate at the apex, with hispid margins; peduncles axillary, usually by threes, tripartite, and 3-flowered at the apex; corolla subcampanulate, 5-parted. 2. H. Native of the island of Scio, where it was collected by Oliveri and Bruguére.
645

Oliveir’s Madder. Pl. straggling.
20 R. Thunb. bæghi (D. C. prod. 4. p. 590.) plant glabrous in every part; leaves usually 4 in a whorl.—Native of the Cape of Good Hope. R. laevis, Thunb. fl. cap. 151. but not of Poir.
The rest unknown.

Thunberg’s Madder. Pl. straggling.

§ 2. Involucratae (the flowers of the plants contained in this section are involucreted by bracteas). D. C. prod. 4. p. 590.

Peduncles axillary, bearing each 4 bracteas in a whorl, which constitute an involucrum to the flowers. Flowers 1-3, rising from each involucrum, sessile, or pedicellate, usually tetrameros.—Diffuse prostrate plants, all natives of America, which probably should be joined with Galium according to A. Richard.

* Berries glabrous. Leaves 1-nerved.
21 R. Walteri (D. C. prod. 4. p. 590.) stems tetragonal, smooth on the angles, and pilose on the sides; leaves ovate, membranous, rather pilose on both surfaces while young, but having the keel and margins scabrous in the adult state; bracteas ovate, acute; flowers solitary from the involucrum; fruit glabrous, pedicellate. ¥ H. Native of Carolina and Florida, in shady places. R. peregrina, Walt. car. p. 86. but not of Lin. R. Brönn., Michx. fl. bor. amer. 1. p. 81. exclusive of the syn. of Browne. R. Techénis, Rafin. fl. lud. p. 76.? Flowers small, yellow, tetramerons. Fruit blackish.

Walter’s Madder. Pl. straggling.

22 R. Guadaloupe (Spreng. syst. 1. p. 397.) stems tetragonal, rough along the angles at the base; leaves oblong, mucronate, attenuated at the base, having the margins and keel prickly; peduncles axillary, shorter than the leaves, 1-flowered; flower sessile among the bracteas, which are oblong; berries scabrous. ¥ S. Native of Guadaloupe, where it was collected by Badier and Bertero.

Guadaloupe Madder. Pl. straggling.

23 R. Indecora (Cham. et Schlecht. in Linkrea. 3. p. 229.) stems tetragonal, scabrous from pili; leaves oblong, somewhat cuneated, obtuse, mucronate, membranous, remotely pilose on the nerves beneath and margins; peduncles axillary, solitary, opposite, 1-flowered; bracteas lanceolate; ovary pilose; berries egg-shaped, glabrous, sessile within the involucrum. ¥ F. Native of the south of Brazil.

Indecorous Madder. Pl. straggling.

24 R. Chilensis (Mol. chil. 118. ed. gall. p. 330. but not of Wild.) stems smooth, tetragonal while young, but at length becoming terete and erectitious; leaves oblong-linear, mucronate, pilose on the nerves and margins; peduncles axillary, opposite, 1-flowered, a little longer than the leaves, hairy at top, as well as the bracteas. ¥ F. Native of Chili, near Rancagua and Valparaibo, where it was collected by Bertero, who asserts that it is the Rebel of the natives. Nearly allied to R. indecora.

Chili Madder. Pl. straggling.

25 R. Ramosissima (Pohl, in litt. ex D. C. prod. 4. p. 591.) stems tetragonal, rather hairy along the angles; leaves oblong, obtuse, rather cuneated at the base, 1-nerved, rather pilose beneath and glabrous above, and shining; peduncles axillary, length of leaves, 1-flowered; bracteas oval, glabrous; berry sessile, within the involucrum, glabrous. ¥ G. Native of Brazil, where it was collected by Pohl. Herb becoming black on drying.

26 R. Valantiodes (Cham. et Schlecht. in Linkrea. 3. p. 231.) stems tetragonal, pilose along the angles; leaves sessile, ovate, acute, membranous, 3-nerved, pilose on the margins and nerves; peduncles axillary, verticillate, shorter than the leaves, 1-flowered; bracteas ovate-oblong; flower sessile within the involucrum. ¥ F. Native of Brazil. Stem scabrous from the bases of the hairs remaining. Corolla pilose. Berries glabrous. Valanella-like Madder. Pl. straggling.

27 R. Nuda (H. B. et Kuntz, nov. gen. 3. p. 339. t. 280.) stems tetragonal, beset with reflexed hairs along the angles; leaves elliptic, bluntish, with revolute edges, glabrous above and shining, and rather hairy beneath; peduncles axillary, 1-flowered, opposite, twice the length of the leaves; flower sessile, within the involucrum; berries glabrous. ¥ F. Native at the foot of the burning mount Pichincha, near Quito. Allied to R. Waleri.

Nits-leaved Madder. Pl. straggling.

28 R. vitis (Cham. et Schlecht. in Linkrea. 3. p. 230.) glabrous; stems tetragonal, scabrous from retrograde bristles on the angles, and on the nerves and margins of the leaves; leaves oblong, obtuse, hardly attenuated at the base, rather mucronate, membranous; peduncles axillary, verticillate, 3-flowered, length of leaves: the middle flower sessile; bracteas oblong, acute. ¥ F. Native of the south of Brazil. Berries glabrous.

Vile Madder. Pl. straggling.

Ciliated-leaved Madder. Pl. procumbent.

30 R. Monantha (D. C. prod. 4. p. 591.) stems procumbent, much branched, tetragonal, smoothish; leaves oval or ovate-oblong, obtuse, beset with long hairs, hispid above; peduncles axillary, solitary, 1-flowered, bearing each 4 leaves or bracteas just under the flower; flower sessile, within the involucrum; fruit glabrous, smooth. ¥ F. Native of Peru, where it was collected by Haenke. Galium monanthum, Bartl. in herb. Haenke. This species is nearly allied to R. ciliata.

One-flowered Madder. Pl. procumbent.

31 R. Ovatis (D. C. l. c.) stems climbing a little, tetragonal, hairy; leaves 4 in a whorl, oblong-oval, acuminate, equal, at length reflexed; peduncles axillary, 1-flowered, a little shorter than the leaves, bearing 4 oval acute bracteas at top under the flower; fruit glabrous. ¥ F. Native of Peru, among rubbings. Galium ovati, Ruiz et Pav. fl. per. 1. p. 59. Oval-leaved Madder. Pl. climbing.

32 R. Crocea (D. C. l. c.) stems procumbent, branched; branches tetragonal; leaves 4 in a whorl, linear, ciliated, rather scabrous beneath; peduncles axillary, short, 1-flowered, bearing 4 leaves at the apex; fruit glabrous.—Native of Peru, at Tarma and Huancaco, on arid declivities. Galium croceum, Ruiz et Pav. fl. per. p. 126. Flowers 3-4-cleft. Fruit of a reddish copper-colour.

Saffron-coloured-fruited Madder. Pl. procumbent.

33 R. Levigata (D. C. l. c.) plant quite glabrous; stems tufted, much branched, diffuse; leaves 4 in a whorl, ovate-oblong or ovate-lanceolate; peduncles axillary, 1-flowered, bearing 4 leaves at the apex; flower sessile, within the involucrum; fruit glabrous, smooth. ¥ H. Native of Mexico, where it was collected by Haenke. Galium levigatum, Bartl. mss.

Smooth Madder. Pl. diffuse.

34 R.? Corymbosa (D. C. prod. 4. p. 591.) stems creeping, filiform; branches alternate, erect, corymbose dichotomons, tetragonal; leaves 4 in a whorl, sessile, approximate, oblong-lanceolate, rather ciliated, glabrous; peduncles 1-flowered, bearing each 4 bracteas: fruit glabrous.—Native of Peru, on the

Corynabo-flowered Madder. Pl. creeping.

** Berries hairy or scabrous. Leaves 1-nerved.

Under-fruited Madder. Pl. straggling.

36 R. Rëb'lun (Cham. et Schlecht. in Linneaa. 3. p. 289.) the whole plant is scabrous, and clothed with short pilis; stems acutely tetragonal; leaves obovate-elliptic, obtuse, mucronate, rather membranous, with ciliated margins, scabrous from hairs on both surfaces; peduncles axillary, 1-flowered, opposite or verticillate; bracteas broad-lanceolate; flower sessile; berry sessile, globose, rather pilose. Ñ. F. Native of Chili, Brazil, and Caracas. Poep. ex. Ulric. chil. no. 705. Fœill. obs. 3. p. 60, t. 45. R. Chilénis, Willd. spec. 1. p. 604. but not of Mol. The plant is called Rubia in Chili, as well as other species; and the roots are red, and used for dyeing like the common madder.

Rubun Madder. Pl. straggling.

37 R. Richardia'sa (Gill. miss. ex Hook. et Arn. in bot. misc. 3. p. 362.) plant glabrous, scabrous, shining; stems erectish, teretely quadrangular; leaves 4 in a whorl, linear-oblong, acute, 1-nerved, one-half shorter than the internodes; peduncles opposite or in whorls, equal in length to the leaves, bearing 4 bracteas and 3 flowers at the apex; fruit tubercular in the immature state.——Andes of Mendoza.

Richardson's Rubia. Pl. straggling.

38 R. Henke'a'sa (Gill. miss. ex Hook. bot. misc. 3. p. 363.) plant hairy, hoary; stems procumbent, terete; leaves 4 in a whorl, linear, acute, deflexed, one-nerved, broader at the base; peduncles in whorls much longer than the leaves, bearing 3 flowers and 4 bracteas at the apex; fruit tubercular, scabrous. Ñ. F. Native of Chile, about Mendoza.

Henke's Rubia. Pl. procumbent.

39 R. Fu'silla (Gill. miss. ex Hook. et Arn. in bot. misc. 3. p. 363.) plant tufted, glabrous, bristly, shining; stems smooth, terete, furrowed; leaves 4 in a whorl, oblong-linear, mucronate, with smoothish margins; peduncles equal in length to the leaves, bearing 3 flowers and 3 bracteas at the apex; fruit minutely tubercular when immature. Ñ. F. Native of Chile, in the province of San Louis. This has quite the appearance of some states of Gâlîum pâmùmum.

Small Rubia. Pl. straggling.

40 R. Ori'noce'ssa (H. B. et Kunth, nov. gen. amer. 3. p. 239.) stems tetragonal, glabrous, scabrous on the angles; branches pilose; leaves on short petioles, oblong, acute, pilose, one-half shorter than the internodes; peduncles axillary, 1-flowered, solitary; flower almost sessile, within the involucrum; berries pilose. Ñ. F. Native on the banks of the Orinoco, in hot places, and of the south of Brazil, ex Cham. et Schlecht. in Linneaa. 4. p. 228. R. Bröwnei, Spreng. syst. 1. p. 397. Gâlîum paucifórum, Willd. herb.

Orinoco Madder. Pl. straggling.

41 R. Murcon'a'ta (Hook. et Arn. in bot. misc. 3. p. 363.) stems prostrate, glabrous, terete, 4-furrowed, branched; leaves 4 in a whorl, linear-oblong, glabrous, shining, with revolute edges, 3 times shorter than the internodes; common peduncles axillary, longer than the leaves; flowers cyosome. Ñ. F. Native of Chili, about Conception and Tarma; and of Peru, in arid places. Gâlîum leucocarpum, D. C. prod. 4. p. 612. Gâlîum Tarmen, Spreng. syst. p. 27. G. murconatae. Ruiz et Pav. fl. per. 1. p. 66. G. apiculatum, Rœm. et Schultes, syst. 3. p. 222. Fruit milk coloured.

Murconate Madder. Pl. prostrate.

42 R. Inca'na (H. B. et Kunth, nov. gen. amer. 3. p. 338.) stems tetragonal, hispid on the villi; leaves 4 in a whorl, ovoid, short-acuminated, mucronate, with revolute margins, which are as well as the middle nerve hispid from pili; peduncles axillary, 1-flowered, length of leaves; flower sessile, within the involucrum; berries rather pilose. Ñ. F. Native on the Andes about Quindiu, near El Moral. Corolla rather hairy outside.

Hoary Madder. Pl. straggling.

43 R. h'na (H. B. et Kunth, nov. gen. amer. 3. p. 338.) stems tetragonal, hairy; leaves 4 in a whorl, on short petioles, oblong, acute, mucronate, hairy; peduncles axillary, opposite, 1-flowered, hardly shorter than the leaves; flower sessile, within the involucrum; berries scabrous. Ñ. F. Native near the town of Quito.

Hairy Madder. Pl. straggling.

** ** Leaves 3-nerved. Berries glabrous.

44 R. Nôxia (St. Hil. pl. rem. bras. p. 229.) stems tetragonal, beset with retrograde bristles along the angles below, and hairy at top; leaves sessile, elliptic, obtuse, ending in a very short point, 3-nerved, membranous, rather pubescent, scabrous from pili above, and on the nerves beneath; peduncles axillary, solitary, 1-flowered, pilose, bracteas 4, ovate; berries glabrous.——Native of Brazil, in woods in the province of Minas Geraes. Corollas greenish, hardly pilose. Flowers either sessile or pedicellate within the involucrum. Berries white.

Hurtful Madder. Pl. straggling.

45 R. S'tena (Pohl. in litt. ex D. C. prod. 4. p. 593.) stems tetragonal, glabrous, scabrous along the angles from retrograde bristles; leaves sessile, ovate, mucronulate, membranous, 3-nerved, rather scabrous along the margins and nerves, especially beneath, glabrous; peduncles axillary, tetragonal, rather longer than the leaves; bracteas oval, glabrous; berries glabrous, sessile, within the involucrum. Ñ. F. Native of Brazil, where it was collected by Pohl. Nodi of stems scabrous from short crowded hairs. Bracteas greenish-yellow. Berries blackish.

Rough Madder. Pl. straggling.

46 R. Dif'usa (Pohl. in litt. ex D. C. prod. 4. p. 593.) stems tetragonal, hispid; leaves sessile, ovate, acute, membranous, 3-nerved, hispid along the margins and nerves, especially beneath, glabrous; peduncles axillary, 1-flowered, longer than the leaves; bracteas 4, ovate, acute, rather hispid; berry glabrous, sessile within the involucrum. Ñ. F. Native of Brazil, where it was collected by Pohl. Upper leaves smoothish. Peduncles 5-6 lines long. Berries blackish.

Diffuse Madder. Pl. straggling.

§ 3. Galioidealae (this section contains plants having the habit of species of Gâlîum. D. C. prod. 4. p. 492. American species with tetradruous flowers, which are disposed in dichotomous cymes, never girded by any involucrum.

47 R. Equisetoides (Cham. et Schlecht. in Linneaa. 3. p. 232.) branches compressedly tetragonal, scabrous from retrograde bristles; leaves small, erectly adpressed, somewhat triangular, acute; cymes divaricate, dichotomous or trichotomous; flowers sessile in the forks; bracteas 4, under the branches; berries glabrous. Ñ. F. Native of the south of Brazil.

Horse-tail-like Madder. Pl. straggling.

48 R. Epedroideae (Cham. et Schlecht. in Linneaa. 3. p. 231.) glabrous; stems nearly terete; branches acutely tetragonal, roughish; leaves narrow-elliptic or linear, acute, smooth; cymes
dichotomous or trichotomous; bracteas conforming to the leaves under the branches; flowers pedicellate; berries glabrous. 2. F. Native of Brazil. Leaves deciduous, smooth.

Ephedra like Madder. Pl. straggling.

1. lobes graec. peduncles G. in p. Native bracteas F. peduncles peduncles leaves G. leaves leaves. upper foot lobes under — are green-house easily leaves sessile, species terminal, composed H. nal terete, difference and G. Flowers Scabrous Cult. Weak Quito, 2

Var. β, serrulatum (D. C. prod. 4. p. 593.) leaves membranous, serrated by prickles round the margins. 2. H. Native about Naples, where it was collected by Passy.

Flax-leaved Bed-straw. Fl. June, July. Clt. 1759. Pl. 1 to 2 feet, var. γ, 3 to 4 feet. 3 G. Paschale (Forsk. desirip. p. 203.) stems weak, glabrous, smooth; leaves 8-9 in a whorl, linear-lanceolate, with scabrous margins, glabrous, mucronate; peduncles axillary, opposite, longer than the leaves, trichotomous at the apex; fruit glabrous, minute. 2. H. Native about Constantinople. G. Hierosolymitænum is probably not distinct from this, ex Vahl, symb. 2. p. 29, but that plant is joined to G. le'ere by Schrader, and to G. scabrum by Persoon. Flowers white.

4 G. incurvum (Sibth and Smith, fl. greec. t. 132.) stems panicled; leaves 8 in a whorl, linear, glabrous, awned, incurved; lobes of corolla obute, awned; fruit glabrous. 2. H. Native of Crete, on the sphenecotic mountains. Flowers yellow.—Perhaps the same as G. incurvum, D'Urv. enum. p. 15, which was collected on rocky hills in the island of Samos. Stem often pubescent. Peduncles axillary and terminal, trichotomous.

Incurved Bed-straw. Pl.

5 G. sub trifidum (Reinw. ex Blum. bijdr. p. 944.) stems twiggly, obversely scabrous; leaves usually 6 in a whorl, short, narrow, linear-lanceolate, acutish, rather scabrous; peduncles terminal, few-flowered. 2. F. Native of Java, on the mountains. Said to be nearly allied to G. spathulætum and G. pumilum. Sub trifid Bed-straw. Pl. 1 foot.

7 G. incanum (Sibth and Smith, fl. greec. t. 150.) leaves 6 in a whorl, linear, and as well as the stems hoary; peduncles 3-flowered; lobes of corolla awned; fruit glabrous. 2. H. Native on Mount Parnassus. Flowers white. (f. 111.)

Hoary Bed-straw. Pl. tufted, 1/2 to 1 foot.

8 G. oblilium (Vill. dauph. 2. p. 324. t. 8.) stems ascending, tetragonal, villous at the bottom; leaves 8 in a whorl; lower ones oblate; villous; upper ones linear-lanceolate, glabrous; peduncles twice trifid, glabrous; lobes of corolla ending in a setaceous acumen each; fruit glabrous. 2. H. Native of Dauphiny, Picmont, Etruria, and Austria, in rugged places, and in hedges among the mountains. G. mucronatum, Lam. dict. 2. p. 581. D. C. fl. fr. 4. p. 258. Flowers white. Habit of G. Boccini, but differs in the fruits of the corolla ending in a setaceous point.
Oblique Bed-straw. Pl. 1 foot, ascending.

10 G. alte stre (Gaud. in Rosm. et Schultes, syst. 3. p. 225.) plant tufted, glabrous, ascending, erectish; stiff; stems smooth, glabrous; leaves 8 in a whorl, obversely lanceolate, with smoothish margins; umbels trichotomous, fastigate; lobes of corolla acute, not awned; fruit smooth, glabrous. 2. H. Native of France, Switzerland, Germany, Carniola, and Upper Italy, among the mountains and alps. G. levee var. a, b, and y. D. C. fl. fr. 4. p. 256. G. sylvéstre alpestre, Gaud. fl. helv. 1. p. 439. G. anisophyllum, pusillum, montanum, and argenteum, Vill. dauph. 2. p. 318-324. t. 78. G. levee, Schleich. G. Jussieu's, Vill. dauph. 2. p. 523. t. 7. Flowers white. There are varieties of this species with stems from a finger to a hand high, quite glabrous or rather hairy. It is intermediate between G. levee, G. Boccioni, and G. supinum, which probably should be all combined under one name.

12 G. pulchrum (Lam. dic. 2. p. 580. ill. no. 1368. t. 60. f. 2.) plant tufted; leaves 6-8 in a whorl, linear, smooth, bisulate beneath, very acute, tumid at the base; flowers almost terminal, subumbellate; peduncles longer than the leaves; fruit glabrous. 2. H. Native of the Pyrenees, in rugged places, &c. D. C. fl. fr. no. 3374. Req. diss. mss. G. triechophyllum, All. ped. auct. p. 1. Flowers white. Lobes of the corolla obtuse.

Var. a. hypnoides (Vill. dauph. 2. p. 325.) plant tufted, erectish; peduncles 2-3-flowered. 2. H. Native of Dauphiny, frequent on the mountains.

Var. γ, rectum (Req. diss. mss.) stems erectish, branched above; peduncles divided, 2-4-flowered. 2. H. Native of Provence, &c. among rocks.

Var. e, pubescens (D. C. fl. fr. suppl. p. 496.) stems tufted, erectish, and are, as well as the leaves, downy. 2. H. Native of Provence, in exposed, rocky places. G. pubescens, Req. in litt. 1813. G. pusillum, Linn. spec. 154. G. pulsínum hirtéllum, Gaud. fl. helv. 1. p. 433.

13 G. littorale (Guss. fl. sic. prod. 1. p. 172.) stems stiff, tetragonal; branches approximate; leaves usually 8 in a whorl, oblong-lanceolate, dilated at the apex, mucronate, a little serrated on the margin, spreading or reflexed; branches of panicle trichotomous, erect; corolla downy outside, with ovate-lanceolate, awned lobes. 2. H. Native of Sicily, in sandy, bushy places by the sea side. Flowers white. Nearly allied to G. Mollugo and G. apiculatum.

Var. β, pubescens (Guss. l. c.) stems and peduncles downy or villous at top.

Sea-shore Bed-straw. Pl. 1 to 2 feet.

15 G. Tyroleâne (Willd. enum. 1. p. 153.) stems flaccid, tetragonal, equal, smooth; leaves 6-8 in a whorl, obvate-lanceolate, mucronate, with scabrous margins; floriferous branches panicled; peduncles trifid; lobes of corolla awned; fruit smooth, glabrous. 2. H. Native about Tyrol, on the mountains, &c. Req. diss. mss. G. splendens, Horn. suppl. 17. G. Mollugo, var. Link. Flowers white. Probably a mere variety of G. Mollugo.

16 G. cinéreum (All. ped. no. 22. t. 77. f. 4.) stems erect, woody at the base, much branched, panicled at top, tetragonal and smooth; leaves 6-8 in a whorl, linear, glaucous beneath, stiff, mucronate, with hardly scabrous margins, usually reflexed; branches of panicle trichotomous; lobes of corolla ending in a setaceous mucron each; fruit glabrous, smooth. 2. H. Native of the south of France, in exposed places; and Upper Italy and Vallis. In the lowlands of Scotland, on the banks of the river Leith near Slateford, 3 miles from Edinburgh. D. C. fl. fr. no. 3364. G. diffusíum, Hook. sect. p. 53. Brittles on the edges of the leaves pointing forward. Flowers white.

Var. γ, pâlum (D. C. fl. fr. no. 3364.) lower part of the stems and lower leaves downy. 2. H. Native of dry, exposed places.

17 G. Hyrcânicum (Meyer, verz. plz. p. 53.) plant glaucous, downy; stems erectish, branched a little, tetragonal, smooth; leaves 6 in a whorl, nearly linear, mucronately acuminate, 1-nerved, smooth; umbels trichotomous, terminal; corolla glabrous, having the lobes terminated by a deciduous, inflexed point; fructiferous pedicels erectly spreading, hardly
twice the length of the fruit. 2. H. Native of Caucus, among rocks, and in stony, dry places, on the Talus mountains.

Var. β, lucidum (D. C. l. c. e.) lobes of corolla setaceous acuminated. 2. H. Native of hills in Piedmont and Dauphiny. G. lucidum, All. ped. no. 21. t. 77. f. 2. G. rigidum, Vill. dauph. 2. p. 319.

Var. δ, approximatum (D. C. prod. 4. p. 596.) whorles of leaves closer together. 2. H. G. lucidum, Hort. par.

*Erect* Bed-straw. Fl. June, July, Britain. Pl. 1 to 2 feet. 19 G. Mollugo (Lin. spec. p. 155.) stems flaccid, tetragonal, thickened above the nodi, glabrous, spreadingly branched; leaves 6-8 in a whorl, elliptic-oblanceolate, mucronate, spreading, serrated a little; peduncle much branched, disposed in panicles; lobes of corolla acuminate; fruit glabrous, smooth. 2. H. Native almost throughout Europe and Caucasus, in hedges; plentiful in Britain. ©der. fl. dan. t. 455. Bull. herb. t. 283. Smith, engl. bot. t. 1675. Lob. icon. t. 802. f. 12. G. boreale, Lapeyr. ex Benth.—Petiv. herb. brit. t. 30. f. 4. Flowers white, and sometimes yellowish. Herb very variable in height and breadth of leaves. Leaves hairy on the margins and keel, but never rough to the touch. The plant is called Wild Madder, and Great Bastard Madder. The roots are creeping, and yield a red dye like the true Madder, but of a brighter colour: like that also they dye the bones of animals red that feed on them.

Var. γ, scabrum (D. C. fl. fr. no. 3361. β.) lower parts of stems and lower leaves scabrous from hairs. 2. H. Native of exposed places. G. scabrum, With. brit. 190.

Var. ε, clatum (D. C. prod. 4. p. 596.) stems taller and more humid at the joints. 2. H. Native of moist places, as bogs. G. elatum, Thul. fl. par. ed. 2. vol. 1. p. 76.

*Shrubby* Bed-straw. Fl. June, July. Clt. 1819. Sh. 1 ft. 21 G. mediterraneum (D. C. prod. 4. p. 596.) stems ascending, tetragonal, smooth; lower leaves 4 in a whorl, obovate, mucronate: upper leaves 6 in a whorl, linear-lanceolate, mucronate, with rather scabrous margins; peduncles di-trichotomous; lobes of corolla ending in an awn; fruit glabrous. 2. H. Native of Corsica, on Mount Reston, where it was collected by M. Thomas; and on the mountains of Liguria, by Badaro. G. campéstre, Dub. bot. gall. 1. p. 248. but not of Wild. Flowers white or yellowish. It differs from *G. campéstre* in the stem being smooth, not scabrous on the angles, in the form of the leaves, and in the awned lobes of the corolla.

*Mediterranean* Bed-straw. Pl. ascending. 22 G. maxium (Moris, elench. sard. 1. p. 55.) plant glabrous; stems smoothish, much branched, erect; leaves 6 in a whorl, oblong-linear, obtuse, with scabrous edges; branches 4 in a whorl; peduncles triachotomous; lobes of corolla acutish; fruit glabrous. 2. H. Native of Sardinia, among bushes, and in wet pastures by the sea side.

*Largest* Bed-straw. Pl. 2 to 3 feet.

*Pyrenean* Bed-straw. Pl. ½ foot, tufted.

27 G. helodes (Hoffm. et Link. fl. port. 2. p. 47.) stems weak, diffuse, scabrous; leaves 5–6 in a whorl, lanceolate-linear, mucronulate, scabrous above and on the margins; panicles capillary.  ʔ. H. Native of Portugal, in marshes about Torres Vedras. G. uliginosum, Brodt. fl. lus. 1. p. 150. It is very like G. uliginosum, and probably only a variety of it.

28 G. palustre (Lin. spec. p. 153.) stems diffuse, tetragonal, rather scabrous; leaves 4–6 in a whorl, obvolute, obtuse, unequal, glabrous, with scabrous edges: superior ones lanceolate; peduncles nearly terminal, trichotomous; lobes of corolla ovate, awnless; fruit smooth, glabrous. ʔ. H. Native of Europe and Siberia, on the banks of rivers and ditches, and in moist meadows; frequent in Britain. Ėd. fl. dan. t. 423. Smith, engl. bot. t. 1857. Hook. fl. lond. fasc. 1. t. 20.—Petiv. brit. t. 30. f. 5. Roots creeping. Flowers numerous, white. Plant tall when supported by other herbage.

Var. β, constrictum (Dub. bot. gall. 1. p. 260.) leaves linear.

Var. γ, obtusum (D. C. prod. 4. p. 597.) leaves 5–6 in a whorl; stem roughish.

29 G. suerdi (Sibth. et Smith, fl. grtec. t. 128.) stems diffuse, much branched, smooth; leaves 4 in a whorl, lanceolate, acute, glabrous; flowers terminal and axillary, by threes; fruit glabrous. ʔ. H. Native of Candia, on the mountains. Leaves with roughish margins. Flowers greenish-purple, bracteolate. Bracteas ciliated, ovate, acute.

Corky-fruit Bed-straw. Pl. diffuse.

30 G. suerdi (Trevis. mag. nat. amic. berl. 1815. vol. 7. p. 146.) stems flaccid, scabrous along the angles; lower leaves 6 in a whorl, rameal ones 4 in a whorl, linear-elliptic, unequal; branches of panicle dichotomous, panicled; fruit glabrous, spherical, emarginate. ʔ. H. Native of Tauria, among reeds about Astrachan; and of Caucasus, in humid places near Lenkeran, mixed with G. palustre, Bieb. suppl. 106. G. palustre, Bieb. fl. taur. 1. p. 103. Corolla white.

Trifid-peduncled Bed-straw. Fl. Ju. July. Clt. 1826. Pl. proc. 32 G. tinctorum (Lin. spec. p. 153) stems decumbent, smooth; leaves 4–6 in a whorl, linear, obutose, scabrous on the margins and keel; peduncles axillary and terminal, elongated, subcorymbose, many-flowered; lobes of corolla 4, obtuse; fruit glabrous, smooth. ʔ. H. Native of North America, in low marshy places, as in Canada, United States, Newfoundland; Straits of De Fuca, on the North-west Coast. Very nearly allied to the preceding, but differs from it in the stems being smooth, in the peduncles being longer, and in the flowers being always 4-parted. It is said that from the roots of this species the Indians prepare the red dye with which they colour the feathers and other ornaments of their dress. Some states of G. palustre, in our country, when they have more numerous leaves than usual, are scarcely distinguishable from the G. tinctorum.

Dyers' Bed-straw. Pl. decumbent.

33 G. obtusum (Torr. fl. bot. ed. 2. p. 55.) stems smooth; procumbent, tetragonal; leaves 4 in a whorl, oblong-lanceolate, obtuse, acuminate on the margins and nerve; peduncles 3-flowered; lobes of corolla acute; fruit smooth, globose. ʔ. H. Native about Boston, on the banks of rivers and rivulets. Corollas white.

34 G. asprellum (Michx. fl. bor. amer. 1. p. 178.) stems diffuse, much branched, tetragonal, rough from retrograde prickles along the angles; cauline leaves 6 in a whorl, rameal ones 4, lanceolate, acuminate, prickly on the nerve and margins; florescence branches divaricate, many-flowered; pedicels short; lobes of corolla awnless; fruit glabrous. ʔ. H. Native of North America, from Canada to Virginia. Pursh. fl. amer. sept. 1. p. 103. Flowers white. Perhaps the same as G. Claytoni or G. trifidum.

Rough Bed-straw. Pl. decumbent.

37 G. asperifolium (Wall. in Roxb. fl. ind. 1. p. 381.) stems branched, weak, tetragonal, scabrous from recurved hairs along the angles; leaves 6 in a whorl, oblong-linear, somewhat cuneated, mucronate, rather scabrous above, but beset with recurved hairs on the nerve beneath and margins; peduncles axillary, many-flowered, disposed in a kind of leafy panicle; fruit glabrous.—Native of Nipal. Req. diss. mss. G. parvifolium, D. Don, prod. fl. nep. 133. Flowers white, but blackish when dried. Lower leaves 8 in a whorl. The stem and branches are soft, while the leaves are harsh.

Root long, red. Leaves 8–9 in a whorl, ex Rœm. et Schultes.

Etna Bed-straw. Pl. tufted.

39 G. frutescens (Cav. icon. 3. p. 3. t. 206. f. 1.) stems suffrutescents at the base, erect; branches tetragonal, glabrous; leaves 6 in a whorl, linear, mucronate, subrevolute; peduncules
RUBIACEÆ. CCXVI. Galium.

651

Hoffm. germ. 1. p. 71. Root creeping, red. Flowers pale yellow, or cream-coloured. Very like G. boreale, but larger, with broader leaves. There is a variety of this species with hispid fruit, according to Steven, obs. p. 70.

Var. β, angustifolium; leaves narrower and longer; flowers fewer. 2. H. Native of Kotzebue's Sound; abundant in dry elevated soils, under the shade of solitary pines, in the valley of Columbia, North-west America. The leaves are almost as narrow as those of G. boreale, but the inflorescence and fruit are very different. G. rubioides, Hook. et Arn. in Beech. voy. pt. bot. p. 115. and 125. This variety has been received by Dr. Hooker from the United States, under the name of G. Bermodium.

Jointed Bed-straw. Fl. July. Clt. 1752. Pl. 1 foot. 47 Valantoides (Bieb. fl. taur. l. 1. p. 102.) stems eriophytis, branched at the base, glabrous, smooth along the angles; leaves 4 in a whorl, rhomboid-lanceolate, twice longer than broad, obtuse, 3-nerved, rather scabrous on both surfaces; pedicle trichotomous, 3-nerved, scabrous; fruit glabrous, smooth. 2. H. Native of Caucasus, among subalpine rocks. Req. diss. diss. ex herb. D. C. Rœm. et Schultes, syst. 3. p. 215. Very nearly allied to G. rubioides and G. articulatum. Flowers cream-coloured. There is a variety of this with hispid fruit, according to Stev. obs. p. 70.

48 G. Ca'spicum (Stev. obs. l. ross. p. 70.) whole plant villous; stems obliquely tetragonal; lower leaves 8 in a whorl, lanceolate-oblong, mucronate, upper ones opposite; floriferous branches panicled, and are, as well as the fruit, villous. 2. H. Native of the north of Persia, in the province of Ghilan. Flowers white. Stature and leaves of G. sylvestricum, but the panicle is dense, like that of G. mollugo. Caspian Bed-straw. Pl. 1 to 2 feet.

49 G. rotundifolium (Lin. spec. l. 156. exclusive of var. β.) stems diffuse, glabrous; leaves 4 in a whorl, roundish-ovate, 3-nerved, ciliated; peduncles axillary and terminal, loose, elongated, naked, trichotomous at the apex; fruit nearly globose, beset with bristles, which are hooked at the apex. 2. H. Native nearly throughout the whole of Europe, in mountain woods; and on the Talusche mountains in Caucasus. Lam. diss. l. 2. p. 577. D. C. fl. fr. no. 3386. G. dodecaphylla, Ehrl. herb. p. 63. Aspèrula leavigata, β, Lam. diss. l. 1. p. 298.—Bocci. sic. f. 5. f. 1.—Moris. hist. 9. t. 21. f. 5.—Barrel. icon. t. 323. Flowers white. Stems procumbent.

51 G. obovatum (H. B. et K.) nov. gen. amner. 3. p. 336. t. 278.) stems almost simple, pilose; leaves 4 in a whorl on short petioles, obovate, acute, flat, smoothish, ciliated, 4 times shorter than the internodes; flowers terminal, by threes, pedunculate; fruit covered with hooked bristles. —Native of South America, in temperate parts of the kingdom of Quito, about Chillo and Guanacabamba. Corolla of a whitish violaceous colour.

Nearly allied to G. rotundifolium.

Obovate-leaved Bed-straw. Pl. 1 ½ foot.

52 G. Java'num (Blum. bijdr. p. 943.) branches tetragonal, hairy; leaves 4 in a whorl, roundish obovate, 3-nerved, with the margins and veins downy beneath; cymes pedunculate, trichotomous, leafy. —Native of the East of Java, on the mountains.

Said to be allied to G. elegans.

Java Bed-straw.

53 G. Neesi'num (Rq. diss. mess. ex D. C. prod. 4. p. 600.) stems ascending, erectish, branched, tetragonal, beset with short hairs; leaves 4 in a whorl, roundish-ovate, ending each in a very short cusp, 3-nerved, hairy; peduncles axillary and terminal, longer than the leaves, trichotomous, hairy; fruit nearly globose, beset with hooked bristles. 2. F. Native of Teneriffe, in the Chestnut woods. G. hisrütum, Nees, in Buch. in. berl. p. 113. t. 22. but not of Ruiz et Pavon. G. ovatifolium, Schott, Spix, and Mart. 1. p. 55. ex Link. in Buch. can. p. 151. Flowers white. —Said to be nearly allied to G. rotundifolium.

Nees's Bed-straw. Pl. ascending.

54 G. elegans (Wall. in Roxb. fl. ind. 1. p. 382.) stems diffuse, ascending, tetragonal, hairy; leaves 4 in a whorl, elliptic, oblong, sessile, 3-nerved, rather hairy above, and villous all along the nerves and margins beneath; peduncles axillary and terminal, trichotomous, hardly pilose, disposed in a panicle; fruit roundish, hispid from bristles, which are hooked at the apex. 2. F. Native of Nipaul. G. Pandúanum, Wall. cat. no. 6212. Roots creeping. Fruit small. Flowers white. Habit of G. cruciátum.

Var. B., gläbrus'énum (Rq. diss. mess. ex D. C. l. c.) stems and leaves smoothish. 2. II. Native of Nipaul.

55 G. Hamiltonii (Spreng. cur. post. p. 39.) stems erect, branched, pilose; leaves 4 in a whorl, oblong, acute, rather pilose on both surfaces; peduncles terminal, trichotomous, loose-flowered; fruit hispid. 2. F. Native of Upper Nipaul, at Mereha. G. latifólium, Ham. in D. Don, prod. fl. nep. 133.

Hamilton's Bed-straw. Pl. 1½ foot.

56 G. hirtéfólium (Rq. diss. mess. ex D. C. prod. 4. p. 600.) stems weak, branched, rather scabrous; leaves 4-6 in a whorl, linear, bluntish, glabrous above, and scabrous from pili on the keel and margins beneath; peduncles axillary and terminal, bifid, disposed in a kind of panicle; pedicles divaricate; corollas bristly outside; fruit roundish, hispid from bristles, which are hooked at the tops. 2. F. Native of Nipaul, at Narainhyth. G. ciliátum, D. Don, prod. fl. nep. p. 133, but not of Ruiz et Pav. G. Aparine, Roxb. fl. ind. 1. p. 382.? Stems rather hispid. Flowers small, milk-coloured.

Hairy-flowered Bed-straw. Pl. ½ to 1 foot.

57 G. uncinéla'num (D. C. prod. 4. p. 600.) stems weak, diffuse, branched, tetragonal, hispid at the base, and glabrous at the apex; leaves 4 in a whorl, ovate, acutish, hispid on both surfaces, hardly 3-nerved at the base; peduncles dichotomously corymbose, few-flowered; fruit beset with bristles, which are hooked at the apex, and about equal in length to the diameter of the fruit. 2. F. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlandier.

58 G. Chamisso'sii (Hook. et Arn. in bot. misc. 3. p. 363.) plant quite glabrous, perennial; stems erectish, acutely tetragonal; angles smoothish; leaves deflexed, oblong, acute, with revolute margins; pedicels axillary and terminal, trifid, bifid, or trichotomous; pedicles very much divaricate; fruit roundish, hispid from compressed bristles, which are acute at the apex, but not hooked. 2. F. Native of Chili, about Valparaiso. This approaches somewhat in habit to Aspérula galioides.

Chamisso's Bed-straw. Pl. 1 foot.

59 G. Gillie'sii (Hook. et Arn. in bot. misc. 3. p. 364.) perennial; stems herbaceous, diffuse, almost simple, acutely 4-angled; leaves 4 in a whorl, oval, obliquely 1-nerved, with spinulose margins; pedicels axillary and terminal, 3-flowered, equal in length to the leaves; flowers pedicellate; fruit hispid; bristles longer than the fruit, not hooked at the apex.

Var. a: stem and leaves glabrous. 2. F. Native of Chili, in El Valle de Los Caigas, Andes of Mendoza, Cordillera of Chile.

Var. B: stem and leaves hairy. 2. F. Native of Chili, at El Malpaso and Los Palomares, Andes of Mendoza.

60 G. Suffruticosum (Hook. et Arn. in bot. misc. 3. p. 365.) suffruticosum, hairy, canescens; stems erectish, simple, terete; leaves oblong-linear, mucronate, hairy: the nerves as well as the revolute margins pilose; pedicels alternate. longer than the leaves, divaricately pilose. 2. F. Native of Chili, in Vina de La Mar, near Valparaiso. The hairs forming the pubescence point downwards.

Suffruticosum Bed-straw. Pl. 1 foot.

61 G. Eriocarp'snum (Bartl. in herb. Hennke, ex D. C. prod. 4. p. 600.) plant suffruticosum, glabrous, erect; leaves 4 in a whorl, oblong, 1-nerved; flowers trichotomously pilose; fruit beset with bristles, which are as long as it, but are not hooked at the apex. 2. F. Native of Cordillera of Chili. This is very distinct from all other species.

62 G. Tricho'carpum (D. C. prod. 4. p. 600.) stems dichotomous, much branched, glabrous, tetragonal, having the angles scabrous from retrograde bristles, the rest glabrous; corollas trichotomous, few-flowered; fruit beset with bristles, which are a little shorter than it, but not hooked at the apex. —Native of Chili, about Rancagua, among bushes. Allied to G. eriócarpum, but differs in the bristles of the fruit being shorter and fewer.

63 G. boreá'le (D. C. fl. fr. suppl. p. 498.) stems erect, straight, tetragonal, smoothish; leaves 4 in a whorl, linear-lanceolate, 3-nerved, glabrous; pedicels axillary, trichotomous, much longer than the leaves, disposed in a terminal panicle; bracteas obovately orbicular. 2. H. Native throughout the whole of Europe, in moist rocky shady places, by rivers and lakes; plentiful in some parts of Britain, as in the north of England and Scotland. Roots creeping, brownish. Leaves with scabrous margins. Flowers milk-coloured.

RUBIACEAE. CCXVI. GALIUM.

Northern Bed-straw. Pl. 1½ foot.

65 G. coriacea (Bunge in Ledeb. fl. ross. alt. ill. t. 216.) stems branched, tetragonal, scabrous at the base; leaves coriaceous, shining, with revolute scabrous edges: lower ones 4 in a whorl, obovate-oblong: upper ones opposite, oval, rather scabrous, as well as the stems; peduncles axillary, 2-4-flowered; fruit hispid from hooked pili at the base, much shorter than the pedicels. 2. H. Native of Siberia, in the fissures of rocks at the river Katunga, at a place called Boom, and at the river Tschuija. Peduncles slender, bifid, trifid, rarely twice trifid, rather hispid. Flowers yellowish-white.

Coriaceus-leaved Bed-straw. Pl. ¾ to 1 foot.

Circinaria-like Bed-straw. Pl. 1 to 1½ foot.

67 G. lanceolatum (Torr. fl. un. st. 1. p. 163.) stems erect, glabrous; leaves 4 in a whorl, ovate-lanceolate, acute, with ciliately scabrous edges, 3-nerved at the base; peduncles terminal, dichotomous, divaricate, longer than the leaves; flowers terminal, sessile, deflexed; corollas very acute; fruit beset with hooked bristles. 2. H. Native of North America, in the states of New York, Massachusetts, and Boston; and of Canada about Quebec. G. circinans β lanceolatum, Torr. cat. new york, p. 239. G. Torreyi, Bigel. fl. bost. ed. 2. p. 56. G. circinans var. Nutt. Flowers milk-coloured.

Lanceolate-leaved Bed-straw. Pl. 1 to 1½ foot.

68 G. Branchatium (Pursh, fl. amer. sept. 1. p. 103.) stems flaccid, elongated, brachiatly branched, hispid; branches short; leaves 6 in a whorl, oblong-lanceolate, acuminate, glabrous, having the margins and keel ciliated by bristles; floriferous branches verticillate, longer than the leaves, divaricately dichotomous; pedicels 2-flowered; fruit beset with hooked bristles. 2. H. Native of North America, from New England to Virginia, in meadows, and on the margins of woods, frequent. G. longicaule, Rafin. fl. lud. p. 75.0. Flowers white.

Branchiate Bed-straw. Pl. 1 to ½ foot.

69 G. Cuspidatum (Muhl. cat. ë Ell. sketch. carol. 1. p. 197.) stems prostrate, glabrous; leaves usually 6 in a whorl, lanceolate, acuminate, a little ciliated; peduncles trifid: lobes of corolla acuminate; fruit pilose. 2. H. Native of Carolina and Georgia. Flowers white. Fruit beset with long white pili.

Cuspidate-flowered Bed-straw. Pl. prostrate.

70 G. hispidulum (Michx. fl. bost. amer. 1. p. 79.) stems procumbent, much branched, hispid; leaves 4 in a whorl, oval-lanceolate, acuminate, with revolute edges, wrinkled, hispid on both surfaces; flowers nearly solitary, terminal; fruit hispid. 2. H. Native of Lower Carolina. Perhaps the same as G. lappaceum, fl. per. 1. p. 59.0. ex Pursh, fl. sept. amer. 1. p. 104. Flowers white.

Dense-flowered Bed-straw. Pl. 1 foot.

73 G. triflorum (Michx. fl. amer. 1. p. 80.) stems procumbent, tetragonal, hispid or smoothish; leaves 6 in a whorl, oblong, cuspidate, glabrous, scabrous along the nerves and edges, 1-nerved; peduncles axillary and terminal, 3-flowered, longer than the whorles of leaves; flowers pedicellate; fruit beset with bristles, which are hooked at the apex. 2. H. Native of Carolina, Pennsylvania, New York, Canada, Unalaska, Sitka, and Norland, in rather humid shady places. It is common from Quebec to the Rocky Mountains, and as far north as lat. 55°, and from the west side of the Rocky Mountains to the Pacific. Cham. et Schlecht. in Linneæa. 3. p. 222. Torrey, fl. un. stat. 1. p. 167. Wildl. hort. berol. t. 66. G. cuspidatum, Muhl. cat. p. 15. G. suaveolens, Walñ. fl. lapp. p. 48. Req. dis. ex herb. D. C. There are varieties of this with either rough stems, as in G. aparine, or glabrous stems. Flowers small, white. Habit and stem of Asperula odorata.

Var. β. viridiflorum (D. C. prod. 4. p. 602.) stems smooth; corollas green. 2. H. Native about Moscow, in mossy woods. G. hyssopifolium, Goldb. in litt. 1821. Req. dis. mss. ex herb. D. C.

74 G. Maritimum (Linn. mant. p. 38. but not of Thunb. prod. 3.) plant villous all over; stems much branched, tetragonal; leaves 4-6 in a whorl, but the ultimate ones are opposite, all lanceolate-linear, acute; peduncles axillary, 1-flowered; corollas and fruit villous or hispid outside. 2. H. Native of Nice and
the Levant, in exposed rocky places. Corollas reddish. Stems
creeping at the base.

Var. β, villorum (D. C. prod. 4, p. 602.) plant more crowded;
leaves 4-8 in a whorl. 2. H. Native of the south of Europe,
and at the bottom of the Pyrenees. G. villorum, Lam. dict. 2.
—Barred, icon. p. 81.—Bocc. mus. 2, p. 110. t. 86. Fruit
clothed with white hairs.

1 foot.

75 G. Brachyphylhum (Schultes, mant. 3. p. 180.) plant
smoothish, much branched, procumbent; leaves 4-6 in a whorl,
but the upper ones are opposite, all lanceolate, mucronate,
and reflexed; pedicels 2-3-together, axillary, 1-flowered; fruit
scabrous from pubescence. 2. H. Native of Caucasian, about
Buduce, in the calcareous range, &c. G. brevifolium, Stev.
mem. nom. 3, p. 253. but not of Smith et Sibth. G. alpèstre,
taur. suppl. p. 107. Flowers white. This is an intermediate
plant between the granular and villous species.

Short-leaved Bed-straw. Pl. procumbent.

76 G. Greæcum (Linn. mant. p. 38.) stems suffruti
cose, branch
ed at the base; branches erect, hispid; leaves 6 in a whorl,
linear, hairy, erect; peduncles axillary and terminal, few
flowered, a little longer than the leaves; fruit beset with long
white bristles. 2. H. Native of Greece, on Mount Parnassus,
and the islands of Cois and Candia, on exposed rocks. Sibth et
t. 166. Peduncles forming a racemose or thyrsoid panicle.

Flowers small, yellowish-brown.

77 G. caënum (Req. diss. miss. ex D. C. prod. 4, p. 602.)
stems suffruti
cose, tufted; branches very hairy and hoary; leaves
lanceolate, with involute margins, hairy on both surfaces, hoary
beneath; peduncles eymose, few-flowered, 2-3 times longer
than the leaves; fruit hispid. 2. H. Native of Syria, where it was
collected by Donati and Labillardiere. Flowers small, purplish.

Perhaps only a variety of G. greæcum.

Hoary Bed-straw. Pl. ½ foot.

78 G. Micranthum (Pursh, fl. amer. sept. 1. p. 103.) stems
much branched, divaricate, beset with retrograde prickles;
leaves short, lanceolate, mucronate, glabrous, having the margins
and keel prickly; floriferous branches divaricate branched;
pedicels usually 2-flowered; fruit hispid. 2. H. Native of
North America, from Canada to New York, in mountain bogs.

Said to resemble G. uliginosum very much.

Small-flowered Bed-straw. Pl. divaricate.

§ 4. Coccogalia (from coccus, kokkos, a grain, and gailium; in
reference to the granular fruit). D. C. prod. 4, p. 602. Perennial
plants. Leaves 4 in a whorl. Flowers on long peduncles, herma
phrodite. Fruit granular.

79 G. cotinoides (Cham. et Schlecht. in Linnæa. 3. p. 227.)
stems diffuse, weak, tetragonal, beset with retrograde bristles
along the angles; whorles of leaves distinct; leaves 4 in a whorl,
sessile, lanceolate, acute, with the nerve and margins scabrous;
panicles trichotomous, few-flowered, terminal; pedicels capillary,
very long; fruit glabrous, minutely tubercular. 2. F. Native of
Chili, in hedges near Taluanga, and about Conception.

This is a very showy species, with the habit of G. uliginosum.

80 G. Lanuginosum (Lam. ill. no. 1360.) stems, branches,
and peduncles clothed with long soft dense hairs; leaves 4 in a
whorl, lanceolate, acute, glabrous, with scabrous margins; pedi

Var. \( \beta \), trachyphyllium (Wallr. l. c.) stems and leaves rather scabrous; fruit glabrous; flowers deep yellow. \( \psi \). H. Native of Europe and Caucasus, in open places. Mill. fig. t. 120. Oed. fl. dan. t. 1146. Mart. fl. rust. t. 54. Curt. fl. lond. 6. t. 13. Smith, engl. bot. t. 660. G. vèrum pubescens, Guss. prod. 171. G. tuberculatum, Presl, del. prag. p. 120.

Var. \( \delta \), maritimum (D. C. fl. fr. 4. p. 248.) stems low, much branched, glabrous at the base, villous at the apex; ovaries glabrous. \( \psi \). H. Native of Armoracia, in sand by the sea side.

Var. \( \epsilon \), tomentosum (Meyer, verz. pfl. p. 54.) stems and fruit densely clothed with tomentum. \( \psi \). H. Native of Caucasus, on the tops of the Talsich mountains near Drych.

The common name Bed-straw given to all the species is from the verb to straw, anciently written straw. Before the invention of feather-beds a variety of herbs were used to stew beds with; among these doubtless this was one. In Johnson's edition of Gerard, it is called our Ladies' Bed-straw (p. 1127.). From the notion of its curling milk, Dioscorides has named it γλαυκον; and it is said to have been used in many parts for this purpose, but from later experiments it has not succeeded in coagulating milk. It has probably been put into milk destined to make cheese, not so much for the purpose of curling it, as of giving it a flavour, or as Matthioli expresses it, to make it eat the sweeter. The French formerly prescribed the flowers in hysterical and epileptic cases. Boiled in alum-water the flowering stems dye a good yellow colour. The roots dye a very fine red, not inferior to madder.

True Ladies' Bed-straw or Cheese-renten. Fl. July, Aug. in Britain. Pl. 1 to 2 feet.

86 G. RUTHE\'NEUM (Willd. spec. l. c. p. 596.) leaves 8 in a whorl, linear-filiform, cuspitate, with revolute scabrous margins; stems also scabrous; flowers panicked; peduncles pubescent; fruit hispid from villi. \( \psi \). H. Native of Siberia and Caucasus, growing along with G. vèrum. Flowers deep yellow.

Var. \( \beta \), rosmarinifolium (Ledeb. fl. alt. l. c. p. 158.) leaves 8-10 in a whorl, linear, shining above and pubescent, and clothed with hoary tomentum beneath, with revolute edges; stems tomentose suffruteose at the base; panicle coarctate; fruit villos. \( \psi \). H. Native of Siberia, at the river Tschuja, in the Kairic desert in dry exposed places.

Ruthian Lady's Bed-straw. Pl. 1 foot.

87 G. Ver-MOLLUGO (Wallr. in Schiede, pl. hybr. p. 64.) stems tetragonal, rather downy; leaves sublanccolate-linear, rather scabrous, with revolute scabrous edges, downy beneath; panicles rather divaricate; flowers rather distant; corollas cream coloured, with acutish segments. \( \psi \). H. Native of Germany. This is a hybrid raised from the seed of G. vèrum, impregnated by G. mollugo. G. vèrum \( \beta \), Rem. et Schultes, syst. 3. p. 233. G. mollugo var. ochroleuca of authors.

 Vera-Mollugo or Hybrid Ladies' Bed-straw. Pl. 1 to 2 feet.

88 G. TunE\'A\'NUM (Lam. dict. l. c. p. 583.) stems erect, terete, canescens; leaves 8-10 in a whorl, linear, downy, with rough revolute edges; pedicles many flowered, disposed in a panicle; fruit hispid. \( \psi \). F. Native of Tunus, about Algiers in hedges. Descf. fl. atl. l. c. p. 129. Poir. voy. 2. l. c. p. 110. Stems villous. Flowers yellow. Resembles G. vèrum.

Tunus Bed-straw. Pl. 1 to 2 feet.

89 G. MIN\'UTUM (Lin. spec. l. c. p. 154.) stems decumbent, smooth; leaves 8 in a whorl, lanceolate, mucronate, serrated from prickles, glabrous, incurved; peduncles reflexed; fruit fleshy. \( \psi \). H. Native of Russia. Gmel. sib. 3. p. 169. no. 45. Flowers yellow. The plant resembles G. vèrum very much, and is probably only a variety of it.

Minute Bed-straw. Pl. decumbent.

90 G. HUMI\'I\'UM (Bieb. fl. taur. l. c. p. 104.) stems prostrate, much branched, villous; leaves 6 in a whorl, linear, spreading much, villous; floriferous branches axillare, aggregata; lobes of corolla acutish; fruit downy. \( \psi \). H. Native of Caucasus, Tauria, on the lower Volga, in exposed places, and by way sides common. Corollas cream-coloured; anthers yellow. Habit and inflorescence like that of G. vèrum.

Trailing Bed-straw. Pl. trailing.

91 G. ARE\'AE\'NUM (Lois. fl. gali. l. c. p. 585.) plant glabrous; stems prostrate, much branched; leaves 6-10 in a whorl, linear-oblong, short-apatieulate, thick, with revolute rather scabrous edges; corymb small, on short peduncles, crowded into a panicle; fruit glabrous, rather fleshy. \( \psi \). H. Native of the west of France, from Bayonne even to Armoracea on the south, in the sand by the sea side. D. C. fl. fr. suppl. p. 492. G. hierosolymitaniun, Thom. chl. land. 40. but not of Lin. G. megalocephalum var. \( \beta \), D. C. fl. fr. ed. 3. no. 3530. exclusive of var. a. G. minittum, Aubr. morb. p. 16. Flowers yellow, varying from 3-5-dent. Distinct from the sea side variety of G. vèrum.

Sand Bed-straw. Pl. prostrate.

§ 7. Eriocagia (from erica, a heath, and gaium; the habit of the species is that of E'rica). D. C. prod. 4. p. 604. Perennial or suffruteosus plants. Leaves 4-6 in a whorl. Inflorescence axillare. Flowers hermaphrodite.

92 G. ERE\'COIDES (Lam. dict. l. c. p. 583.) stems suffruteosus, much branched, downy; leaves approximate, 4-5 in a whorl, linear-lanceolate, with revolute margins, apiculate, stiff, smoothish; flowers axillary, nearly sessile, solitary, bifracteata; corolla pilose outside; fruit covered with stiff short hairs. \( \psi \). G. Native of Monte-Video and Chili. Cham. et Schlecht. in Linne. 3. p. 225. Larger leaves 2-3 lines long, and the smaller ones only half a line. Flowers minute, cream-coloured. Fascicles of leaves sessile, hence the plant has the habit of a heath. Stems decumbent.

Var. \( \beta \), intermédia (Cham. et Schlecht. in Linne. 3. p. 225.) plant shrubby, clothed with short down; leaves linear, quite glabrous, ending in a long cusp each. \( \psi \). G. Native of Brazil, in Campo d'Utma.

Var. \( \gamma \), atherodes (Cham. et Schlecht. in Linne. 3. p. 225.) quite glabrous in every part, as also the fruit; leaves linear, with revolute edges. \( \psi \). G. Native of Brazil, in Estrella do Campo Aguda. G. atherodes, Spreng. cur. post. p. 39.

93 G. HI\'I\'I\'UM (Lam. dict. l. c. p. 583.) root woody; stems herbaceous, branched, tetragonal, very leafy, hispid; leaves 4-5 in a whorl, sessile, lanceolate, more or less hairy on both surfaces; flowers axillary, verticillate, nearly sessile, bibracteata; lobes of corolla acute; fruit glabrous, tubercular. \( \psi \). G. Native of the south of Brazil and Monte-Video. Cham. et Schlecht. in Linne. 3. p. 224. Req. diss. siss. G. réflexum, Pohl, in litt. G. megalopétamum, Spreng. cur. post. p. 39. ex Cham. et Schlecht. in Linne. Stems decumbent or erect. Flowers yellow. Inflorescence of G. verticillâtum.

Hairy Bed-straw. Pl. decumbent or erect.

94 G. CAMOFRUM (Pohl, in litt. ex D. C. prod. 4. p. 604.) plant quite glabrous; stems erect, tetragonal; leaves 4 in a whorl, sessile, linear, acutish, spreading, with revolute edges, more or less ciliat; flowers axillary, almost sessile; fruit finely granulated.—Native of Brazil, where it was collected by Pohl. Flowers small. Fruit almost like that of G. sp\'ùrium, but differs in being almost sessile. Leaves 4 or 5 lines long. Allied
Rubiaceæ.  

96. G. corona'tum (Sibth. & Smith, fl. grac. t. 125.) stems ascending, branched from the base, smooth; leaves 4 in a whorl, elliptic, obtuse, nearly veinless, with the margins and base ciliated; peduncles quinquefidi, glabrous, bracteate; flowers polygamous; fruit glabrous. 2. H. Native of Bithynia, on Mount Olympus; and of Tauria and Caucasus. Valànía Taürica, Bieb. fl. taur. 2. p. 457.—Buxb. cent. 5. p. 47. f. 39. There is a variety of this with rather hispid stems. Flowers pale yellow.  

Crowneed Bed-straw. Fl. June, July. Clt. 1816. Pl. pro-  
cumbent.

98. G. vèrnum (Scop. carn. ed. 2. no. 144. t. 2.) stems erect, simple or branched from the base; leaves 4 in a whorl, 3-nerved, ciliated; peduncles dichotomous, bracteate, shorter than the leaves; flowers polygamous; fruit glabrous. 2. H. Native of France and Switzerland, Upper Italy, Germany, Hungary, Gallicia, Siberia, &c. in grassy places. Stems and leaves glabrous or hispid, with the exception of the cilia. Flowers yellow or cream-coloured. D. C. fl. fr. ed. 3. no. 3353. Very like G. cruciátum. Valànía vèrna, G. Don, in Loud. hort. brit. p. 411.  

99. G. Pèrsicum (D. C. prod. 4. p. 605.) plant quite glabrous, smooth, erect, of many stems; leaves 4 in a whorl, ovate-oblong, not ciliated; peduncles axillary, many-flowered, 3 times shorter than the leaves, bracteate; fruit glabrous. 2. H. Native of Persia, near Ama'dan, where it was collected by Olivier
pilose, muricately along the angles; lower leaves ovate: cauline ones 6 in a whorl; uppermost one opposite, all with revolute hispid edges; panicles decompound; lobes of corolla cupulitate; fruit glabrous. **O. H.** Native of Gibraltar, on the mountains. Flowers yellow.

*Gibraltar Bed-straw.* Pl. ½ to 1 foot.

*Pigmy Bed-straw.* Pl. small.

107 G. Cordatum (Röem. et Schultes, syst. 3. p. 259.) plant glabrous, erectish, branched from the base; leaves 4 in a whorl, ovate, unequal: floral ones sessile, ovato-cordate, deflexed, and covering the flowers and lower parts of the nodi; peduncles branched, short, few-flowered; fruit glabrous. **O. H.** Native of the Levant, at the foot of Mount Lebanon, where it was collected by Labillardiere, &c. The flowers are probably yellow. This plant is often to be found in gardens under the name of *Cattleya cucullata.* Nearly allied to *G. articulatum.*

*Cordate-leaved Bed-straw.* Pl. ½ foot.

§ 10. *Xantharpaines* (from ξανθος, xanthos, yellow, and αρπαν, aparne, aparine, the Greek name of cleavers or goose grass; in reference to the yellow flowers of the species). D. C. prod. 4. p. 600. *Plants annual.* Leaves 4-8 in a whorl. *Inflorescence cymosely panicled.* Flowers yellow, hermaphrodite. Fruit glabrous.

108 G. Campestre (Schousb. ex Willd. enum. 1. p. 152.) stem erect, tetragonal, having the roughness on the angles turned upwards, not retrograde; lower leaves 4 in a whorl, the rest 6, elliptic, mucronate, with scabrous margins; peduncles dichotomous; lobes of corolla lanceolate, bluntish. **O. H.** Native of Barbary. Röem. et Schultes, syst. 3. p. 294. Link, enum. 1. p. 155. Corollas cream-coloured. Leaves 4 lines long, and 2 lines broad. Stems bentam at the base. Leaves on the upper part of the branches sometimes opposite.

Var. β. *Vahlii* (D. C. prod. 4. p. 606.) stem smoothish; leaves oblong. **O. H.** Native of Barbary, where it was collected by Vahl and Lamarck, &c. See Lam. dict. 3. p. 584. observations under G. megalospermum. The leaves are almost like those of var. a, but the margins are more scabrous. Lobes of corolla not awned. Fruit granular.

109 G. Glomeratum (Desf. fl. atl. 1. p. 128. t. 40.) stem erect, branched, panicled, tetragonal: angles rough; leaves 6-8 in a whorl, linear-lanceolate, mucronately acute, serrulate scabrous on the margins; panicles trichotomous; lobes of corolla very acute, a little awned; fruit glabrous. **O. H.** Native of Barbary, in corn-fields. Flowers pale yellow. Said to be allied to *G. campstare.*

*Glomerate-flowered Bed-straw.* Pl. ¼ to ½ foot.

110 G. viscosum (Vahl, symb. 2. p. 29.) stems ascending, tetragonal, smooth, branched; lower leaves 4 in a whorl: upper ones 6, linear-lanceolate, with serrated margins and a smooth keel; the serratures directed upwards; peduncles filiform, by threes; pedicels 2-flowered; fruit clamy. **O. H.** Native of the kingdom of Tunis, on the mountains. Corolla pale yellow, almost white.

**VOL. III.**

*Clamydium-flowered Bed-straw.* Pl. ¼ foot.

111 G. Unfvelli (Req. diss. mss. ex D. C. prod. 4. p. 607.) stem erect, branched at the base, glabrous; leaves 6-8 in a whorl, linear, erect, glabrous, with revolute edges; peduncles axillary and terminal, trifid; pedicels 3 times longer than the flowers; fruit glabrous. **O. H.** Native of the islands in the Grecian Archipelago, in arid places. G. floribundum, D'Urville cat. no. 130. but not of Smith. Flowers purplish in the dried state. Habit of *G. setacea,* but differs in the fruit being quite glabrous.

*D'Urville's Bed-straw.* Pl. ½ foot.

112 G. Divicaricatum (Lam. dict. 2. p. 580.) stem ascending or erect, branched at top, slender, smoothish; leaves 6-8 in a whorl, linear, acute, hispid; peduncles axillary and terminal, slender, elongated, divaricate, trifid at the apex; pedicles twice the length of the flowers; fruit glabrous. **O. H.** Native of the south and middle of France; Liguria and Sicily, in arid sandy places. D. C. fl. fr. no. 3370. icon. rar. t. 24. Req. diss. mss. G. tenua, Vill. dauph. 2. p. 92 t. 7. Flowers greenish-

113 G. Tenuissimum (Bieb. fl. taur. 1. p. 104.) stems weak, ascending, much branched, rather scabrous along the angles; leaves 6-8 in a whorl, linear, acute, scabrous, hispid; peduncles axillary and terminal, trichotomous, divaricate; pedicels length of peduncles; fruit glabrous. **O. H.** Native of Tauria, Caucasus, Iberia, in uncultivated and sterile places. G. purpureum, Pall. ind. taur. but not of Lin. Flowers small, greenish-white. Very nearly allied to *G. divaricatum,* and probably only a variety of it according to Steven, but differs in the pedicels being 3 or 4 times longer.

115 G. Apicum (Sibth et Smith, fl. græc. t. 126.) stems pilose, diffuse; leaves 4 in a whorl, obovate, uniform, with scabrous edges; peduncles trifid, leafless; fruit glabrous. **O. H.** Native of Candia and other islands in the archipelago, frequent. Pedicules 3-flowered; middle flower hermaphrodite and quadridif; lateral ones male and trifid. Certainly a species of *Vailiandia.*

*Sunny Bed-straw.* Pl. diffuse.

116 G. Gaudichaudii (D. C. prod. 4. p. 607.) stems weak, decumbent, tetragonal, rather hispid; leaves 4 in a whorl, ob-
RUBIACEAE. CCXVI. Galium.

long-linear, with hairy revolute edges; floriferous branches short, axillary, few-flowered; lobes of corolla hardly acutish; fruit glabrous.—Native of New Holland, at Port Jackson, where it was collected by Gauchaud. Stems 8-10 inches long. Leaves 2-3 lines long, shorter than the internodes. Flowers white.

Gauchaud's Bed-straw. Pl. decumbent.

§ 12. *Europaeris* (from eu, well, and aparine, cleavers; the section is supposed to contain the true kinds of cleavers). D. C. prod. 4. p. 607. Plants annual. Stems scabrous. Leaves 4-8 in a whorl. Inflorescence axillary. Flowers usually hermaphrodite. Fruit granular or hispid, diously globose.

119 G. *sacri*um (Lin. spec. p. 154.) stems decumbent, scabrous from retrograde prickles along the angles, but glabrous at the knees; leaves 8-9 in a whorl, lanceolate, mucronate, keeled, scabrous from retrograde prickles along the keel and edges; peduncles many-flowered, hardly recurved, while in the fruit longer than the leaves; fruit glabrous, smooth. O. H. Native of Europe and Siberia, in fields and all cultivated ground; in Scotland, in cornfields about Forfar, but rare. D. C. fl. fr. ed. 3. no. 3377. Smith, engl. bot. t. 1871. G. agrétei leiospermum, Wallr. sched. p. 59. G. hispidum, Hofm. germ. 1. p. 74. G. adaeirens, Jacq. hort. vind. ex Jan. herb. G. aparine var. Spreng. Flowers green. Perhaps two species are confused under this name, differing much in the size of the fruit.

120 G. *scabri*um (Vahl, in Horn. hort. linn. 1. p. 135.) stem angular, scabrous from retrograde prickles; leaves 8 in a whorl, linear, spreadingly reflexed, longer than the internodes, mucronate, very scabrous above, and scabrous from prickles along the keel and margins; peduncles axillary, few-flowered, suberymbose; fruit globose, diously hispid from bristles, which are hooked at the apex. O. H. Native of Egypt.

121 G. *aparine* (Lin. spec. p. 157.) stems weak, branched, rough from retrograde prickles, villous at the nodi; leaves 8 in a whorl, lanceolate-linear, apiculated, scabrous from retrograde prickles along the margins and keel; peduncles simple and bifid, scabrous; fruit diously globose, very hispid from bristles, that are hooked at top. O. H. Native throughout the whole of Europe, north of Asia, and North America, in hedges, fields, and in most cultivated places; plentiful in Britain. Oed. fl. dan. t. 495. Smith, engl. bot. t. 816. Bull. herb. fr. t. 215. Heyne, term. bot. t. 13. f. 6. Mart. fl. rust. t. 104. Woodv. med. bot. suppl. 269. Valantia Aparine β, Lam. fl. fr. 3. p. 383. Aparine hispida, Moench. meih. p. 640. Rubia tinctorum, Lapeyr. ex Benth. Aparine, Doed. pemp. 353. Petiv. brit. t. 30. f. 11. Flowers small, pale buff-coloured. Fruit rather large. Stems climbing. The well-known property of this plant of adhering to whatever it comes in contact with, acquired it the names of Cleavers or Clivers, and Catchweed or Scratch weed; and from being a favourite food or medicine of geese, Goosegrass, Goose, and Goslingweede. The walks, according to Linnaeus, are used in Sweden as a filter to strain milk through. Dioscorides relates that the shepherders made the same use of it in his time. It is reckoned to purify the blood, and for that purpose the tops are an ingredient in spring broth. The expressed juice of the herb taken to the amount of 4 ounces or a quarter of a pint night and morning, during several weeks, is very efficacious in removing many cutaneous disorders. It has been most celebrated in scrofulous and cancerous sores, but the experiments made has not turned out in its favour. The seeds are a good substitute for coffee. The roots, like most of the genus, will dye red, and eaten by birds have tinged their bones of that colour.

Var. β, minor (Req. dist. mss. ex D. C. prod. 4. p. 608.) stem dwarf; leaves usually 6 in a whorl, and smaller. O. H. Native of the island of St. Lucia, near Narbonne.

122 G. *vaillant* (D. C. fl. fr. 1805. no. 3581.) stems weak, nearly simple, glabrous at the nodi, but scabrous from retrograde prickles along the angles; leaves 8 in a whorl, linear, having the keel and margins scabrous from retrograde prickles; peduncles simple or bifid; fruit globose dilymoid, rather hispid from a few bristles, which are hooked at their tops. O. H. Native of Europe, in cultivated fields; plentiful in some parts of Britain; G. ingens, Waldst. et Kripl. var. hung. 3. p. 202. (1808) Bess. gall. 121. G. agrétei echinospermum, Wallr. sched. p. 59. G. Aparine β, Lam. Flowers small, yellowish. Fruit about half the size of those of G. aparine, and not so hispid.

123 G. *aparine* (Forsk. descrip. p. 30.) stems weak, prickly along the angles, but the prickles are not retrograde as in most of the species, but lean forward, and the knees or joints are equal and glabrous; leaves 6 in a whorl, oblong, scabrous from retrograde prickles along the margins and keel; peduncles 3 from the top of each branch, bifid; fruit hispid from bristles, which are hooked at the tops. O. H. Native of Arabia, in shady places. Vahl. symb. 2. p. 30. Flowers white. Fruit like that of G. aparine.

Cleavers-like Goose-grass. Pl. procumbent.

124 G. *pauflor*um (Bunge, l. c.) annual; stems weak, glabrous, tetragonal, scabrous from retrograde prickles along the angles; leaves 6 in a whorl, spatulate-oblong, attenuated at the base, cuspidate by a spine, hispid above, and glabrous be-
neath, with scabrous margins; peduncles axillary, a little longer than the leaves, bracteate, 1-2-flowered; corollas very minute, obsect; fruit didymous, very hispid from hooked bristles.

2. G. Native of China, in humid places, near Sri-jui-say.

**Few-flowered Goose-grass.** Pl. decumbent.

125 G. australë (D. C. prod. 4. p. 600.) stems weak, pro-
cumbent, branched, tetragonal, pilose, on one side; leaves 4 in a whorl, oblong, mucronate acutely, rather pilose, with sub-
revolute edges; peduncles axillary, 3-flowered, hardly longer than the leaves; fruit very hispid from bristles.—Native of New
Holland, at Bass Straits, where it was collected by D'Urville. Said to be nearly allied to G. recurviurn, but differs in the ped-
cels not being recurved, and in the fruit being twice the size.

**Southern Goose-grass.** Pl. procumbent.

126 G. gra'cile (Bunge, in mem. acad. sc. Petersb. 2. p.
109.) stem simple, erect, quite glabrous, shining, tetragonal; leaves 4 in a whorl: lower ones obovate, middle ones ellipti-
cus, superior ones oblone. 1-nerved, scabrous from dots, hispid on the margins; panicles axillary, dichotomous, very slender, exceeding
the leaves; corollas very minute, obsect; fruit hispid from hooked bristles.

2. G. Native of China, on mountains, near Lan-zuán-sy.

**Slender Goose-grass.** Pl. ½ foot.

127 G. te'nerum (Schleich. ex Gaud. fl. holv. 4. p. 442.) stems filiforam, glabrous; leaves 6 in a whorl, obovate, seta-
cuously apiculate, scabrous from retrograde prickles on the margins; peduncles by threes, trifid, spreading; fruit hispid.

O. H. Native of the Alps of Switzerland. Corollas small, white.

**Tender Goose-grass.** Pl. procumbent.

128 G. ligitiórum (D. C. fl. fr. no. 3382. icon. rar. t. 26.) stems decumbent, branched, rather scabrous; leaves 4-6 in a
whorl, linear-lanceolate, acute, shorter than the internodes, rather scabrous; peduncles elongated, divaricate, bifid or trifid;
fruit nearly globose, hispid at the top from somewhat hooked hairs.

O. H. Native of the south of France, Italy, Sicily, in rough
stone places, and probably about Paris, but very doubtful. G. Parisienne, Lin. spec. p. 157. exclusive of the synonyms. G. 

sic. p. 61. ex Guss. Flowers small, reddish. This species differs from G. Anglicum and G. gracile in the fruit being hispid.

**Var. β, nidum** (D. C. prod. 4. p. 609.) stems short, erect.

O. H. Native of Europe, in very sterile places. D. C. icon.

tar. 26. right-hand figure.

**Litigious Goose-grass.** Fl. June, July. Pl. procumbent.

129 G. microspé'rum (Desf. fl. atl. 1. p. 130.) stems erect,
tetragonal, glabrous, rough; branches divaricate; leaves 6 in a
whorl, linear-acute, denticulated; fruit hispid. O. H. Native of Barbary, near Marse; and of Sardinia. Aspérula scabra,
Very nearly allied to G. divaricatum, Lam., and is perhaps only a variety of it, with hispid fruit. According to Steven, obs.
ined in herb. Willd. It is only a variety of G. litigious.

½ foot.

130 G. se'ta'ceum (Lam. dict. 2. (1786.) p. 584.) stems fili-
form, erect, scabrous at bottom; leaves usually 6-8 in a whorl,
but from 4 to 8, linear-setaceous, with rather scabrous margins:
lower ones oblong; peduncles slender, divaricate, trifid; fruit hispid from bristles, which are hooked at the apex. O. H.
Native of Spain, Mauritania, Sicily, Provence, in exposed stone
G. microcarpum, Wahl, symb. 2. (1791.) p. 30. G. capillare,
Cav. icon. 2. (1792.) p. 75. t. 191. f. 1. Lag. gen. et spec. no.
127. G. floribundum, Sibth. et Smith, fl. greac. t. 134. ? G.

capillare and G. microcarpum, Spreng. syst. Flowers red. The
oldest name is here admitted for this plant, as in all other cases.

**Scilaceous-leaved Goose-grass.** Fl. June, July. Clt. 1819.

Pl. 1 to ½ foot.

131 G. sitthóphi (Rom. et Schultes, syst. 3. p. 244.) stems smooth;
leaves 8 in a whorl, linear, revolute scilaceous, scabrous:
lower ones obovate; pedicels capillary; fruit rather pilose.
O. H. Native of the Grecian Islands, on sterile hills. G. capillare, Smith, prod. fl. greac. 1. p. 94. but not of Cav.
G. Créticum annuum tenuifolium flore albo, Tourn. cor. p. 4.
Flowers pale yellow or cream-coloured. Perhaps only a variety of G. microspermum or G. setaceum.

**Sitthóphi's Goose-grass.** Pl. 

132 G. bre'viórum (Sibth. et Smith, fl. greac. t. 155. but not of Stev.) stems villous; leaves 7 in a whorl, obovate, awned,
scabrous; peduncles trichotomous, terminal; lobes of corolla
awned; fruit hispid. O. H. Native of Caramania, on the sea-
Shores. Flowers cream-coloured. The bristles on the stem and
leaves are not retrograde, as on most of the species. Perhaps
the same as G. album, Willd. ex Rom. et Schultes, syst.

**Short-leaved Goose-grass.** Pl. 1 foot.

133 G. a'leum (Forsk. descr. const. p. 20.) stems erect,
downy, coloured at the nodi; leaves 6-8 in a whorl, oblong,
mucronate, with scabrous hardly serrulated margins, glabrous above, and villous beneath, especially on the keel;
fruit hispid. O. H. Native about Smyrna. Flowers white.

**White-flowered Goose-grass.** Pl. ½ foot.

134 G. recu'rum (Req. diss. 1791. ex D. C. prod. 4. p. 609.)
stems weak, decumbent, smoothish; leaves 6 in a whorl, but the uppermost ones are only 4, obovate-oblong, nar-
rowed at the base, acutish at the apex, glabrous; peduncles axillary, 3-flowered, equal in length to the leaves, deflexed while in
fruit, hairy; fruit small, globose, hispid. O. H. Native of the Grecian Archipelago, among rocks. G. micranthum, D'Ur

Montpelier, at Pont Jouvenal, where it was collected by Requier.

138 G. Smirni; branches erect, simple, bluntly quadrangular, scabrous; leaves 4 in a whorl, uppermost opposite, all deflexed, elliptic-lanceolate, scabrous; flowers axillary, by threes, therefore 6 in a whorl, erect; fruit hispid, with distinct, elongated mericarps. O. H. Native of the Greek Islands; among rocks. Shérdia crética, Smith, fl. græc. t. 116. Flowers greenish yellow.

† Species of Gálium not sufficiently known.

* Species natives of Europe.

139 G. Sóleiroli (Lois. nov. nov. not. 7.) stems weak, angular, downy (Lois.), villous (Spreng.); leaves 5-6 in a whorl, ovate-lanceolate, acute, hairy; peduncles dichotomous (Lois.), divaricate, trifid, few-flowered (Spreng.); fruit wrinkled. Ρ. H. Native of Corsica, by the sea-side, where it was collected by Sóleiroli. G. Córiscum, Spreng. cur. post. p. 39. Flowers unknown.

Sóleiroli's Bed-straw. Pl. procumbent.

140 G. Goldlachicum (Kluk. in Bess. prím. fl. gal. 2. p. 337.) stems procumbent, diffuse, tetragonal; leaves 8 in a whorl, narrow-lanceolate, awned, girded by strong hairs at the apex; flowers umbellate; fruit globose.—Native of Galicia, in grassy places. Said to be like G. leíve and G. Boccíiá.

141 G. Pentándreum (Gilex. ex Kluk. in Bess. prím. fl. gal. 2. p. 338.) stems erect, branched; leaves 8 in a whorl, linear-lanceolate, spotted with white at the apex; racemes few-flowered; flowers pentamers; fruit didymous—Native of Galicia. Flowers yellowish. Said to be nearly allied to G. vêrâm, and is probably merely a pentamers-flowered variety of that plant.

Pentandrous Bed-straw. Pl. 1 foot.

142 G. ochroleúcum (Kit. in Schultes, cestr. fl. ed. 2, vol. 1, p. 305.) stems erect, quadrangular, smooth; leaves 8 in a whorl, linear-subulate, with very rough margins, and ending in large mucrones each; flowers by threes, corymbose, campanulately funnel-shaped. Ρ. H. Native of Austria, on mountain rocks. Flowers cream-coloured.—Perhaps a species of Aspérula.

Cream-coloured-flowered Bed-straw. Pl. 1 foot.

143 G. Montanum (Lin. spec. p. 155.) stems weak, scabrous; leaves 4 in a whorl, linear, smooth; corymbs trifid. Ρ. H. Native of Germany, France, England. Corolla white, purplish outside before expansion. Anthers brown. This plant is not known at the present day, as the plant under this name in the Linnean herbarium does not agree with the characters given of it by him.

Mountain Bed-straw. Pl. ½ to ⅔ foot.

** A species native of the Levant.

144 G. hierosolymíta-num (Lin. amem. 4. p. 451.) leaves 10 in a whorl, lanceolate-linear; flowers umbellate, fastigate.

—Native of Palestine. Stature of G. rúbrum. The rest unknown.

Jerusalem Bed-straw. Pl. ½ to 1 foot.

*** Species natives of Asia.

145 G. tubérósus (Lour. coch. p. 79.) root oblong, tuberous; stem procumbent, simple; leaves 4-5 in a whorl, lanceolate, glabrous; pedicels axillary, 1-flowered, crowded, longish; fruit rough.—Native of China and Cochinchina, where it is cultivated for the sake of the tubers, which are farinaceous, and are eaten when boiled. Flowers hardly known. Perhaps a true species of Gálium.

Tuberous-rooted Bed-straw. Pl. procumbent.

146 G. striócosum (Thunb. nov. act. ups. 7. p. 141. t. 4. f. 1-9.) stems procumbent, tetragonal, scabrous along the angles; leaves 6 in a whorl, elliptic, ending in a spinoe point, hispid from pili yellowish, and nearly glabrous beneath, with ciliately scabrous edges; flowers axillary, on short peduncles.—Native of Japan. G. uliginósus, Thunb. fl. jap. 58.

Strigose Bed-straw. Pl. decumbent.

*** Species natives of the Cape of Good Hope.

147 G. mucronátum (Thunb. prod. p. 30. fl. cap. 151.) stems downy, weak, tetragonal, rising in numbers from the same root; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute serrated edges; branches few-flowered; fruit glabrous.—Native of the Cape of Good Hope. Perhaps the same as G. mucronátum, Spreng. pug. 2. no. 49. The G. mucronátum, Lam. and the G. mucronátum, Ruiz et Pav. are distinct species. Mucrones of leaves white.

Mucronate-leaved Bed-straw. Pl. ½ foot.

148 G. hórdidum (Thunb. fl. cap. 1. p. 556. phybl. bl. p. 16.) stem suffruticos, erect, tetragonal, prickly along the angles; leaves usually 8 in a whorl, linear, reflexed, serrated by prickles. Ρ. G. Native of the Cape of Good Hope.

Horrid Bed-straw. Shrub 2 feet.

149 G. glá'rum (Thunb. prod. p. 30. fl. cap. 152.) stems flexuous, erect, tetragonal, glabrous, serrated along the angles; leaves 6 in a whorl, obovate-oblong, acute, glabrous, with ruplicately-serrated edges; peduncles ample, lateral and terminal, pinnated. Ρ. G. Native of the Cape of Good Hope. Flowers white. Very like G. aspérum.

Glabrous Bed-straw. Pl. 1 foot.

150 G. A'spérum (Thunb. prod. p. 30. fl. cap. 554.) stem flexuously erect, beset with white twisted hairs, and scabrous along the angles; leaves 6 in a whorl, oblong, glabrous, with ruplicately serrated margins; flowers few. Ρ. G. Native of the Cape of Good Hope. Angles of stem rough from retrograde denticulations. Fruit glabrous.

Rough Bed-straw. Pl. 1½ foot.

151 G. expá'num (Thunb. prod. 30. fl. cap. 152.) stem tetragonal, smooth, with divaricate downy branches; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute margins; pedicels trichotomous, spreading, divaricate; fruit smooth. Ρ. G. Native of the Cape of Good Hope. Corollas white.

Expanded Bed-straw. Pl. 1 foot.

152 G. Cape'nsé (Thunb. prod. p. 30. fl. cap. 151.) stems frutescent at the base, erect, branched; branches terete, downy; leaves 6-8 in a whorl, linear-lanceolate, glabrous, with revolute margins; peduncles dichotomous; fruit glabrous, smooth. Ρ. G. Native of the Cape of Good Hope. Flowers white.

Cape Bed-straw. Shrub 1 foot.

**** Species natives of North America.

158 G. unifé'rum (Michx. fl. bor. amer. 1. p. 79.) stems flaccid, smooth; leaves 4 in a whorl, linear, acute, glabrous;
peduncles axillary, solitary, 1-flowered, very short; flowers drooping; fruit glabrous. 2. H. Native of Carolina. Fertile branches ascending. Said to be nearly allied to C. tinctorium. Flowers white. G. uninervum, Req. ined. in herb. D. C. is a variety of G. triflorum.

One-flowered Bed-straw. Pl. ascending.

154 G. parviflorum (Rafin. med. disp. 5. and in Desv. journ. bot. 1. p. 297.) stems diffuse, angular, glabrous; leaves 5-6 in a whorl, linear-lanceolate, very acute, glabrous; flowers very numerous, panicked.—Native of New York, about Newport and Delaware. Flowers small, white.

155 G. spinulosum (Rafin. med. sern. p. 40, but not of Merat.) plant diffuse; leaves 4-6 in a whorl, cuneiform, cuspidate, spinulose, scabrosus; peduncles lateral, dichotomous, manyflowered; fruit scabrous.—Native of Maryland. Desv. journ. bot. 4. p. 270. Rem. et Schultes, syst. 3. p. 528.

Spinulose Bed-straw. Pl. diffuse.

156 G. Mexicanaum (H. B. et Kunth, nov. gen. amer. 3. p. 387.) stem beset with retrograde prickles; leaves 8 in a whorl, linear, acuminate pungent, glabrous, with revolute edges, which are, as well as the middle nerve, rough from retrograde prickles, one-half shorter than the internodes; corynbs terminal, sub-trichotomous; fruit hispid. 3. H. Native of Mexico, near Guanaxauti. Perhaps a species of Rubia.

***** Species natives of South America.

157 G. denticulatum (Bartl. in herb. Haenk, ex D. C. prod. 4. p. 612.) stems diffuse, branched, rather hispid from bristles; leaves 4 in a whorl, ovate, cuspidate, ciliate by distant bristles, rather hairy on both surfaces, 1-nerved; flowers few, terminal, usually by threes; pedicels capillary; fruit glabrous.—Native of Mexico, at Real del Monte. Perhaps a species of Rubia.

158 G. hispidum (Ruiz et Pav. fl. per. 1. p. 50.) stems procumbent, tetragonal, much branched, hairy; leaves 4 in a whorl, lanceolate, reflexed, hairy; peduncles axillary, 1-flowered, solitary, short; fruit scabrous. 3. H. Native of Peru, in the province of Canta, in shady places. Perhaps a species of Rubia.

159 G. piliferum (H. B. et Kunth, nov. gen. amer. 3. p. 337.) stems weak, beset with retrograde prickles; leaves 8 in a whorl, linear-lanceolate, acuminate by hairs, glabrous, with revolute edges, which are, as well as the middle nerve, beset with retrograde prickles, much shorter than the internodes; flowers terminal, on long peduncles; fruit hispid. 3. H. Native of New Granada, on the Andes. This plant ought probably to be excluded from the genus, on account of its campanulate corolla. Habit of G. uliginosum.

160 G. canescens (H. B. et Kunth, nov. gen. amer. 3. p. 336.) stems almost glabrous; branches and leaves villous; leaves 4 in a whorl, ovate, acuminated, triple-nerved, canescent beneath, much shorter than the internodes; floriferous branches bifid; flowers lateral and axillary, solitary and terminal, by threes; fruit beset with hooked bristles. 3. H. Native about the town of Quito. Habit of G. maritima, but is said to be annual. Perhaps a species of Rubia.

Canescent Bed-straw. Pl. procumbent.

161 G. Caripense (H. B. et Kunth, nov. gen. amer. 3. p. 337.) stem glabrous, beset with retrograde prickles; leaves 8 in a whorl, upper ones 6, oblong-lanceolate, mucronate, having the margins beset with retrograde prickles, much shorter than the internodes; flowers terminal, usually by threes, pedunculate; fruit hispid. 3. H. Native of Cumaná, near Caripé, in shady places. Said to be allied to G. tinctorium, but is annual.

Caripé Bed-straw. Pl. diffuse.

162 G. lappaceum (Ruiz et Pav. fl. per. 1. p. 59.) stem rather scendant, much branched, tetragonal; branches villous, dichotomous; leaves oblong or obovate, 4 in a whorl, hispid; upper ones 3 in a whorl, lanceolate; peduncles axillary, 1-flowered; fruit hispid from bristles.—Native of Peru, about Huancaco, at Puelles Collem. The fruit is said to be baccate. Perhaps a species of Rubia.

***** Species the native habitats of which are unknown.

163 G. dichotomum (Lehm. ind. sem. hort. hamb. 1823. p. 7.) stem dichotomous, frutescent, quadrangular; leaves 4 in a whorl, obovate-lanceolate; fruit glabrous. 3. H. Native country unknown. Said to be allied to G. fruticoseum, but the leaves are much broader and shorter, and the flowers are larger.

164 G. rufidum (Ait. hort. kew. 1. p. 144.) stem erect, tetrate, pilose, rather scabrous; leaves verticillate, linear, scabrous above; panicles divaricate. 3. H. Native country unknown.

Cult. The species of Gálium are of the most easy culture and propagation. They will all grow in any common soil. The perennial kinds are easily increased by dividing the plants, or by seeds. The seeds of annual species should be sown where the plants are intended to remain. Those species natives of bogs or marshes should be planted in a moist situation; and those natives of warmer climates should be protected during winter, either by covering with mats or hauhum of other herbs, or by placing them in a green-house. None of them are worth-cultivating, unless in botanical gardens.

LIN. SYST. Tetrándria, Digynia. Calyx with an oblong tube, and the limb not persicuous. Corolla 4-parted, campanulate; lobes ovate, very short. Stamens 4, very short. Stigmas 2. Fruit oblong, rather incurved; one of the mericarps being abortive, the fruit is only 1-seeded.—An annual, erect, much-branched, slender, glabrous herb. Leaves 2, oblong, and stipulas 2, very like the leaves, constituting a 4-leaved whorl. Flowers 3 from each axil, on short pedicels, and therefore constituting 6-flowered whorles. Bractea large, membranous, complicate, and as if it were holding the fruit within its hollow. Flowers small, all fertile. Fruit hispid at the apex.

Cult. Sow the seeds in a warm dry situation, where the plants are intended to remain for seed.

LIN. SYST. Polygynia, Mone‘cia. Flowers by threes; middle one fertile, hermaphroditic, and the two lateral ones male, and combined with the middle one. Tube of calyx ovate; limb dentilculated, permanent, the denticulations many, irregular and stiff. Corollas rotate; male ones trifid, and the hermaphroditic one quadrifid. Stamens 3-4. Styles 2 in the hermaphroditic flower; stigmas capitiate. Fruit 3-horned, in consequence of the ovaria of the three flowers being combined; the lateral horns sterile, and the middle one biovulate, but usually only 1-seeded at maturity. —Annual branched herbs. Stems tetragonal. Leaves oval, opposite, and stipulas 2, very like the leaves, forming a 4-leaved whorl. Flowers 3 in each axil, sessile, small, yellow, therefore they appear 6 in a whorl. —According to the observation of A. Richard, the seeds are half naked at maturity from the rupturing of the mericarp.

1. V. MÉRASIA (Lin. spec. p. 1480.) stem, leaves, and calyces glabrous. O. H. Native of the south of Europe, in dry rocky places, and on old walls; on the whole coast of Tuscany; on the sandy shores of the County of Nice; and in the south of France, about Nemours; also about Montpellier and Leghorn. Sibth. et Smith, fl. grac. 137. V. quadrifolia, Mœch. meth. p. 610.—Sabb. hort. 1. t. 83.—Mich. gen. 13. t. 7.—Mor. oxon. 3. sect. 9. t. 21. f. 2.—Col. ephrr. t. 297. Angles of fruit fringed.

**WALL CROSS-WORT**. Fl. May, July. Cl. 1739. Pl. 1/2 foot.

**VAR. β. ACULEATA** (D. C. prod. 4. p. 614.) plant larger; fruit glabrous, longer than the denticulations of the calyx. O. H. Native of the kingdom of Naples, among rubbish and on old walls.

**HISPID CROSS-WORT**. Fl. May, July. Cl. 1768. Pl. 1/2 to 3/4 foot.

Cult. Sow the seeds on an old wall or on rock-work, or in any dry sandy soil and situation.

**Tribe XIII**.

**OPERCULARIA** Æ (this tribe contains plants whose fruit opens by an operculum). A. Rich. mem. soc. hist. nat. Par. 5. p. 142. D. C. prod. 4. p. 614.—Opecularia, Juss. ann. mus. 4. p. 418. and 10. p. 328.—Opecularia Gaertn. fruct. 1. p. 111. t. 24. Flowers combined: having the calyceine tubes resembling at length a pecicular operculum. Corollas 3-5-cleft. Stamens 1-5; filaments hardly adnate to the tube of the corolla at the base. Style short; stigmas 2, slender, elongated, acute. Fruit 1-seeded by abortion, combined, 2-valved (f. 112. b.), at length dehiscing.—Herbs or shrubs, usually natives of Australia. Leaves opposite. Stipulas twin on both sides, distinct or combined. Flowers combined into a head, girded by a partial, many-toothed involucrem. Heads of flowers sometimes umbellate and pedunculate, and sometimes sessile and capitulate, usually girded by a universal involucrem.—This tribe agrees with *Spermacoceae* in habit and stigmas, but the number of stamens is variable, and therefore it approaches the order *Valerianaceae*.

CCXIX. POMAX. CCXXX. OPERCULARIA.

LIN. SYST. Mono-Tetradria, Monogynia. Limb of calyx wanting. Corolla 3-4-cleft. Stamens 1-4. Seeds wrinkled from tubercles.—Suffrutaceous herbs. Leaves opposite, furnished with one leaf-formed stipula on each side. Peduncles 7-10, terminal, umbellate, involucrated by the 2 floral leaves and 4 small stipulas, bearing at their tops a small distinct head of flowers each; heads girded by a blunt 8-10-toothed involucrem. Flowers 3 within each partial involucrem, joined together by the tubes of the calyces.

**HAIRY POMAX**. Fl. June, July. Cl. 1826. Pl. 1/2 to 1 ft.

2. P. OLA’BRÉA (D. C. l. c.) plant glabrous in every part; leaves elliptic, attenuated at the base. ß. G. Native of New Holland, about Port Jackson. Stipulas smaller than in the preceding species.

**Glabrous Pomax.** Shrubs 1 foot.

**Cult.** The species of this genus grow best in a mixture of loam, peat, and sand; and cuttings root freely under a handglass.

LIN. SYST. Mono-Pentandria, Monogynia. Limb of calyx 3-4-lobed. Corolla 3-5-cleft. Stamens 1-5. Seeds nearly smooth.—Herbs suffruticosae at the base. Leaves opposite, furnished with distinct stipulas on both sides. Heads of flowers globose, terminal, or rising from the forks of the branches, pedunculate, or nearly sessile. Universal involucrem wanting, or composed of the 2 upper leaves and 4 small stipulas. Partial involucrea acutely 8-10-toothed.

1. O. HISPIDA (Spreng. syst. 1. p. 385.) stems diffuse, furrowed, tetragonal, rough from numerous hairs; leaves small, ovate, pilose; heads pedunculate, rising from the forks of the branches, drooping. ß. G. Native of New Holland. O. aspéra, Juss. ann. mus. 4. p. 427. t. 70. f. 1. Universal involucrem wanting; partial ones 8-10-toothed, each containing 3-5 flowers. Corolla 5-cleft, monandrous or diandrous, white.

2. O. Sessiliflora (Juss. l. c. p. 427. t. 170. f. 2.) glabrous; stems diffuse, slender, hardly furrowed; leaves linear; heads of flowers small, hemispherical, sessile in the forks of the branches ß. G. Native of New Holland.

**FIG. 112.**
Partial involucra 4-5 in the same head, each containing 2-4 flowers. Corollas 4-5-cleft, monandrous or diandrous, white. Leaves like those of the species of Linaria.

19 O. *A PECIFÓLIA* (Labill. nov. holl. 1. p. 35. t. 48.) glabrous; stems diffuse, very slender, suffruted; leaves oblong-linear, short; stipulas joined in one on both sides; heads of flowers terminal, small, hemispherical, involucreted by about 4 verticillate leaves. [7] G. Native of New Holland, in Van Lewin's Land. Juss. mem. mus. 4. p. 427. Partial involucra 1-3 in each head, each containing 3-4 flowers. Corollas 4-5-cleft; monandrous or diandrous, white. (Fig. 112.)

**Top-flowered Opercularia.** Shrub 1 foot.

5. **O. VAGINÁTA** (Labill. nov. holl. 1. p. 35. t. 46.) glabrous; stem erect, woody at the base, rather angular; leaves linear; stipulas combined into a long sheath, which is bidentate at top on both sides; heads globose, with papery, terminal. [7] G. Native of New Holland, in Van Lewin's Land. Juss. mem. mus. 4. p. 428. Partial involucra 5-9 in a head, each containing 3-5 flowers. Corolla 4-cleft. Stamens 4, ex Labill.

**Sheddied-stipuled Opercularia.** Shrub 1 foot.

**Hairy Opercularia.** Pl. 1 foot.

7. **O. HYSSÓPÓLIA** (Juss. mem. mus. 4. p. 428. t. 71. f. 1.) stem erect, rather angular, clothed with short down; leaves narrow-lanceolate, with somewhat ciliated margins; stipulas combined entire, acute; heads of flowers rising from the forks of the branches, on short peduncles, drooping a little, globose. [7] G. Native of New Holland. Partial involucra about 5 in every head, each containing 2-4 flowers.

**Hyssop-leaved Opercularia.** Shrub 1 foot.

8. **O. LIGUSTRÓLIA** (Juss. mem. mus. 4. p. 428. t. 71. f. 2.) stem erectish, tetragonal, hairy from short down, but glabrous between the nodi; stipulas combined at the base on both sides, acutely 2-lobed; heads of flowers rising from the forks of the branches, on short peduncles, drooping. [7] G. Native of New Holland, about Port Jackson. The rest as in the preceding species.

**Privet-leaved Opercularia.** Shrub 1 foot.

10. **O. OCYMIPTÓLIA** (Juss. ann. mus. 4. p. 428. t. 71. f. 3.) glabrous; stems diffuse, tetragonal, suffruted; leaves ovate-oblong, petiolate; stipulas combined in one on both sides; heads of flowers rising from the forks of the branches, on short peduncles, drooping, globose, naked. [7] G. Native of New Holland. Heads larger than peas, with 7-9 partial involucra in every head, each containing 4-6 flowers. Corolla 3-4-cleft. Stamens 2-3, ex Juss.

11. **O. RUINDÓIDEA** (Juss. ann. mus. 4. p. 428.) stems tetragonal, ascending, glabrous; leaves lanceolate, with revolute margins; margins and middle nerve scabrous beneath; stipulas combined on both sides, entire or bidentate; heads on short peduncles, rising from the forks of the branches, drooping, globose, naked. [7] G. Native of New Holland, on the Eastern Coast. Heads of flowers larger than peas. Partial involucra 5-7 in every head, each containing 5-6 flowers. Corolla 3-4-cleft. Stamens 3-4.

**Madder-like Opercularia.** Pl. 1½ foot.

† **Doubtful species.**

12. **O. ASPÉRA** (Géört. fruct. 1. p. 112. t. 24.) leaves oblong, scabrous, veiny; heads of flowers pedunculate, axillary.—Native of New Zealand, ex Solander. O. aspera, Spreng. syst. 1. p. 385. Probably the same as *O. hispida*.

**Rough Opercularia.** Pl. 1 foot.

13. **O. DÍPIYLLA** (Géort. L. c. p. 113.) stem and leaves unknown; heads of flowers rising from the forks of the branches; partial involucra hispid, many, in every head, each containing 3-4 flowers; flowers tetramerous.—Native of New Zealand. Juss. ann. mus. 4. p. 428. Rubioides diphylla, Soland. mss. The rest unknown.

**Two-leaved Opercularia.** Pl. 1 foot?

**Cult.** For culture and propagation see Pòmax, p. 662.

**CCXXI. LIPOS'TOMA** (from *lépis*, *leipo*, to fall from, and *stoma*, *stoma*, a mouth; lid from capsule). D. Don, in edinb. new phil. journ. Jan. 1830. Sweet, fl. gard. n. s. with a figure.

**L. SYST. TETRÓNDRIA, Monogynia.** Limb of calyx 4-parted. Corolla tubular at the base, and ventricose at the throat, and bearded inside, with a 4-lobed limb; lobes ovate, spreading, valvate in avitation. Stamens 4, inserted in the throat, exserted; filaments compressed; anthers linear, versatile. Style capillary; stigmas 2, subulate, hispid. Capsule globose, 2-celled, opercular, many seeded, but often 1-celled from the middle dissepiment having vanished. Placentas 2, spherical, stipitate, inserted beneath the middle of the dissepiment. Seed small, angular, scabrous. Embryo slender, with oblong plano-convex cotyledons, and a cylindrical obtuse radicle, which is a little longer than the cotyledons.—Diffuse trailing pilose herbs, natives of Brazil. Leaves opposite, petiolate. Stipulas subulate, interpetiolar. Flowers sessile, capitulate, intermixed with bracteas. Heads of flowers pedunculate, solitary, axillary. Corollas blue.

**Capitate-flowered Lipostoma.** Pl. trailing.

2. **L. SER'ÉCEUM** (D. Don. l. c.) plant hairy; hairs adpressed; leaves ovate, acute, when young silky. Y. S. Native of Brazil, in pastures. The whole plant is clothed with silky adpressed hairs. Heads of flowers smaller than the preceding. Corolla
blue, hairy. Seeds triquetrous, dark brown, beset with elevated dots.

Silky Liposoma. Pl. trailing.

Cult. For culture and propagation see Richardsiopsis, p. 628.

† Genera of Rubiaceae not so sufficiently known as to be placed in any particular situation in the body of the order.

Linn. syst. Pentandria, Monogynia. Calyx with a short tube, and a 5-parted limb; lobes flat, obtuse. Corolla coriaceous, funnelform, with a short tube, which is woolly inside, and a 5-parted, rarely 4-parted limb; segments of the limb twisted to the right in aestivation. Anthers linear, sessile within the tube of the corolla. Style clavate, spirally 10-ribbed. Ovary 2-celled, covered by an epigynous disk. Fruit unknown.—A shrub, with slender terete branches. Leaves opposite, coriaceous, lanceolate, acuminate, downy beneath and on the branches, on short petioles. Flowers numerous, glomerate, on short pedicels, axillary. Calyxes tomentose.—This genus is nearly allied to Psilospermum, but is distinguished from it in the aestivation of the corolla, and in the fruit not being silique-formed.

1 P. glomeratum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 619.) ภ S. Native of the island of Luzon, one of the Philippines. Leaves 3½ inches long and 1 broad. Flowers small.

Glomerate-flowered Psilobium. Shrub.

Cult. For culture and propagation see Psychotria, p. 599.

CCXXIII. PLATYMERIUM (from πλατύς, platys, broad, and μέτρον, metron, a measure; probably from the parts of the flowers being broad). Bartl. in herb. Hænke. D. C. prod. 4. p. 619.

Linn. syst. Tetra-pentandria, Monogynia. Calyx with a short tube, and a rotate 5-parted, rarely 4-parted limb; lobes flat, obtuse. Corolla coriaceous, funnel-shaped, with a short tube, which is woolly inside, and a 5-parted, rarely 4-parted limb; segments of the limb twisted to the right in aestivation. Anthers linear, sessile within the tube of the corolla. Style clavate, spirally 10-ribbed. Ovary 2-celled, covered by an epigynous disk. Fruit unknown.—A shrub, with slender terete branches. Leaves opposite, coriaceous, lanceolate, acuminate, downy beneath and on the branches, on short petioles. Flowers numerous, glomerate, on short pedicels, axillary. Calyxes tomentose.—This genus is nearly allied to Psilobium, but is distinguished from it in the aestivation of the corolla, and in the fruit not being silique-formed.

1 P. glomeratum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 619.) ภ S. Native of the island of Luzon, one of the Philippines. Leaves 3½ inches long and 1 broad. Flowers small.

Glomerate-flowered Platymerium. Shrub.

Cult. For culture and propagation see Psychotria, p. 599.

Linn. syst. Tetra-pentandria, Monogynia. Calyx small, tubular, with 5-toothed border. Corolla tubular, slender. Stamens 5? Style and fruit unknown.—Stems quadrangular. Leaves opposite, petiolate, ovate, acute at the apex, acuminate at the base, yellowish beneath, soft to the touch. Stipulae large, interpetiolar, broadly ovate, acute, glabrous. Heads of flowers almost sessile, surrounded by large 5-toothed calyciform villous involucra. The place which this genus should occupy in the order is very doubtful.

1 S. Africana (Beauv. fl. d'Ind. 2. t. 76. fig. 75.) Native of the west coast of Africa, in deserts about the river Gaboon: we have also seen it in the neighbourhood of the Gaboon river. Flowers pale yellow.

Africana Stipularia. Shrub.

Cult. For culture and propagation see Psychotria, p. 599.

CCXXV. BENŽONIA (named in compliment to the celebrated African traveller Benzoni, who died at Benin, the habitat of the plant). Schum. pl. guin. p. 113. D. C. prod. 4. p. 620.

Linn. syst. Tetra-pentandria, Monogynia. Calyx with a glbose tube, and a small 5-toothed limb; teeth erect. Corolla tubular, coriaceous, 5-cleft; segments concave, cup-shaped. Anthers triquetrous, sessile in the throat. Style filiform; stigma ovate-globose, acutish, marked by 6-7 longitudinal furrows. Fruit unknown.—A shrub, native of Guinea. Branches terete, beset with pili above, and with papillae below. Leaves opposite, ovate-oblong, acuminate, glabrous, on short hairy petioles. Stipulae interpetiolar, lanceolate, glabrous. Peduncles axillary, dichotomous, corymbose, and as well as the bifid pedicels hairy.

1 B. contorta (Schum. pl. guin. p. 113.) ภ S. Native of Guinea, in various parts.

Corymbose-flowered Benzonia. Shrub 5 to 6 feet.

Cult. See Psychotria, p. 599. For culture and propagation.

CCXXVI. HIMANTANTHUS (from ἰμαντός, himantos, a garment, and ἀνθος, anthos, a flower; the flowers are involucrated by a large bractea before expansion). Willd. rel. ex Roxb. et Schultes, syst. 5. p. 13. D. C. prod. 4. p. 621.

Linn. syst. Pentandria, Monogynia. Tube of calyx adnate to the ovary, turbinate; limb loose, permanent, 5-parted; segments ovate, acuminate, 2 of them one-half smaller than the other three. Corolla funnel-shaped, having the tube much longer than the calyx, dilated a little at the apex; and the limb 5-cleft, with oblong segments. Stamens 5, capillary, very short, inserted in the base of the tube. Anthers linear, erect, shorter than the tube of the corolla. Style truncate, clavate; stigma subulate. Ovary 2-celled, 2-seeded.—A tree. Leaves elliptic-lanceolate, petiolate, quite entire, glabrous. Flowers spicate, sessile, involucrated by a large deciduous bractea each before expansion.—This tree belongs probably to Rubiaceae, but the stipula and situation of the leaves, seeds, &c. are unknown.

1 H. nigida (Hoffm. ex Willd. l. c.). ภ S. Native of Brazil, in the province of Para, where it is called Sucuba by the natives.

Stiff Himantanthus. Tree.

Cult. For culture and propagation see Psychotria, p. 599.

Linn. syst. Pentandria, Monogynia. Calyx permanent, 5-toothed. Corolla campanulate, 5-toothed; teeth oblong. Filaments 5, inserted in the middle of the corolline tube. Anthers linear, exserted. Stigma 1. Capsule woody, 2-valved. Seeds winged.—Trees, natives of Caracas. Leaves opposite. Flowers terminal, trichotomous, panicled, sweet-scented. This is a very doubtful genus from the description given by Willdenow; but according to Richard it is related to Cinchonaceae, in consequence of the winged seeds; but the stipula are not mentioned, and the leaves are said to be deeply and remotely toothed; and therefore it ought probably to be excluded from Rubiaceae.

1 S. erythroxylos (Willd. l. c.) leaves oblong-rhomboid,
toothed at the apex, downy beneath. 7. S. Native of mountain woods, about Caracas.

Red-wooded Sickingia. Tree or shrub.

2 S. LONGIFOLIA (Willd. 1. c.) leaves oblong-ovate, quite entire, glabrous. 5. S. Native along with the preceding.

Long-leaved Sickingia. Tree.

Cult. See Psychotria, p. 599, for culture and propagation.

CCXXVIII. CALYSPHY' RUM (from καλύξ, kalys, a calyx, and σφυρόν, sphyron, a little hammer; the calyx is like a peduncle). Bunge, in mem. acad. mss. Petersb. 2. p. 107.

Linn. Syst. Triandra, Monogynia. Tube of calyx linear-pentagonal, adnate to the ovarium, 10-striped; limb subcampanulate, profoundly 5-lobed; segments lanceolate, equal, acute, erect, deciduous. Corolla superior, funnel-shaped, about equal in length to the calycine segments; throat wide, glabrous; limb ample, spreading, 5-parted; segments roundish, imbriate in activation: the fifth one a little smaller than the rest. Stamens 5, inserted in the bottom of the tube of the corolla, and alternating with its segments. Anthers linear-oblong, 2-celled, dehiscing at each side by a longitudinal chink. Ovary inclosed in the tube of the calyx, 2-celled, many-ovulate. Style filiform, exserted; stigma petalate. Capsule 2-celled; cells many-seeded. Seeds disposed in 2 rows in each cell, inserted in the dissepiet, imbriate, compressed.—Perhaps the genus is more nearly allied to Lobeliaceae than to Rubiaceae.

1 C. FLUIDUM (Bunge, 1. c.) leaves opposite, almost sessile, oblong, acuminate, toothed; flowers 2-4, sessile, terminating the branches; corollas grumose. 5. G. Native of China, in gardens. Flowers size and form of those of Rhododendron Daüricum.

Flowery Calysphyrum. Shrub.

Cult. See Pômaz, p. 602, for culture and propagation.

† † Genera referred to Rubiaceae by authors, but do not belong to the order.

Bellonia, Linn. belongs to Solanaceae; and Gärtnera, Lam., Ustélíà, Will., Págîmia, Aubl. belongs to Logiaceae.

Tube of calyx adnate to the ovarium; limb variable in the different genera, sometimes toothed or parted, sometimes going away in pappus, which is at first involute, and at length expanded. Corolla tubularly funnel-shaped, usually 5-lobed, rarely 3-4-lobed; lobes obtuse; tube equal or gibbous, or spurred at the base. Stamens adnate to the tube of the corolla, but free at the apex, alternating with its lobes when they are equal in number, but varying in number in the different genera from 1 to 5. Anthers ovate, 2-celled. Style filiform; stigmas 2-3, free, or combined in one. Fruit membranous or submentumaceous, indehiscent, crowned by the limb of the calyx in the younger state; sometimes 3-celled, in this case 2 of the cells are vacant; sometimes only 1-celled. Seed in the fertile cell or solitary fruit, pendulous, exalbumbinous. Embryo straight, with a superior radicle, and 2 flat cotyledons.—Annual or perennial herbs, very rarely woody at the base. Roots of the perennial species thickish, intensely sweet-scented; of the annual species slender, white, and inodorous. Leaves opposite, exstipulate, different in diverse species, and in the same plant. In the latter case the lower ones are usually entire, and the superior ones are laciniate. Flowers disposed in cymose corymbs, usually hemiprodite, very rarely dioecious by abortion, usually furnished with from 1-3 bracteas, white, rose-coloured or bluish, but in the genus Nardostachys they are purple, and in Patrinia yellow.

The plants contained in this order are more interesting for the sake of their symmetry and neatness than on account of any particular attractions; they may be considered a connecting link between Rubiaceæ and Dipsáceæ. Most of them are pretty. The Valérianellas are useful esculents, known under the name of corn salads; Centrénthus ruber is also eaten in the same way in Sicily. Their medicinal properties are of a decisive character. The roots of Valeriana officinalis, Pu, Célica, and others are bitter, tonic, aromatic, antispasmodic, and vermifugal; they are occasionally used as febrifuges. The odour of valerian is not generally agreeable, but eastern nations procure from the mountains of Austria the roots of Valeriana Célica, with which they perfume their baths; and the natives of India at this day employ the Nardostachys, the spikenard of old times, as a perfume, and against hysterics and epilepsy.

Synopsis of the genera.

6 Fe'dia. Limb of calyx with 4 unequal subulate lobes (f. 113. c.). Corolla filiform, with an unequally 5-lobed sublingent limb (f. 113. f.). Stamens 2 (f. 113. h.). Stigma bifid (f. 113. g.). Fruit spongy (f. 113. b.), indehiscent, 3-celled.

8 Centránthis. Limb of calyx involute at the time of flowering (f. 114. b.), but afterwards evolute and deciduous, of many-feathered bristles (f. 114. h.). Corolla with a narrow tube, which is spurred at the base (f. 114. c.), and a regular 5-

9 Valeriana. Limb of calyx the same as in Centranthus. Corolla with an obconical or cylindrical tube (f. 115. b.), which is equal or gibbous at the base, and a bluntly 3-cleft limb (f. 115. b.), rarely only 3-cleft. Stamens 3 (f. 115. b.). Fruit indehiscent, 1-celled, and 1-seeded at maturity.

Lin. syst. Tetrandria, Monongia. Limb of calyx truncate or erect, very short, somewhat 5-toothed. Corolla regular, spurred, bluntly 5-lobed. Stamens 4, adnate to the bottom of the tube of the corolla, rarely 5. Stigma trinodal-capitate. Capsule 3-celled, crowned by the limb of the calyx, usually having chaff-formed bracteas adhering to it at the base, with one of the cells fertile, and 2 usually thick.—Perennial herbs. Leaves for the most part pinnate-lobed. Flowers corymmetric, golden-yellow.

1 P. Sibirica (Juss. l. c.) stem beset with 2 rows of hairs; leaves rather fleshy: primordial ones oblong, lanceolate or spatulate, undivided and obtuse, entire, toothed, serrated, or pinnatifid towards the apex; cauline leaves pinnate, with entire, usually obtuse segments; fruit adnate to the paleae. 4. H. Native of Siberia, among subalpine rocks. Sims. Bot. mag. t. 2925. P. coronata, Fisch. in litt.; Valeria Sibirica, Lin. spec. p. 48. but not of Wild. Valeriaia Ruthenica, Wild. spec. 1. p. 181. Fédia Sibirica, Vahl, enum. 2. p. 122. Gernet. 3. fr. t. 86. f. 3. Valerianella lutea, Moench. Valeria Sibirica b hümilis, Gmel. spec. 3. p. 123. no. 3. Amm. ruth. no. 25. t. 3. Radical leaves spatulate, entire, toothed or serrated, but sometimes pinnatifid at the apex; cauline leaves pinnate. Fruit crowned by the 5-toothed limb of the calyx. Flowers yellow. Root black, strong-scented.

4 P. heterophylla (Bunge, in mem. acad. imp. peterb. 2. p. 109.) stem leafy, downy; lower leaves pinnatifid, with distant ovate-oblong coarsely toothed lobes: the terminal lobe the largest, sharply toothed or deeply lobed, acuminate; superior leaves quite entire or serrate, with oblong-linear elongated quite entire lobes; flowers corymmetric; achenia bracteate. 4. H. Native of the north of China, on the mountains. Nearly allied to P. rupéstris, but differs in the lobes of the leaves being fewer, shorter, broader, and in being variously cut, and in the upper leaves being of a different form.

Variable-leaved Patrinia. Pl. 1 foot.

5 P. Scabiosaefolia (Link, enum. 1. p. 131.) stem glabrous; radical leaves ovate or oblong, deeply serrated and lunate; cauline leaves pinnatifid, with lanceolate-linear acute segments; terminal segment very long; corylums loose, rather panicled; fruit triquetrous, naked. 4. H. Native of Dahuria. Sweet-flags. fl. gard. t. 154. Todd. bot. cab. t. 1340. P. scabiosaefolia, Fisch. in litt. Fédia scabiosaefolia, Trev. act. bonn. 13. p. 165. Flowers yellow. There is a variety of this plant having the radical leaves rather pilose, and the rest glabrous. Limb of calyx wanting or truncate.

6 P. Villosa (Juss. 1. c.) stem villous; leaves villous; radical ones petiolate, auriculate; cauline ones sessile, toothed; corylums panicled. 4. H. Native of Japan. Valeria Sibirica, Thunb. fl. damp. 5. p. 22. t. 6. but not of Wall. Fédia villosa, Vahl, enum. 2. p. 10. Peduncles axillary and terminal. Bracteas linear. Flowers yellow.

Villos Patrinia. Pl. 1 foot.

7 P. Ceratophylla (Hook. fl. bor. amer. 1. p. 290.) stem glabrous; leaves all rather fleshy, downy, petiolate; radical ones linear-lanceolate, entire, pinnatifid or bipinnatifid, with divericate lobes; cauline leaves profoundly pinnatifid, with linear segments; panicles elongated; peduncles ternately verticillate. 2. H. Native of North-west America, common on low wet soils between the Kettle Falls and Spokane, and in the valleys of the west side of the Rocky Mountains. Root thick, fusiform. Stems simple. Peduncles opposite or 3-4 in a whorl. Pedicels short, and flowers crowded. Flowers white. The roots during the spring months are collected by the Indians, baked on heated stones, and used as an article of winter and spring food. From a bitter and seemingly pernicious substance, it is thus converted into a soft and pulpy mass, which has a sweet taste, resembling that of treacle, and is apparently not wholesome.

Horn-leaved Patrinia. Pl. 1 to 1 1/2 foot. Cult. The species of Patrinia grow well in any light soil, and are easily increased by seeds.

II. NARDOSTACHYS (from nardos, nardos, a shrub, and stachys, a spike; but is so named from the plant called spikenard.) D. C. coll. mem. vitt. 1-2. prod. 4. p. 624. —Patrinia, D. Don. prod. fl. nep. p. 159.

Lin. syst. Tetrandria, Monogyna. Limb of calyx 5-parted; lobes ovate-oblong, acute, foliaceous, somewhat denticulated, permanent. Corolla regular, spurred, bluntly 3-lobed, with a bearded throat. Stamens 4, adnate to the bottom of the corolla. Stigma capitata. Capsule 3-celled, crowned by the calycine lobes, and shorter than those, but not adnate to the bracteas.—Herbs, with the habit of Scorzonerà hümilis, having very sweet-scented perennial roots, which are beset with erect fibres at the neck. Leaves entire, oblong; radical ones very long; cauline ones

1 N. Jatamani  (D. C. coll. mem. vii. t. 1.) stem villous; leaves downy; radical ones lanceolate-long: cauline leaves sub-lanceolate; fascicles of flowers opposite, pedunculate, and terminal. 2. F. Native of Nipaul, on the Himalaya mountains and Gosaingthang; in Mandon and Chitor provinces; in the provinces of Delhi, Bengal, and Deccan. Valeriana Jatamansi, Jones in asiat. res. 2. p. 405. and 4. p. 109. Roxb. in asiat. res. p. 451. D. Don, in Lamb. cinch. p. 180. with a figure. Valeriana spica, Vahl, enum. 2. p. 13. Patrunia Jatamansi, D. Don, prod. fl. nep. p. 159. Nardus Gar. ab. hort. arom. p. 193. with a figure of the root. Nardus Indica. J. Bauh. hist. 3. p. 502. Nardostachyton or Spica Nardi or Nardus Gangitns or Nardus Syrica of the ancients, and Jatamangsi of the natives of India. It had long been a desideratum among the moderns to know to what order and genus the plant belonged, which produced the spikenard of the ancients. We are indebted to that learned orientalist, the late Sir William Jones, for having first pointed it out satisfactorily, although he confounded it with another species totally distinct, and from which he has taken his botanical description and figure. This mistake arose from his not having received perfect specimens himself; but trusting wholly to the account and drawing given him by a friend, who was entirelyversed in botany, and who therefore could not be supposed to distinguish accurately two plants of the same genus. The Jatamani or Jatamangsi belongs to the genus Nardostachys, and resembles in several respects the Celtic Nard, Valeriana Céltica. The roots are simple, perpendicular, from 4 to 6 inches long, and the upper half is very thickly covered with the remains of the past leaves, resembling coarse hairs, and the smell resembles those of Valeriana officinalis. This smell, which to many would not perhaps prove grateful, has led some to doubt its being the spikenard of the ancients. Dr. Francis Hamilton, in his account of Nipaul, has expressed some doubts on the subject, but he says, "As there can be no disputing about taste, I cannot take upon myself to say how far the encomiums bestowed on the spikenard are applicable to this valerian, and the native women no doubt consider the smell very agreeable, because most of such as can afford it use oil impregnated with this root for perfuming their hair. All I can say is, that if this root is the spikenard of the Roman ladies, their lovers must have had a very different taste from the youth of modern Europe. Notwithstanding the objections that might be raised against the Jatamansi, on the ground that the perfume produced by its roots would not prove perhaps so grateful to our modern ladies, yet to the ladies of ancient Rome it might have been highly grateful, as it is to those of Nipaul at the present day. The late Sir William Jones, in two learned dissertations published in the second and fourth volumes of the Transactions of the Asiatic Society, has, indeed, so fully demonstrated by so many proofs that the Nardostachys is identical with the spikenard of the ancients, and this opinion is supported by so many concurring circumstances, that there can, I think, be no doubt now left on the subject. The Valeriana Hardwickii, with which Sir W. Jones confounded it, has short fleshy roots, sending out numerous cylindrical fibres, the radical leaves coriaceous, and those of the stem pinnate and ternate. The flowers panicked, and in other respects it differs widely."

Jatamansi or Spikenard. Pl. ½ foot.  

2 N. grandiflora  (D. C. coll. mem. vii. t. 2.) stem quite glabrous; leaves oblong, glabrous: cauline ones ovate or coriaceous; heads of flowers solitary, terminal. 2. F. Native of Nipaul, at Kamaon. Fédia grandiflora, Wall. mss. Bracteas 5-nerved, membranous, oval, longer than the capsule. Capsule downy; lobes of calyx evidently dehiscencnt.

Great-flowered Spikenard. Pl. ½ foot.

Cult. See Triplostégia, p. 680. for culture and propagation.

III. DUFRESNIA (named after Peter Dufresne, M.D., author of Histoire Naturelle et Medicale de La Famille des Valerianes, 4to, Montpelier, 1811.) D. C. coll. mem. vii. t. 3. prod. 4. p. 624.

1 D. orientalis  (D. C. coll. mem. vii. t. 3.) 2. F. Native of the Levant, between Mosul and Bagdad, where it was collected by Olivier and Bruguier.

Oriental Dufresnia. Pl. ½ foot.

Cult. This plant should be grown in a pot in a mixture of peat, loam, and sand; and placed among other alpine plants; it can only be increased by seeds.

LIN. SYST. Triandria, Monogynia. Limb of calyx toothed, permanent. Corolla spurless, regular, 5-lobed. Stamens 3. Stigma nearly undivided or trifid. Fruit 3-celled, rather membranous, indehiscent, crowned by the toothed or acerate limb of the calyx.——Annual herbs. Stems dichotomous at the tops. Leaves oblong, or linear, undivided, or toothed at the base, or the superior ones pinnatifid. Flowers solitary in the forks, or in fascicled corymbs, bracteate, small, white, rarely rose-coloured.

§ 1. Locista (from locusta, a locust; so named from some semblance in the branches). D. C. prod. 4. p. 624. Mature fruit 2 or 3-celled; one of the cells alone fertile, and gibbous on the back; the two sterile ones equal or broader than the fertile one, sometimes distinct, and sometimes coadunate, from the dissepiment having vanished.

* Mature fruit 2-celled.

VI. Valericanna.

Turgida Lamb's-lettuce. Pl. ½ to 1 foot.
5 V. gibbosa (D. C. coll. mem. t. 3. f. 3.) fruit globose, somewhat compressed, glabrous, crownless, coriaceous and flat on one side, and gibbous on the other, and furnished with 2 stripes on both sides; fertile cell turgid, cellular, and furnished with a furrow; and the 2 sterile ones smaller, and furrowed on the back; bracteas linear-oblong, spreading, quite entire; flowers subcapitate; leaves oblong-linear, entire. O. H. Native of Sicily, on the mountains in exposed places. Fédia gibbosa, Guss. 1. p. 28. Herb smoothish, 2-3 inches high. Nearly allied to V. turgida.

Gibbous-fruited Lamb's-lettuce. Pl. ½ foot.
6 V. costata (D. C. prod. 4. p. 620.) fruit roundish, a little compressed, glabrous, not crowned; fertile cell turgidly cellular and convex on the back, and the 2 sterile ones profoundly furrowed on the back; bracteas oblong, spreading, with glabrous edges; flowers subcapitate; leaves linear-oblong, quite entire. O. H. Native of the south of Tauria, in vineyards. Fédia costata, Stev. mem. mosc. 5. p. 344. Bibl. suppl. p. 28. Herb 1-2 inches long, simple, slender, smoothish. Fruit nearly allied to V. turgida and V. gibbosa, but much smaller.

Ribbed-fruited Lamb's-lettuce. Pl. 1 to 2 inches.

§ 2. Psiloceae (from ψιλός, ψιλός, slender, and κολός, κοιλός, a hollow; in reference to the narrow sterile cells of the fruit). D. C. prod. 4. p. 626. Fruit 3-celled, flattened in front; fertile cell not cellullarily turgid on the back; and the 2 sterile ones filiform, and much narrower than the fertile one, usually close and nerved.

* Limb of calyx parted into recurved stiffish teeth.

9 V. corniculata (Mey. verz. p. 49.) fruit oblong, with the 2 sterile cells filiform, and the fertile one convex on the back; crown of fruit tubular, trisulate; teeth elongated, linear, usually dentilicate, straight or hooked at the apex. O. H. Native of Caucasus, in corn-fields near Baku. Habit of plant nearer to V. uncincata than to V. echinata.

Horned-fruited Lamb's-lettuce. Pl. ½ to 1 foot.

* Limb of calyx crccit, toothed or entire, never recurved.

10 V. eriocarpa (Desv. journ. bot. 2. p. 314. t. 11. f. 2.) fruit ovate, obliquely ribbed, hispid; the 2 sterile cells of fruit

rust, t. 24. Flowers pale blue. There is a variety of this species having the upper leaves toothed or jagged according to Vahl. Lamb's lettuce is also called corn-salad; Ackerman in German, and Valerianella in Italian. It is a diminutive annual plant, common in corn-fields or sandy soils. The leaves are of a pale glaucous hue, and rather succulent. When cultivated it rises almost a foot high, and flowers in March. Gerarde tells us that foreigners using it while in England led to its being cultivated in our gardens. It is used in salads through the winter and early in spring, both as a substitute for common lettuce in those seasons, and to increase the variety of small salads. For these purposes it has long been a favourite plant in France under the denominations of mâché, doucette, salade de chanoine, and poule grass. It is raised from seed, of which a quarter of an ounce is sufficient for a bed 4 feet by 5. To answer the common demand 2 or at most 3 sowings will be sufficient, viz. a principal sowing at the beginning or towards the middle of August, a secondary sowing early in September, to furnish together crops in winter and early spring; and a smaller sowing in spring at the close of February or in the course of March, if the plants are required in continuation throughout that season, though they are apt to get rank tasted in warm dry weather. If wanted throughout summer, sow once a month, and cut the crop quite young. Sow the seeds in any bed of common mellow earth, broad cast, and rake in the seed. When the plants are up, thin them to 2 or 3 inches asunder, that they may have room to acquire some small stocky growth for gathering. For seed leave some plants in spring.

Var. ß. lasiocarpa (Rechb. l. c. f. ñ.) fruit downy.

Salad Lamb's-lettuce. Fl. April, May. Britain. Pl. ½ to 1 ft.
2 V. radia (Dufr. val. p. 57.) fruit oblong, rather tetragonal, glabrous, smooth; limb of calyx obliquely truncate, almost wanting; sterile cells of fruit combined in one, from the dissemination being incomplete, equal in size to the fertile one; bracteas linear-oblong, spreading, ciliate a little; leaves oblong-spatulate, attenuated at the base, subdenticulate. O. H. Native from Pennsylvania to Carolina, in corn-fields. Valeriana radia, Wild. spec. 1. p. 185. Fédia radia, Michx. fl. bor. amer. 1. p. 18. Bart. comp. 1. p. 20. Fruit downy, according to Michx.; but in the specimen it is obviously glabrous. Flowers pink. Perhaps only a variety of V. olistira. The young leaves are used as a salad.

3 V. exscapa (Stev. mem. soc. mosc. 3. p. 251.) fruit 2-celled, one of which is sterile, ovobate, ribbed, glabrous, sessile at the neck, and protruded at the apex, and 5-6-toothed: teeth oblong, straight, thick: leaves ligulate, glabrous; stem none. O. H. Native of Caucasus, near Gandsha. Fédia exasperata, Lev. mem. mosc. 5. p. 354. Rem. et Schultes, syst. 1. p. 366. Fédia acutus, Bibl. suppl. p. 35. Flowers pink. The fruit is said to be 2-celled, with both the cells fertile, but it is probably like the other species, having only one of the cells fertile, and the 2 sterile combined ones.

** Mature fruit 3-celled.

4 V. Turgida (D. C. prod. 4. p. 626.) fruit nearly globose, compressed on one side and concave-convex, almost awnless, glabrous; fertile cell turgid, convex and cellular on the back, and the 2 sterile cells about equal in size to the fertile one; bracteas oblong, spreading, ciliate; flowers subcapitate; leaves obvolute: upper ones oblong-linear, quite entire. O. H. Native of Tauria, in corn-fields. Fédia turgida, Stev. mem. mosc. 2. p. 178. but not of others. A very distinct species.
very narrow; limb of calyx obliquely truncate, campanulate, 6-toothed; teeth erect, the 3 front ones the shortest; bracteas adpressed, linear; leaves oblong-linear, quite entire, or toothed at the base. 

**Var. β. rugulosa** (D. C. Fl. prod. 4. p. 627.) bracteas ovate-lanceolate; habit firmer. 

O. H. Native along with the species. Fédia rugulosa, Spreng. pag. 2. p. 2. 

**Woolly-fruited Lamb's-lettuce.** Fl. April, May. CIt. 1821. Pl. $\frac{1}{2}$ to 1 foot. 

11 V. mixta (Dufr. val. p. 59. t. 3. no. 6.) fruit ovate, villos, having the 2 sterile cells very narrow; limb of calyx oblique, with 3 short teeth; bracteas linear, adpressed; leaves oblong, quite entire. 

**Mixed Lamb's-lettuce.** Fl. May, June. Cit. 1818. Pl. $\frac{1}{2}$ to 1 foot. 

12 V. MORISONI (D. C. Fl. prod. 4. p. 627.) fruit ovate, rather conical, downy; limb of calyx oblique, tridentate on one side, and furnished with 1-2 nearly obsolete teeth on the other; the 2 sterile cells of fruit filiform, much narrower than the fertile one; bracteas subulate, erect, cartilaginously ciliated; flowers corystose; leaves linear-tongue-shaped, quite entire or few-toothed at the base. 

—Mor. oxon. t. 16. f. 35. Fédia locusta olitoria, Oed. fl. dan. t. 738. Flowers purple. 

**Var. β. leioarpa (D. C. Fl. prod. 4. p. 627.) fruit glabrous.** 

O. H. Native along with the species. F. dentata, Stev. F. Morisoni, Agardh. Fédia dentata, var. leioarpa, Rehb. pl. crit. t. 62. There are varieties of this, having the leaves 3 in a whorl, and pinnatifid. 

**Morison's Lamb's-lettuce.** Fl. April, June. Britian. Pl. 1 ft. 

13 V. purecula (D. C. Fl. prod. 4. p. 627.) fruit ovate, downy, hardish, rather angular, not umbilicated; limb of calyx very short, oblique, 3-5-toothed; the 2 sterile cells of the fruit filiform, and very narrow; bracteas linear, erect, ciliately denticulated, with membranous margins; flowers corystose; leaves linear-oblong, quite entire, or hardly undenticate at the base. 

**Downy Lamb's-lettuce.** Pl. $\frac{1}{2}$ foot. 

14 V. TRUNCATA (D. C. Fl. prod. 4. p. 627.) fruit ovoid, downy, convex on the back, and bicostate in front; the 2 sterile cells of fruit filiform, much narrower than the fertile one; limb of calyx ear-formed, obliquely truncate, quite entire, equal in length to the fruit; bracteas linear, dilated and concave at the base, ciliately serrated; flowers corystose; leaves oblong, quite entire. 

O. H. Native of Caucausus, and Cydonia, in corn-fields; also of the Island of Melos, and in Cazar and Theodosia. Fédia truncata, Rehb. pl. crit. t. 115. Fédia dentata, Sieb. ex Rehb. V. auricula, D'Urrv. enum. 5. but not of D. C. 

**Truncate-calyxed Lamb's-lettuce.** Pl. $\frac{1}{2}$ foot. 

§ 3. Platyglâce (from Platy-ge, platus, broad, and kolas, a hollow; in reference to the broad, hollow, sterile cells of the fruit). D. C. Fl. prod. 4. p. 627. Fruit 3-celled, furrowed in front; sterile cell not ciliately gibose on the back, and the two sterile cells broader than the diameter of the fertile one, or nearly equal to it; the transverse section nearly orbicular. 

* Limb of calyx entire or toothed; erect; teeth not hooked at the apex. 

15 V. auricula (D. C. Fl. fr. suppl. p. 492. coll. mem. t. 3. f. 6.) fruit ovate, glabrous; limb of calyx obliquely truncate, almost quite entire, acutely auricle-formed; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear, glabrous; flowers disposed in dichotomous corymbs, rather loose; leaves oblong, quite entire, or toothed at the base. 

O. H. Native of Europe, in fields, especially in the south. Fédia auricula, L. gen. helv. t. 1. p. 84. t. 4. Rehb. pl. crit. t. 68. Fédia olitoria, Gaertn. fr. t. 2. p. 86. Flowers pink. This species is often confused with V. dentata, and numerous others. There is a variety of it with pinnatifid leaves and villous fruit, according to Rehb. 

**Var. β. laxiflora** (D. C. Fl. prod. 4. p. 626.) dwarf; leaves obovate-oblong. 

**Auricled-calyxed Lamb's-lettuce.** Fl. May, June. Cit. 1821. Pl. $\frac{1}{2}$ foot. 

16 V. dentata (D. C. Fl. fr. no. 3331.) fruit ovate, glabrous, smoothish, chinky in front; limb of calyx obliquely truncate, auricle-formed, tridentate; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear-lanceolate, glabrous, hardly ciliated; flowers dichotomously corystose, rather loose; leaves oblong-linear, quite entire. 

O. H. Native of Europe, in woods; and of Caucausus, near Rakau, in corn-fields. Dufr. val. p. 57. t. 3. no. 5. Fédia dentata, Vahl, enum. 2. p. 20. exclusive of the syn. of Moris. Valerianâ dentata, Willd. spec. 1. p. 183. V. rimosa, Bast, journ. bot. 1814. 1. p. 20. Val. olitoria, Sturm. deutsch. fl. with a figure. Flowers blue. This is an intermediate plant between V. auricula and V. *pumila*, and probably not distinct from the former. 

**Toothed-calyxed Lamb's-lettuce.** Pl. $\frac{1}{2}$ foot. 

17 V. pumila (D. C. Fl. fr. no. 3335.) fruit nearly globose, inflated, glabrous, engravexen in front, retuse at the apex; limb of calyx tridentate, short, unequal; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, lanceolate, with membranous villosely-ciliated margins; flowers corystose; leaves oblong-linear, deeply toothed at the base. 

**Var. β. laxiflora (Rom. et Schultes, syst. 5. p. 366.) fruit** villous. 

18 V. spheerocarpha (D. C. prod. 4. p. 628.) fruit globose, umbilicate on one side, and convex and bicostate on the other; limb of calyx tridentate, one of the teeth longer than the others; bracteas spreading, lanceolate, acute, with scarious serrately ciliated edges; leaves linear-lanceolate, rather scabrous: uppermost ones pinnatifid at the base; stem smooth. ☺ H. Native of Sicily, in pastures on the mountains. Fedia spheerocarpha, Guss. prod. 1. p. 28. pl. rar. p. 14. t. 4. f. 1.

19 V. cyniocaarpha (Meyer. verz. pl. p. 49.) fruit nearly linear, with the 2 sterile cells curved, and the fertile cell rounded on the back, and nearly equal; crown of fruit campanulate, 3 and sometimes 4-toothed: the lateral tooth elongated, linear, and straight, the rest usually obsolete. ☺ H. Native of Caucasus, near Swant, in arid places.

20 V. trigonocaarpha (D. C. prod. 4. p. 628.) fruit trigonal, glabrous, broadly excavated in front, almost without a crown, with callous angles: the 2 sterile cells of the fruit larger than the fertile one; bracteas oblong-linear, glabrous, spreading; flowers capitate: leaves quite entire: lower ones ovate-oblong, upper ones oblong, ciliated at the base. ☺ H. Native about Constantinople, where it was collected by Castagne.

** Teeth of calyceous limb hooked at the apex.

21 V. hamata (Bast, in D. C. prod. 4. p. 628.) fruit ovoid, villous outside, somewhat tetragonal, engraved in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx spreading, broader than the fruit, quite glabrous inside, and cleft into 6 lobes beyond the middle; lobes awned, hooked at the apex; bracteas adpressed, oblong, ciliated; flowers rather densely capitate; upper leaves linear, entire or tripartite, and are as well the stem glabrous. ☺ H. Native in the region of the Mediterranean. D. C. coll. mem. t. 3. f. 7. V. coronata, Guss. prod. 1. p. 25. V. coronata integrifolia, Rchb. pl. crit. 1. p. 54. t. 66. f. 1.—Col. echpr. t. 209. Fedia coronata of many authors. Flowers pink.

22 V. coronata (D. C. prod. 4. p. 628.) fruit ovoid, villous, somewhat tetragonal, engraved in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx cup-shaped, broader than the fruit, hairy inside, cleft into 6 lobes beyond the middle: lobes awned, hooked at the apex; bracteas adpressed, ciliated; flowers densely capitate; upper leaves pinnatifid, and are as well the stem downy. ☺ H. Native of the region of the Mediterranean. V. coronata, D. C. fl. fr. no. 3333. Dufr. val. 60. t. 3. f. 2. Fedia Sicula, Guss. prod. 1. p. 25. Fedia coronata, Rchb. pl. crit. t. 66. f. 3 et Y. Vahl, enum. 2. p. 20. Flowers pink.

** * Limb of calyx inflated, closed by the inflated calyceous teeth.

23 V. vesicaria (Meen-ch. meth. p. 497.) fruit villous, crowned; limb of calyx bladdery, inflated, 6-toothed; teeth conning, acute; the 2 sterile cells of fruit a little smaller than the fertile one, or nearly equal in size to it; bracteas adpressed, ovate, ciliated, shorter than the fruit; leaves entire or toothed; stem rather villous. ☺ H. Native in the region of the Mediterranean, in corn-fields. D. C. fl. fr. 4. no. 3332. coll. mem. t. 3. f. 8. Dufr. val. p. 60. t. 3. f. 9. Fedia vesicaria, Vahl, enum. 2. p. 20. Rchb. pl. crit. 1. t. 70. Valeriana vesicaria, Willd. Val. locusta, β, vesicaria, Lin. Sibth. et Smith, fl. grac. t. 34. Flowers linc.

§ 4. Solenocaer'ce (from σωλην, solein, a tube, and κολοκ, kolos, a hollow; in reference to the sterile cells of the fruit). D. C. prod. 4. p. 629. Fruit 2-celled, broadly furrowed in front; the fertile cell not cellulyarly gibbose on the back, and the 2 sterile cells broader than the fertile one, and curved, and therefore the transverse section is triluate.

* Lobes of calyx hooked a little.

24 V. platyloba (Dufr. val. 59. t. 3. f. 1.) fruit ovoid, villous outside, rather tetragonal, broadly furrowed in front, boat-shaped; limb of calyx spreading, broader than the fruit, rather hairy inside, 6-lobed to the middle; lobes ovate, each furnished with a hooked mucron; bracteas adpressed, ciliated, ovate-oblong, sub-capitate; upper leaves toothed, and are as well the stem glabrous. ☺ H. Native in the region of the Mediterranean. D. C. coll. mem. 3. f. 9. Fedia discoides, Rchb. pl. crit. 1. p. 54. t. 67. Fedia rotata, Rchb. i. c. p. 93. Flowers pink.

* * * Limb of calyx erect.

† Species not sufficiently known.

26 V. chenopodiifolia (D. C. prod. 4. p. 629.) plant dichotomous; leaves ovate, acute, toothed below; cymes naked, divericate, dichotomous; filaments long. ☺ H. Native of Virginia. Fedia chenopodiifolia, Pursh, fl. amer. sept. 2. p. 727.

Goose-foot-leaved Lamb's-lettuice. Pl.

Cult. The seeds of all the species only require to be sown in the open ground in the early part of spring. All the species answer very well for spring salad.

V. ASTREPHIA (from a, priv., and στρεφω, strepho, to turn; the calyx is not turned back at the time of flowering, as in Valeriana.) Dufr. val. p. 56. exclusive of many species. D. C. coll. mem. vii. prod. 4. p. 629.—Hemesotria, Rafin. ann. gen. phys. 6. p. 88.—Valeriana species, Ruiz et Pav. Smith.—Fedia species, Kunth.

Lin. syst. Tridndria, Meumgynia. Tube of calyx very short, somewhat 5-toothed or subcampanulate. Corolla funnel-shaped, 5-toothed, gibbos on one side at the base, and therefore furnished with a kind of spur. Stamens 3. Style 3-cleft at the apex; stigmas slender. Fruit 2-celled, one of the cells alone fertile; and the other is sterile, and marked by a furrow in the middle, and is therefore probably formed of 2 cells, having the partition between
them obliterated. —Nearly glabrous herbs. Radical leaves rhomboid, cut; cauline ones impari-pinnate, with oval-oblong, deeply toothed segments. Flowers disposed in panicles or corymb, white.—Habit of Valeriana, and the fruit almost of Valeriana, but is easily distinguished from both these genera in the corolla being gibbously spurred on one side at the base, and in the style being 3-clawed.

Herb hardly a hand high. Flowers white.

Cherry-like Asteriæ. Pl. \(\frac{1}{2}\) to \(\frac{1}{2}\) foot.

2. A. CRERIS (Dufr. val. p. 13.) stem glabrous, as also at the nodi; panicle elongated, with dichotomous branches, floriferous in the axis of the forks; corolla gibbous at the base; limb of calyx sub-campanulate, almost entire. \(O. H.\) Native of Chili, among bushes, and in meadows and corn-fields. Valeriaïna crispa, Ruiz et Pav. 1. p. 41. Herb 2 feet high. Flowers white.

Curled Asteriæ. Pl. 2 feet.

3. A. LAAXA (Hook. et Arn. in bot. misc. 3. p. 364.) plant herbaceous, glabrous; radical leaves ovate-cordate, bluntly toothed; cauline leaves lyrate-pinnatifid, terminal lobe the largest; panicle loose, divaricata; ultimate pedicels short, crowded; fruit ovate, excavated on one side, 3-ribbed on the back, and crowned by an annular ring.—Native of Chili, about Concepcion. Fedia laxe, Hook. et Arn. in Beech. voy. pt. bot. p. 28. This species approaches near to Fedia paniculata, but that plant is pubescent, and has a pappose fruit.

Loose-flowered Asteriæ. Pl. 1 foot.

4. A. LOBA (Hook. et Arn. in bot. misc. 3. p. 364.) leaves pinnate-lobed; lobes distinct, coarsely toothed; terminal lobe broadly ovate, lateral ones oblong, much smaller; lower teeth looking downwards, upper ones upwards; rachis glabrous; corymbs pedunculate, opposite, distant, disposed in a panicle; fruit glabrous.—Native of Chili.

Var. \(\alpha\); stem beset with long hairs. The stem below the last pair of opposite cauline leaves is hairy, above them it is glabrous.

Var. \(\beta\); stem glabrous.—Native of Chili, about Valparaíso.

Lobed-leaved Asteriæ. Pl. 1 foot.

Cult. A. cheroshyloides should be treated like other tender annuals; the rest should be protected in winter by placing them in a frame or green-house. All are only to be increased by seeds.

L. syxs. Diandria, Monogynia. Limb of calyx short and straight; lobes 4, subulate, unequal (f. 113. c). Corolla with a filiform spurred tube (f. 113. a.), and an unequally 5-lobed subrinfert limb (f. 113. f.). Stamens 2 (f. 113. h.). Stigma bifi幼稚 (f. 113. k.). Fruit indeliscent (f. 113. b.), rather spongy, 3-celled; the 2 sterile cells narrow, and the fertile one broader and 1-seeded.—Glabrous annual herbs. Leaves entire or toothed. Flowers capitately corymbose or cymose, rose-coloured or purple. Bracteas adpressed.

—Mor. oxon. sect. 7. t. 16. f.

27.—Piss. mon. t. 5. Stem purplish. Flowers red. This is a very ornamental annual. The fruit is like a cornucôpia.

2 F. scorpiôœs (Duf. val. p. 55. t. 1.) leaves ovate, petiole: lower ones quite entire; middle ones irregularly toothed: upper ones ovate-lanceolate, hardly pinnatifid; flowers cymose, unilateral and sessile along the two branches of the cyme. \(O. H.\) Native of the north of Africa, about Tangiers. Flowers purple.

Scorpion-like-cymed Fedia. Pl. \(\frac{1}{2}\) foot.

† Species not sufficiently known.

3 F. paniculâtâ (Colla, app. 3. p. 36.) lower leaves spatulate, nearly entire: middle ones lanceolate, obsoletely toothed: upper ones linear-lanceolate, quite entire; stems erect, glabrous; pedicels dichotomous. \(O. H.\) Native country unknown. Perhaps a species of Valerianaëlæ.

Panicled Fedia. Pl. 1 foot.

Cult. The seeds of the species of Fedia only require to be sown in the open border in spring, like other hardy annuals. A light soil suits them best.

L. syxs. Tràndria, Monogynia. Margin of calyx straight, quite entire. Tube of corolla furnished with a short spur at the base, and gibbous in front; limb 5-cleft, bilabiate. Stamens 3. Capsule cartilaginous, 1-celled, 2-winged; but the capsule may be truly said to be 3-celled, the 2 empty or abortive cells forming the wings. —A glabrous herb, with a habit between Centrînthus and Fedia, but the flowers are triandrous, and the fruit is singularly distinct. Flowers monoeocious, rose-coloured, crowded, in whorles. Bracteas multifid, with subulate segments.

1 P. conqêsta (D. C. prod. 4. p. 631.) \(O. H.\) Native of the north-west coast of America, on the banks of streams and moist rocks, along the shore near the mouth of the Columbia, where it was collected by Douglas. Valerianâlæ congêsta, Lindl. bot. reg. t. 1095.

Var. \(\beta\), minor (Hook. fl. bor. amer. 1. p. 291.) leaves narrow. \(O. H.\) Native along with the species. Valerianâlæ parviflora, Doug. mss.

Crowded-flowered Plectritis. Pl. July. Clt. 1826. Pl. \(\frac{1}{2}\) to 1 foot.

Cult. The seeds of this plant only require to be sown where the plants are intended to remain in the open border.

LIN. Syst. Monandria, Monegynia. Limb of calyx involute (f. 114. b) when the flower is in blossom, but afterwards it unfolds into a deciduous pappus; composed of many plumose bristles (f. 114. h). Corolla with an oboconical tube, which is spurred at the base (f. 114. c), and a regular 5-lobed limb (f. 114. d). Stamens 1 (f. 114. e). Fruit indehiscent, 1-celled, and 1-seeded at maturity.—Quite glabrous European herbs. Leaves undivided or pinnate. Flowers red or white, unilateral along the branches of the panicle, which is corymbose.

* Spur of flower elongated. Flowers red, very rarely white.

1 C. longifolius (Stev. obs. pl. ross. p. 76.) leaves lanceolate-linear, quite entire; spur one-half shorter than the tube of the corolla, and about equal in length to the ovary; corolla twice the length of the limb of the corolla. ♀. H. Native of Armenia, about Tiflis, among rocks. C. angustifolius, Bieb. fl. taur. 1. p. 67. but not of D. C. The leaves are intermediate in breadth between the following two, and are probably glaucous like them. Corollas red, an inch long.

2 C. angustifolius (D. C. fl. fr. 4. p. 259.) leaves linear-lanceolate, quite entire; spur one-half shorter than the tube of the corolla, and about equal in length to the ovary; corollas much exserted. ♀. H. Native of Spain, south of France, Switzerland, Italy, Greece, on the mountains in stony open places. Dufr. val. p. 39. Val. rubra, β. Lin. spec. p. 44. Valeriana angustifolia, Cav. icon. 4. t. 353. Sibth. and Smith, fl. grece. t. 29. but not of Host. Val. monandria, Wil. delph. 2. p. 280. Flowers red, half an inch long. This plant does not change under cultivation.

3 C. ruber (D. C. fl. fr. 4. p. 632.) leaves ovate or lanceolate: upper ones unequal at the base, toothed a little; spur one-half shorter than the tube, and much longer than the ovary; corollas exserted by the corolla but a very little. ♀. H. Native of the south of Europe, the Levant, north of Africa, and on Mount Vesuvius, and now cultivated in almost every garden. It is to be found in some parts of Britain, on chalk cliffs, on walls, and among rubbish, but is probably an escape from gardens. Stev. obs. pl. ross. p. 67. C. maritimus, Gray, brit. arr. 2. p. 479. C. latifolius, Dufr. val. p. 38. H. B. et Kunth, nov. 3. p. 323. Valeriana rubra, All. ped. 1. p. 1. Valeriana rubra, a, Lin. spec. p. 44. engl. bot. t. 1531.—Berg. phyt. t. 141. Do- don, pempt. 351. f. 1.—Riv. mon. t. 3. f. 2. Plant of a glaucous hue. Flowers red.—There is a variety of this with narrow leaves, and another with white flowers. In this and the preceding the root is sweet-scented, and the stem suffruticos at the base.

* Spur of flower very short (f. 114. c). Flowers white.

4 C. nervosum (Moris. elench. sard. 2. p. 4.) leaves all elliptic or oblong-lanceolate, attenuated into the petioles, 3-7-nerved, quite entire; flowers cymose corymbose; spur very short. ♀. H. Native of Corsica, at a place called Alle Trinita, and of Sar- dinia, on the mountains. Valeriana trinitensis, Viv. fl. cors. p. 3. add. fl. italic. p. 67. Flowers white.

Nerved-leaved Spurred-Valerian. Pl. 1 foot.

Cult. All the species are elegant border-flowers. They will grow in any common soil, or on walls or rock-work, and are all readily increased by seed.

IX. VALERIA'NA (said by some to be named after one Valerius, who is said to have used this plant first in medicine; and by others to be from valere, to be in health, on account of the medicinal qualities of V. officinalis). Neck. elem. 1. p. 128. D. C. fl. fr. 4. p. 238. Rœm. et Schultes, syst. no. 119. D. C. prod. 4. p. 632.—Valeriana, Phylläctis, and Aesthæria, Dufr.—Valeriana species and Oligacée species, Wild.

LIN. Syst. Trîndria, Monogyňia. Limb of calyx involute in the time of blossom, but it unfolds itself at last into a deciduous pappus, which is composed of many plumose bristles (f. 115. d). Corolla with an oboconical or cylindrical tube (f. 115. b), which is equal at the base or gibbous, but not spurred, with a bluntly 5-cleft limb (f. 115. b), rarely 3-cleft. Stamens 3 (f. 115. b). Fruit indehiscent, 1-celled and 1-seeded at maturity. —Herbs or subshrubs. Leaves variable even in the same plant. Flowers corymbose, capitate or panicled, nearly all white, rarely blue, rose-coloured, or yellow.

Stiff Valerian. Pl. tufted.

2 V. tenuifâlia (Ruiz et Pav. fl. per. 1. p. 39. t. 65. f. d.) plant stemless; leaves crowded in a stellate manner, linear-subulate, ciliated at the base, very unequal, outer ones very long; corollas sessile, crowded, head-formed; corollas 3-cleft; genitals exserted. ♀. H. Native of Peru, on the tops of the Alps. Phylläctis tenuifolia, Pers. ench. 1. p. 39. Dufr. val. p. 55. Flowers white.

Fine-leaved Valerian. Pl. tufted.
3 V. spathulata (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. b.) plant tufted; stems many, simple, 2-edged; leaves linear-spatulate, obtuse, downy, hardly ciliated; corollas connate, terminal, involucre; corollas 3-5-cleft; stamens exserted. 2. F. Native of the alps of Peru, at Bomombo, in the province of Tarma. Phyllacis spathulata, Pers. ench. 1. p. 39. The corolla is said, in the text of the fl. per., to be 3-cleft, but it is drawn 5-cleft in the figure; however, in the specimen examined it is obviously 3-cleft. Flowers white.

Spatulate-leaved Valerian. Pl. \( \frac{1}{2} \) foot.

4 V. obovata (Schultes, mant. 1. p. 214.) plant stemless, tufted; root fusiform; leaves disposed in a stellate manner, linear-spatulate, obtuse, hairy; flowers unbellately capitulate, involucrated. 2. N. Native of North America, on dry hills on the banks of the Missouri, about Arikaree. Phyllacis obovata, Nutt. gen. amer. 1. p. 21. Flowers and fruit unknown.

Obovate-leaved Valerian. Pl. tufted.

Sect. II. Arctiastrum (from Arctia and astrum, an affixed signification, like; the plants contained in the section have the habit of species of Arctia.) D. C. pro. 4. p. 633. Corolla 4-5-cleft, with a long tube. Flowers yellow, few, hidden among the upper leaves. Leaves imbricate, coriaceous, thick, quite entire. Stems fruticulose. Perhaps a proper genus.

5 V. arctoideos (H. B. et Kunth, nov. gen. amer. 3. p. 324.) stems suffruticosus, tufted, rather procumbent; leaves imbricated, linear-terete, fleshy, glabrous, dilated at the base, and ciliated; flowers 1-3-together, terminal, sessile; corollas 4-5-cleft; stamens exserted. 2. F. Native of Quito, on the tops of the Andes. Corolla yellow, glabrous, with a very long filiform tube. Style inclosed. Fruit unknown.

Arctiast-like Valerian. Pl. procumbent and tufted.

6 V. sedifolia (D'UrV. fl. mal. p. 44.) stem suffruticosus, spreading; branches ascending, short; leaves imbricated, thick, coriaceous, resinous at the apex, narrowed at the base, very minutely ciliated; flowers 5-7, terminal, propped by the leaves; corolla 5-cleft; stamens equal in length to the corolla. 2. F. Native of the Falkland Islands, upon nearly naked rocks on Mount Chatelux. Flowers yellow.

Sect. III. Phu, or Valeriana vicie (this section is supposed to contain the true species of Valeriana.) D. C. pro. 4. p. 653. Corolla 5-cleft, usually white, rarely red or bluish.

§ 1. Stems suffruticosus, not climbing. Leaves undivided.

7 V. alpifolia (H. B. et Kunth, nov. gen. amer. 3. p. 325.) stems shrubby, procumbent; leaves spatulate, fleshy, quite glabrous, approximate; heads of flowers pedunculate; corolla 5-cleft; style exerted; stamens inclosed. 2. F. Native of the kingdom of Quito, in frigid places at the foot of Mount Antisanza, at Chussulangi. Habit of Globularia cordifolia. Flowers white. Allied to V. spathulata.

Alpnast-leaved Valerian. Pl. procumbent.

8 V. microphylla (H. B. et Kunth, nov. gen. amer. 3. p. 325. t. 275.) stem shrubby, erect; branches terete, clothed with fine down; leaves ovate-oblong, quite entire, 3-nerved, rather coriaceous, downy above; panicles crowded; corolla 5-cleft; stigmas inclosed; fruit glabrous. 2. F. Native on the Andes, about Pasto, in frigid places. Corolla white, with a red throat.

Small-leaved Valerian. Pl. 1 foot.

9 V. connata (Ruiz et Pav. fl. per. 1. p. 59. t. 67. f. c.) stem shrubby, ascending, much branched, with 2 rows of down; leaves lanceolate, connate, quite entire, glabrous, ciliated at the base; corollas compact, opposite, almost sessile, disposed in an interrupted raceme; stamens equal in length to the corolla, which is 5-cleft. 2. F. Native of Peru, in the province of Tarma, at Dizemo, among rocks. Flowers small, white.

Connate-leaved Valerian. Shrub 2 feet.

10 V. quadrangularis (H. B. et Kunth, nov. gen. amer. 3. p. 326.) stem suffruticosus, and is as well as the branches quadrangular, glabrous, pilose at the nodi; leaves ovate-oblong, denticulated at the base, 3-nerved, rather fleshy, glabrous; corollas dichotomous, divaricate; corolla 5-cleft; stamens inclosed; fruit glabrous. 2. F. Native of Peru, on the Andes. Corolla red, gibbous at the base. Pappus about 14-rayed.

Quadrangular-branched Valerian. Shrub.

11 V. triplicata (H. B. et Kunth, nov. gen. amer. 3. p. 326.) branches woody, terete, glabrous; branchlets angularly furrowed; leaves 3 in a whorl, sessile, lanceolate-oblong, coriaceous, glabrous; heads by threes, axillary and terminal, pedunculate; corolla 5-cleft; stamens exserted. 2. F. Native of New Granada, near Santa Fe de Bogota, in frigid places on the mountains.

Three-leaved Valerian. Shrub.

12 V. hirtella (H. B. et Kunth, nov. gen. amer. 3. p. 327.) stem suffruticosus, terete, hairy; branchlets hairy; leaves linear-lanceolate, quite entire, 3-nerved, somewhat coriaceous, rather pilose above, and glabrous beneath; panicles much branched; fruit glabrous. 2. F. Native of the Andes of Quito, on the top of Mount Assauy. Flowers unknown. Pappus 6-8-rayed.

Hairle Valerian. Shrub 2 to 3 feet.

13 V. chamissonis (Cham. et Schlecht, in Linneae. 3. p. 129.) stem shrubby, erect, downy at the tops, and densely leafy; leaves ovate-lanceolate, coarsely and bluntly serrated; panicles straight, pyramidal; corolla 5-cleft; stamens equal in length to the corolla. 2. F. Native of the interior of Brazil. Flowers small. Fruit unknown.

Germander-leaved Valerian. Shrub.

§ 2. Stems scandent, shrubby, rarely herbaceous. Leaves undivided.

14 V. tomentosa (H. B. et Kunth, nov. gen. amer. 3. p. 327.) shrubby, scandent; branches terete, clothed with hoary tomentum; leaves ovate, cordate, denticulated at the base, membranous, downy above, and clothed with white tomentum beneath; corollas axillary, pedunculate, dichotomous; corolla 5-cleft; stamens exserted. 2. G. Native of the temperate parts of Quito, in the valley of Choto. Corolla small, white, gibbous at the base. Fruit unknown.

Tomentose Valerian. Shrub cl.

Clematis-like Valerian. Shrub cl.

16 V. cassifolia (H. B. et Kunth, nov. gen. amer. 3. p. 328. t. 274.) shrubby, scandent; branches terete, glabrous; leaves ovate-elliptic, obtuse, quite entire, rather fleshy, glabrous; corollas trichotomous, divaricate; corolla 5-cleft, pilose outside; stamens inclosed; style exerted. 2. G. Native of New Granada, in frigid places, near La Erre and Sebondo. Fruit unknown.

Thick-leaved Valerian. Shrub cl.

17 V. laurifolia (H. B. et Kunth, nov. gen. amer. 3. p. 528.) shrubby; branches terete, glabrous, tetragonal while young; leaves ovate-oblong, acuminate, quite entire, rather coriaceous, quite glabrous and shining; panicles branched, with the branchlets and bracteas downy. 2. G. Native of New Granada.

Laurel-leaved Valerian. Shrub cl.

18 V. scändens (Lin. spec. p. 47, but not of Forsk.) stem glabrous, herbaceous, scendent; branches terete; leaves trilobate; leaflets quite entire; the terminal broad-ovate, acuminate, large: lateral ones lanceolate, smaller; panicles axillary, loose; stems exserted; fruit rather pilose.

Climbing Valerian. Pl. cl.

§ 3. Stems herbaceous, never scendent. Leaves all undivided.

* Species natives of America.

19 V. pilosa (Ruiz et Pav. fl. per. 1. p. 39. t. 66. f. a.) stem herbaceous, erect, pilose; leaves linear-lanceolate, pilose, with revolute margins: radical leaves obtuse: cauline ones few, dist. acute; corymb racemose; stems exserted.
2. G. Native of Peru, in frigid places. The whole herb has the habit of Plantago albicans. Corollas white.

Pilose Valerian. Pl. 1 foot.

20 V. longifolia (H. B. et Kunth, nov. gen. amer. 3. p. 330.) stems herbaceous, terete, rather hairy; leaves quite entire, coriaceous, glabrous: radical ones linear-lanceolate, petiolate; cauline ones linear, sessile; panicle branched; corolla 5-cleft, glabrous; stems exserted. 2. G. Native of New Granada, in alpine places. There is a variety of this with the stem 1-3 feet high, and the radical leaves 3-12 inches long. Corollas white. Nearly allied to V. pilosa and V. plantaginea.

Long-leaved Valerian. Pl. 1 to 3 feet.

21 V. salicaria-leaved (Vahl, enum. 2. p. 16.) plant glabrous, herbaceous; stem simple, striated, rooting at the bottom; leaves lanceolate, quite entire, sessile: upper ones cordate at the base; corymbs terminal, decomposed.—Native of Buenos Ayres.

Salicaria-leaved Valerian. Pl. 1 ½ foot.

22 V. plantaginea (H. B. et Kunth, nov. gen. amer. 3. p. 330.) stem herbaceous, erect, tetragonal, farrowed, glabrous, pilose at the nodi; leaves quite entire, coriaceous, glabrous: radical leaves oblong-spicate, petiolate: cauline ones lanceolate, sessile, connate at the base; panicles branched; stems exserted; fruit glabrous. 2. G. Native of Quito, in arid places, on the plains of Antisana, and on the declivities of Mount Pichincha. Flowers white. Pappus of fruit few-rayed.

Plantain-like Valerian. Pl. 4 to 6 feet.

23 V. lapathifolia (Vahl, enum. 2. p. 11.) stem herbaceous, striated, glabrous; leaves ovate-cordate, almost quite entire, undivided, villous above on the nerves, the rest of the leaf glabrous: superior leaves sessile; corymb trichotomous.—Native of the Straits of Magellan.

Dock-leaved Valerian. Pl. 1 ½ foot.

24 V. urticifolia (H. B. et Kunth, nov. gen. amer. 3. p. 330. t. 275.) stem herbaceous, erect, terete, hairy; leaves roundish-ovate, subcordate, acute, sinuately toothed, rather pilose above: lower leaves petiolate: upper ones sessile; panicles branched; corymbs downy; corolla gibbous at the base; genitals exserted; fruit glabrous. 2. G. Native of New Granada and Peru. Flowers white. Root a round tuber.

Nettle-leaved Valerian. Pl. 1 foot.

25 V. scorpioides (D. C. prod. 4. p. 635.) stem rather herbaceous, erect, terete, downy; leaves ovate or roundish, denticate crenated, pilose above and on the margins; panicle corymbose, trichotomous; branches of panicle elongated, bearing unilater flowers; fruit small, ovate, glabrous. 2. H. Native of Mexico, in the valley of Tolucca, where it was collected by Berlandier. Habit almost of Feidia scorpioides.

Scorpion-like Valerian. Pl. 1 foot?

26 V. praeterea (H. B. et Kunth, nov. gen. amer. 3. p. 329.) stem herbaceous, farrowed, glabrous: cauline leaves sessile, ovate-cordate, long-acuminated, sharply toothed, stiff, glabrous; panicles much branched; fruit villous. 2. F. Native of Mexico, near Pascuaro. Flowers unknown. Pappus of calyx 11-12-rayed.

Tall Valerian. Pl. 3 to 4 feet.

27 V. macrorhiza (Poepp. pl. exsic. no. 918.) glabrous; radical leaves spatulate, obtuse, tapering into the petiole, which is twice the length of the limb; scape a little higher than the leaves; panicles racemose spicate, terminal, having the racemes opposite: the lower ones pedunculate; floral leaves linear. 2. F. Native of Chili, near the baths of Villa Vicencio and La Quebrada de San Isidro, and on the Andes of Mendoza. Root thick. Flowers white. Stamens exserted. Habit almost of V. coarctata.

Long-rooted Valerian. Pl. 1 foot.

28 V. coarctata (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. a.) stems herbaceous, erect, simple, striated, downy; leaves narrow-lanceolate, attenuated, dentilicate, ciliated: cauline leaves few; flowers crowded in whorles, disposed in a somewhat interrupted spike. 2. G. Native of Peru, at Huassa-Huassi, in frigid places in the province of Tarma. Flowers white. Fruit said to be oblong, and crowned by 5 scales. Astréphia coarctata, Dufr. var. p. 30.

Coarctate Valerian. Pl. 1 foot.

29 V. serrata (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. c.) plant tufted, glabrous; stems striated; leaves cuneate-lanceolate, serrated from the middle to the apex; flowers in crowded whorles, disposed in an interrupted elongated spike. 2. F. Native of Peru, in cold places. Astréphia serrata, Dufr. val. p. 51. Flowers white. Fruit as in V. coarctata, to which it comes very near.

Serrated-leaved Valerian. Pl. ½ foot.

Fleshy Valerian. Pl.

31 V. oblongifolia (Ruiz et Pav. fl. per. 1. p. 40. t. 65. f. a.) plant herbaceous, pilose; stems many, striated, almost leafless; radical leaves oblong, dentate, obtuse: cauline ones linear, serrate-cul; corymb contracted. 2. F. Native of Peru, on the alps in the province of Tarma, towards Pasco. Flowers white.

Oblong-leaved Valerian. Pl. 1 foot.

32 V. obtusifolia (D. C. prod. 4. p. 635.) plant herbaceous, erect, glabrous; root tuberous; leaves obtuse: lower ones obovate or oval, petiolate: upper ones sessile, oval-oblong, toothed at the base; corymbs coarctate. 2. F. Native of Chili. Valeriana, no. 630. Poepp. pl. exsic. Fruit unknown. Herb 3-7 inches high. Flowers white, crowded. Stamens not exserted. Allied to V. oblongifolia, and with it is intermediate between the present and following division of the genus.

Blunt-leaved Valerian. Pl. ½ foot.

* * Species natives of Europe and the Levant.

33 V. alliarannea (Vahl, enum. 2. p. 11.) plant glabrous; erect; stem striated; leaves all cordate, undivided, equally toothed, acuminate; lower ones petiolate, upper ones almost sessile; corymb rather contracted; fruit glabrous. 2. H. Native of Cappadocia, Iberia, and throughout Caucasus, in alpine
places. Valériana macrophylla, Bieb. fl. taur. 1. p. 25. Flowers white, tinged with red.

**Alliaria-leaved Valerian.** Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

35 **V. var.**, _cuspitata_, (D. C. prod. 4. p. 636.) stems humble, nearly naked; lower cauleine leaves ovate, acuminate, undivided or subtrifid. 2. H. Native of Abruzzo, on the Appennines. Val. cuspitata, Bert. med.

**Mountain Valerian.** Fl. June, July. Clt. 1748. Pl. 1 to 1 foot.

36 **V. alpiflora** (Stev. in mem. soc. nat. mos. 5. p. 342.) radical leaves ovate, almost quite entire, obtuse; cauleine leaves triplicate or ternate, acute; upper ones linear, entire; flowers capitately corymbose; pappus of calyx equal to the achenia in length. 2. H. Native of Siberia, of the banks of the rivers Senteled, Uba, and Ima; and of the Alps on the Swiss peaks. V. montana, Bieb. fl. taur. 1. p. 25. no. 67. 3. p. 28. Schultes. mant. 1. p. 258.—Gmel. sib. 3. p. 121. no. 2. The whole plant is glabrous. Corymbs coarctate when in flower, but rather loose while in fruit.

**Alp Valerian.** Pl. 1 foot.

37 **V. saxatilis** (Lin. spec. p. 45.) radical leaves on long petioles, elliptic, 3-5-nerved, undivided, or a little toothed, ciliated; cauleine leaves small, linear; stems erect; corymbs racemose; fruit glabrous. 2. H. Native of the Alps of France, Austria, Italy, &c. Jacq. austr. s. t. 267. vind. 204. D. C. fl. fr. 4. no. 3324. Bert. amen. italic. p. 326. Krok. sil. no. 52. t. 6.—Pluk. phyt. t. 293. f. 2. Root blackish, very sweet-scented, and when chewed leaving a bitterness on the tongue. The whole plant shining, and about half a foot high, with the stems subdivided at top. Flowers white, often dioecio-polygamous.

38 **V. saliuncia** (All. ped. 1. p. 3. t. 70. f. 1.) plant glabrous; leaves spatulate or obovate, obtuse, entire, on short petioles; corymbs sometimes tridentate at the base; stems short; flowers disposed in capitate corymb; fruit oblong, glabrous. 2. H. Native of Savoy, Vallaiss, Piedmont, Dauphiny, Italy, on the higher Alps. Dufr. val. p. 47. V. supina, D. C. fl. fr. 4. no. 3323. but not of Jacq. V. Celtica, Vill. dauph. p. 285. but not of Lin. Root acrid, sweet-scented. Flowers sweet-scented, white, tinged with red.

**Lavender Valerian.** Fl. May, June. Clt. 1824. Pl. 1/2 to 1/2 foot.

**Celtic Valerian.** Fl. June. Clt. 1748. Pl. 1/2 to 1/2 foot.

40 **V. globularia-leperömula** (Ram. in D. C. fl. fr. 4. p. 286.) plant glabrous, glaucous; radical leaves petiolate, ovate, quite entire, obtuse; cauleine ones pinate; lobes or leaflets of the lower leaves obovate, of the superior ones linear; corymbs short, coarctate, subracemose; fruit oblong, glabrous. 2. H. Native of the Pyrenees, on rocks; and of Spain, on Mount Pinnafurtado. Dufr. val. p. 41. no. 4. and no. 5. V. heterophylla, Lois. fl. gall. 1. p. 21. t. 2. but not of Baung. V. glauca, Lapeyr. abr. V. rupicola, Lag. var. 2. p. 212. gen. et spec. 2. no. 16.

**Globularia-leaved Valerian.** Pl. 1 foot.

41 **V. intermédia** (Vahl. enum. 2. p. 9.) plant glabrous, erect; lower leaves on short petioles, cordate, quite entire; corymbs one triplicate, with lanceolate quite entire lobes; corymbs at length panicked. 2. H. Native of the Pyrenees. V. montana γ appendiculata, Lapeyr. abr. p. 19. V. tripeters β. integrifolia, Arn. in litt. Perhaps a variety of _V. montana_ or _V. tripeters_, or a hybrid between these two species. Flowers white.

42 **V. tripeters** (Lin. spec. p. 45.) plant glabrous, erect; radical leaves petiolate, cordate or ovate, toothed; cauleine ones sessile, triplicate, with ovate-oblong or lanceolate lobes, which are toothed a little; corymbs panicked at length; fruit glabrous. 2. H. Native of Europe, in rocky places on the mountains, as of Austria, Carniola, Dauphiny, and Piedmont. Jacq. austr. s. t. 265. Baung. fl. trans. 1. p. 36. var. a and β.—Pluk. phyt. t. 251. f. 7-8.—Barrel. icon. t. 742. Root brownish, strong smelling. Flowers white, in loose corymbs. There are varieties of this plant having the radical leaves cordate or ovate, and the stem ones more or less divided, toothed or cut; lobes or leaflets of the upper leaves linear, undivided.

43 **V. saxicola** (Meyer, verz. plf. p. 49.) root creeping; stems nearly terete; radical leaves oblong or ovate, quite entire; lower cauleine leaves petiolate, trifid or triplicate; lobes linear or oblong: uppermost leaves linear, sessile, entire; flowers hermaphrodite, corymbose, crowded. 2. H. Native of Western Caucasus, among alpine rocks.

**Rock Valerian.** Pl. 1 foot.

44 **V. Pyrenaeica** (Lin. spec. p. 46.) plant downy, erect; stems striated; lower leaves large, petiolate, cordate, unequally-toothed; superior ones pinate, having the 1-2 lower pairs of _4r2_.
lobes or leaflets oblong or acuminated, and the terminal one broad-ovate or roundish, cordate, serrated; corylms ample; fruit glabrous.  

2. H. Native of the Pyrenees, in woods; and of Scotland, in woods, particularly about Edinburgh and Glasgow. D. C. fl. fr. no. 3317. Sowerb. engl. bot. t. 1591. — Pukl. sert. f. 232. f. 1. V. Canadensis, Riv. mon. t. 6. — Buxb. cent. 2. p. 19. t. 11. A showy pale green herb, with large leaves. Flowers pale red, disposed in ample corymbs. There is also a white flowered variety of this plant.

45 Valeriana. (Lam. ill. 1. p. 92.) plant glabrous, erect; stems terete, nearly smooth; radical leaves petiolate, undivided, oblong-oblong, remotely toothed, the rest pinnate; leaflets or lobes ovate or ovate-oblong, toothed; corylms subpanicled; fruit glabrous.

Italian Valerian. Pl. 1 to 2 feet?

46 V. elongata (Lin. spec. p. 1664.) plant glabrous, erect; stems striated; radical leaves petiolate, oval; cauleine leaves sessile, subcordate or hastate; upper leaves deep-3-5-cleft, acute; panicle elongated, with the lateral branches short and subleaves; corolla very short, tubularly campanulate; fruit glabrous.  

2. H. Native of Austria, Carniola, &c. on the Alps. Jacq. fl. auct. 3. t. 219. vind. t. 1. Morr. ox. sect. 7. t. 15. f. 29. Root whitish, with little taste or smell. Flowers dusky. Stems 6-10 inches high.

Var. β, poligama (D. C. prod. 4. p. 637.) plant larger; upper leaves trifid.  

2. H. Native of Galicia, in humid meadows. V. dioica, Bess. prim. 1. p. 48. enum. p. 40. V. polygama, Bess. in litt. Flowers coruleous, a little larger than in V. elongata; but very similar in form.

47 V. asarifolia (Dufr. val. p. 44.) plant glabrous, erect; radical leaves petiolate, cordate-rempon, a little toothed; cauleine leaves few, pinnate; lobes or leaflets of the upper leaves linear; corylms rather contracted.  

48 V. tuberosa (Lin. spec. p. 46.) plant glabrous; radical leaves ovate, lanceolate-oblong or oblong, undivided, quite entire; cauleine leaves pinnatifid, with 2-3 pairs of linear segments or lobes, the terminal segment the largest; corylms at first ovate, hairy.  

2. H. Native of the south of Europe, from Spain to Caucasus; of Siberia, near Sogra and Wydrixca, and from Buchtorni to Lake Noor Saisan. Vahl, enum. 2. p. 12. Dufr. val. p. 45. D. C. fl. fr. no. 3220. Lob. icon. t. 717. f. 2. Cam. epit. p. 16. Root tuberous, blackish, simple or double, ovate or oblong. There are varieties of this species with the cauleine leaves pinnatifid, or the lower ones are quite entire, oblong-lanceolate and elongated, and the upper leaves more or less pinnatifid. Flowers pale red.

Var. β, monorhiza (D. C. prod. 4. p. 637.) root simple, nearly glabrous; radical leaves ovate-cordate.  

49 V. Phu (Lin. spec. p. 45.) plant glabrous, erect; stems terete, smooth; radical leaves oblong or elliptic, undivided; cauleine ones pinnatifid, with oblong lobes; corylms panicked; lobes of stigma 3, slender; fruit glabrous, but exhibiting 2 hairy lines.  

Phu or Garden Valerian. Fl. May, July. Chlt. 1597. Pl. 2 to 4 feet.

50 V. duhania (Bunge, in Led. fl. alt. 1. p. 52.) primary radical leaves quite entire or auricled; the rest lyrate, pinnatifid, and the cauleine leaves pinnate; leaflets oblong, obtuse, almost entire; superior ones decurrent; corylms compound; flowers hermaphrodite.  

2. H. Native of Siberia. V. officinalis, Falk. topon. beitr. 2. no. 50. —Gmel. fl. sib. 3. p. 120. no. 1. exclusive of the synonyms. This species is very nearly allied to V. officinalis, but differs from it in the lower leaves being undivided or auricled. Stem and margins of leaves beset with minute, adpressed hardly conspicuous pili.

Var. a, lentisfolia (Bunge, l. c.) segments of leaves 7-11, more remote and broader than in var. β.  

2. H. Native of Siberia, frequent on schistous mountains in exposed places.

Var. β, angustisfolia (Bunge, l. c.) segments of leaves 21-27, more crowded and narrower, and more elongated than in var. a.

2. H. Native of Siberia, near Salair and Barnaul.

Doublous Valerian. Pl. 2 to 3 feet.

51 V. dioica (Lin. spec. p. 44.) plant glabrous, erect; stems striated; radical leaves petiolate, ovate or subpatulate, undivided; cauleine leaves pinnatifid, with linear-oblong lobes; flowers dioecious; corylms of the male flowers loose; of the female ones contracted; lobes of stigma almost combined; fruit glabrous.  

Var. β, integrifolium (D. C. prod. 4. p. 637.) all the leaves both radical and cauleine are quite entire.

2. H. Native of Silesia. V. dioica semplicifolia, Reich. icon. 1. p. 48. t. 59.—Loes. pruss. no. 724. t. 84.

** Species natives of America.**

52 V. capitata (Pall. in Willd. herb. no. 789. exclusive of Cham. et Schlecht. which is Gentiana frigida,) plant glabrous, erect; stems down at the nodi; radical leaves petiolate, roundish, simple; cauleine ones almost sessile, simple or ternate; leaflets sinuously serrated, middle one the largest; panicles terminal, capitate, girded by long linear bracteas; tube of corolla elongated; fruit ovate, compressed, glabrous.  

2. H. Native of the higher ranges of the Sagen Alps, at the bay of St. Laurence; Kotzebue's Sound; on the Arctic shores of America beyond Behring's Straits; and between the Coppermine and Mackenzie rivers. Link, jahrb. 1. pt. 3. p. 66. Cham. et Schlecht. in Linnæa. 3. p. 130. Perhaps distinct from V. tripetris, ex Stew. obs. in herb. Willd.

Capitulate-flowed Valerian. Pl. 1 foot.

53 V. sylvestris (Banks, mss. Richards, in Franklin. 1st journ. ed. 2. append. p. 23) plant glabrous, erect; stems striated; radical leaves petiolate, ovate or subpatulate, undivided; cauleine leaves pinnate-parted, with ovate-lanceolate nearly entire

IX. Valerianæ.
VALERIANAE.  IX. Valeriana.

677

segments; flowers hermaphrodite; lobes of stigmas 2–3, minute; fruit ovate, compressed, glabrous.  *V. H.* Native of Newfoundland, ex Banks, Clearwater River, ex Richards, Prairies of the Rocky Mountains abundant, ex Drummond. In every respect this agrees with the European *V. dioica*. It differs from *V. Pha* by the smaller and shorter fruit, and entire absence of the two hairy lines.

**Wood Valerian.** Pl. 1 foot.

54 **V. laxiflora** (D. C. pro. 4. p. 638.) plant glabrous, ascending, suffruticoso at the base; leaves petiolar, ovate or oval, with a few coarse irregularly dentately cut teeth; floriferous branches elongated, almost naked; superior leaves pinnatifid-parted, with 1–2 linear quite entire leaves on each side; floral leaves linear; panicle loose, with opposite branches, which are trifid and few-flowered at the apex.  *F. H.* Native of Chili. Valeriana, no. 825. Poepp. pl. exsic. Fruit oblong, glabrous.

**Lae-flowered Valerian.** Pl. ascending.

**Shining-rooted Valerian.** Pl. $\frac{1}{2}$ foot.

56 **V. Humboldtii** (Hook. et Arn. in bot. misc. vol. 3.) stem herbaeous, erect, terete, and is as well as the leaves smooth; radical leaves entire, roundish-elliptic, crenated; cauline leaves sessile, pinnatifidly lyrate; panicles much branch'd; corollas quinquefoil; stamens exerted; fruit glabrous, crowned by feathered pappus.  *F. H.* Native of Peru, in rocky places. *V. hyalinorhiza*, H. B. et Kunth, nov. gen. amer. 3. p. 381, but not of Ruiz et Pav.

**Humboldt's Valerian.** Pl. $\frac{3}{4}$ to $1\frac{1}{2}$ foot.

57 **V. pinnatifida** (Ruiz et Pav. fl. per. 1. p. 40. t. 69. f. b.) plant herbaeous, glabrous; stems erect, simple, striated; two lower leaves lanceolate, quite entire; the rest pinnatifid, with oblong serrate-toothed lobes; panicle loose; lateral corymbs ditrichotomous; stamens exerted.  *F. H.* Native of Peru, at Chancay and Lima on hills. Val. brachïata, Pers. ench. 1. p. 87. Root tuberous, sweet scented, as in *V. Pha*. Flowers white. A variety of the present plant, or a distinct species, was gathered by Bertero in the grassy pastures on Mont La Leona at Rancagua, in Chili.

**Pinnatifid-leaved Valerian.** Pl. 1 foot?

58 **V. leucoca'rea** (D. C. pro. 4. p. 638.) plant herbaceous, erect, glabrous; lower leaves on long petioles, oboval-oblong, obtuse, attenuated at the base, membranous; cauline leaves very few, small, pinnate-parted at the base, with linear lobes; panicle loose, with opposite trichotomous branches; fruit pale, glabrous, compressed.  *F. H.* Native of Chili. Valeriana, no. 847. Poepp. pl. exsic. Stem 2 feet high. Radical leaves with the petioles 10–12 inches long. Stamens not exerted. Pappus of calyx plumose.

**White-fruited Valerian.** Pl. 2 feet.

59 **V. vagina'ta** (H. B. et Kunth, nov. gen. amer. 3. p. 381.) plant glabrous; stems tufted, simple, tetragonal; radical leaves oblong-elliptic, petiolate, toothed a little; cauline leaves sinuate pinnatifid, sheathed at the base, with linear pilose segments; corymbs crowded; stamens inclosed; style much exerted.  *F. H.* Native of New Spain, in humid places near Real del Monte. Corolla glabrous, gibbous at the base, white.

**Sheathed-leaved Valerian.** Pl. $\frac{1}{2}$ foot.

60 **V. panicu'la** (Ruiz et Pav. fl. per. 1. p. 41. t. 70. f. a.) plant herbaceous, villous; stems many, erect, strictly furrowed, terete, rather 2-edged; radical leaves undivided, cordate, acut; cauleine leaves pinnate, with 3–5 ovate acute, dentiluated leaflets; panicle diffuse; stamens length of corolla.  *F. H.* Native of Peru, in moist rocky places. Corollas small, gibbous at the base, white. Pappus of calyx 10-rayed.

**Panicled-flowered Valerian.** Pl. 2 to 3 feet.

**Few-flowered Valerian.** Pl. 2 feet.

62 **V. herbe'ca'ra** (D. C. pro. 4. p. 638.) plant herbaceous, erect, glabrous; lower leaves petiolate, oboval-oblong, coarsely toothed; superior ones sessile, pinnate-parted, with lanceolate-toothed lobes; branches of panicle opposite, trichotomous; bracts linear, obtuse; fruit small, ovate, velvety from short crowded down.  *F. H.* Native of Chili. Valeriana, no. 942. Poepp. pl. exsic. Herb 1$\frac{1}{2}$ foot high. From the fruit being casenous, it agrees with *V. Papilla*, but the fruit is 3 or 4 times smaller.

**Hairy-fruited Valerian.** Pl. 1$\frac{1}{2}$ foot.

5 § 5. Stems herbaceous. Leaves all pinnate-lobed.  

*Species natives of America.*

63 **V. papilla** (Bert. in litt. ex D. C. pro. 4. p. 638.) stems erect, glabrous; leaves glabrous, lyrate pinnatifid; having the lateral lobes linear and entire, and the terminal one large, oboval-oblong, and somewhat sinuate; panicle trichotomous; fruit oblong, very hispid.  *F. H.* Native of Chili, in sandy pastures along the Cachapul, at a place called St. George, where it is called by the natives *Papilla*, and about the banks of Collina. Herb 1$\frac{1}{2}$ foot high. Pedicels pilose. Fruit large. Flowers unknown. Pappus blackish.

**Papilla Valerian.** Pl. 1$\frac{1}{2}$ foot.

64 **V. pyrami'dalis** (H. B. et Kunth, nov. gen. amer. 3. p. 331.) plant glabrous; stem herbaeous, terete, furrowed; leaves pinnate, with sessile ovate-cordate quite entire segments or leaflets; panicle much branched, pyramidal; genitils almost inclosed; fruit oblong, glabrous.  *F. G.* Native on the walls of the city of Quito. Corolla with a very short tube, white.

**Pyramid-al-panicled Valerian.** Pl. 3 feet.

65 **V. bridges'si** (Hook. et Arn. in bot. misc. 3. p. 365.) glabrous; leaves lyrate pinnatifid; lobes erose, curled; lateral ones small, terminal one much larger; radical leaves obovate, and more entire than the rest; panicle elongated, with opposite dichotomous distant branches; fruit ovate, glabrous.—Native of Chili, on the mountains and plains near Valparaiso. Very closely allied to *V. crispa*, with a totally distinct fruit, which, in this species, is not flat on one side, with a tubercle on the other, but presents a tubercle which is internally spongy on both sides, nor is it half so large as in *V. crispa*.

**Bridges's Valerian.** Pl. 1 to 2 feet?
66. *V. polemonoides* (H. B. et Kunth, nov. gen. amer. 3. p. 332.) plant downy; stems herbaceous, erect, terete; leaves pinnate; leaflets oblong, on short petioles, quite entire, rather fleshy, smoothish above; panicle much branched; genitils inclosed. _2. F. Native of the kingdom of Quito, between Humbato and Llaetaecunga. Corolla glabrous, gibbous at the base, white.

*Polemonium-like* Valerian. Pl. 2 to 3 feet.

67. *V. decussata* (Ruiz et Pav. fl. per. 1. p. 42. t. 70. f. b.) plant herbaceous, downy; stems erect, striated; leaves pinnate; leaflets lanceolate, acuminate, a little dentilicated; the terminal one rather the largest; panicle loose, divaricate, downy; staminules nearly inclosed. _2. F. Native of Peru, among rocks, and in hedges. Peduncles decussate. Corolla small, white.

*Decussate-peduncled* Valerian. Pl. 3 feet.

68. *V. polystachya* (Smith, icon. ined. 3. t. 51.) plant glabrous, erect; stems a little striated; leaves pinnatifid, with linear quite entire acute segments; racemes compound, elongated, composed of opposite spikes.—Native of Buenos Ayres, in moist places, where it was collected by Commerson. Vahl, enum. 2. p. 5. Astrëphia polystachya, Dufr. val. p. 51. Oligacocë polystachya, Willd. herb. Corolla hardly gibbous at the base.

*Many-spiked* Valerian. Pl. 2 feet.

69. *V. sorificolia* (H. B. et Kunth, nov. gen. amer. 3. p. 332.) stems herbaceous, erect, terete, rather pilose below; leaves pinnate; leaflets sessile, ovate-oblong, cuneated at the base, coarsely serrated, glabrous; panicle much branched; staminules inclosed; style exerted. _2. F. Native of Mexico, on the western declivities of mountains between Valladolid and Puecuarao. Corolla glabrous, gibbous at the base, white.

*Mountain-Ash-leaved* Valerian. Pl. 2 to 3 feet.

70. *V. sanguisorboïdæ* (Cav. icon. 5. p. 456.) plant herbaceous, glabrous; stems prostrate at the base, and erect at the apex; leaves pinnate; petioles naked almost to the middle; leaflets sessile, ovate, few-toothed, equal; panicle racemose, oblong, rather loose. _2. F. Native of the Cordillera of Chili. V. sanguisorbas, Pers. ench. 1. p. 37. Flowers white.

*Burnet-leaved* Valerian. Pl. 1 foot.

71. *V. glauca* (Poep. pl. exsic. no. 127.) plant herbaceous, erect, glabrous; stems terete, naked at the apex; leaves glau- cous, pinnate; leaflets obovate-oblong, toothed, those at the base of the petiole small, and those at the top of the leaf larger and confluent; branches of pinnate opposite, trichotomous; bractæe linear. _2. F. Native of Chili, where it was collected by Poepigg. Allied to *V. sanguisorboïdæ*, but the petioles are almost leafy to the base. Leaflets narrowed into the petioles.

*Glaucescent* Valerian. Pl. 1 to 2 feet.

72. *V. virgata* (Ruiz et Pav. fl. per. 1. p. 42. t. 66. f. b.) plant suffruticosæ, almost glabrous; stem much branched, striated, rather downy; leaves pinnate; leaflets entire or bifid, with linear bluntish entire lobes; corymbis paniculatæ, with dichotomous branches, bearing a sessile flower in each fork; stamens exerted. _2. F. Native of Peru, in the province of Canta, among broken rocks. Flowers white.

*Twiggly* Valerian. Pl. 3 feet.

73. *V. globiflora* (Ruiz et Pav. fl. per. 1. p. 43. t. 65. f. b.) plant herbaceous, humble, hispid on one side; stems striated, hardly longer than the leaves, almost naked; leaves pinnate; leaflets sinuate-toothed; flowers capitate; bractæae spatulate, membranous. _2. F. Native of Peru, on the alps in the provinces of Tarma and Canta. Corollæ white.

*Globe-flowered* Valerian. Pl. 1; 1 foot.

74. *V. lyra* (Vahl, enum. 2. p. 4.) plant herbaceous, glabrous; stem bearing 2 leaves; radical leaves lyrate; leaflets oblong, dentately serrated; the terminal one rather pinnatifid:

**Species natives of Asia.**

80. *V. lesschenaultii* (D. C. coll. membr. viii. prod. 4. p. 640.) plant herbaceous, glabrous, erect; stems nearly terete; leaves pinnate, with 3-4 pairs of membranous repandly toothed leaves, with an odd one; the leaves of the upper leaves very narrow; panicule loose, elongated; lateral corymbis dichotomous; flowers sessile in the forks; fruit oblong, downy. _2. F. Native of Mexico, in the valley of Tolucco. Very like *V. Hardwickii*, but differs in the stem and leaves being quite smooth, in the segments of the leaves being more ovate, in the corymbbs being dichotomous, and in the fruit being oblong.

*Toluccana* Valerian. Pl. 1 to 2 feet?

77. *V. mexicana* (D. C. coll. membr. viii. prod. 4. p. 640.) plant herbaceous, glabrous, erect; stems almost terete; leaves pinnate, with 2 pairs of oblong leaflets, and an odd one: the latter is larger and ovate, and usually auricled at the base, but all are repandly toothed; panicle loose, elongated, having the lateral branches elongated and trichotomous; staminules exerted; fruit ovate, scabrous. _2. F. Native of Mexico, about the city, where it was collected by Berlandier. Very nearly allied to *V. Hardwickii* and *V. Toluccana*, but is distinguished from both by its angular stem.

*Mexican* Valerian. Pl. 1; 1 foot.

**Species natives of Asia.**

80. *V. lesschenaultii* (D. C. mem. viii. prod. 4. p. 640.) radical leaves petiolate, ovate, obtuse, crenated, hairy on both surfaces; stems erect, simple, glabrous between the joints, but the joints are pilose; cauline leaves remote, small; sessile; upper ones pinnately divided into 3-5 linear glabrous lobes, the terminal lobe the longest; corymbbs contracted; fruit villous. _2. F. Native of the East Indies, on the mountains of An- gueda, where it was collected by Leschenault. Stem 2 feet high. Radical leaves with the petiolas, hardly 2 inches long. Habit of *V. doedic*. 

*Leschenault's* Valerian. Pl. 2 feet.

81. *V. reflexa* (Wall. cat. no. 434.) the whole plant is
VALERIANEE. IX. VALERIANA.

Tschuaj, against the mouth of the river Tschegan. Root with long thick yellowish white fibres, emitting sermenta. Leaves glabrous, rather fibrous, the primary ones simple or auricled. Flowers disposed in whorles of threes. Pappus of fruit greyish-violet.

Rock-loving Valerian. Pl. ½ to ¾ foot.

88 V. ALTENFIOLIA (Led. fl. alt. 1. p. 52.) caule leaves alternate, pinnate; leaflets lanceolate-linear, downy beneath as well as on the stem; flowers corymbose. 2. H. Native of Siberia, near the city of Irkutzk. Stem erect, simple. Radical leaves wanting in the specimen examined. Upper caule leaves sessile, but the petioles become gradually elongated to the base. Genital exerted. Corolla 5-parted, cleft longitudinally.

Alternate-leaved Valerian. Pl. 1 to 1½ foot.

89 V. DIOSCORES (Sibth. et Smith, fl. græc. t. 33.) plant glabrous, erect; lower leaves lyrate pinnate, with ovate toothed leaflets: the terminal one large; upper leaves with equal lanceolate toothed leaflets; cymes crowded, panicked; peduncles dichotomous. 2. H. Native of Lycia. Roots tuberous. Flowers pale red.

Dioscorides' Valerian. Pl. 2 feet.

*** Species natives of Europe.

90 V. SAMBUCIFOLIA (Mikan, in Rœm. et Schultes, syst. 1. p. 351.) stems erect, striated, glabrous, pilose at the joints; leaves all pinnate; leaflets 4-5 pairs and an odd one; those of the lower leaves ovate, and coarsely toothed, of the superior ones oblong-lanceolate toothed, and rather decurrent; panicles thyrsoid. 2. H. Native of Germany. Link, enom. hort. berol. 1. p. 63; V. altissima, Horn.? This is a larger plant in all its parts than V. officinalis, and does not change by culture. Flowers pink.

91 V. OFFICINALIS (Lin. spec. p. 45.) plant smoothish, erect; stems furrowed; leaves all or nearly all pinnate, with 7-8 pairs of lanceolate serrated leaflets, and an odd one; corollas at length panicked; fruit glabrous. 2. H. Native of Europe and Caucasus, in humid places, and about the banks of pools and rivers; plentiful in Britain. Dufr. val. p. 40. D.C. fl. fr. no. 3315. Blackw. herb. t. 171. Woolav. med. bot. t. 96. Heyne, arz. gew. 3. t. 32. Curt. lond. 6. t. 3. Sowerb. engl. bot. 698. Oed. fl. dan. t. 570. V. sylvestris, Dodon. pemp. 349. f. 2. Phû, Column. phyt. 114. Phû Germânicum, Fusch. hist. p. 857. This is a very common and a very variable plant, having the stem from 2 to 4 feet high, glabrous or pilose: the lower leaves almost undivided, or all pinnate, with the leaflets broader or narrower, and more or less decurrent, most often toothed, very rarely quite entire, shining or opaque; corollas contracted or loose; but all these variations are hardly considered varieties. V. lucida, Hort. par. V. excelsa, Poir. dict. 7. p. 301. V. altissima, Mikan in Dess. enom. p. 4. V. répens, Host, austr. 1. p. 35. are only varieties of V. officinalis. Root composed of long slender fleshy fibres, uniting into a hard, and sending out long fleshy creeping shoots from the crown. Leaves bearded at the base on the under side. Flowers pale red, having a singular odour. Pappus of seeds 12-rayed, purplish. In high dry pasture heaths and woods, the plant becomes smaller and more hairy, with the leaves narrower, and the roots more highly aromatic and less nauseous.

The roots have a strong, and to most people a disagreeable smell; its taste is warm, bitterish, and subacid, communicating its properties to wine, water, and spirit; but it is best in substance, and may be taken from half a drachm to 2 drachms to a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in
hysterical cases; and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual constiveness it is an excellent medicine. The unpleasant flavour of valerian is best concealed by a small addition of mace. A tincture of the root in proof spirit, and in volatile spirit, is ordered in the London Pharmacopœia. Dr. Cullen says, that if it has sometimes failed, it is from the disease depending upon different causes, or the root being frequently employed in an improper condition, or in doses not large enough.—It is well known that cats are much delighted with the roots. Dr. Stokes informs us, that rats are equally fond of them, and that rat-catchers employ them to draw the rats together.

**Officinal Valerian.** Ff. June, July, Britain. Pl. 1 to 4 ft.

92 V. Siricœnœsis (Bongard, in mem. acad. imp. Petersb. 2. p. 145.) stem erect, glabrous, but pilose at the nodi; lower leaves ternate: superior ones pinnate, with 2 pairs of ovate, acuminated, corymbs dense, contracted. 2. H. Native of the island of Sitcha, where the roots are used by the natives as a precious medicine. Very nearly allied to V. sambucifolia and V. officinalis.

**Sitcha Valerian.** Pl. 2 to 3 feet.

93 V. angustifolia (Tausch. ex Host, fl. austr. 1. p. 36. but not of Cav.) plant downy, erect; stems furrowed; leaves pinnate; leaflets linear-lanceolate, obtuse, ciliated, quite entire, the 3 terminal ones confluent. 2. H. Native of Bohemia, on hills and mountains. Flowers rose-coloured. Root like that of V. officinalis.

**Narrow-leaved Valerian.** Pl. 1 to 2 feet.

**** A species native of the Cape of Good Hope.

94 V. Cape‘ensis (Thunb. prod. p. 7. fl. cap. p. 33.) plant glabrous, erect; stem striated; leaves pinnate; segments or lobes alternate? ovate-toothed, acute, the odd one the largest; corymbs plicate. 2. G. Native of the Cape of Good Hope, in valleys on the mountains. Habit of V. officinalis, but differs from it in the shorter lobes of the leaves. The roots are used in the same way as V. officinalis. Stem pilose at the joints.

**Cape Valerian.** Pl. 1 foot.

† Species not sufficiently known.

95 V. Leucophæa (D. C. prod. 4. p. 641.) V. orientalis minus florae leucophaee, Tourn. cor. p. 6. Allied to V. tuberosæ, ex Stev. obs. p. 67, but the bracteas are long and distant. Flowers dusky.

**Dusky-flowered Valerian.** Pl. 1 foot.

96 V. angustifolia (D. C. prod. 4. p. 641.) V. orientalis angustifolia, floribus et radice Valerianae hortensia, Tourn. cor. p. 6. This plant is nearly allied to V. officinalis, but differs in the narrower leaves.

**Narrow-leaved Valerian.** Pl. 2 to 3 feet.

**Cult.** All the hardy species thrive well in any common garden soil, and are easily increased by dividing at the root. Many of them are very ornamental border-flowers. The tender kinds, or those from warmer climates, should be grown in pots, in a mixture of peat, sand, and loam, so that they may be protected in winter by placing them in a frame or greenhouse.

X. BET'CEKEA (named after M. Betcke, who has described many species of Valeriana). D. C. coll. mem. vii. prod. 4. p. 642.

1 B. samolifolia (D. C. prod. 4. p. 642.) lower leaves ovate-oblong: upper ones ovate-roundish, sessile, stem-clasping; gymnos small, on short peduncles in the axils of the leaves; bracteas oblong. 0. H. Native of Chili, in mountain pastures near La Punta de Cortes, and about Valparaiso and Concepcion. Valériana seu Fédia samolifolia, Bert. in litt. 1829. and in bull. sc. 1830. p. 111. Habit of Samolus or Claytonia.

Samolus-leaved Betcke. Pl. ½ foot.

2 B.? Gilliesii (Hook. et Arn, in bot. misc. 3. p. 366.) plant quite glabrous; root tufted, woody; radical leaves roundish-elliptic, almost 3 times shorter than the petioles, quite entire; scapes about equal in length to the leaves; flowers in crowded heads; fruit glabrous, lanceolate, angular; limb of calyx short, urceolate.—Native of Chili, in cliffs of rocks near La Casa de Pietro, and the Andes of Mendosa, forming dense masses. B. samolifolia, Gill. but not of D. C. There is on the scape usually one pair of floral leaves: from the axil of each arises a head of flowers, in addition to the terminal one; and these three heads are often so close as to appear like one. This is probably not a species of Betcke; its fruit is not triquetrous; nor is the limb of the calyx 1-toothed and deciduous; but the fruit is still 1-seeded.

Gillies's Betcke. Pl. ½ foot.

**Cult.** The seeds will only require to be sown in the open ground in May, in a sheltered situation.

XI. TRIPLOSTE'GIA (Triploos, triploos, triple, and stegos, stigmas, a covering; the flowers are clothed by 3 covers, a double involucrum and the calyx). Wall. cat. no. 436. D. C. coll. mem. vii. prod. 4. p. 642.

**Linn. syst. Triandria, Monogynia.** Flowers covered by a triple tegument, a double involucrum, and the calyx. Outer involucrum 4-parted and 4-keeled: inner one tubular, 8-toothed, and 8-ribbed. Calyx adhering to the ovarium, with a small 4-toothed limb. Corolla funnel-shaped, 5-cleft, not gibbus at the base, nor spurred. Stamens 3, rising from the base of the tube; anthers a little exerted. Stigma capitate. Utricius 1-seeded, beaked, covered by the double involucrum, and crowned by the teeth of the calyx, downy.—An Indian herb. Root long, fibry, scentless. Stems obsolescantly 4-furrowed, simple or sparingly branched, bearing longish articulated hairs towards the top, which are tipped with glands. Leaves approximate at the base of the stem, oval-lanceolate, toothed, pinnatifid, downy above, and rather villous beneath, petiolate; caules leaves few, pinnatifid, small. Corymbs or panicles clothed with glandular down. Flowers small, by threes, downy.

1 T. glanduliferæ (Wall. l. c.) 2. H. Native of Nipaul, on mountains about Gosaingsthan, growing along with Nardostachys.

**Gland-bearing Triplostegia.** Pl. ½ to 2 feet.

**Cult.** This plant should be grown in a pot, in a mixture of loam, peat, and sand, and placed among other alpine plants. It may be propagated by dividing at the root, or by seed.

**Tube of calyx closely girding the ovarium (f. 118. d.).** Limb of calyx variable, short or elongated, entire (f. 117. g.), toothed, or ending in numerous variable bristles (f. 118. d.) which are usually plumose, and pappus-formed. Corolla gamo-
petalous (f. 117. f. f. 118. e.), inserted in the top of the tube, rarely ragger, but usually unequal (f. 117. f. f. 118. e.), 4-5-cleft. Stamens 4 (f. 118. f.), inserted in the tube of the corolla, and alternating with its lobes, nearly always distinct and free; anthers 2-celled. Style filiform (f. 118. g.); stigma simple, longitudinal or subcapitate. Fruit indelihent, membranous or sub-necumteentaceous (f. 118. h. f. 117. c.), crowned by the limb of the calyx (f. 117. i. f. 118. i.), 1-celled, 1-seeded, usually covered by the involucel (f. 117. g.). Seed pendulous in the fruit; albumen fleshy. Embryo straight, with a superior radicle.—Herbs or subshrubs. Leaves opposite, rarely verticillate, very variable in form, and even so in the same individual, the radical and cauline ones being very different. Flowers in dense heads, girded by involucera, very rarely in whorles. Involucel calyciform, girding the flower.

This order was formerly joined with Valeriânee, but is readily distinguished from it by the whole habit, by the flowers being in involucrated heads, and the single flowers being involucellate; by the fruit being constantly 1-celled and 1-seeded, in the stamens being always 4 in number, by the stigmas being simple, and by the seeds being albuminous. In this latter respect it agrees with the order Calycéreæ, but is distinguished from it in the embryo being erect, not inverted, and in the anthers being free, not combined into a tube. It agrees also with Compositae, from which it differs in its distinct stamens, and its pendulous albuminous seeds. What is called the involuce is a curious organ, resembling an external calyx, and is to each particular flower in the head of Dipsaceæ, what the partial involucrum of Compositae is to each umbellule. In several species of Scabiosa the ovary is entirely united with the tube of the calyx. Mr. Brown remarks, that the base of the style coheres with the narrow apex of the tube of the calyx, even in those plants of the order in which the dilated part of the tube is entirely distinct from the ovary. This kind of partial cohesion between pistillum and calyx is directly opposite to what usually takes place, namely, the base of the ovary being coherent, while its upper is distinct. It equally, however, determines the apparent origin or insertion of the corolla and stamina, producing the unexpected combination of floe superius with ovary liberum. The order also agrees in many respects with Nyctaginaceæ and Globulariaceæ.

The plants contained in this order have almost the habit of Compositae; all have the flowers growing in heads. Many of them are elegant border-flowers, and are cultivated with great facility. Some of the species of Scabiosa have been employed as diaphoretic and anti-syphilitic, but are now neglected.

Synopsis of the genera.

TRIBE I.

MORINA. Corolla ringent. Stamens 4, combined by twos, or didynamous. Flowers verticillate, bracteate.

1. MORINA. Involucrum 1-leaved, campanulate, with spiny-toothed edges. Calyx with an ovate tube, and a foliaceous bifid limb. Corolla long, tubular.

TRIBE II.

SCABIOSA. Corolla 4-5-cleft (f. 118. e.), not ringent. Stamens 4-5 (f. 118. f.), free, nearly equal. Flowers aggregate upon a receptacle (f. 118. c.); the heads involucrated by a general involucrum, and each flower girded by a calyciform involucel (f. 117. g.).

2. DIPSACEA. Involucrum of many leaves, much longer than the paleæ among the flowers, which are foliaceous. Corolla 4-cleft. Stamens 4. Fruit crowned by the subtetragonal limb of the calyx, inclosed within the involucel.

3. CEPHALAEREA. Involucrum of many imbricated leaves, which are shorter than the paleæ (f. 116. a). Involucel terminated by a 4-8-toothed crown. Corolla 4-cleft (f. 116. c.). Stamens 4. Fruit tetragonal, crowned by the limb of the calyx, and inclosed within the involucel.

5. PTEROCLEPHALUS. Involucrum double, each series of 4-6 leaves. Receptacle villous or chaffy. Involucel toothed (f. 117. h.) or awned. Limb of calyx ending in feathery bristles (f. 117. i. f. 118. i.). Corolla 5-cleft. Stamens 4, rarely 2-3.

TRIBE I.

SECT. I. DIOTOCALYX (from ιός, dis, twice, and ους, ovs otoos, an ear, and καλυκα, kalys, a calyx; in reference to the limb of the calyx being of 2 lobes). D. C. prod. 4. p. 644. Leaves sinuated and spinose-toothed. Lobes of calyx 2, oblong, more or less emarginate at the apex, unarmar. Stamens combined by twos, perhaps in all the species.

figure. M. orientalis, Mill. M. vitticella, Maench. suppl. Flowers white and reddish on the same plant. Stamens joined from the base to the anthers by two.

_Long-leaved Morina._ Pl. 2 to 3 feet. 3 M. _polyphylla_ (Wall. cat. no. 425. D. C. prod. 4. p. 644.) leaves pinnatifid: lobes spinosely toothed; floral leaves rather villous, elongated, stiffly spinose; lobes of calyx deeply divided. 2. F. Native of Nipaul, at Gosaingatan. Intermediate between _M. Persica_ and _M. longifolia_, but is distinguished from them in the leaves being more elongated and acuminated, and in the lobes of the calyx being bifid beyond the middle. _Corolla and genitals unknown._

_Many-leaved Morina._ Pl. 2 to 3 feet.

**Sect. II. Acanthocaileyx** (from _acanthos_, acanthos, a spine, and _caileyx_, calyx, a calyx; in reference to the limb of the calyx being spiny-toothed). _D. C. prod._ 4. p. 645. Leaves quite entire, except the floral ones, which are a little spiny-toothed. Limb of calyx oblique, irregularly spiny-toothed. Stamens 4, distinct, didynamous.

4 M. _nana_ (Wall. cat. no. 424. _D. C. prod._ 4. p. 645.) cauline leaves quite entire: floral ones bearing spines at the base; involucre 1-leaved, ciliated by spines; limb of calyx oblique, irregularly spiny-toothed. 2. F. Native of Nipaul, at Gosaingatan. M. Nipaulensis, D. Don, _fl._ nep. _prod._ 161. Stem villous at top, as well as the young leaves. Flowers red. _Corollas villous outside, 3 times longer than the calyx._

_Dwarf Morina._ Pl. ½ to 1 foot.

**Cult.** The species of _Morina_ thrive best in a light rich soil; and may be increased by dividing at the root, or by seed.

**Tribe II.**

II. _Dipsacus_ (said to be from _ēdēbās_, dipsas, to thirst; probably in consequence of the conate leaves holding water: _ēdēbās_, _dipsakos_, _dipsakos_, is also the Greek name for the disease called diabetes, which is always accompanied by great thirst). _Tourn._ _inst._ t. 265. Lin. _gen._ 114. _Gært._ _fruct._ 2. t. 86. _Coul._ _dips._ p. 21, f. 24. _Wallr._ sched. crit. p. 49.

**Linn. syst. Tetraéria, Monogynia.** Involucrem of the head of flowers of many leaves, longer than the palea. Palea on the receptacle acuminate, rather foliaceseous. Involucre tetrandrous, 8-furrowed. Limb of calyx somewhat cyathiform or discoid. Corolla 4-cleft. Stamens 4. _Sigmod longitudinal._ Fruit crowned by the subtropical limb of the calyx, and inclosed within the involucre.—_Erect, pilose, or prickly biennial herbs._ Leaves opposite, usually conate at the base, toothed or jagged. Heads of flowers terminal, oblong-ovate or roundish. _Corolla lilac-coloured, yellow, or white._

1 D. _sylvesteris_ (Mill. _dict._ no. 2.) stem prickly; leaves conate at the base, ovate-lanceolate, acuminate, toothed; leaves of involucrem incurved, weak, longer than the heads of flowers; paleace of heads straight, linear-lanceolate, setaceous, bent; involucel not drawn out beyond the furrows. 2. H. Native of Europe and Siberia, frequent; plentiful in some parts of Britain, about hedges and by road sides. _Jaq._ _fl._ austral. t. 402. Oed. _fl._ dan. t. 965. Smith, _engl. bot._ t. 1032. Curt. _lond._ 3. t. 9. D. _sylvesteris_ a, _Coul._ _dips._ p. 22. D. _vulgāris_, _Gmel._ _fl._ _bad._ 1. p. 312. D. _fullo-lūs_, _Thor._ _chol._ _land._ 1. p. 36. _Poll._ _pal._ _no._ 157. D. _purpurāceus_, Fuchs._ _hist._ 225. _Flowers bluish-purple, first breaking forth about the middle of the head._ Heads of flowers ovate-oblong. _The water contained in the basin formed by the leaves is said to cure warts on the hands, and to serve as a beauty-wash for the face; hence Ray conjectures it had its name, Labrum veneris._

2 D. _laciniatus_ (Linn. _spec._ no. 141.) stem prickly; leaves conate at the base, sinuously jagged, and the lobes spiny-toothed; leaves of involucrem erectish, stiffish, usually shorter than the head, which is ovate; paleace straight, linear-subulate; involucel not drawn out beyond the furrows. 3. H. Native of Europe and Siberia, in hedges and ditches, as of Germany, France, Alace, Austria, Caucasus, &c. _Jaq._ _fl._ _austr._ 5 t. 403. D. _sylvesteris_, var. γ, _Coul._ _dips._ p. 22. _Leaves downy beneath._ _Corollas whitish; anthers reddish._

_Jagged-leaved Teazele._ Fl. July, Aug. Clt. 1685. _Pl._ 3 to 5 ft. 3 D. _divaricatus_ (Presl. _fl._ _sic._ p. 57. _del._ _prag._ 117.) stem prickly; radical leaves oblong, rather lyrate, ciliated; cauline ones interruptedly pinnatifid; lobes divaricate, pinnatifid at the base; leaves of involucrem shorter than the head, which is ovate; paleace spinescent, arched; involucels unknown. 3. H. Native of Sicily, on the edges of fields. _Guss._ _prod._ 1. p. 157. D. _laciniatus_, _Uric._ _hort._ _pan._ _p._ 66. ?

_Dicratele Teazele._ _Pl._ 3 to 5 feet.

4 D. _ruderalis_ (Mill. _dict._ no. 1.) stem prickly; leaves conate at the base, oblong-lanceolate, serrated: upper ones entire; leaves of involucrem spreadingly reflexed, shorter than the heads, which are cylindrical; paleace stiff, recurved; involucel not drawn out beyond the furrows. 2. H. Native of the south of Europe, where it is said to grow spontaneously in fields. It is said to be a native of England; but scarcely wild. _Plenc. off._ t. 50. _Sowerb._ _engl._ _bot._ 2050. _Hayn._ _term._ _bot._ t. 41. f. 8. _Coul._ _dips._ p. 22. _D. sativus_, _Gmel._ _fl._ _bad._ 1. p. 314. D. _fullo-lūs_, _Linn._ _spec._ p. 140. D. _sylvesteris_, _Coul._ _in._ _litt._ 1824. —_Lob._ _icon._ 2. p. 17, with a figure. _Flowers whitish, with pale purple anthers._ This and the three preceding have been combined by Coulter.

_Fuller's Thistle or Teazele is called Chardon a foulon in French, Kardendistel in German, and Cardencha in Spanish; Dipsaro in Italian: is a biennial plant from 4 to 6 feet high, prickly and rough in the stem and leaves, and terminated by rough bur-like heads of flowers. It is cultivated in Essex and the West of England, for raising the nap upon woollen cloths, by means of the crooked paleace upon the heads. For this purpose they are fixed round the circumference of a cylinder, which is made to turn round, and the cloth is held against them. There are no varieties of the cultivated Teazele, but the wild species is not
materi ally different, and may be used in its stead, though its chaff is not quite so rigid.

The soils on which the Teazle grows the strongest are deep loamy clays, not over rich. The situation should be rather elevated, airy, and exposed to the south. In the rotation, it may occupy the place of a green and corn-crop, as the first year the plants are treated like turnips, and the second the crop is ripened. The soil should be ploughed deep, and well comminuted by cross ploughings or stirrings with pronged implements.

The sowing season is the beginning of April; the quantity of seed is from 1 to 2 pecks per acre, and in quality it should be fresh and plump. The mode of sowing is almost always broadcast, but no crop is better adapted for being grown in drills, as the plants require hoicing and thinning. The drills may be either sown on ridgelets or a flat surface, in the manner of turnips, or by ribbing. The distance between the rows may be from 18 inches to 2 feet. In Essex, carraway is commonly sown with the teazle crop, but this is reckoned a bad plan.

The after culture of this crop consists the first year in hoicing and stirring the soil, and in thinning out the plants to the distance of 1 foot every way, if sown broad-cast, or to the distance of 6 inches, if sown in rows. Vacancies may be filled up by transplanting, and a separate plantation may be made with the thinnings, but these never attain the same vigour as seedlings.

The culture the second year consists also of hoicing, stirring, and weeding, till the plants begin to root. When the teazle is grown broad-cast, the intervals between the plants are dug by means of spades which have long narrow blades, about the length of 16 or 17 inches, and not more than about 4 inches in breadth. With these the land is usually worked over in the intervals of the plants, three or four times during the summer months; and in the course of the following winter, as about the latter end of February, the land between the plants is to be again worked over by the narrow spades, care being taken that none of the mould falls into the hearts of the plants; and again, about the middle of May, when they begin to spindles, another digging over is given, the earth being raised round the root-stems of the plants, in order to support and prevent them from being blown down by the wind. Some cultivators perform more frequent diggings, that the ground may be rendered cleaner and more mellow; consequently the growth of the plants will be more effectually promoted. The business in Essex has usually the name of spaddling, and is executed with great despatch by labourers that are accustomed to perform it.

The taking of the Teazle crop, when no regard is had for seed, commences about the middle of July, when the blooms begin to fall from the heads. It is the best method to have the heads cut as they become ripe; but the work is usually executed at three different times, at the distance of ten days or a fortnight from each other. It is performed by means of a knife, contrived for the purpose, and a string attached to the haft. This last is done in order that it may be hung over the hand. A pair of strong gloves are also necessary. Thus prepared, the labourer cuts off the ripe heads along the rows or lines, with about 9 inches of stem, and ties them up in handsfull, with the stem of one that is more perfectly ripened. And on the evening of the day on which they are cut, they should be put into a dry shed; and when the weather is fine, and the air clear, they should be taken out and exposed to the sun daily, till they become perfectly dry. Much care must, however, be taken that no rain falls upon them. In doing this, some make use of long small stakes or poles, on which these handsfull are hung during the time of their preparation.

As soon as they are completely dried, they should be laid up in a dry room, in a close manner, till they are become tough, and of a bright colour, and ready for use. They should then be sorted or separated into three different kinds, by opening each of the small bundles. These are distinguished into kings, middlings, and scrubs, according to their different qualities. They are afterwards, the author of "The Somerset Report" says, made into packs, which, of the first sort, contain 9000 heads, but of the second, 20,000; the third is a sort of very inferior value. By some, before forming them into packs, they are done up into what are termed staves, by means of split sticks, when they are ready for sale.

The produce of Teazle varies from 10 to 15 packs per acre; nine packs of kings, nineteen of middlings, and two of scrubs, are reckoned a large crop, with a great bulk of haulm. Often, however, the crop fails.

The use of the heads of the Teazle has been already mentioned. The haulm is of no use but for burning as manure. Parkinson observes, that this is a sort of crop that may be grown to advantage on many lands; in rotation, as a fallow to prepare for wheat; and by burning the straw and refuse stuff after the crop is reaped, it will be found not to impoverish, but rather to improve the land. In their young state, the teazle plants stand the winter without danger, and are a good crop for clearing land of all weeds, from their lateness in the process of hoicing, there being few weeds at so advanced a season; on all these accounts they become an advantageous crop for the farmer.

To save seed, leave a few of the very best plants uncropped, and then, when the seed is ripe, cut off only the largest and terminating heads, from which the seed is easily separated by beating with flails, and cleaned by a winnowing machine or a sieve.

The chief injuries to which the Teazle is liable are those effected by the fly and slugs in its infant state.

5 D. sinuat us (Willd. mss. in Rom. et Schultes, syst. 3. p. 519.) leaves pinnafiddily sinuated: segments laciniately toothed. g. Native of Persia, on the alps in the province of Gil-ian. Coul. dips. no. 22.

Sinuated-leaved Teazle. Pl. 3 to 4 feet.

6 D. ve'roix (Lois. fl. gall. p. 719. t. 3.) stem and leaves echinated from prickles; leaves connate at the base: radical ones sinuated; middle ones pinnafidd: upper ones entire; leaves of involuca spreading, a little longer than the heads, which are ovate; paleæ subulate, straight, stiff; involucel drawn out beyond the furrows into a short membrane. g. g. Native of Corsica and Sardinia, on the edges of fields. Said to grow in plenty in Austria, Bohemia, and Moravia. Tratt. tab. t. 255. D. C. fl. fr. suppl. p. 486. Coul. dips. p. 23. Flowers white or pale red. The central head of flowers is usually cylinrical, and the lateral ones roundish.

7 D. gemelinii (Bieb. fl. taur. 1. p. 92.) stem prickly; leaves sessile: lower ones undivided or cut: superior ones pinnate-parted, with oblong acute segments; leaves of involucra deflexed, incurved, weak, shorter than the heads, which are ovate, or nearly globose; paleæ membranous, aequinately aved; involucel drawn out beyond the furrows into a membranous crown. g. Native of Tauria, at Kuma, about the ruins of Maschar, but rare, ex Steven; at the river Don, ex Golb.; and of Siberia, ex the Irtil, ex Gmel. sib. 2. p. 209.; and of the Kirghisian Steppe, between Bucktorminsk and Lake Noor Saisan, ex Led. fl. alt. 1. p. 127. Coul. dips. p. 23. D. laciniiatus, Falck. top. beytr. 2. no. 140. Corollas blue.

8 D. stragouosts (Willd. mss. ex Rom. et Schultes, syst. 3. p. 520.) leaves toothed and entire, appendiculated: upper ones jagged at the base, ciliated; involucra twice the length of the paleæ; paleæ setaceous, twice the length of the flowers. g.
DIPSAC.E. II. DIPSACUS. III. CEPHALARIA.

I. Native of Persia, in the province of Ghilan. Coulit. dipls. p. 23. Said to be allied to the following.

Strigose Teazle. Pl. 3 to 4 feet.

9 D. virosus (Lin. hort. ups. p. 25.) stem prickly, glabrous; prickles hair-formed under the head; leaves glabrous, petiolate, ovate, toothed, auricled at the top of the petioles; leaves of involuca deflexed, shorter than the heads, which are globoso, but hardly exceeding the pales, which are linear-subulate and pilose; involucel not drawn out beyond the furrows. 3. H. Native nearly throughout the whole of Europe, in woods and hedges; Caucasus, in Alpine places. In England, in moist shady places on a chalky or lime-stone soil. Oed. fl. dan. t. 1448. Jaccq. fl. austr. t. 248. Smith, engl. bot. t. 877. Coulit. dipls. 23. Curt. lond. t. 10. Cephalaria appendiculata, Schrad. cat. sem. geott. 1814. Paleee ciliated. Corollas white. Anthers dark purple or brown.

10 D. striatus (D. Don, prod. fl. nep. 160.) stem unarmed, but beset with short retrograde hairs; leaves petiolate, lanceolate, acute, dentately serrated, beset with villi on both surfaces; leaves of involucel spreading deflexed, shorter than the head, but hardly exceeding the pales, which are glabrous, crowned, straight at the apex, ciliated, canescent; involucels hardly furrowed, crowned. 3. H. Native of Nipaul. D. inermis, var. a, Wall. in fl. ind. 1. p. 367. Stem erect, branched, hexagonal. Flowers cream-coloured. According to D. Don, in fl. nep. the leaves are connate at the base. Heads of flowers spherical.

11 D. inermis (Coulit. dipls. p. 23.) stem unarmed, downy, but having the branches hispid under the heads; leaves petiolate, ternate or somewhat pinnatifid, clothed with adpressed pilly on both surfaces; lobes lanceolate, acuminate, serrated; leaves of involucel deflexed, shorter than the heads, which are glabrous, but exceeding the pales a little; paleae ovate, mucronate, ciliated at the apex; involucels hardly furrowed, crowned. 3. H. Native of Nipaul, in Alpine places. D. inermis, var. β, Wall. in fl. ind. 1. p. 367. D. mitis, D. Don, prod. fl. nep. p. 161. Stem hexagonal, pilose, unarmed. Palaeae about equal in length to the flowers. Corollas yellow.

Unarmed Teazle. Fl. July. Pl. 2 to 3 feet.

12 D. asper (Wall. cat. no. 428. D. C. prod. 4. p. 646.) stem prickly; leaves undivided or pinnatifid, oblong-lanceolate, acuminate, serrated, scabrous on both surfaces from bristy hairs; leaves of involucel deflexed, shorter than the heads, which are globose, but exceeding the pales, which are ovate, ciliated, and mucronate; involucels hardly furrowed. 3. H. Native of the East Indies, on the Pundá Mountains. Stem and branches angular; angles beset with stiff prickles.

Rough Teazle. Pl. 2 to 3 feet.

13 D. Leschenaultii (Coulit. in litt. ex D. C. prod. 4. p. 647.) stem smooth, rather hairy; leaves lyrate pinnatifid, very villous on both surfaces, acuminate, coarsely serrated at the apex: lower ones petiolate, lobes of leaves 3-nerved at the base; leaves of involucel spreading, shorter than the heads, which are globose, and hardly exceeding the pales, which are oblong, acuminate and pilose; involucel drawn out a little into a membranous crown beyond the furrows. 3. H. Native of the East Indies, on the Nellighery Mountains, where it was collected by Leschenault and Noton. Scabiosa Brunoniána, Wall. cat. no. 429. The plant is called Donde Gueda by the natives. Stem 3 feet high, rather hairy, not prickly. Habit of Cephalaria alpina.

Leschenaultii's Teazle. Pl. 3 feet.

Cult. None of the species are worth growing, except in botanic gardens. They will grow in any soil in which the seeds may be sown.

Lin. syst. Tetrándria, Monogynia. Involucra surrounding the heads of many imbricated leaves (f. 116. a.), shorter than the pales. Involucel tetrandrous, rarely compressed, 8-furrowed, terminated by a 4-8-toothed crown. Limb of calyx rather cup-shaped or discoid. Corollá 4-cleft. Stamens (f. 116. d.). Stigma longitudinal. Fruit tetragonal, crowned by the limb of the calyx, inclosed within the involucel. —Perennial herbs. Leaves toothed or pinnatifid. Heads of flowers terminal, globose (f. 116. e.); paleae imbricated: outer ones sterile. Corollas white, cream-coloured, or lilac. —This genus is hardly distinct from Dipsacus, unless in the involucel being very short.

* Perennial plants. Palaeae acuminated, downy.

** Annual plants. Palaeae membranous, awned at the apex.

3 C. Transylvánica (Schrad. l. c.) stems terete, rather pilose at the base; leaves pinnatifid: lower ones lyrate; lobes of the cauline leaves linear-oblong toothed; terminal lobes lanceolate, serrated a little; palaeae glabrous, membranous, oblong, ending in a dark purple awn each; teeth of involucel 8, short, equal. 2. H. Native of the south of Europe, from Vascony to Constantinople, in fields; and of Caucasus, on mountains near Grosnuja. Coulit. dipls. p. 24. t. 1.
III. Cephalaria.

685. Cephalaria. (C. L. S.) annuals, stems terete, leaves pinnatifid, lobes oblong, entire, dentate; flowers blue; involucels small.

Var. a. communque (C. L. S.) stems terete, leaves pinnatifid, lobes oblong, quite entire, dentate; flowers blue; involucels small.

Var. b. seministata (C. L. S.) stems terete, leaves pinnatifid, lobes oblong, entire, dentate; flowers blue; involucels small.

Var. c. corniculata (C. L. S. and Sch.) stems terete, leaves pinnatifid, lobes oblong, entire, dentate; flowers blue; involucels small.

Var. d. corniculata (C. L. S. and Sch.) stems terete, leaves pinnatifid, lobes oblong, entire, dentate; flowers blue; involucels small.

Var. e. corniculata (C. L. S. and Sch.) stems terete, leaves pinnatifid, lobes oblong, entire, dentate; flowers blue; involucels small.
ri- didus, Lag. Succia rigidia, Spreng. l. c.—Conn. horit. amst. t. 93. Shrubby. Flowers white. Said to be allied to C. lev- cynthia. There are varieties of this with either glabrous or scabrous leaves. The upper leaves are cut, with revolute edges.

11 Var. b. verb. attenuata (Rem. et Schultes, l. c. Coult. l. c.) leaves oblong, toothed, and somewhat pinnatifid at the base. G. Scabiosa verbenacea, Lam. ill. no. 1314.

† Species not sufficiently known.

Greek Cephalaria. Pl. 2 feet.

Humble Cephalaria. Pl. 3/4 to 1 foot.

Ustulato-bracted Cephalaria. Pl. 1 to 2 feet.

N.B. Scabiosa marina, Lin. mant. p. 329. is distinct from Scabiosa maritima, Lin., and are probably referrible to the present genus, but are hardly known.

Cult. The hardy herbaceous kinds of Cephalaria are of the most easy culture, and will grow in any kind of soil, and are readily increased by dividing at the root, or by seed. The seeds of the annual species only require to be sown in the open border. The green-house shrubby kinds should be grown in a mixture of loam, peat, and sand, and may be increased either by young cuttings under a hand-glass, or by seed.

Lin. syst. Tetrandria, Monogynia. Involucre of heads of many leaves. Paleae none. Receptacle hairy. Involucel compressed, with 4 hollows closely girding the fruit, denticated at the apex, having 2 of the teeth larger than the other 2, furnished with a short stipe. Limb of calyx cup-shaped, neither papose nor awned at the apex. Corolla 4-5 cleft. Stamens 4.—Erect branched, usually villous herbs.

2 K. frondóntia (Lin. spec. ed. 2. p. 1666. exclusive of Till. syn.) leaves serrated; superior ones lanceolate, quite entire; corollas 10, equal to the involucel; ciliate of calyx 15 in number. G. Native of the Levant. Wildl. spec. p. 561. exclusive of the syn. of Tourn. Rem. et Schultes, syst. 3. p. 87. exclusive of the Lam. syst. Coutil. d. p. 28. Scabiosa propónica, Lag. gen. et spec. p. 9. Plant villous. Corollas purple. Pistilla white; the corolla is said to be 4-cleft by Linneus. This is a doubtful plant, and is perfectly unknown at the present day, as the plant known in our gardens under this name is K. orientalis.

Sect. II. Trichéroides (this section contains plants having the habit of those of the next section). D. C. prod. 4. p. 650. Involucel spreading, 10-12-leaved. Flowers few or many. Involucel bidentate at the apex. Corollas rather irregular. Limb of calyx ciliate.—Annual herbs. Flowers bluish or rose- coloured.

3 K. urvillei (Coutil. d. p. 29. t. 1. f. 10.) lower leaves pinnatifid; superior ones linear, quite entire; corollas 10-12 in each head, nearly equal, hardly longer than the involucel, which is spreading; teeth of crown of the involucel 8, a little awned. G. Native of the island of Léri, in arid fields, where it was collected by D'Urville; and also of Bulgaria. K. orientalis, D'Urville. enum. p. 14. Plant villous? Stems branched, divaricate. Heads of flowers small. Corollas pale blue.

D'Urville's Knautia. Pl. 1 to 2 feet.

4 K. hybrída (Coutil. d. p. 30. and in litt. 1824.) lower leaves petiolate, lyrate; lobes obobuate, toothed: terminal lobe the largest, ovate or roundish; cauline leaves oblong, simple, serrated; heads many-flowered: the 2 teeth of the involucel of many bristles; ciliate of calyx 20-24, obdente. G. Native of the south of Europe. Scabiosa hybrída, All. auct. p. 9.

Sect. III. Trichéra (from τριχεῖς, trichēs, hairs; in reference to the limb of the calyx). Schrad. l. c. D. C. prod. 4. p. 651.—

5 K. arvénsis (Coulit. dips. p. 29. var. α, β, γ, τ. l. f. 13.) stems hispid; leaves sessile, villous; radical leaves unequally pinnatifid, with lanceolate lobes; cauline leaves pinnatifid, with linear lobes; uppermost leaves linear-lanceolate; leaves of involucrum blunt.

6 H. Native of Europe, in corn-fields and meadows. Sowerby, engl. bot. t. 659. Curt. lond. 4. t. 13. Fl. dan. t. 447.— Blackw. t. 185. Flowers bluish, and varying from white to or purple. Perhaps Scabíosa dubia, Mœnch. hess. no. 116. t. 3. which is said to have a 5-cleft corolla, is only a variety of this species. This plant may rather be considered a troublesome weed in corn-fields, but in grass-fields it may be considered rather useful, as it produces a large quantity of foliage, which is not refused by kine, sheep, or horses. The plant varies much in the divisions of the leaves, and in its hairiness. It sometimes occurs with white flowers. The flowers held over the smoke of tobacco in a few minutes become a beautiful green. The plant is slightly astringent, bitter, and saponaceous. The root creeps deep in the ground.

Var. α, vulgáris (D. C. prod. 4. p. 651.) leaves downy: radical ones pinnatifid or entire; cauline leaves always pinnatifid.

7 K. montána (D. C. prod. 4. p. 651.) stems hispid, brachiate; leaves oblong, serrated: lower ones entire and jagged; heads of flowers radiant; leaves of involucrum acute, narrow.

Mountain Knautia. Fl. July, Cilt. 1820. Pl. 3 to 6 feet.

9 K. ciliáta (Coulit. dips. p. 30.) stems very hispid; leaves ovate, hispid, lower ones petiolate, entire, auricled or pinnatifid: cauline ones deeply toothed, cordately stem-clasping or perfoliate; leaves of involucrum ciliated.

11 K. diversífolia (D. C. prod. 4. p. 652.) stems branched, hispid; radical leaves pinnatifid: lobes rather falcate, quite entire; lower cauline leaves petiolate, ovate-lanceolate, bluntly toothed; superior leaves lyrate; uppermost leaves stem-clasping, quite entire; leaves of involucrum ovate-cordate.

10 K. legionáriosis (D. C. prod. 4. p. 652.) stems hispid from retrograde hairs; leaves lanceolate, long-acuminate, remotely toothed; lower ones entire; leaves of involucrum 18, exceeding the flowers.

13 H. Native of Spain, on the mountains of Leonce. Scabíosa Legionáriosis, Lag. nov. gen. et spec. 3. Asteroécéphalus Legionéonis, Spreng. syst. 1. p. 379. Flowers red. There is a variety of this with pinnatifid leaves and white flowers. Said to be nearly allied to *K. sylváctica*.

Leonce Knautia. Fl. June, July. Pl. 2 feet.

11 K. salcéldi; stem scabrous from hairs; leaves all undivided, lanceolate: lower ones entire: upper ones sharply toothed in the middle.

14 H. Native of Spain, on the mountains of Leonce. Scabíosa Salcéldi, Lagasc. Leaves downy on both surfaces, hoary beneath. Peduncles long, beset with rufous villi under the head of flowers. Involucrum of many lanceolate pilose leaves, the length of the flowers, which are of a lilac colour.

4 P. Palestinus (Coulter. dips. p. 31. t. 1 f. 14.) plant clothed with silky villi; lower leaves obovate-oblong; quite entire, the rest lyrate, pinnatifid; lower lobes small, decurrent: terminal lobe large, obovate-oblong; involucre containing 8 florets at the base; crown of involucr. membranous; bristles of calyx 8–10, subulate, spreading, irregularly pilose at the sides.  O. H. Native of the islands of Cyprus and Sic.; and of Palestine. Knautia Palestina, Lin. mant. 117.—

§ 2. Perennial or frutescent species. Leaves jagged or toothed.

5 P. Lusitaniaicus (D. C. pro. p. 4. p. 653.) stems ascending, sparingly pilose; lower leaves bipinnatifid; superior ones pinnatifid; segments of all linear; palea of the receptacle and leaves of involucr. scarious and hairy; involucres many-toothed; awns of calyx 6–9, feathery.  O.  L. H. Native of Portugal, between Abrantes and Casabranca. Scabiosa plumosa, Hof. et Link, Fl. port. 3. p. 91. Cephalaria plumosa, Röm. et Schultes, syst. 3. p. 70. Scabiosa Gramuniaca, Broth. fl. lus. 1. p. 145. Flowers pale red. Perhaps Asteroccephalus intermedius, Lag. gen. et spec. p. 8. which is the Scabiosa intermedi, Röm. et Schultes, 3. p. 76. is referrible to this species, as also Scabiosa maritima and Sc. tenuifolia, Lag. elenchi. hort. mar. 1803. and 1805.

6 P. Bruusonxet (Coulter. in litt. 1824, ex D. C. pro. p. 4. p. 653.) leaves bipinnatifid; corollas equal; awns of calyx 6–7, linear, feathery, hardly twice the length of the involucr.  H. H. Native of Gibraltar, about San Roque, where it was collected by Broussonet.

Broussonet’s Pterocephalus.  Pl. 1 foot.

Tomentose Pterocephalus.  Pl. ½ foot.
§ 3. Perennial or frutescent species, with entire leaves.

9 P. n'ieus (Coults. d. p. 32.) lower leaves orbicular: cauline ones obovate-spatulate, quite entire, and are as well as the stems clothed with white tomentum; bristles of calyx 10-12, plumose, 3 times longer than the seed. \( \frac{2}{2} H \). Native of Spain, on the top of Sierra Toxada. Scaibióa nívea, Aragd, in Rem. et Schultes, syst. p. 81. A very small plant.—According to Spiegel, it is the same as the following.

Sowly Pterocapalus. Pl. 1 to 2 inches.

Spatulate-leaved Pterocapalus. Pl. \( \frac{1}{4} \) to \( \frac{1}{2} \) foot.

11 P. ca'nus (Coults. in litt. 1824. ex D. C. prod. 4. p. 653.) leaves quite entire, obovate-oblong, hoary; peduncles shapen, bearing each one head of flowers; corollas 5-cleft; involuellae lageniform, downy, without furrows; rays of calyx 20-25, plumose, linear, twice longer than the involucre; stigmas margarinate. \( \frac{2}{2} H \). Native of the Levant, between Amadan and Kermanca, where it was collected by Olivier and Bruguier. Scabiosa dentatórum var. from the Levant, Coults. d. p. 32.

Hoary Pterocapalus. Pl. \( \frac{1}{2} \) foot.

12 P. lasióspérmus (Link, in Buch. can. p. 150.) stem suffruticos, with many branches; leaves on very short petioles, oblong-lanceolate, quite entire, crowded, white from short dense tomentum; involucres densely plumose. \( \frac{2}{2} G \). Native of the Great Caneary island, near Trente, and among rocks on the top of Pico Tedi. Pter. dentatórum var. pusilla, Coults. d. p. 32. Scabiosa frutícosa, Smith, mss.

Woolly-seeded Pterocapalus. Shrub small.

13 P. dumétórum (Coults. d. p. 32. var. a,) stem suffruticos, erect, bearing many heads of flowers; leaves petolate, quite entire, oval, acuminate, at the base, smoothish on both surfaces; peduncles and involucres downy; rays of calyx 20-24, plumose, linear, hardly twice the length of the involucr. \( \frac{2}{2} G \). Native of Teneriffe. Scabiosa dumétórum, Bouiss. in Wildll. enum. 1. p. 146. Tribhícia dumétórum, Rem. et Schultes, syst. 3. p. 56. Leaves crowded at the tops of the branches.

Thicket Pterocapalus. Shrub small.

Cult. For culture and propagation see Cephalária, p. 686.

VI. SCABIO'SA (from scabies, the itch; which disorders the common sort is said to cure). Rem. et Schultes, syst. 3. p. 2. Coults. d. p. 32. D. C. prod. 4. p. 654.—Astrocéphalus, VOL. III.
DIPSACEÆ.

9 S. Alēp'ētica (Coul. d. p. 35. t. 2. f. 8.) stem branched; leaves pinnate-lobed; lobes oblong-linear, quite entire; heads of calyx pedunculate; corollas radiant; base of involucels hardly elongated, equal in length to the linear foveole; crowns spreading, 3 times longer than its base, 20-24-nerved; limb of calyx on a long peduncle; bristles shorter than the crown. Q. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruguieri. Stems humble, silky, villous. Peduncles smoothish.

Aleppo Scabious. Pl. humble.

10 S. UcKra'nica (Lin. spec. p. 144.) stem branched; leaves ciliated at the base: lower ones pinnatifid, with linear distant lobes: superior ones linear, quite entire; heads pedunculate; corollas radiant; base of involucels hemispherical, equal in length to the foveole, which are ovate-linear; crown 20-24-nerved, acutely toothed, shorter than the bristles. Q. H. Native of the south of Europe, from Spain to Tauria; also of the temperate parts of France. Coul. d. p. 63. var. a, ε, , γ, δ. t. 2. f. 9. D. C. fl. fr. no. 3330. Mor. bibl. ital. p. 9. Rehb. pl. crit. 4. t. 316. but the fruit is erroneous in the figure. Scabiosa alba, Scop. del. 3. p. 33. t. 16. S. argentea, Lin. spec. p. 145. Sibth. et Smith, fl. gracc. t. 168. Desf. ann. mus. t. 11. t. 24. S. Gmelini, St. Hill. bull. phil. 661. p. 149. t. 3. Asterocéphalus pilosus, Lag. gen. et spec. p. 8. Aster argenteus, Spreng. Sclerostémum Scopoli and S. argenteum, Schott.—Gmel. sib. 2. p. 213. t. 87. Cauline leaves ciliated at the base. Flowers from blue to white, and greenish yellow. Segments of corolla entire, ciliated.

Var. v, unbellet'ta (Coul. l. c. var. β.) flowers pedicellate, within the involucrum. Q. H. Native about Venice. Moricand, fl. ven. 1. p. 84.

11 S. Mi'râ'nthra (Desf. ann. mus. 11. t. 25. choix. t. 40.) stem branched; leaves hairy; lower oneslyrate pinnate, with oblong or linear lobes; lower leaves oblong or lanceolate-toothed; heads of flowers on long peduncles, ovate; corollas equal; base of involucels hemispherical, equal in length to the linear ovate foveole; crown 20-24-nerved, acutely toothed, shorter than the bristles. Q. H. Native of Tauria, Caucasus, Armenia, and Iberia, in sterile stony places. S. micrantha and S. Bieberstelnii, Rem. et Schultes, syst. 3. p. 80 and 75. S. Sicula, Bieb. fl. taur. p. 98. S. UcKra'nica ć, Coul. d. p. 35. and diss. mss. 1824. Asterocéphalus micranthus, Spreng. S. orientális villós, flore suave rubente, fructu pulcro oblongo, Tourn. cor. inst. p. 35. Flowers red. Plant villous. According to Desfontaines the radical and upper cauline leaves are entire.

12 S. Olivi'ēn (Coul. d. p. 36. t. 2. f. 10.) stem much branched, dichotomous; leaves linear-oblong, villous, entire or auricled; heads small, pedunculate, few-flowered; base of involucel hemispherical, equal to the ovate foveole; crown entire, spreading, 20-24-nerved, hardly exceeding its base; limb of calyx almost sessile, with much exerted bristles.—Native of the Levant, between Bagdad and Kermansha, where it was collected by Olivier and Bruguieri. Stem glabrous, white. Herb very slender. Flowers white.
Olivier's Scabious. Pl. 1 to 2 feet.

19 S. SETTIFERA (Lam. ill. no. 1321.) stem branched, downy; lower leaves ovate-spandulate, crossed or cut, rather villous; superior ones pinnate, with linear-lanceolate obtuse segments, the terminal segment the longest; corollas radiate, much longer than the involucrum. 2. H. Native of the south of France, about Marseilles. S. atropurpurea 37. 4. D. prod. 4. p. 657. Asterocephalus setifer, Spreng. Corollas lilac. Bristles of calyx 5, black.

Bristle-bearing Scabious. Pl. 2 feet.

20 S. grandiflora (Scop. del. ins. 3. p. 29. t. 14.) stem branched, downy; lower leaves ovate-spandulate, crossed or cut, rather villous; superior ones pinnate, with linear-lanceolate obtuse segments, the terminal segment the longest; corollas radiate, much longer than the involucrum. 2. H. Native of the south of France, about Marseilles. S. atropurpurea 37. 4. D. prod. 4. p. 657. Asterocephalus setifer, Spreng. Corollas cream-coloured or white, with reddish tubes. Bristles of calyx 5, reddish brown.

21 S. maritima (Lin. amon. 4. p. 304.) stem branched; radical leaves pinnatifid, with toothed lobes; middle cauline ones pinnatifid, with linear entire lobes; uppermost ones linear and quite entire; fructiferous heads globose; involucrum twice shorter than the radiant flowers. 0. or g. H. Native of the south of France, Corsica, Italy, and Sicily, in arid places by the sea. D. C. fl. fr. suppl. no. 3309 a. S. Cupani, Guss. prod. 1. p. 160. 0. S. angulata, Rafin. car. p. 81? S. atropurpurea var. Coul. Stem villous. Flowers lilac, rose-coloured or white.

22 S. daucoides (Desf. fl. atl. 1. p. 123. t. 35.) stem almost simple; lower leaves lyrate; cauline ones pinnate-parted, with linear acute cut segments; leaves of involucrum pinnatifid; bracteae exceeding the fruit. g. H. Native of Algiers, on hills. Coul. ditt. mss. 1824. Asterocephalus daucoides, Spreng. syst. 1. p. 388. Very Like S. atropurpurea. Plant downy. Corollas bluish or violaceous.

Carrat-like Scabious. Pl. 1 to 2 feet.

23 S. AMBIVIA (Teml. fl. supple. 5. 1826. p. 77.) plant glabrous; leaves fleshy, shining, crossed; radical leaves oblong, cauline leaves lyrate or pinnatifid, with oblong remote entire lobes; heads few-flowered, radiate; tube of corolla very long; corolla spongy, involute. 2. H. Native of the kingdom of Naples, at Paneta del Fusaro, in corn-fields by the sea side. Flowers purple or blue.

Ambiguous Scabious. Pl. 1 to 2 feet.

24 S. conocephale (Vivian. addl. fl. lin. in fl. lyb. p. 67.) plant hairy; radical leaves elliptic, toothed; cauline ones pinnate; flowers 5-cleft, pedicelate within the involucrum; involucels trifid; seed triaristate.—Native of Liguria, in the valley of T 2.
Andora, and Sicily. Perhaps a prolific variety of S. grandiflora, Guss. or S. atropurpurea.

**Horn-of-Plenty Scabious.** Pl. 2 feet.

25 S. *integrata* (Hoffm. et Link, fl. port. 2. p. 88.) lower leaves oblong, entire; inferior ones lyrate; upper ones pinnatifid or wanting; corollas 5-cleft, radiate. .getUserId(). Native of Portugal. Said to be allied to *S. Columbária* and *S. grandiflora.

**Entire-leaved Scabious.** Pl. 2 feet.

* Species belonging to the present tribe of the genus, but are not sufficiently known.

26 S. *limonfolia* (Vahl, symb. 2. p. 27.) stem shrubby; radical leaves coriaceous, obovate, quite entire, glabrous, and green above, but reticulated and clothed with hoaryomentum beneath; cauline leaves connate at the base; corollas equal, 6-cleft; crown scarious, plicate, denticulated at the apex, broad, extended; limb of calyx sessile; bristles of calyx 4-5, exserted. .getUserId(). Native of Portugal, among the mountains on calcareous rocks. Guss. 1825. prod. p. 164. Coult. dips. p. 42. Asterocephalus limonifolius, Spreng.—*Cop. pang. 2. t. 247.* Lower leaves like those of *Sulcata Limonium.* Corollas blue.

**Limonium-leaved Scabious.** Shrub.

27 S. *saxatilis* (Cav. 1825. icon. 2. p. 68. t. 184.) stem herbaceous, glabrous; leaves lanceolate, quite entire, green above, tomentose beneath; cauline leaves very few, connate at the base; corollas equal, 4-5-cleft; crown white, ciliated; bristles of calyx 5, purple.  getUserId(). Native of Spain, in the fissures of rocks, in Valencia. Coult. dips. p. 42. Asterocephalus saxatilis, Spreng. Corollas white; anths violaceous. Very like *S. sucissa.*

28 S. *s. titens* (Reem. et Schultes, syst. 3. p. 82.) stem herbaceous; leaves undivided, elliptic, serrated, shining, petiolate; corollas radiate, 5-cleft.  getUserId(). Native of the Azores. S. lúcia, Ait. hort. kew. ed. 1. vol. 2. p. 229. but not of Vill. Asterocephalus lúcidas, Spreng.

**Sect. III. Succisa (from succido, to cut down; on account of the praeorous root of the first species).** Coult. dips. p. 37. D. C. prod. 4. p. 657. but not of others. Base of involucres not distinguishable from the tube; having the foveole engraven from the base to the crown. Crown spreading, short, membranous. Limb of calyx sessile, with 5 bristles, of which some are sometimes abortive and sometimes all.

* Corollas 5-cleft.

29 S. *africa* (Linn. spec. p. 145.) stem shrubby; leaves lyrate, coarsely toothed, rather hairy; heads of flowers pedunculate; corollas hardly radiant; tube of involucel obovate; crown one-half shorter than the tube, 24-28-nerved; bristles of calyx 5, exserted.  getUserId(). Native of the Cape of Good Hope. Coult. dips. p. 37. t. 2. f. 12. Shrub evergreen, with the leaves variable in form, sometimes they are obovate-oblong, toothed at the base (Herm. par. t. 219.), sometimes cut at the base (Brey. icon. 33. t. 26.); 5 or 6. *Alissiama, Jacq. hort. vind. t. 185.*) sometimes lyrate pinnatifid (Herm. par. t. 221.). *Indurata, Lin. mant. p. 196. ex Reem. et Schultes, syst. 3. incisa, Mill. dict. no. 18. Young stems and leaves villous. Heads about the size of walnuts. Corollas white, but in the variety altissima pale purple or blue.

30 S. *Fusce* (D. C. prod. 4. p. 658.) stem branched, smoothish; leaves all pinnate, almost glabrous, with linear acute entire lobes; leaves of involucrum equal in length to the corollas, which are 5-cleft and radiant; crown of the involucel, which is somewhat cylindrical, membranous, and 3 times shorter than the tube; bristles of sessile calyx pale, twice the length of the crown.  getUserId(). Native of Dahuria. It was sent to Gey from Fischer under the name of *S. Dahurica.* Perhaps the same as *S. comosa, Reem. et Schultes, syst. 3. p. 84.? in which the corollas are said to be large, showy, and violaceous, and in this bluish-purple.

**Fischer’s Scabious.** Pl. 2 feet.

31 S. *semifapposa* (Salzm. pl. excis. 1825. ex D. C. prod. 4. p. 658.) plant hairy, rather canescent; stem herbaceous, branched; lower leaves oval, coarsely toothed, petiolate; superior ones pinnatifid, with oblong-linear, acute, subdentate lobes; heads of flowers pedunculate; leaves of involucrum linear-subulatate, ciliated, at length reflexed; corollas radiate; heads ovate; lower fruit of the heads without bristles; the rest furnished each with 5 long exserted bristles.—Native about Tangiers and Mogodor. *S. atropurpurea* γ, coroná erectá, Coult. dips. p. 37.

**Semi-papouose Scabious.** Pl. 1 to 2 feet.

32 S. *tuëïda* (Vill. Fl. dauph. 2. p. 293.) plant glabrous; stems usually 1-flowered; leaves shining; radical ones ovate-lanceolate, obtuse, crenated; cauline ones pinnatifid, with linear acute lobes; involucrum usually exceeding the radiant flowers; crown 20-24-nerved, 3 times shorter than the tube; bristles of calyx 5, black, equal in length to the flowers, but 3 times longer than the crown.  getUserId(). Native of France, in alpine places. Savoy, Switzerland, Austria, Syria, and Croatia. D. C. fl. fr. 4. p. 228. Rechb. pl. crit. 4. t. 381. S. strícta, Waldst. et Kt. pl. rar. hung. 2. t. 138. S. Nórica, Vest. bot. zeit. 1805. no. 3. Wahl. fl. carp. p. 39. S. Columbária a, Coult. dips. p. 38. exclusive of the two synonyms. Asterocephalus strietus, Spreng. Corollas pale blue, or of a pale violaceous colour. In the wild plant the stems usually bear only one head of flowers. This plant, with several of the following, are combined under the name of *S. polymorpha,* by Wibel, and by Couleur under that of *S. Columbária.*

33 S. *ame*ná (Jacq. fil. edoc. 1. p. 86. t. 59.) stem branched, rather hairy at the base; radical leaves obovate, toothed or lyrate, rather hairy; cauline leaves pinnatifid, with lanceolate acute nearly entire lobes; peduncules elongated, beset with retrograde villi under the heads; corollas radiate; crown 20-nerved, 3 times shorter than the tube; bristles of calyx 5, of a rufous brown colour, 4 times longer than the crown.  getUserId(). Native of Russia. S. nitida, Bernh. ex Reem. ex Schultes, syst. 3. p. 68. S. longipedunculata, Fisch. et Jacq. *Columbária a.* Coult. dips. p. 38. Asterocephalus aménus, Spreng. Flowers lilac or rose-coloured. There are varieties of this having the involucrum either longer or shorter than the flowers.

**Pleasing Scabious.** Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

34 S. *agustifolia* (Hoffm. verz. 1826. p. 206.) stem quite glabrous; leaves downy; radical ones petiolate, obovate, toothed; lower ones lyrate-pinnatifid, serrate at the tip; superior ones ovate, somewhat lyrate twice bipinnate, with linear lobes; peduncles scabrous from retrograde hairs at the apex; leaves of involucrum linear, terminated each by a hair.  getUserId(). Native country unknown. Said to be allied to *S. ame*na.

**Narrow-leaved Scabious.** Pl. 1 to 2 feet.

35 S. *ochroleu* (Linn. spec. p. 146.) stem branched, rather hairy; radical leaves lyrate-pinnatifid, downy on both surfaces; cauline ones pinnate-paired, with flat linear lobes; peduncules elongated, rather hairy; crown 20-nerved, one-half shorter than the tube; bristles of calyx fuscecent, 3 times longer than the crown.  getUserId(). Native of Europe, Caucasus, and Sp—
DIPSACEÆ. VI. SCABIosa.

693

36 S. Scópóli (Link, enum. hort. berol. 1. p. 128. but not of Vis.) stem clothed with retrograde hairs above; leaves hairy; radical ones oblong, crenate; lower cauleine leaves pinnatifid; superior ones bipinnatifid; lobes linear, cut; leaves of involucrum linear, clothed with adpressed hairs. 2. H. Native of the northern part of Europe. Corollas cream-coloured. According to Link, this species comes nearest to S. ochrolelica, but differs from Coulter, to S. Banática.

37 S. Revesa (Lodev. ined. sem. hort. dorp. suppl. 1834. p. 6.) radical leaves oblong, obtuse, crenate, clothed with numerous hairs; the stem bearing a few; cauleine leaves pinnate, with deeply cut segments; peduncles beset with retrograde hairs; involucrum exceeding the corolla, which are rather radiate and 5-cleft. 2. H. Native country unknown. Said to be nearly allied to S. grandiflora and S. Scópóli.

Hoary Scabious. Pl. 8 to 2 feet.

48 S. KHZANTHâ (Viv. fl. lib. spec. p. 6. t. 3. f. a. b.) radical leaves elliptic: cauleine ones pinnate-lobed: lobes all linear; central peduncle rising from the root, bearing one head: the rest rising from the tops of the branches; leaves of involucrum 5, linear; corollas 5-cleft, radiant; bristles of calyx 5. 2. H. Native of Corynephorus, on the mountains.

Root-flowered Scabious. Pl. 1 to 2 feet.

Hladnik’s Scabious. Pl. 1 to 2 feet.

50 S. Humilis (Host, fl. austr. 1. p. 195. but not of Thunb.) stem branched, glabrous, ascending; lower leaves oblong, crenated or jagged: superior ones pinnate-parted: lobes jagged; peduncles beset with reflexed hairs; leaves of involucrum linear-subulate; corollas 5-cleft, radiant; bristles of calyx 5. 2. H. Native of the Alps of Austria, about Gemona. Corollas white, suffused with purple. Rehb. pl. crit. 5. p. 30. as.

Humble Scabious. Pl. 3 foot.

51 S. deglita (Horn. hort. hafn. 1. p. 127.) leaves all linear: or pinnatifid: peduncles very long; leaves of involucrum exceeding the corollas, which are 5-cleft and radiant. 2. H. Native of Italy. Flowers red or lilac. The plant we have in the gardens under this name appears to be nothing but S. Gra-nuâria.

Neglected Scabious. Fl. June, July. C1t. 1825. Pl. 1 to 2 feet.

52 S. Laciniâ (Licht. in Rem. et Schultes, syst. 3. p. 87.) plant downy; stem dichotomous; lower leaves obovate-oblong, unequally and bluntly serrated: superior ones pinnatifid; lobes cut, acute: corollas 5-cleft, radiant.—Native of the Cape of Good Hope. Leaves of involucrum downy, linear, acute, and sometimes bifid, one-half shorter than the corollas, which are pale violet.

Jagged-leaved Scabious. Pl. 1 to 2 feet.

53 S. Pyrenaica (All. ped. 1. p. 140. t. 25. f. 2. and 26. f. 1.) the whole plant clothed with cinerous tomentum; stem a little branched, few-flowered; radical leaves oblong, crenated: upper cauleine ones bipinnatifid: lobes linear, quite entire; corollas radiant; leaves of involucrum lanceolate; crown 3 times shorter than the tube, 20-nerved; bristles of calyx 5, 4 times longer than the crown. 2. H. Native of the south of Europe, on the lower mountains and hills; and of Africa, on the Taousch Mountains, in dry fields. Dub. bot. gall. p. 256. S. colubriâ, var. Coult. d. p. 38, exclusive of the synomymes. Corollas frequently reddish-purple, but most often of a bluish-purple.

54 S. holosérica (Bertol. dec. 3. p. 49.) plant clothed with soft hoary tomentose velvety down; lower leaves lanceolate, obtuse, crenated: superior ones pinnatifid, with lanceolate acute entire lobes; leaves of involucrum linear; corollas radiant; crown 20-nerved, 3 times shorter than the tube, which is hairy; bristles of calyx 5, black, twice longer than the crown. 2. H. Native of the Appenines, Abruzzo, Dalmatia, and the Pyrenees. D. C. fl. fr. 5. p. 480. Dub. ench. 1. p. 256. S. colubriâ holosérica, Coult. d. p. 39. Asterocephalus sericus, Spreng. Leaves sometimes all simple. Corollas bluish purple.

55 S.WEBRIA (D. Don, in bot. reg. t. 717.) plant clothed with soft silky hoary tomentum; lower leaves petiolate, obovate, crenated: superior ones pinnatifid, with ovate or oblong entire lobes; heads on long peduncles; corollas nearly equal; crown 4 times longer than the tube; bristles of calyx 5, black. 2. H. Native of Phrygia, on the top of Mount Ida. Asterocephalus Webleianus, Spreng. Flowers cream-coloured.

Webley’s Scabious. Fl. July. C1t. 1818. Pl. 4 foot.

56 S. mollis (Willd. enum. suppl. p. 7.) lower leaves supra-compound: superior ones bipinnate-parted: lobes of all very slender and filiform, smoothish, except the margins, which are rather pilose; peduncles very long, scabrous; involucrum equal to the corollas, which are 5-cleft and radiant; crown spreading; bristles of calyx 3-5, short. 2. H. Native country unknown. Rehb. pl. crit. 4. t. 355. S. capillâta, Roem. et Schultes, syst. 3. p. 64. Lower leaves lyrate, soft, tomentose, ex Link. enum. 1. p. 128. Flowers pale violaceous, ex Wild. Perhaps only a variety of S. colubriâ or S. Pyrenaeâ.

Soft Scabious. Fl. June, July. C1t. 1820. Pl. 2 to 3 ft.

57 S. puâma (Poir. dict. 6. p. 723.) plant hispid from grey pili; stem short, almost simple; radical leaves lyrate or pinnatifid, with obtuse toothed lobes: cauleine pinnate-parted, with linear acute lobes, which are sometimes trifid at the apex; leaves of involucrum lanceolate, villous, shorter than the corollas, which are 5-cleft and radiant; bristles of calyx 5, black, nearly equal in length to the corollas. 2. G. Native of the Cape of Good Hope. Asterocephalus pumilus, Spreng. S. acalulis, Lin. mant. 196. Thunb. fl. cap. p. 145. S. nudicalis, Lam. ill. no. 1351. Corollas cream-coloured or nearly white. Plant very hairy.

Dwarf Scabious. Pl. 3 foot.

59 S. dichotomâ (Ucria. pl. lin. add. 249. Willd. enum. 1. p. 144.) smoothish; stem dichotomous; heads almost sessile at the sides, globose; leaves oblong, entire: radical ones petiolate
and toothed: cauline ones almost sessile, quite entire; corollas equal; tube of involucral nearly cylindrical; crown 20-24-merved, one-half shorter than the tube; bristles of calyx spreading, very short, inclosed. O. H. Native of Mauritania, Sicily, &c. Coult. daps. 9. t. 2. f. 15. Guss. prod. 1. p. 163. Asterocéphalus dichotomus, Linn. gen. et spec. 8. S. parriflora, Desf. fl. atl. 1. p. 119. Lower leaves sometimes lyrate or jagged. Corollas 5-cleft, and flesh-coloured; but by some authors they are said to be 4-cleft.

Corollas 4-cleft.

61 S. Succisa (Linn. spec. 148.) root primrose, or appearing as if it was bitten off at the end; radical leaves ovate-lanceolate, acuminated at both ends: cauline leaves conuate, almost entire; heads of flowers pedunculate; leaves of involucrum disposed in 2-3 series; corollas equal; tube of involucrum 4-sided; crown very short, undulate; bristles of calyx short, a little exserted, conviven. O. H. Native of Europe even to Caucasus, very common in bogs and moists meadows and pastures; plentiful in Britain. Fl. dan. t. 279. Smith, engl. bot. t. 878. Curt. Lond. 3. t. 10. Coult. daps. p. 39. t. 2. f. 17. D. C. fl. fr. 4. p. 226. Blackw. t. 142. Asterocéphalus Succisa, Wallr. sched. 1. p. 52. Succisa praténis, Moench. meth. p. 489. The lower stem leaves are toothed, but the upper ones are entire. Involucrum hairy. Flowers violet or dark purplish blue, varying to flesh-coloured and milk-white. The leaves are sometimes gashed according to Haller, and the heads of flowers are sometimes proliferous. In cul-tivation the plant becomes more branched than in the wild state. In days of superstition it was fabled that the Devil, envying the good this herb might do to mankind, bit away a part of the root; hence the plant is commonly called Devil's-bit. This appearance of a stumped root is not peculiar to S. succisa, but is observed in some species of Plantágo, and many other herbs. According to Bergen the root is astringent, and the infusion of it bitters, but not unpleasant. A strong decoction of it, kept a good while, was formerly an empirical secret for gonorrhoeas. LINNEUS says that the dried leaves are used to dye wool yellow or green.

Var. a, hirútæ (Wallr. sched. l. c.) stem, peduncles, and both sides of leaves hairy. O. H. This is the British variety. Succisa hirútæ, C. Bauh. pin. p. 269.

Var. b, labrátæ (Wallr. sched. l. c.) stem and both sides of leaves glabrous. O. H. Succisa labrá, C. Bauh. pin. 269. S. labrá, Schott. in Roëm. et Schultes, syst. 3. p. 61.

62 S. austrális (Wulf. in Roëm. arch. 3. p. 216.) plant smoothish; leaves ovate, elongated, acuminated, almost quite entire: lowermost ones somewhat auriculated at the petioles; heads ovate; leaves of involucrum disposed in two series; corollas equal; tube of involucel lagenasiform; crown obsolete; bristles of calyx abortive. O. H. Native of Upper Italy, Syria, and Pannonia, in marshy parts of woods, and by the sides of rivulets. Coult. daps. p. 40. t. 2. f. 18. Richb. pl. crit. 4. t. 325. S. répens, Brigt. for Jul. 19. Nocc. et Balb. fl. ticin. 68. t. 2. S. pseudaustrális, Roëm. et Schultes, syst. 3. p. 60. Roots creeping, tufted. Corollas of a bluish violet or purple colour, but WULLEN says they are yellow; there are, therefore, 2 plants probably confused under this name, or only mere variations in the colour of the flowers.

Southern Devil's-bit. Fl. June, Aug. Clt. 1820. Pl. 1 ft. 63 S. tenuitólia (Linnaæa. vol. 8.) bristles of pappus twice longer than the denticulated calyx; corollas downy, equal, shorter than the involucrum; heads ovate; stem erect, branched; cauline leaves pinate, with linear, acute, quite entire, elongated segments. O. H. Native country unknown. Said to be nearly allied to S. Austrális.

† Species not sufficiently known.

§ 1. Leaves entire or serrated.

64 S. amplexicauli (Linn. mant. p. 195.) stem herbaceous, bracteolate; leaves stem-clasping, lanceolate, quite entire: radical ones trifid; corollas radiant. 4-cleft.—Native country unknown. Succisa amplexicaulis, Spreng. Said to be nearly allied to S. integrifólia, Lin. Corollas bluish. According to Coulter, it is probably a species of Knautia.

Var. b, lyrátæ (Roëm. et Schultes, syst. 3. p. 62.) lower leaves lyrate, obtuse, crenated; superior ones lanceolate, sessile. O. H. Native of France. S. lyrátæ, Lam. ill. no. 1310. Flowers pale red.

Stem-clasping-leaved Scabious. Pl. 1 foot.

65 S. Cochinní'nsis (Linn. coch. p. 68.) stem quite simple, nearly naked; leaves lanceolate, undivided, undulate; radical leaves quite entire; involucrum 3-leaved; corollas 5-cleft; pappus pilos.—Native of China and Cochín-china. Asterocéphalus Cochinní'nsis, Spreng. Flowers purple. Corollas 5-cleft, nearly equal. Bristles of calyx 5.

Cochín-china Scabious. Pl. 1 foot.

§ 2. Leaves lyrate or pinnate-lobed.

Corollas 4-cleft.

66 S. s Dahlurica (Willd. in Roëm. et Schultes, syst. 3. p. 521.) leaves pinnate-parted; tomentose; lobes pinnatifidly jagged; stem tomentose; corollas 4-cleft, radiant.—Native of Dahluria. Coult. daps. p. 41. There is another plant under this name by Fischer, cultivated in the gardens.

Dahurian Scabious. Pl. 1 foot.

67 S. hítra (Willd. in Roëm. et Schultes, syst. 3. p. 251.) leaves all pinnate, and are as well as the stem hairy; lobes or segments linear-lanceolate, acute; corollas 4-cleft, radiant.—Native of Siberia. Coult. daps. p. 41. The rest unknown.

Hairy Scabious. Pl. 1 to 2 feet.

Corollas 5-cleft.

68 S. Styriá'ca (Vest. in flora. 1821. p. 146.) plant clothed with fine hairs; stem much branched, many-flowered; leaves all pinnate-parted; lobes lanceolate, few, each furnished with a tooth; leaves of involucrum linear, spreading; corollas 5-cleft, radiant, outer lobes acute; crown quite entire; bristles of calyx wanting.—Native of Styria.

Styrian Scabious. Pl. 1 to 2 feet.

Cult. Many of the species of this genus are very ornamental, and are well fitted for decorating flower-borders. The perennial herbaceous kinds are easily increased by seed, or dividing at the root. The seeds of annual kinds only require to be sown
in the open ground. The shrubby species are increased by cuttings under a hand-glass, or by seed. The species most worthy of cultivation are Scutellaria, S. grammatifolia, S. atropurpurea, S. grandiflora, and many others.

Calyx of 5 unequal segments. Corolla regular, funnel-shaped, with a long slender tube, and 5-3-nerved segments; glandular spaces or areoles below the stamens, and alternate with them. Stamens 5, monadelphous; anthers combined by their lower half. Ovary inferior, 1-celled. Style smooth, clavate in the upper part; stigma capitate, undivided. Fruit or achene indehiscent, crowned by the rigid spiny segments of the calyx. Seed solitary, inverted, sessile. Embryo in the axis of fleshy albumen, slender. Herbaceous plants, with alternate leaves without stipulas. Flowers collected into heads, which are either terminal or opposite the leaves, surrounded by an involucrum, and bearing bracteas among the flowers. Flowers sessile, hermaphrodite or neuter. This is a very small tribe of plants, differing from Capparis in their albuminous pendulous ovulum, and half distinct anthers; and from Diphasaceae in their filaments being monadelphous, and their combined anthers.

Synopsis of the genera.

1. Calycera. Crown of fruit in some long horned, and in others short and scaly.

2. Boopis. Limb of corolla not contracted, campanulate. Fruit crowned by the segments of the calyx, which are stiff and membranous, but acute and spinaceous at the apex.

3. Acicarpa. Lower flowers of the heads fertile: superior ones numerous and sterile. Tube of anthers undivided. Fruit combined into a globose echinated head.

I. Calycera (from καλυξ, a calyx, and κερας, kerats, a horn; the crown of the fruit is a long horn). Cav. icon. 4. p. 34. t. 358. Juss. ann. mus. 2. p. 350. Pers. ench. 2. p. 500.

Lin. syst. Syneginesia, Necessaria. Involucrum 5-parted. Flowers fertile, dissimilar, and promiscuous. Segments of the calyx in some long and horn-formed, and in others short and scale-formed. Limb of calyx contracted a little below the lobes. Tube of stamens inserted a little below the contraction of the corolla, divided at the top. Herbaceous plants with sub-pinnatifid leaves and terminal heads of flowers.

1. Cavanillesi (Richard, in ann. mus. 6. p. 77.) glabrous; leaves semi-pinnatifid; fructiferous heads almost 2 inches long, globose; bracteoles narrow and subulate at the apex. F. Native of Chili. C. herbaracea, Cav. icon. 4. p. 34. t. 358. Pers. ench. 2. p. 500. Flowers green.

Cavanilles's Calycera. Pl. 1 foot.

Cosmary-leaved Calycera. Shrub 2 feet.

Cult. The species of Calycera should be grown in pots, in a mixture of loam, sand, and peat; and they will be readily increased by seed.

II. Boopis (from βοῦς, bous, an ox, and ως, ops, an appearance; the flowers have some resemblance to the eye of an ox). Juss. ann. mus. 2. p. 350. t. 58. f. 2. Pers. syn. 2. p. 500. Cassini, dict. 5. suppl. p. 28. Richard, mem. mus. 6. p. 87.

Lin. syst. Syneginesia, Necessaria. Involucrum 7-8-cleft. Flowers fertile, nearly alike. Segments of calyx shorter than the corolla, membranous, some entire, and some deeply toothed. Limb of corolla without any contraction, campanulate, half divided. Column of stamens inserted at the base of the limb of the corolla; tops of filaments distinct.—Many stemmed brancher herbs, with pinnatinate pinnatifid leaves, and terminal heads of flowers.

1. B. anthersoides (Juss. l. c.) leaves pinnatifid; segments of leaves linear. H. Native of Buenos Ayres, where it was first detected by Commerson. Pers. ench. 2. p. 500. Rich. l. c. p. 87, pl. ii.

Anthemis-like Boopis. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2. B. alpina (Poep. mus. coll. 2. no. 833. ex Cham. et Schlecht. in Linnaea. 6. p. 258.) leaves oblong-obovate, fleshy, entire, or furnished with a tooth on one or on both sides, quite glabrous. F. G. Native of Chili. Root woody. Stem erect, simple, only leafy at the base. Corolla yellowish. Involucrum 12-toothed.

Alpine Boopis. Pl. 2 to 3 inches.

Leucanthema-leaved Boopis. Pl. 1 to 2 inches.

Cult. The seeds only require to be sown in a warm sheltered situation in the open ground.

Lin. syst. Syneginesia, Necessaria. Involucrum 4-5-parted: outer ones adnate to the ovary. Lower flowers of heads fertile, superior ones much more numerous and sterile, with the ovary of all combined. Segments of the calyx for the most part ending in acicular spines. Limb of corolla funnel-shaped. Column of stamens inserted beneath the attenuated part of the limb of the corolla, undivided to the top of the anthers. Bases of connectives knot-formed.—Herbaceous plants, with toothed or entire leaves, and terminal and lateral heads of flowers.

1. A. tribuloides (Juss. l. c.) plant erect, glabrous; leaves oblong, cuneate-obovate, obtuse, with broad teeth; style much exserted. H. Native of Buenos Ayres, where it was collected by Commerson. Cryptocarpa tribuloides, Cassini, dict. 12. p. 85.

Caltrop-like Acicarpa. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2. A. spatulata (R. Br. comp. p. 29. Richard. mem. mus. 6. p. 78. pl. 12.) procumbent, glabrous; leaves spatulate, tapering a long way at the base, denticulated and entire at the apex, and mucronate; style a little exserted. H. Native of Brazil, where it was collected by Sello. Cryptocarpa spatulata, Cassini, dict. 12. p. 85.

Spatulata-leaved Acicarpa. Cit. 1824. Pl. proc.

3. A. lana (Lag. in Pers. ench. 2. p. 488.) stem woolly; leaves linear, glabrous, having a tooth on one side, and some-
times on both; uppermost leaves entire.—Native of New Spain.

Woolly-stemmed Aeciarpha. Pl. prostrate.

Cult. Being annual plants, the seeds only require to be sown in the open ground in a warm sheltered situation.

N. B. Cevallia sinuata (Lag. gen. et spec. p. 11. with a figure,) appears to be allied to the present order, but the characters of the plant are not sufficiently known.

Calyx superior, 5-toothed, or 5-parted, seldom entire, with the tube adnate to the ovary at the base. Corolla monopetalous, irregular, inserted in the calyx, 5-loped, or deeply 5-cleft. Stamens 5, inserted into the calyx alternately with the lobes of the corolla; anthers cohering; pollen oval. Ovary inferior, with from 1 to 3 cells, but usually of 2 cells. Ovula very numerous, attached to the axis or parietes of the fruit. Style simple; stigma usually 2-loped, surrounded by a cup-like fringe. Fruit capsular or baccate, 1-2-celled, rarely 3-celled, many seeded, dehiscent at the apex. Seeds attached to the axis or parietes of the fruit. Embryo straight, in the axis of fleshy albumen, with the radicle pointing to the hyắm.—Herbaceous plants or shrubs. Leaves alternate, exstipulate. Flowers axillary or terminal, of various colours.

This order appears more nearly related to Compositæ than to Campanulaceæ, in their cohering anthers, and in the irregularity of the corolla; the stigma is surrounded by hairs, which are probably analogous to the indium of Goodeniæ, to which order Lobelieæ approaches very closely. It participates in all the affinities of Campanulaceæ.

The plants contained in this order are all dangerous or suspicious, in consequence of the acidity of their milk. Topa Feuillei yields a dangerous poison in Chili. The most active article of the Materia Medica of North America is said to be Lobelia inflata; it is possessed of an emetic, sudorific, and powerful expectorant effect, especially the first. When given with a view to empty the stomach, it operates vehemently and speedily, producing, however, great relaxation, debility, and perspiration, and even death, if given in over-doses. Barton, 1. p. 189.

The antisyphilitic virtues ascribed to Lobelia syphilitica are supposed to have resided in its diuretic properties; they are, however, generally discredited altogether. Barton, 2. p. 211. Hippobromia longiflora, a native of some of the West India Islands, is one of the most venomous of plants. The Spanish Americans call it Rebeita Cavallos, because it proves fatal to horses that eat it; it acts as a violent cathartic, the effects of which no remedy can assuage, and which ends in death. The leaves are an active vesicatory. Lobelia cardinalis is an acrid plant, which is reckoned anthelmintic. Barton, 2. p. 180. All the plants contained in this order are very ornamental, and therefore well deserving the care of the gardener. The flowers are very showy blue, white, red, scarlet, but seldom yellow.

Synopsis of the genera.

1 Clermontea. Calyx tubular, 5-cleft. Corolla arched, 5-cleft, almost regular. Stamens with combined filaments and cohering anthers; the two lower anthers bearded. Stigma 2-loped, girded by hairs. Capsule baccate, naked at the apex, indehiscent, 2-celled, many-seeded.

2 Rollandia. Calyx 5-parted. Corolla compressed at the sides, with an undivided tube, and a 5-parted, somewhat bilabiata limb. Stamineous column adnate to the superior part of the corolla. Anthers cohering, two lower ones bearded. Stigma pilose. Capsule baccate, crowned by the calyx, 2-celled, many-seeded, indehiscent.

3 Cyanea. Calyx 10-furrowed, with oblong, foliaceous, curled segments. Corolla tubular, arched, with a 5-parted, somewhat bilabiata limb. Stamens, combined filaments, and cohering bearded anthers. Stigma capitate ciliated. Capsule baccate, 10-furrowed, indehiscent, crowned by the limb of the calyx, 2-celled, many-seeded.

5 Praidia. Limb of calyx 5-toothed (f. 119. a.). Corolla cleft on the back, even to the base, and therefore the limb is 5-parted, unilairate, or all on the lower side (f. 119. b.). Stamens combined above and the anthers cohering; the two lower anthers mucronate (f. 119. d.). Stigma 2-loped. Capsule baccate, crowned.

6 Tupa. Calyx spherical, 5-parted. Corolla cleft on the back almost to the base, having the limb divided into 5 segments, which are all united at their tips. Stamens combined almost to the base; anthers cohering, bearded. Stigma 2-loped, protruding. Capsule 2-celled, many-seeded.

7 Siphocampa Junius. Limb of calyx 5-parted (f. 120. d.). Corolla with a curved undivided tube, which is ventricose in the middle, and a 5-parted bilabiata limb (f. 120. b.). Stamens and anthers combined; anthers bearded. Capsule 2-celled, 2-valved, dehiscent.

8 Lobelia. Limb of calyx 5-parted (f. 121. a.). Corolla with the tube cleft on the upper side, and thickened at the base, and a bilabiata limb (f. 121. g.). Anthers cohering; 2 lower ones usually bearded. Capsule 2-celled, 2-valved, dehiscent at the apex.

9 Dortmann. Limb of calyx 5-parted. Corolla with the tube cleft on the upper side, a bilabiata limb, and a bearded throat. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half-spherical, 3-celled, 3-valved, dehiscent, many-seeded, surrounded by the calyxine segments below the apex.

10 Parastranthus. Limb of calyx 5-cleft. Corolla
with hardly any tube, and a bilabiate, 5-parted, reversed limb. Column of stamens under the lower lip. Filaments and anthers combined; the latter bearded. Stigma bifid or trident. Capsule crowned by the segments of the calyx, 2-celled, many-seeded.

11 Isótoma. Limb of calyx 5-parted (f. 122. a.). Corolla salver-shaped (f. 122. d.), or funnel-shaped, with an entire or cleft tube, and a 5-parted, nearly regular limb (f. 122. d.). Filaments combined; anthers cohering, beardless; the two lower ones mucronate. Stigma capitate, protruding. Capsule 2-celled, many-seeded, dehiscent.

13 Lystróma. Limb of calyx 5-parted. Corolla with an entire tube, and a 5-parted sub-bilabiate limb. Anthers cohering; the 2 lower ones bearded, or terminating in a membranous process. Stigma 2-lobed, ciliated. Capsule 1-celled, opening by an operculum at the apex, many-seeded.

14 Mosórsis. Calyx tubular, 5-cleft. Corolla salver-shaped, with a terete tube, which is cleft on one side, allowing the stamens to escape, and a regular rotate limb. Anthers cohering. Capsule 2-celled, many-seeded, dehiscent.

17 Cýnia. Limb of calyx 5-cleft. Corolla bilabiata, 5-parted; the segments easily separated to the base. Stamens with combined hairy filaments, and free anthers. Stigma hollow, gibbous, bearded. Capsule 2-celled, many-seeded, dehiscent.

18 Canonaénthus. Calyx hemispherical, with a 5-parted limb. Corolla tomentose outside, campanulate, regular, 5-parted at the apex. Stamens with free filaments, and combined anthers. Capsule unknown.

Lin. syst. Pentándria, Monogýmia. Calyx tubular, arched, 5-cleft, coloured, length of corolla, caducous. Corolla tubular, arched, 5-cleft, almost regular. Stamens 5, one of which falls off along with the corolla, with combined filaments and cohering anthers; the 2 lower ones bearded. Stigma 2-lobed, girded by pili. Capsule baccate, 2-celled, naked at the apex, dehiscent; cells many-seeded.—Shrubby or arboreous laetaceous plants. Leaves alternate, entire. Flowers racemose, axillary, bracteate, showy, white, or of a rose-violet colour, blue.

1 C. oblongífolia (Gaud. l. c. t. 71.) leaves on very long petioles, oblong, acutius, crenated; calyx 5-parted. ½. G. Native of the Sandwich Islands.

Oblong-leaved Clermontea. Shrub.

2 C. perviciófólia (Gaud. l. c. t. 72.) leaves oblong-lanceolate, acute, crenated; calyx 5-cleft. ½. G. Native of the Sandwich Islands. Lobélia Clermontiánea, Gaud. mss.

Peach-leaved Clermontea. Shrub.

3 C. grándifólia (Gaud. l. c. t. 73.) leaves obovate-oblong, rather acuminate, dentately crenated; flowers large; calyx 5-parted. ½. G. Native of the Sandwich Islands. Lobélia grandifólia, Gaud. mss.

Great-flowered Clermontea. Shrub.

Cult. All the species of this genus bear ornamental blossoms, and are therefore worth cultivating in every collection of greenhouse plants. A mixture of loam, sand, and peat is the best soil for them; and they will be easily increased by cuttings planted in the same kind of soil, under a hand-glass, in a little bottom heat.

II. ROLLA´NDIA (named after R. M. Rolland, gunner of the expedition under Freycenet, who rendered great services to ornithology). Gaud. in Freyc. voy. pt. bot. p. 458.

Lin. syst. Pentándria, Monogýmia. Calyx closely adhering to the ovary; limb free, 5-parted, with short obtuse segments. Corolla tubular, with the sides compressed; tube curved, undivided; limb 5-parted, somewhat bilabiate: segments narrow, Stamens 5. Staminate tube adnate at the bottom to the superior part of the tube of the corolla. Anthers cohering, two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, indehiscent, 2-celled, crowned by the permanent calyx; cells many-seeded.—Laetaceous shrubs. Leaves alternate, exstipulate. Peduncles axillary, few-flowered. Pedicels unibracteate at the base. Flowers white.

1 R. lanceolatá (Gaud. l. c. t. 74.) shrub branched; leaves large, oblong-lanceolate, doubly toothed, hairy beneath; calyx 5-parted, glabrous, with ovate obtuse segments; racemes few-flowered; stamens epipetalous. ½. G. Native of the Sandwich Islands. Lobélia Rollandiánea, Gaud. mss. Lobélia lanceolata, Hook. et Arn. in Beech, voy. pt. bot. p. 88.

Lanceolate-leaved Rollandia. Shrub.

2 R. crípá (Gaud. l. c. p. 459.) shrub branched; leaves large, oblong, tapering much to the base, sharply toothed, glabrous, with undulately curled margins; calyx 5-parted, downy, with ovate obtuse segments; stamens epipetalous. ½. G. Native of the Sandwich Islands. Lobélia crispa, Gaud. mss.

Crepid-leaved Rollandia. Shrub.

3 R. pinnatífida; leaves oblong-lanceolate, acute at both ends, running into the short petioles, remotely pinnatifid, sinuately and doubly toothed: flat and glabrous above, reticulately veined beneath and rather hairy; teeth short, and are as well as the lobes obtuse and callously mucronate; racemes axillary; calyx and corolla hairy; ovary obconical, crowned by the auriculate, ovate, obtuse, calycine segments. ½. G. Native of Owahu, on the mountains. Lobélia pinnatifida, Cham. in Linnae. 7. p. 221. Leaves like those of a species of Sóechus. Pedicels rising from a fleshy peduncle, and furnished with scale-shaped bracteae. Corollas 2 lines long, deciduous. Stem branched. Perhaps a species of Cygnea.

Pinnatifid-leaved Rollandia. Shrub.

4 R. amácuá; leaves oblong-lanceolate, acute at both ends, sinuately and doubly toothed, flat and glabrous above, and hairy beneath and fussescent: teeth callously mucronate; racemes axillary; ovary obconical, smooth; calycine segments ovate, obtuse, mucronate, rather hairy; corolla hairy, especially on the nerves. ½. G. Native of Owahu. Lobélia ambigua, Cham. in Linnae. 7. p. 221. Stem simple. ? Corolla deciduous.
LOBELIACEÆ. III. CY'ANEÄ. IV. DELISSEA. V. PRATIA.

**Ambiguous Rollandia.** Shrub.  
5 R. calycina; leaves oblong-lanceolate, acute at both ends, unequally and erose crenated, flat and pilose above, and reticulately veined, fuscous and hairy beneath; calyx glabrous, with oblong, bluntish, 1-nerved segments; ovary olive-formed, crowned by the erect calyceine teeth; limb of corolla hairy; tube of anthers hairy about the base and along the furrows. "G. Native of Oahu. Lobélia calycina, Cham. in Linnaea. 7. p. 229. Corolla deciduous.

**Large-calysed Rollandia.** Shrub.  
Cult. See Clermontia, p. 698. for culture and propagation.

**III. CY'ANEÄ (from κυανός, kyanos, blue; colour of flowers).** Gaud. in Freyc. voc. pt. bot. p. 457.

**LIN. SYST. Pentândria, Monogynia.** Calyx adhering to the ovary, 10-furrowed, longer than the limb, which is foliaceous and 5-parted; segments oblong, with reflexed undulate curled margins. Corolla tubular, cylindrical, arched; limb 5-parted, somewhat bilabiata. Stamens 5, with combined filaments, and cohering bearded anthers. Stigma capitate, simple, ciliated with hairs. Capsule baccate, 10-furrowed, indescent, 2-celled, crowned by the permanent calyx; cells many-seeded.

1 C. Grimes's Cyanea (Gaud. l. c. p. 458. t. 78.) bracketed; leaves large, pinnae-parted, smoothish, with lanceolate coarsely toothed segments; petioles, rachis, and pedunciles beset with tubercular prickles; segments of calyx large. "G. Native of the Sandwich Islands. Lobélia Grimesiana, Gaud. mss. Hook. et Arn. in Beech. voc. pt. bot. p. 88.

Grimes's Cyanea. Shrub.  
Cult. See Clermontia, p. 698. for culture and propagation.

**IV. DELISSEA (named after A. M. Delisse, a physician from the Isle of France, and naturalist to the French expedition under D'Entrecasteaux, to the South Seas—from 1800 to 1804).** Gaud. in Freyc. voc. pt. bot. p. 457.

**LIN. SYST. Pen'tândria, Monogynia.** Calyx closely adnate to the ovary; limb free, 5-toothed, permanent. Corolla tubular, arched, deciduous; tube cylindrical, undivided; limb 5-parted, somewhat bilabiata; segments narrow. Stamens 5, with connate filaments, and cohering anthers; the two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, crowned by the permanent calyx, 2-celled, indescent; cells many-seeded.—Shrubby lacysecent plants. Leaves scattered, exstipulate, entire. Flowers racemose, axillary, pale red, or white or red; pedicels unibracteate at the base.

1 D. *Subcordata* (Gaud. l. c. p. 457. t. 77.) bracketed; leaves ovate, sharply toothed, glabrous. "G. Native of the Sandwich islands. Lobélia subcordata, Gaud. mss.

Subcordate-leaved Delissea. Shrub.  
2 D. *Undulata* (Gaud. l. c. t. 78.) stem simple; leaves oblong, sharply and coarsely toothed, glabrous, with undulate margins. "G. Native of the Sandwich Islands. Lobélia undulata, Gaud. mss.

Undulate-leaved Delissea. Shrub.  
3 D. acuminata (Gaud. l. c. t. 76.) bracketed; leaves oblong, doubly dentilicate, hairy on both surfaces. "G. Native of the Sandwich Islands. Lobélia Delissea, Gaud. mss.

LOBELIACEÆ. III. CY'ANEÄ. IV. DELISSEA. V. PRATIA.

**Narrow-leaved Delissea.** Shrub.  
Cult. For culture and propagation see Clermontia, p. 698.

**V. PRATIA (named in memory of M. Prat-Bernon, of the French navy, who accompanied Freycinet, but died a few days after the expedition sailed).** Gaud. in Freyc. voc. pt. bot. p. 456.—Lobélia species of authors.

**LIN. SYST. Pen'tândria, Monogynia.** Calyx adnate to the ovary; limb free, 5-toothed (f. 119. a.). Corolla funnel-shaped, cleft on the back, even to the base; limb 5-parted, spreading, unilabiate (f. 119. b.). Stamens 5, with the filaments combined into the tube above, and the anthers cohering; the two lower anthers mucronate (f. 119. d.). Stigma 2-lobed. Capsule covered by the fleshy calyx, 3-celled (f. 119 e.); indescent; cells many-seeded.—Small herbs. Stems filiform, branched. Leaves thickish. Flowers axillary, solitary, pedunculate, rarely corymbose, of a pale violet colour; peduncles bracteolate.

1 P. repens (Gaud. in Freyc. voc. p. 456. t. 79.) glabrous; stems creeping; leaves petiolate, rather reniform, undulate subcrenated. "F. Native of the Falkland Islands. Lobélia Pratiana, Gaud. mss. Flowers bluish-violet (f. 119. e.).

Creeping Pratia. Pl. creeping.

**Erect Pratia.** Fl. May, June. Cult. 1819. Pl. 1 foot.

3 P. corymbôsa; glabrous; stems weak, angular, branched; superior leaves linear-spatu-late; lower ones roundish, running into the petioles: all deeply serrated; flowers disposed in dense pedunculate corymbs; "F. Native of the Cape of Good Hope. Lobélia corymbosa, Hook. in bot. mag. t. 2639. Flowers pure white, richly dotted with purple, capitulate. Filaments and anthers combined; the latter bluish purple. Stigma capitulate, surrounded by a circle of hairs. Corymbose-flowered Pratia. Fl. June, July. C. 1824. Pl. 4. decumbent.

4 P. hederaceâ (Cham. in Linnaea. 7. p. 212.) glabrous; stems filiform, creeping; leaves on short petioles, orbicular, crenately toothed. "F. Native of Brazil, on the banks of the Uruguay, along with Hydrocotyle pusilla, and other parts of Brazil. Corolla bluish, villous inside. Filaments ciliate inside. Pedicels exceeding the leaves.

**Ivy-like Pratia.** Pl. creeping.

5 P. begoniæfolia; leaves roundish-cordate, serrate, petiolate, hairy on both surfaces, oblique at the base; pedicels solitary; calyce segments linear-subsutate; stems filiform, creeping, hairy. "F. Native of Nipaul, at Suembu, in fields near the town of Katmandu, and near water-courses and springs. Lobélia begoniæfolia, Wall. in asiat. res. 13. p. 377. Hook. bot. mag. with a figure. L. obliqua, Ham. mss. ex D. Don, prod. fl. nep. p. 158. Herb rather canescent. Flowers small, blue. Fruit round, fleshy, about the size of a pea, purple, with numerous flattened brownish seeds attached to 2 thick septal placentas.

4 v 2
LOBELIACEAE. V. PRATIA.

6. P. radi'cans; an annual, creeping, glabrous herb; leaves sessile, lanceolate, remotely serrated; pedicels axillary, solitary, twice the length of the leaves. 2. G. Native of China, from which place it was accidentally introduced to the botanic garden, Calcutta. Lobelia radiicans, Willd. spec. 1. p. 948. The plant spreads over the soil and roots at every branch. The flowers are large for the size of the plant, of a pink colour. Segments of the corolla equal, unilateral, and narrow-lanceolate, with 2 green glands under the middle sinuses, opposite to the long, green, 2-lobed stigma.

Rooting Pratia. Pl. creeping.

Thunberg's Pratia. Pl. creeping.

Cult. A mixture of loam, peat, and sand is a good soil for the species of Pratia; and they will easily be increased by dividing at the root, or by seed.

VI. TUPA (Tupa is the Chili name of the first species). Lobelia species of authors.

LIN. SYST. Pentandria, Monogynia. Calyx adhering to the spherical ovarium; limb 5-cleft. Corolla long, inflated at the base, cleft on the back its whole length, unlabiate; limb divided into 5 segments, which are all united at their tips. Stamens 5, united into a tube; anthers cohering, all bearded, or only in 2 lower ones. Style protruding beyond the anthers; stigma orbicular, 2-lobed, not bearded. Capsule 3-celled, 3-valved? cells many-seeded.—Tall strong herbaceous plants. Leaves alternate, ovate-lanceolate, downy. Flowers pedicellate, disposed in terminal racemes, or solitary from the axils of the upper leaves. Superior leaves sessile.

1. T. Feuillei; stem erect, thick, suffruticose at the base, simple, leafy; leaves ovate-lanceolate, sessile, decurrent, clothed with soft whitish down; raceme terminal, spike-like. 2. G. Native of Chili and Peru. Lobelia Tupa, Lin. spec. 3138. Sims, bot. mag. 2550. Sweet. fl. gard. 234. Feuille. per. 2. p. 739. t. 29. Corollas large, of a reddish scarlet colour, and are as well as the peduncles and calyces downy. This is a very poisonous species, even the smell of the flowers will cause vomiting, accordingly Feuille, and the milk of it, if by any accident it touches the eyes, occasions blindness.

2. T. sa'liciifolia; leaves lanceolate, sessile, glabrous, serrulated, reticulated beneath; pedicels axillary, bracteate, 1-flowered, shorter than the leaves; stem terete, filled with medula, simple or branched. 2. G. Native of Chili, about Valparaiso. Lobelia Tupa, Ait. hort. kew. 1. p. 357. Lobelia gigantea, Sims, bot. mag. 1325. Lobelia sa'licifolia. Sweet. Corollas yellow at first, then orange, and finally blood-red. Anthers hairy.

3. T. purpurea; leaves lanceolate, serrated, glabrous; flowers racemose; calyx spherical, 5-toothed; stem simple suffruticose. 2. G. Native of Chili, in the neighbourhood of Valparaiso. Anthers hairy. Lobelia purpurea, Lindl. bot. reg. 1325. Flowers fine purple.

4. T. argu'ta; leaves linear-lanceolate, serrulated, quite glabrous on both surfaces; pedicels axillary, shorter than the leaves; stem suffruticose, simple, glabrous. 2. G. Native of Chili. Lobelia arguta, Lindl. in bot. reg. 973. Pedicels bibracteate in the middle. Corollas of a deep yellow colour. Tube of anthers shorter than the style. Very like T. salicifolia.

VI. TUPA. VII. SIPOCAMYLYS.

Canaville's Tupa. Shrub 2 to 5 feet.

6. T. secunda; glabrous; leaves elliptic-lanceolate, wrinkled when dried, denticulated, with rather revolute edges; racemes terminal, axillary, 2-3, central, short; pedicels rising from the base of the upper leaves or bracteas, which are small and linear; column of stamens much exerted; two upper anthers bearded. 2. G. Native of Peru. Lobelia secunda, Ruiz et Pav. in herb. Lamb. Leaves dense. Segments of calyx membranous.

Secondflowered Tupa. Shrub.

7. T. ou'ata; glabrous; leaves ovate, slightly and distantly denticulated on the edges, wrinkled when dried; raceme long, terminal, linear, dense, secund; column of stamens much exerted; anthers bearded on the lower side. 2. G. Native of Peru.

(v. s. in herb. Lamb).

Ovate-leaved Tupa. Pl.

8. T. obovata; leaves obovate, obtuse, clothed with rusty tomentum beneath, slightly denticulated; pedicels axillary, 1-flowered, longer than the leaves; calyx spherical; corolla rather short. 2. G. Native of Peru. Lobelia incana, Ruiz et Pav. in herb. Lamb. Leaves wrinkled when dried. Flowers purple or red. Anthers all bearded.

Ovate-leaved Tupa. Pl. 2 to 3 feet.

9. T. polyphylla; leaves ovate-lanceolate, mucronate, sharply serrated, quite glabrous; racemes terminal leafy; tube of corolla not much longer than the calyx; two lower anthers bearded. 2. G. Native of Chili, on hills about Valparaiso. Lobelia polyphylla, Hook. et Arn. in Beech. voy. pt. bot. p. 33. Pedicels filiform, about the length of the bracteas. Corolla hardly an inch long, downy, dark purple.

Cult. The species of Tupa are deserving of cultivation in every collection, on account of the beauty and singularity of their flowers. They are generally raised from seed imported from the places of their natural growth; and when the plants are of a sufficient size, they are planted out into the open border in front of a south wall, where they flower in great perfection. In winter they may either be protected with the haum of herbs, or be taken up and put, and placed in a greenhouse or frame till the spring, when they should again be planted out.

VII. SIPOCA'MYLYS (from σιφων, siphon, a tube, and καυσάθως, kampsus, a curve; in reference to the curved tube of the corolla). Pohl. pl. bras. 2. p. 104.—Lobelia species of authors.

LIN. SYST. Tetrandria, Monogynia. Calyx adnate to the ovarium; limb 5-parted (f. 120. d.), having the segments shorter than the tube of the corolla. Corolla irregular, tubular (f. 120. a.); tube entire, decinate, rather ventricose in the middle, and rather concave at the base; limb 5-parted, bilabiate (f. 120. b.); upper lip of 2 straight or spreading segments; the 2 lower segments of the lower lip diverging, and the middle one more profound. Stamens and anthers combined, the latter bearded. Capsule ovate, 2-celled, 2-valved, dehiscing at the apex.—Erect shrubs or subshrubs. Leaves alternate and opposite, petiolate. Flowers axillary, solitary, rarely crowded at the tops of the stem or branches, so as
to appear racemose. The segments of the corollas are usually falcate or lanceolate; the upper ones generally the longest. The 2 lower anthers are usually bearded, and sometimes they are all bearded.

1 S. macra’nthus (Pohl, pl. bras. 2. p. 105. t. 168.) leaves oblong-ovate, acute, dentilicate, quite glabrous; tube of corolla ventricose at the apex, incurved; calyx glabrous, having the segments the length of the third part of the tube of the corolla. S. Native of Brazil, about Rio Janeiro, and elsewhere in that province, in shady bushy places.—Vaud. in Rom. script. p. 147. no. 2. Stem fistular, simple, green. Flowers axillary, solitary, approximate at the tops of the stems, and forming leafy racemes. Corollas of a bluish red colour. Anthers all much bearded at the apex.

Long-flowered Siphocampylus. Shrub 3 feet.

2 S. calyx (Pohl, pl. bras. p. 106. t. 169.) leaves ovate, acute, and rather villous, downy beneath; tube of corolla glabrous, rather ventricose; segments of calyx hairy, 4 times shorter than the tube of the corolla. S. Native of Brazil, in the province of Minas Geraes. Stem medullary in the centre, simple, hairy, a little branched. Flowers axillary, approximate at the top of the stem and branches, forming leafy racemes. Corollas of a bluish red colour.

Hoary Siphocampylus. Shrub 2 to 3 feet.

3 S. crenati-foliis (Pohl, pl. bras. 2. p. 107. t. 170.) leaves oblong, somewhat attenuated at the base, deeply crenated, downy beneath; tube of corolla glabrous, ventricose; calyx hairy, having the segments 4 times shorter than the tube of the corolla. S. Native of Brazil, in the province of Minas Geraes, among bushes about Villa St. João d’el Rey. Stem suffruticoso, fistular, tetragonal, furrowed. Leaves 3 inches long, and 1½ broad, yellowish green. Flowers axillary, solitary, remote, but so crowded at the tops of the stems as to appear leafy spikes; of a bluish red colour.

Crenate-leaved Siphocampylus. Shrub 2 to 3 feet.

4 S. villosululus (Pohl, pl. bras. 2. p. 108. t. 171.) leaves oblong-ovate, acute, deeply serrated, hairy, rather villous beneath, and truly villous on the nerves; corolla rather hairy; calyx having the segments 4 times shorter than the tube of the corolla. S. Native of Brazil, among bushes at Estrema, not far from Rio de Jiquitinhonha. Stem fistular, tetragonal, rather villous. Leaves 2 inches long, and 1½ broad. Flowers axillary, solitary; the upper ones forming leafy racemes. Corolla of a bluish-red colour.

Fimbrous Siphocampylus. Pl. 2 feet.

5 S. longipedunculatus (Pohl, pl. bras. 2. p. 109. t. 172.) leaves cordate at the base, and acuminate at the apex, dentilicate, quite glabrous; flowers solitary, on very long peduncles; tube of corolla ventricose, and is as well as the calyx glabrous; segments of the calyx 5 times shorter than the tube of the corolla. S. Native of Brazil, in the province of Rio Janeiro, among bushes. Stem suffruticoso, filled with medula, simple, glabrous. Leaves more than 3 inches long, and 1½ broad. Flowers all remote, on peduncles 4 inches in length. Corollas bluish-red.

Long-pedunculate Siphocampylus. Shrub 3 feet.

6 S. cardiophyllus (Pohl, pl. bras. 2. p. 110. t. 173.) leaves cordate, acuminate, rather undulated, quite glabrous, with remote short dentilications; flowers solitary, on long peduncles; tube of corolla as well as the calyx glabrous; calyce segments much shorter than the tube of the corolla. S. Native of Brazil, in the province of Minas Geraes, among bushes in mountainous places at Serra de Chumbo, not far from Rio Abaite. Stem suffruticoso, fistular, a little furrowed, glabrous. Leaves 2½ inches long, and more than an inch broad; the dentilications are the extension of the veins. Upper flowers forming a leafy raceme. Corolla bluish-red, having the segments ciliate.

Heart-leaved Siphocampylus. Shrub 3 feet.

7 S. sirius (Pohl, pl. bras. 2. p. 111. t. 174.) leaves coriaceous, acute, and rather villous, quite glabrous, shining, opake beneath, and the nerves are pilose when examined by a lens; tube of corolla rather ventricose, and rather hairy when examined by a lens; calyx downy, having the segments 3 times shorter than the tube of the corolla. S. Native of Brazil, in the province of Minas Geraes, about Facendo do Apolloniar, not far from Rio Abaite. Stem suffruticoso, filled with medula, glabrous. Leaves 2½ inches long, and more than an inch broad. Superior flowers forming a leafy raceme. Corolla bluish-red, hairy.

Shining-leaved Siphocampylus. Sh. 2 to 3 feet.

8 S. cortusiferus (Pohl, pl. bras. 2. p. 112. t. 175.) leaves cordate, acuminate, deeply and marginately toothed, ciliate, glabrous, rather hairy on the nerves and veins beneath; tube of corolla rather ventricose, glabrous; calyx glabrous, having the segments much shorter than the tube of the corolla. S. Native of Brazil, in the province of Minas Geraes, among bushes in mountainous places about Vieira. Stem herbaceous, fistular, glabrous. Leaves more than 2 inches long and an inch broad. Corymbs terminal, simple, many flowered. Corollas scarlet, smooth.

Corymbose-bearing Siphocampylus. Pl. 2 to 3 feet.

9 S. colu-mene; leaves oblong, rounded at both ends, crenate, coriaceous, rugged above, glabrous, and shining, but clothed with fuscouscent tomentum beneath; pedicels axillary, longer than the leaves; corolla a little curved, beset with stellate tomentum outside, having the segments linear-falcate, and nearly equal. S. Native of New Granada, in high places near the city of Santa Fe de Bogota. Lobelia Colunmæ, Mutis in Lin. suppl. p. 393. Smith, icon. ind. 1. p. 22. t. 22. H. B. et Kunth, nov. gener. 3. p. 302. Calyx tomentose outside. Two lower anthers bearded. Corollas red.

Column-forming Siphocampylus. Shrub.

Bearded Siphocampylus. Shrub 3 to 4 feet.

11 S. ferrugineus; leaves obovate-oblong, acutish, obliquely dentilicate, smoothish above, but clothed with rusty stellate tomentum beneath, especially on the nerve and veins; flowers axillary, pedicelate, longer than the leaves; calyce segments 4 times shorter than the tube of the corolla. S. Native of New Granada, near Santa Fe de Bogota; and of Peru, near Guanantamanta and Obragillo. Lobelia ferruginea, Mutis, Lin. suppl. p. 394. L. asclepiadea, Willd. rel. in Rom. et Schultes, syst. 5. p. 57. Branches clothed with rusty stellate tomentum. Calyx and corolla clothed with rusty stellate tomentum. Corolla red. Genitalia exerted. Two lower anthers bearded.

Rusty Siphocampylus. Shrub.

12 S. caoetchovic; leaves oblong, acute, rounded at the base, with glandularly dentilicate edges, smoothish above, but clothed with rusty tomentum beneath, particularly so on the nerve and veins; flowers axillary, pedicelate, shorter than the leaves; segments of the calyx dentilicate, one-half shorter
than the tube of the corolla. \* S. Native of the province of Popayan, in valleys near the river Mayo, near La Cruz; also in Paramo de Achipallas. Lobélia Caoutchouc, Willd. \* of Roem. et Schultes, \* t. 57. H. B. et Kunth, nov. gen. amer. 3. p. 304. Branchlets, calyx, and corolla clothed with rusty stellate tomentum. Corollas red. Gentians exerted. Antlers bearded. The milk from this plant forms an elastic gum, which is called Caoutchouc by the natives.

**Caoutchouc Siphocampylus.** Shrub 10 to 15 feet.

13 S. \* umbellatus; leaves oblong-lanceolate, acuminate, denticulate, smoothish above, and downy beneath; flowers crowded into umbels at the tops of the branches, on long pedicels; segments of calyx equal in length to the tube of the corolla; lower lip of corolla entire, acute. \* S. Native of Peru, on the Andes, near Ayavaca; also of Brazil. Lobélia umbellata, H. B. et Kunth, nov. gen. amer. 3. p. 304. t. 268. L. Ayavacensis, Willd. \* of Roem. et Schultes, \* t. 57. A fétid shrub, with villous angular branches. Leaves a foot long. Calyx clothed with viscid hairs. Corolla white, downy. Antlers bearded with yellowish hairs. This will probably form a distinct genus from the lower lip of the corolla being entire. **Umbellate-flowered Siphocampylus.** Shrub.

14 S. \* giganteus; leaves oblong-lanceolate, acuminate, toothed, reticulately wrinkled, glabrous above, and downy beneath, and clothed with hoary tomentum along the nerves and veins; flowers axillary, on very long peduncles; calyx segments equal in length to the tube of the corolla; filaments glabrous. \* S. Native of New Granada, on elevated plains about Bogota; and on the Andes. Lobélia gigantea, Cav. \* of Roem. et Schultes, \* p. 305. Branches downy. Calycine segments irregularly crenated. Calyx and corolla downy outside. Antlers bearded, with long yellowish hairs. Corolla of a yellowish red colour. Intermediate between **Siphocampylus** and **Tupa.**

**Giant Siphocampylus.** Shrub 14 feet.

15 S. \* foetidus; leaves lanceolate-oblong, acuminate, narrowed at the base, denticulate, hairy on both surfaces; flowers axillary, on long pedicels; segments of the calyx equal in length to the tube of the corolla; filaments downy. \* S. Native along with the preceding. Lobélia foetida, Willd. \* of Roem. et Schultes, \* t. 57. H. B. et Kunth, nov. gen. amer. 3. p. 305. Branches hairy, fuscuscent. Pedicels villous, bibracteate at the base. Corolla white? Calyx and corolla hairy outside. Gentians exerted. Antlers densely bearded with yellowish hairs. A fetid shrub.

**Fétid Siphocampylus.** Shrub.

16 S. \* miltius; hairy; leaves oblong, acuminate, serrated, on very short pedicels; pedicels axillary, very long, at the tops of the stem and branches. \* S. Native of Quito, on Mount St. Antonio. Lobélia hirta, Cav. \* of Roem. et Schultes, \* p. 13. t. 520. Branched. Leaves more than 6 inches long and 1½ broad, tapering into the pedicels. Calyx globose, villous. Corollas scarlet, villous. Stamens glabrous.

**Hairy Siphocampylus.** Shrub 5 to 6 feet.

17 S. \* comosa; leaves lanceolate, toothed, powdery beneath; corollas terminal, supported by a tuft of leaves. \* S. Native of New Spain. Lobélia comosa, Cav. \* of Roem. et Schultes, \* p. 9. t. 512. f. 1. Stems simple, furrowed. Leaves on short pedicels, 2 inches long, green above, and yellowish beneath. Pedicels villous. Antlers and stigma bearded. Corollas yellowish.

**Tufted-leaved Siphocampylus.** Shrub 2 to 3 feet.

18 S. \* Cavanillesia; leaves ovate-lanceolate, biserated; flowers axillary, solitary, bibracteate, the whole forming a leafy raceme. \* S. Native of Peru, about the town of Buena Ventura. Lobélia cavanillesi, Cav. \* of Roem. et Schultes, \* p. 10. t. 514. Branches furrowed. Leaves on short pedicels, tomentose beneath: lower ones 3 inches long and 1½ broad. Pedicels bibracteate, thickened at the base and apex. Corolla of a yellowish scarlet colour, cleft a very little way on the back, glabrous.

**Cavanilles's Siphocampylus.** Shrub 3 feet.

19 S. \* besleroides; leaves oblong-elliptic, rounded at the apex, denticulated, hairy on both surfaces; flowers axillary, bibracteate, shorter than the leaves; segments of calyx 4 times shorter than the tube of the corolla. \* S. Native of the Andes, about Popayan. Lobélia besleroides, H. B. et Kunth, nov. gen. amer. 3. p. 306. Habit of a species of **Besleria.** Branches clothed with viscid hairs. Leaves rather hairy on both surfaces. Pedicels villous, bracteate. Calyx and corolla hairy outside, the latter white. Two lower antlers bearded.

**Besleria-like Siphocampylus.** Shrub 2 to 3 feet.

20 S. \* spectabilis; leaves oblong, acute, obtuse at the base, minutely denticulated, glabrous; flowers axillary, pedicellate, shorter than the leaves; corolla glabrous, 5 times longer than the calyx. \* S. Native of the province of New Andalusia, on Mount Cocollar, in shady humid places. Lobélia spectabilis, Willd. \* of Roem. et Schultes, \* t. 57. H. B. et Kunth, nov. gen. amer. 3. p. 306. Branches glabrous, 3½ inches long. Pedicels bibracteate at the base. Calyx glabrous, with somewhat denticulate hairy segments. Corollas scarlet. Antlers bearded.

**Showy Siphocampylus.** Shrub 2 feet.

21 S. \* surinamensis; leaves oblong-lanceolate, acute, obtuse at the base, remotely denticulated, glabrous; flowers pedicellate, axillary, shorter than the leaves; corolla glabrous, with the tube 3 times longer than the segments of the calyx. \* S. Native of Surinam, New Granada, and Brazil. Lobélia surinamensis, Lin. \* of Roem. et Schultes, \* p. 3. p. 306. Branches angular, downy. Leaves petiolate. Segments of corolla undulate. Corolla scarlet. Two lower antlers bearded.

**Long-pedicelled Siphocampylus.** Shrub 2 to 3 feet.

**West's Siphocampylus.** Shrub 2 to 3 feet.

24 S. \* grandis; leaves oblong, acute, crenately serrate, glabrous; umbels terminal, bibracteate; corollas hairy; segments of the calyx 10 times shorter than the tube of the corolla. \* S. Native of New Granada, near Santa Fe de Bogota. Lobélia grandis, Mutis in Lin. \* of Roem. et Schultes, \* p. 3. p. 307. Branches glabrous. Leaves 5 inches long and 2 broad. Flowers pedicellate, red, hairy outside as well as the calyx. Pedicels bibracteate at the base; bibracteate, hairy. Two upper segments of the corolla falcate. Antlers hairy; two lower ones bearded.

**Grand Siphocampylus.** Shrub.
about equal in length to the tube of the corolla. \( S. \) Native along with the preceding species. Lobélia glabrātā, H. B. et Kunth, nov. gen. amer. 3. p. 307. t. 270. Branches glabrous. Leaves 3-4 inches long, glabrous, pale green, petiolate. Pedicels bractless. Calyx and corolla glabrous; the latter greenish. Segments of corolla falcate. Filaments downy; anthers glabrous. Genitals exerted.

_Glabrous_ Siphocampylus. Shrub.

26 S. _Mutisia_‘anus’; leaves oblong, short-acuminate, narrowed and acute at the base, remotely and bluntly toothed, glabrous, except the nerve and veins beneath, which are hairy; flowers axillary, pedicellate, shorter than the leaves; corollas glabrous, much longer than the calycine segments. \( S. \) Native of New Granada, on frigid mountains. Lobélia Mutisiana, H. B. et Kunth. nov. gen. amer. 3. p. 308. Branches rather hispid. Leaves 6-7 inches long. Petioles hairy. Pedicels bractless. Segments of calyx smooth, irregularly crenated. Corolla greenish, with falcate segments. Column of stamens glabrous; two lower anthers bearded.

_Mutis’s_ Siphocampylus. Shrub.

27 S. _volubilis_; stem twining; leaves ovate, acuminate, cordate, sharply toothed, glabrous above, and clothed with fine down beneath; flowers axillary, pedicellate; corolla hairy; segments of calyx 5-6 times shorter than the tube of the corolla. \( S. \) Native on the shady banks of the Oronico. Lobélia volubilis, H. B. et Kunth, nov. gen. amer. 3. p. 309. L. cordata, Wild. rel. ex. Loxa et Schultes, syst. 5. p. 58. Branches glabrous. Leaves cordate at the base. Pedicels downy, bractless. Corollas scarlet. Genitals exserted, glabrous. Anthers bearded (f. 120.).

_Twining_ Siphocampylus. Shrub twining.

28 S. _Berteri_‘a’; leaves remote, on long petioles, ovate-oblong, acuminate, crenately suberéneted, membranous, quite glabrous; pedicels solitary, axillary, loose; stem scendant. \( S. \) Native of Guadaloupe. L. scandens, Bertero. L. Berteriāna, Spreng. syst. 1. p. 712.

_Bertero’s_ Siphocampylus. Shrub cl.

29 S. _sca’dens_; stem scendant; leaves oblong, obtuse, quite entire, rather fleshy, with revolute edges, glabrous; racemes terminal; flowers reflexed; corollas glabrous; calycine segments linear, slightly denticulated. 5-6 times shorter than the tube of the corolla. \( S. \) Native of Peru, in cold places between Paramo de Saraguru and the city of Loxa. Lobélia scandens, H. B. et Kunth, nov. gen. amer. 3. p. 309. Lobélia obusiifolia, Wild., ex. Loxa et Schultes, syst. 5. p. 57. Branches glabrous. Pedicels furnished with one bractea at the base. Calyx glabrous. Corolla scarlet, with falcate segments. Column of stamens glabrous. Two inferior anthers bearded. Stigma girded by a pilose ring.

_Climbing_ Siphocampylus. Shrub cl.

30 S. _duplsera_‘tus_ (Pohl. pl. bras. 2. p. 114. t. 177.) leaves oblong or cordate at the base, twice serrated, petiolate; peduncles longer or shorter than the leaves; genicula exerted. \( S. \) Native of Brazil. Lobélia triphyllassa, Presl, symb. bot. 4. p. 62. t. 4. Corollas red or scarlet.

_Doubly-serrate_ Siphocampylus. Shrub 2 to 3 feet.

31 S. _andrópō_‘on’; leaves ovate, glabrous, hardly denticulated, soft; flowers axillary, solitary, pedicellate; corolla glabrous, curved. \( S. \) Native of the province of Quito, on Mount St. Antonio, in shady woods. Lobélia Andröpōgon, Cav. &c. S. p. 6. p. 10. t. 515. Stem glabrous, furrowed. Leaves 3 inches long, petiolate. Pedicels shorter than the leaves, villous at the base, bracteate. Corolla scarlet, having the lower lip rounded, with 3 small acute teeth. Anthers bearded.

_Bearded-anthered_ Siphocampylus. Shrub 5 to 6 feet.

32 S. _circifolius_; leaves linear-lanceolate, toothed, glabrous; teeth subulate, distant; raceme terminal, leafy. \( S. \) Native of the Antilles and St. Vincent. Lobélia circifolia, Lam. dict. 3. p. 584. no. 12. - Plum. spec. vol. 5. t. 116. Stem straight, simple, naked at the base, glabrous. Corolla curved, green or yellowish green.

_Circum-leaved_ Siphocampylus. Shrub 1 1/2 foot.

33 S. _verticillata_ (Cham. in. Linn. 7. p. 202.) leaves 6-8 in a whorl, almost sessile, narrow-oblong or linear-oblong, sharply and finely serrated, pale beneath; pedicels axillary, verticillate, shorter than the leaves, but the flowers exceed the leaves; calycine segments acute, more than 6 times shorter than the corolla; anthers glabrous on the back, and bearded in front; stem filled with medulla, erect, simple, densely leafy; root oblique. \( S. \) Native of the south of Brazil. Stem of stem and ribs of leaves rather hairy, and the peduncles, calyces, and corollas downy. Corollas red, 2 inches long, curved before expansion.

_Whorled-leaved_ Siphocampylus. Shrub 3 to 6 feet.

34 S. _betulefolius_ (Cham. in. Linn. 7. p. 204.) leaves scattered, petiolate, cordately triangular or ovate, acuminate, somewhat doubly and acutely serrated, nerved, and veined; pedicels axillary, solitary, exceeding the leaves; calycine segments narrow, acute, serrated, more than 6 times shorter than the corolla; anthers exerted, glabrous on the back, and bearded in front; stem flexuous, branched, terete, glabrous. \( S. \) Native of Brazil. Nerves of leaves and pediades downy. Corollas red, long. Very like _S. scandens_.

_Birch-leaved_ Siphocampylus. Shrub 3 feet.

35 S. _convolvolacea_ (Cham. in. Linn. 7. p. 205.) shrubby, climbing, and twining, glabrous; branches terete, slender; leaves petiolar, narrow, ovate-lanceolate, acuminate, with reflexed obsoletely denticulated edges; pedicels axillary, solitary, much longer than the leaves; ovarium oblong; teeth of calyx small; corolla long; anthers a little exserted, naked on the back. \( S. \) Native of Brazil. Corolla red, about 2 inches long. Leaves 3 inches long. Very like _S. scandens_ and _S. volubilis_.

_Conevolvelous-like_ Siphocampylus. Shrub cl.

36 S. _imbricata_ (Cham. in. Linn. 7. p. 206.) leaves imbricated, almost sessile, ovate, cordate, hardly acute, serrulated, with rather reflexed edges, scabrous from hairs above, shining, flat; paler beneath, and more hairy, and reticulately veined; pedicels axillary, shorter than the leaves, and are as well as the calyxes hairy; calycine segments linear, acute, 4 times shorter than the corolla; corollas downy, exceeding the leaves; anthers exerted, naked on the back; stem with many prominent cicatrises, occasioned by the falling of the leaves, clothed at bottom with brown stiff hairs, and densely leafy at the top. \( S. \) Native of Brazil. Leaves 6 in a whorl, by threes. Corolla red.

_Imbricated-leaved_ Siphocampylus. Shrub.

37 S. _lycoides_ (Cham. in. Linn. 7. p. 207.) erect, glabrous; leaves sessile, erect, narrow-lanceolate, acute, remotely and bluntly serrulate; lower ones somewhat verticillate, by threes, alternate; racemes leafy, terminal; floral leaves 6 in a whorl, having the pedicells by threes, verticillate; pedicels erect, a little shorter than the leaves; segments of the calyx ovate,
LOBELIACEÆ. VII. SIPHOCAMPYLLUS. VIII. LOBELIA.

long-acuminated, 6 times shorter than the corolla; anthers a little exserted, glabrous. \( \gamma. \) S. Native of Brazil. Corolla red.

Lycium-like Siphocampylus. Shrub 3 feet.

38 S. depe'dens; leaves coriaceous, ovate-lanceolate, somewhat cordate at the base, acuminate, finely and spinosely denticulated, tomentose beneath, glabrous above; branches and inflorescence downy or tomentose; pedicels from the axils of the upper leaves, and longer than them; column much exserted; calyce lobes linear-subulate. \( \xi. \) S. Native of Peru. Lobélia de'pendens, Ruiz et Pav. in herb. Lamb. Flowers racemose, at the tops of the branches. Plant scarce.

Dependent-branched Siphocampylus. Shrub cl.

39 S. rosamarinifolius; erect; leaves linear-lanceolate, entire, with revolute margins, tomentose beneath, and glabrous above; pedicels axillary, about the length of the leaves; column of stamens exserted; calyx with a spherical tube, and long linear segments. \( \xi. \) or \( \gamma. \) S. Native of Peru. Lobélia purpuræa, Ruiz et Pav. in herb. Lamb. Corollas red. Lower anthers bearded at top. Leaves dense, like those of some species of willow.

Rosemary-leaved Siphocampylus. Pl. 2 to 3 feet.

40 S. macropýllus; leaves broad, obovate, acuminate, glabrous, slightly denticulated, tapering much to the base; flowers almost forming a terminal corymb, much shorter than the leaves; calyx with a hemispherical tube and ovate-lanceolate segments; column of stamens exserted; the lower anther bearded at top. \( \gamma. \) S. Native of Peru. Leaves a foot long. Pedicels crowded. Corollas red. (v. s. in herb. Lamb.)

Large-leaved Siphocampylus. Pl. 2 to 3 feet?

41 S. lacinia'ta; leaves deeply jagged, acuminate; lobes of corolla falcate; column of stamens downy; anthers glabrous, except the two lower ones, which are bearded at the apex; calyx spherical. \( \gamma. \) II. Native of Peru. Lobélia biserráta, Ruiz et Pav. in herb. Lamb. Corollas red or scarlet.

Jagged-leaved Siphocampylus. Shrub.

42 S. fu'scus; clothed with rusty tomentum in every part; calyx spherical, with reflexed denticulated lobes; leaves elliptic-lanceolate, denticulated; peduncles axillary, 1-flowered; corolla clothed with rusty wool; two lower anthers bearded. \( \gamma. \) S. Native of Peru. Apparently a climbing shrub. (v. s. in herb. Lamb.)

Brown Siphocampylus. Shrub cl.

Cult. The species all bear large, showy, scarlet, or red flowers, and are therefore worth cultivating in every collection of stoute plants. They are of easy culture. The soil best suited to them is a mixture of loam, sand, and peat; and cuttings of them strike readily in the same kind of soil under a hand-glass in heat.

VIII. LOBELIA (in honour of Matthew Lobel, author of various works, and particularly that called Icones Plantarum; he was born at Lisle in 1538, became physician and botanist to James I., and died in London in 1616). Pohl, pl. bras. 2. p. 99.—Lobélia species, Lin. and other authors.

Lin. syst. Pentändría, Monogynía. Calyx adnate to the ovary; limb 5-parted (f. 121. a.). Corolla irregular, tubular; tube cleft on the upper side, thickened or ventricose at the base; limb 5-parted, bilabiate; the 2 segments of the upper lip linear-lanceolate (f. 121. f.); lower lip trifid and pendulous, with lanceolate or roundish segments (f. 121. g.). Filaments combined above (f. 121. e.). Anthers cohering (f. 121. c.); bearded; the 2 lower ones usually bearded, and sometimes all. Capsule oval, 2-celled, 2-valved, many-seeded, dehiscing at the apex.—Erect or procumbent herbs. Leaves alternate, usually sessile. Flowers on short pedicels, usually disposed in terminal leafy spikes or racemes, rarely solitary and axillary, blue, red, or white, rarely yellow.

§ 1. Species natives of America.

* Corollas blue.

1 L. campúrum (Pohl, bras. 2. p. 100. t. 165.) leaves linear, acute, remotely toothed, ciliated on the margins, glabrous, rather decurrent; flowers spicate, rather remote on short pedicels; bracteas oblong, acuminate, rarely toothed, pilose; calyx pilose, a little shorter than the tube of the corolla. (o. H. Native of Brazil, in the province of Minas Geraes, in dry fields about Villa de Barbacena. Anthers all bearded. In the plant collected by Sello the lower leaves are ovate, and the upper ones lanceolate. Stem filiform, simple, pilose. Corollas blue.

Field Lobelia. Pl. 1 foot.

2 L. exal'ta (Schott in Pohl, pl. bras. 2. p. 101. t. 166.) leaves sessile, lanceolate, acumimated, rather attenuated at the base, denticulated, quite glabrous; flowers racemose, coarctate, pedicleallate; bracteas lanceolate, acuminate, rather hairy; calyx pilose, exceeding the tube of the corolla in length. (f. S. Native of Brazil, in marshy places in the province of Rio Janeiro, at Fazenda Malheas Ramos, as well as of the province of Minas Geraes. Stem fustular, furrowed, quite simple, glabrous, of a yellowish green colour. Bracteas ciliated. Corollas blue.

Exalted Lobelia. Pl. 5 feet.

3 L. thapsóides (Schott, ex Pohl, bras. 2. p. 102. t. 167) leaves sessile, lanceolate, attenuated at the base, very long, denticulated, ciliated, rather pilose; flowers racemose, coarctate, on short pedicels; calyce segments lanceolate, acumimated, pilose, shorter than the tube of the corolla. (f. S. Native of Brazil, about Rio Janeiro; and of the province of Guayz. Stem tough, filled, simple, rather pilose, of a greenish brown colour. Bracteas ciliated. Flowers dense blue.

Thapsus-like Lobelia. Pl. 6 feet.

4 L. paucifílora (H. B. et Kunth, nov. gen. amer. 3. p. 314.) stem herbaceous, erect, simple; leaves sessile: radical ones lanceolate: cauline ones linear, remotely denticulated, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on short pedicels; calyce segments hairy, as well as the corolla, one-half shorter than the tube of the corolla. (f. S. Native of Brazil, in the province of Minas Geraes, in dry grassy places about Villa Barbacena; and of Mexico, near Valladolid de Mechoacan. L. commutáta, Willd. rel. ex Rem. et Schultes, syst. 5. p. 73. L. simplex, Willd. herb. Corollas blue. Stem glabrous, striated. Bracteas linear, hairy, longer than the pedicels.

5 L. raúnculóides (H. B. et Kunth, nov. gen. 3. p. 312.) leaves linear-lanceolate, acute, denticulated, glabrous, sessile; racemes terminal, loose-flowered; calyce segments equal in length to the tube of corolla; stems branched, procumbent. (f. S. Native near the town of Mexico. L. dracunculóides, Willd. rel. ex Rem. et Schultes, syst. 5. p. 56.?) Stem hairy at bottom. Flowers remote, pedicleallate. Bracteas linear, about the length of the pedicels. Corolla blue, glabrous. Leaves 1/2 inch long. Two lower anthers bearded.

Rampion-like Lobelia. Pl. procumbent.

6 L. collínæ (H. B. et Kunth, nov. gen. amer. 3. p. 312.) leaves lanceolate-linear, acute, denticulated, glabrous, sessile; racemes terminal, ascending: segments of the calyx one-half shorter than the tube of the corolla; stems procumbent; branches ascending, glabrous. (f. S. Native of Peru, on dry
hills between Malacatis and Gonzanama, at the altitude of about 3000 feet. L. linifolia, Willd. rel. ex Rem. et Schultes, syst. 5. p. 67. Leaves 1 to 1½ inch long. Pedicels recurved, about equal in length to the bracteas, which are linear. Flowers of a violaceous blue colour. Two lower anthers bearded.

**Hill Lobelia.** Pl. procumbent.

7 **L. fastigiata** (H. B. et Knnth, nov. gen. amer. 3. p. 313.) leaves lanceolate, remotely denticulated, glabrous, almost sessile; racemes terminal, elongated; calycine segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, with fastigiate branches. **Σ.** Native of Quito, near Popayan and Chillo, at the altitude of about 3000 feet. Lobélia tenuifolia, Willd. rel. ex Rem. et Schultes, syst. 5. p. 56. Stems and branches angular, glabrous. Leaves 12-15 lines long. Bracteas linear, oblong, denticulated, shorter than the pedicels. Corolla violaceous. Two lower anthers bearded.

**Fastigate-branched Lobelia.** Pl. 9

8 **L. m'ollis** (Graham. in edinb. phil. journ. Decemb. 1829.) stem erect, branched, downy; leaves petiolate, cordately ovate, acute, downy above, and along the veins beneath, mucronately and doubly serrated; superior leaves lanceolate; racemes terminal, elongated; pedicels loose; segments of the lower lip of the calyx subulate, shorter than the corolla. **O. F.** Native of Dominica, where it was collected by Dr. Krauss. Leaves 8 lines long and 6 broad. Calycine segment equal in length to the tube of the corolla, which is purplish, with the tube cleft along the upper side. Anthers purplish, having 2 short white awns projecting from their lower edge. Stigma almost simple, bearded. Perhaps a distinct genus.

9 **L. rep'estris** (H. B. et Kunth, nov. gen. amer. 3. p. 313.) leaves sessile, hairy or downy, toothed; lower ones oblong or ovate-oblong, obtuse; superior ones lanceolate, acute; racemes terminal; segments of the calyx hairy, about equal in length to the tube of the corolla; stem erect, branched a little. **Σ.** Native of the province of Popayan, on the declivities of the burning Mount Purace. Lobélia polygalæfolia, Willd. rel. ex Rem. et Schultes, syst. 5. p. 56. Stems rather angular, and are as well as the branches downy. Bracteas linear, lanceolate, twice the length of the pedicels, which are distant. Flowers violaceous. Anthers blue, 2 lower ones bearded.

**Rock Lobelia.** Pl. 1 foot.

10 **L. ten'tera** (H. B. et Kunth, nov. gen. amer. 3. p. 314.) leaves sessile, lanceolate-linear; lower ones lanceolate, remotely denticulated, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on long pedicels; calycine segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, simple, glabrous. **Σ.** Native of the province of Quito, on hills near Puemba. Leaves 12-15 lines long. Flowers blue, remote, about the size of those of *L. aren*us. Filaments ciliated at the base. Two lower anthers bearded.

**Tender Lobelia.** Fl. July. Pl. ½ foot.

11 **L. xala'pesis** (H. B. et Kunth, nov. gen. amer. 3. p. 315.) leaves on long petioles, ovate-deltoid, irregularly crenated, hairy above, glabrous beneath; racemes terminal, pedunculate; calycine segments about equal in length to the tube of the corolla; stem erect, panically branched, angular, glabrous. **Σ.** Native of Mexico, near Xalapa and Macutlipac. Leaves nearly as broad as long. Bracteas linear, much shorter than the pedicels. Filaments ciliated at the base. Two lower anthers bearded.

**Xalapa Lobelia.** Pl. ½ foot.

12 **L. kältmi** (Linn. spec. 1518.) radical leaves spatulate, hairy: cauline ones linear, glabrous, sessile, denticulated or nearly entire; racemes loose, leafy; pedicels furnished with 2 bracteas at the apex, longer than the capsules; stem erect, slender, glabrous. **Σ.** Native of North America, in Canada, Carolina, and New York. Sims, bot. mag. 2238. Corollas beautiful blue, with the segments of the lower lip obovate, acute, marked by 2 white confluent spots in the centre. The variety of this which grows in Carolina has the radical leaves roundly spatulate; the stem more slender, and the flowers smaller.

**Kalm's Lobelia.** Fl. July, Aug. Clt. 1820. Pl. 1 to 1½ ft. 13 **L. nut'talli** (Rem. et Schultes, syst. 5. p. 39.) leaves oblong-linear, denticulated, obtuse, remotish; flowers loosely racemose, distinct; pedicels coloured, shorter than the flowers, bibracteate at the base; segments of the calyx obtuse; stem erect, minutely scabrous, branched. **Σ.** Native of North America, from New Jersey to Carolina, on the dry sandy edges of bogs. _L. gracilis_, Nutt. gen. amer. 2. p. 77. but not of R. Br. Pedicels and corollas blue; the lower lip marked by 2 acute white stripes, and 2 green dots, and other 2 towards the base of the tube. Very like _L. Kalmii_, and probably a variety of it.

14 **L. fen'estralis** (Cav. icon. 6. p. 8. t. 512, f. 2.) leaves lanceolate, acuminate, toothed, half-stem-clasping, glabrous, glaucous; spikes terminal, many-flowered; genitils shorter than the tube of the corolla. **O. H.** Native of Mexico, near the town of St. Bartolome. Stem simple, furrowed. Leaves 2 inches long and 2 lines broad. Flowers almost sessile, disposed in leafy spikes, small, blue, bibracteate at the base, about 2 lines long. Stigma villous. Tube of corolla about 2 lines long. Genitils one-half shorter than the corolla.

15 **L. cliffor'dia** (Lin. spec. p. 1320.) leaves on long petioles, ovate or roundish-ovate, rather cordate, bluntly and sinuately toothed, glabrous; racemes terminal, on long peduncles; calycine segments glabrous, about equal in length to the tube of the corolla; stem erect, nearly simple, glabrous. **O. H.** Native of North America, in humid places; and of Cuba, about the Havana; and of Mexico, near San Andres and Jalapa, in bushy places. Stem angular. Root perpendicular. Bracteas linear, much shorter than the pedicels, which are long and filiform. Corollas blue or violaceous.

**De Clifford's Lobelia.** Pl. ½ to 1 foot.

16 **L. spi'ca'ra** (Ruiz et Pav. in herb. Lamb.) glabrous; stem simple; leaves obvolutely lanceolate, obtuse, denticulated; upper ones lanceolate, sessile, denticulated; racemes simple; pedicels rising from the axils of the linear bracteas. **Σ.** Native of Peru. Flowers small, blue. Like _L. arenus_. Calyx tubular, with subulate segments.

**Spice-flowered Lobelia.** Pl. 1 foot.

17 **L. monte'cola** (H. B. et Kunth, nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, obtuse, rather cordate, doubly serrated, hairy on both surfaces; racemes terminal, on long peduncles; segments of calyx glabrous, about equal in length to the tube of the corolla; stem erect, almost simple, rather angular, glabrous, or a little hairy. **O. H.** Native of New Granada, on the mountains between Fusagasuga and Pande. L. palmarius, Willd. rel. ex Rem. et Schultes, syst. 5. p. 56. Root perpendicular, branched. Bracteas linear, much shorter than the pedicels. Corollas blue, glabrous. Anthers puberulous at the apex, but beardless.

**Mountain Lobelia.** Pl. ½ foot.

18 **L. mic'a'stha** (H. B. et Kunth, nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, acuminate, dentately serrated, nearly glabrous; racemes terminal, sessile; calycine segments glabrous, about equal in length to the tube of the corolla; stem erect, panically branched, angular, hairy. **O. H.** Native of the province of Quito, near Puembo. Lobélia ruđeráfi, vol. III.

24 L. colorata (Sweet fl. gard. n. s. t. 180.) glabrous; leaves lanceolate, acuminate, erosely toothed; raceme spicate, elongated, leafy; calycine segments linear-subulate. \( \gamma \) H. Received from North America, but probably a hybrid between \( L. syphilitica \) and \( L. cardinclus \). Corollas deep azure blue, crowded. Ovarium half inferior. This is probably the \( L. \) carleastes, Nutt. and L. crispa, Graham. ex Loud. hort. brit. p. 75.

Coloured Lobelia. Fl. Pl. 4 to 5 feet.

25 L. celestis (Nutt. ex Loud. hort. brit. p. 592.) this plant is in the gardens, but we are not aware of where it is described; it comes very near to \( L. syphilitica \), and may be a variety of that species. \( \gamma \) H. Native of North America. L. crispa, Graham. ex Loud. hort. brit. p. 75. Flowers of a beautiful blue, disposed in long dense terminal racemes.

26 L. uranocephala (Cham. in Linnaea. 7. p. 321.) stem erect, angular, fistular; leaves hairy, erect, linear, attenuated, acute, finely denticulated; pedicels disposed in a terminal leafy raceme, shorter than the floral leaves, which are densely imbricated, ovate, acute, and shorter than the others, of a blueish colour; segments of the calyx linear, attenuated, about equal in length to the middle of the corolla, which is clothed with fine glandular down; anthers bearded in front. \( \gamma \) S. Native of tropical Brazil. Leaves a foot long. Corolla cleft on the back, nearly 2 inches long, blue.

Blue-tufted Lobelia. Pl. 5 feet.

27 L. glandulosa (Walt. car. p. 218.) leaves lanceolate, glandularly serrated, rather fleshy, glabrous; flowers on short pedicels, racemose; segments of the calyx resolve, toothed; stem erect, branched, rather downy. \( \gamma \) H. Native of Carolina, by the sea side in marshes among grass. L. crassiiulosa, Michx. fl. bor. amer. 2. p. 152. Nutt. gen. amer. 2. p. 76. Pedicels furnished with 2 bracteas, which are terminated by a gland each. Corollas blue, having the disk of the lower lip bearded. Stigma beset with white hairs.

Glandular-leaved Lobelia. Pl. 1 to 2 feet.

28 L. pubérula (Michx. fl. bor. amer. 2. p. 152.) plant very simple, downy; leaves oblong, obtuse, re pandly serrated; flowers almost sessile, forming together a leafy elongated spike; calyx downy; calycine segments erect, lanceolate-subulate, entire, having the sinus a little reflexed; stamens included. \( \gamma \) H. Native from Virginia to Carolina, in mountain tracts. Pursh. fl. amer. sept. 2. p. 447. Bracteas serrulated. Flowers pale blue. Ovarium equal hispid. It differs from \( L. \) Claytoniana in the flowers being thrice the size, and of a more beautiful blue.

Var. \( \beta \), glabellula (Hook. bot. mag. t. 3292.) leaves hardly downy; calyx glabrous. \( \gamma \) H. Native of Louisiana, about Jackson Ville. Corolla bright purplish blue.

29 L. aména (Michx. fl. bor. amer. 2. p. 153.) plant quite glabrous; leaves broad-lanceolate, serrated; spikes secund, many-flowered; segments of the calyx entire; segments of the lower lip of the corolla ovate, acute. \( \gamma \) H. Native from Virginia to Carolina, on the mountains. Leaves usually glabrous, 6-8 inches long, and 1 inch broad. Corollas pale blue. Pursh. fl. sept. amer. 2. p. 443. Nutt. gen. amer. 2. p. 76. Juss. ann. miss. 18. p. 16. t. 1. no. 1.

30 L. gruina (Cav. icon. 6. p. 8. t. 511. f. 2.) leaves sessile,
LOBELIACEÆ. VIII. LOBELIA.

lanceolate-linear, toothed; stem naked at the top, therefore the raceme of flowers is naked and terminal; bracteas subulate. 2. S. Native of New Spain. Stem striated, glabrous. Leaves 2 inches long, glabrous. Corollas blue. Tube of corolla 3-4 lines long; segments of the upper lip narrower than those of the lower, and reflexed. Stigma villous. Filaments exerted, and resembling a stork's head. Very like L. ucens.

Stork's Lobelia. Pl. 1 foot.

31 L. nummularioides (Cham. in Linnae. 7. p. 209.) glabrous; leaves rather fleshy, ovate, coriaceous, rather reniform, obtuse, quite entire, or obliquely submarginally crenated, on short pedioles, and sessile; flowers axillary, on long pedicels; caly- cines segments a little shorter than the corolline tube; anthers glabrous on the back, all bearded; fruit glbose; stems prostrate, radicant, but ascending and floriferos at the apex. 2. S. Native of Brazil, within the tropics, in marshy places. Nearly allied to L. Zeylanica. Corolla blue or violaceous.

Moneywort-like Lobelia. Pl. prostrate and creeping.

32 L. reniformis (Cham. in Linnae. 7. p. 210.) herbaceous, hairy; stems rather capillary, branched, creeping, rooting; leaves ovate, short pedioles, orbicularly reniform, oblong, membranous, nervad, and reticulately veined, pale green above, and glabescence beneath; pedicels terminal and axillary, elongated; corolla glabrous outside, villous inside, with a broad tube, and triangular segments; anthers glabrous on the back; calyccine teeth ovate, acute, much shorter than the tube of the corolla. 2. S. Native of Brazil. Plant tufted, creeping. Leaves hairy, ciliated on the edges. Flowers blue.

Kidney-shaped-leaved Lobelia. Pl. creeping.

33 L. aquatica (Cham. in Linnae. 7. p. 211.) a glabrous aquatic herb; stem erect or floating, flattened in the dry state; leaves scattered, erect, sessile, narrow-lanceolate, acute, obso- letely serrated, 1-nerved; pedicels axillary at the bases of the stem, capillary, erect, twice the length of the leaves; ovarium semi-elliptic, crowned by the calyccine segments, which are a little shorter than the tube of the corolla; anthers all bearded, glabrous on the back, exceeding the corolline tube, but shorter than its segments. 2. S. Native of Brazil, on the banks of rivers, or in marshes among grasses. Flowers blue. Leaves half an inch long.

Aquatic Lobelia. Pl. ½ to ¾ foot.

34 L. sessilifolia (Lamb. in Loc. trans. 10. p. 260. t. 6.) leaves sessile, oblong-lanceolate, serrulated, glabrous; pedicels axillary, shorter than the leaves; stem erect, leafy, glabrous, very simple. 2. H. Native of Kamschatka. L. Camtschatica, Pall. miss. p. 22. Habit of a Euphorbia. Leaves of an obscure green. Flowers blue?

Sessile-leaved Lobelia. Pl. 2 to 3 feet.

35 L. umbellata (Vest, ex Rœm. et Schultes, syst. 5. p. 58.) glabrous; leaves sessile, linear, toothed, dilated and trifid at the apex; flowers terminal, umbellate; stem erect. 2. ? S. Native country unknown. Stem angular. Leaves like those of Chrysanthemum leucanthemum. Involution umbel short. Corollas blue, nearly an inch long, with the segments of the upper lip reflexed, and of the lower one oblong. Stamens a little shorter than the tube of the corolla. Anthers bearded at the apex.

Umbellate-flowered Lobelia. Pl. 1 foot.

** Corollas red, purple or scarlet, rarely yellowish.

36 L. graminéa (Lam. dict. 3. p. 583.) glabrous; leaves linear, ensiform, acute; racemes long, simple; stem erect, simple; bracteas linear, acute, shorter than the flowers.—Native of Peru. Leaves 5 inches long, and 2-3 lines broad. Flowers scarlet, on short pedioles, form of those of L. cardinalis. Filaments and stamens combined.

Grass-y-leaved Lobelia. Pl. 2 feet.

37 L. pulvérulenta (Pers. ench. 2. p. 212.) leaves ovate, on very short petioles, glabrous above and wrinkled, but clothed with white tomentum beneath; corollas campanulate, powdery; stem shrubby. 2. S. Native of South America, on the road from Guaranda to Mount Chimborazo. Stem branched, tormentose. Leaves obtuse, with subrevolute edges, 3 inches long. Pedicels longer than the leaves, altogether forming a leafy raceme. Corollas white from powdery tomentum outside, and reddish inside, less than an inch long, with equal oblong acute segments. Perhaps a species of Clermontia.

Powdery Lobelia. Pl. 6 to 8 feet.

38 L. cordifera (Cav. icon. 6. p. 14. t. 523.) leaves ovate, acute, half-stem-clasping, villous, denticulated; pedicels villous, axillary, solitary; stem villous, furrowed. 2. F. Native of Chili. Leaves 3 inches long. Calyx villous. Corolla scarlet, 1½ inch long, with the segments of the upper lip linear, elongated, of the lower lip ovate, acute. Genitals glabrous.

Heart-bearing Lobelia. Pl. 3 feet.

39 L. decurrens (Cav. icon. 6. p. 13. t. 521.) leaves ovate-lanceolate, biserrated, decurrent, glabrous, approximate; flowers solitary, axillary, short, either forming a long leafy raceme; calyx villous, with the segments deeply serrated; tube of corolla cleft even to the base. 2. F. Native of Chili, on the banks of the river Claro. Sweet flag, fl. n. s. 86. Stem glabrous. Leaves 2 inches long and an inch broad, with 2 small teeth between each large one. Corolla purplish-violet, 1½ inch long; upper lip of 2 linear segments, which are villous at the apex, of the lower acute, and are as well as the anthers pilose.

40 L. conglobrata (Lam. dict. 3. p. 585.) leaves oblong-cuneiform, denticulated, shining; racemes globose, terminal; segments of calyx fringed; stem simple, filled with medula. 2. S. Native of Marínico and St. Domingo. Lin. spec. 4. t. 117. Stem thick, naked at the base. Leaves a foot and more long, and 3 inches broad, exceeding the corymb of flowers. Flowers very numerous, disposed in a short raceme. Bracteas lanceolate, denticulated, shorter than the flowers. Corollas shorter than the calyx, scarlet, but in the larger variety greenish-red. Perhaps a species of Tupa.

Conglobrate-racemed Lobelia. Pl. 1 foot.

41 L. Cavaniélliana (Rœm. et Schultes, syst. 5. p. 43.) glabrous; leaves ovate-lanceolate, acuminate, serrated, sessile; pedicels solitary, axillary, longer than the leaves, the whole forming a leafy raceme; corollas downy. 2. S. Native of New Spain, near Acambaro. L. persicifolia, Cav. icon. 6. p. 12. t. 518. Stem herbaceous, striated, branched. Serrations of leaves setaceous. Calyx globose, Corolla red; with the tube nearly an inch long. Probably a species of Tupa. Anthers bearded with white hairs.

42 L. persicifolia (Lam. dict. 3. p. 584.) leaves narrow-lanceolate, serrated; pedicels axillary, solitary, shorter than the leaves, the whole forming a leafy raceme. 2. S. Native of Guadaloupe, in marshes. Stem fustulose. Leaves numerous. Corolla purplish, glabrous, a little curved, ½ inch long. Perhaps a species of Siphocamys.

43 L. Kraussii (Graham, in edinb. phil. journ. March, 1830. bot. mag. 3012.) leaves sessile, lanceolate, decurrent, sharply serrated, glabrous; pedicels axillary, solitary, longer than the leaves, the whole forming a leafy terminal raceme; calyccine segments subulate, a little toothed, spreading, and are as well as the corolla glabrous; stem herbaceous, glabrous, erect, branched. 2. S. Native of Dominica, where it was collected by Dr. Krauss. Leaves 4½ inches long. Corolla 1 inch long, red, 4 x 2.
cleft along the back to the base; segments linear-subsulate; the upper ones the broadest. Filaments white, downy; anthers lead-colour, terminated by a dense white beard. Nearly allied to L. persicifolia.

44 L. racemosa (Hook. bot. mag. 2137.) stem suffruticose, erect; leaves lanceolate, spinosely serrated; racemes terminal; pedicels exceeding the flowers, at length deflexed; calyce segments awl-shaped, sharply serrated. 2. 8. Native of the Island of St. Christopher; and of Brazil, at Rio Janeiro. Leaves 9 inches long. Branches terete. Pedicels bibracteate. Bracteas serrated. Corolla plaited, cleft on the back, having the lower lip 3-lobed, and the segments of the upper lip narrow, all recoiled backwards, greenish. Anthers lead-coloured, as well as the stigma. This is a true species of Tupa.

46 L. laciniata (Lam. dict. 3. p. 584.) leaves lanceolate, pinnatifidly toothed: the segments again toothed; coryms terminal, small, sessile. 2. 8. Native of St. Domingo. Stem glabrous, a little longer than 2 inches long. Corolla greenish red, glabrous, an inch long.

Jagged-leaved Lobelia. Pl. 1 foot.

Som-thistle-leaved Lobelia. Pl. 2 feet.

48 L. stricta (Swartz, prod. 117. fl. ind. occ. p. 1952.) lower leaves elliptic, spiny-toothed, glabrous, tufted; stem simple, stiff; flowers spicate. 2. 8. Native of Guadaloupe. Lam. dict. 3. p. 584. no. 15. Radical leaves larger than the rest, attenuated at the base, 3 inches long, and an inch broad. Pedicels short, the whole forming a terminal leafy raceme. Corollas purplish.

Straight Lobelia. Shrub 2 to 3 feet.

50 L. assur'gens (Linn. amen. acad. 5. p. 408.) leaves broad, lanceolate, serrated or denticulate and decurrent at the base; racemes simple, terminal; segments of the calyx serrated; capsule angular. 2. 8. Native of Jamaica, on the mountains, particularly on the edges of streams. Andr. bot. rep. 553. Leaves a foot long, glaucescent. Stem reddish, almost simple, glabrous. Flowers crowded, large, downy, purple. The column of anthers has 3 blue grooves. Probably a species of Tupa.

Assurgens Lobelia. Fl. June, Oct. Cit. 1787. Pl. 3 to 4 ft. 51 L. foliosa (Willd. rel. ex Rem. et Schultes, syst. 5. p. 56. H. B. et Kunth, nov. gen. amer. 3. p. 310.) leaves sessile, decurrent, lanceolate, doubly toothed, glabrous; flowers axillary, pedicellate, the whole forming a leafy raceme; corollas hairy; stem erect, simple, glabrous. 2. 8. Native of the kingdom of Quito, in humid places near Guancabamba. Leaves crowded on the stem, 3 inches long. Pedicels hairy. Segments of the calyx furnished at the base with remote subulate teeth, about equal in length to the tube of the corolla. Corolla pale purple. Two lower anthers bearded. Allied to L. decurrens, Cav. and L. cardinalis.

Leafy Lobelia. Pl. 2 to 3 feet.

52 L. laxiflora (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves almost sessile, oblong, acuminated, serrulatd, glabrous; racemes terminal, secund; flowers on long pedicels; corollas hairy; stem erect, simple, angular, glabrous. 2. 8. Native of Mexico, between Quauiniquila and Acapulco. L. fissa, Willd. rel. ex Rem. et Schultes, syst. 5. p. 57. Leaves 23 inches long. Rachis of raceme hairy. Calyx hairy. Corolla pale purple. Allied to L. cardinalis.

Loose-flowered Lobelia. Pl. 2 to 3 feet.

53 L. nigrobulbata (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves short, sessile, oblong-lanceolate, acutish, sharply serrulate, stiltish, glabrous above, but ruged and hairy beneath; flowers axillary, on long pedicels; corollas hairy. 2. 8. Native of New Spain. Stems hairy above. Leaves 2 inches long. Flowers and fruit like those of the preceding species, to which it is very nearly allied.

Stiffish Lobelia. Pl. 2 to 3 feet.

54 L. fulgens (Willd. hort. berol. 2. p. 83. t. 85.) leaves lanceolate, denticulate, with revolute margins, downy as well as the stems; racemes terminal, leafy, somewhat secund. 2. 8. Native of Mexico. Andr. bot. rep. 659. Bonpl. malm. p. 19. t. 7. Stem reddish. Leaves 4-6 inches long. Corollas about an inch long, downy outside, of a splendid scarlet colour.

55 L. cardinalis (Lin. spec. 1820.) leaves oblong-lanceolate, cartilaginous denticulate, glabrous as well as the stems; racemes terminal, unilateral, leafy. 2. 8. Native of Virginia and Carolina; and of Mexico, near Jalapa. Pursh, fl. amer. sept. 2. p. 448. Curt. bot. mag. 320.—Körn. del. 2. t. f. 2. Repündium cardinalis, Mill. dict. no. 1.—Mor. hist. 2. p. 466. sect. 5. t. 5. f. 54.—Hern. mex. p. 879. t. 880. Leaves purplish beneath, 3 inches long, and 1/2 broad. Flowers scarlet. It differs from L. fulgens in being glabrous, and in the segments of the lower lip of the flower being obtuse, not lanceolate, and acute.

56 L. splendens (Willd. hort. berol. 2. t. 86.) leaves lanceolate, denticulate, with flat margins, quite glabrous as well as the stems; racemes terminal, somewhat secund. 2. 8. Native of Mexico. Ker. bot. reg. 60. Stem purplish. Pedicels compressed, purplish. Corolla scarlet, glabrous, very like those of the two last species.

57 L. speciosa (Hort. Lindl. bot. rep. 1445. Sweert. fl. gard. n. s. 174.) This is a hybrid between L. sphyilitica and L. cardinalis, splendens or fulgens. The flowers are purple.

§ 2. Species natives of the East Indies and other parts of Asia.

59. L. Heyneana (Roxb. et Schultes, syst. p. 5. p. 56.) stem filiform, erect, winged; leaves subtriumbroid, serrated, decurrent, setosely ciliated at the base; peduncles axillary, solitary, length of leaves; calyces glabrous.—Native of the East Indies. L. decurrens, Roth, nov. p. spec. mss. The stem is winged from the leaves being decurrent.

Heyne's Lobelia. Pl. ½ to 1 foot? 

60. L. Zeylanica (Lin. spec. 1322.) stems prostrate and creeping, downy; leaves on short petiolo, ovate, somewhat cordate, serrated, acute: lower ones obtuse; peduncles solitary, 1-flowered, axillary, equal in length to the leaves, villous; capsules rather villous. Z. S. Native of China and the East Indies, in fields. L. nummularifolium, Lam. dict. 5. p. 563.?—Seb. thes. 1. p. 37. t. 22. f. 12. Var. B. Hirta, Lin. spec. 555. Plant sparing. Leaves like those of Feronia chamédrysis, D. coriaceus, beset with a few pellucal hairs; lower ones crenated; upper ones serrated. Pedunclules downy. Flowers purple. This is a very pretty plant when in blossom. It differs from L. trigona, Roxb., by its petioled more rounded leaves, terete stems, and its pubescence.

61. L. Chenopodifolià (Wall. cat. no. 1312.) stem branching at the base; lower leaves roundish-ovate, obtuse, broadly crenated; upper ones ovate-lanceolate or deltoid, acuminate, cossetly toothed; peduncles elongated, terminal, bearing loose racemes of flowers at the apex; calycine segments subulate. O. H. Native of the East Indies? Flowers small, probably pale blue.

Goose-foot-leaved Lobelia. Pl. 1 foot. 

62. L. Affinis (Wall. cat. no. 1311.) plant downy, creeping at the base; leaves ovate, petiolate, membranous, cuneated at the base, slightly dentilicated; peduncles axillary, 1-flowered; calyx hairy, with linear segments; stems angular. Z. S. Native of the East Indies, in Silhet and Goalpara. Flowers blue. Stems creeping at the base. This species is very like L. Zeylanica and L. trigona. 

Allied Lobelia. Pl. § foot. 

63. L. Nummularia (Lam. dict. 3. p. 589.) stems creeping, filiform; leaves roundish-cordate, crenated; peduncles 1-flowered, axillary, a little longer than the leaves. Z. S. Native of Java. Habit of Sibharpia. Stem rather villous. Leaves small, rather villous beneath, unequall. Petioles 2-3 lines long. Corolla 4-5 lines long, longer than the stamens. 

Money-nort-leaved Lobelia. Pl. creeping. 

64. L. ? Fu'mila (Burm. prod. 1. t. 60. f. 3.) glabrous; stems procumbent; leaves opposite, ovate, quite entire; panicles terminal. Z. S. Native of Coromandel. Leaves petiolate. Flowers small. 

Dwarf Lobelia. Pl. procumbent. 

65. L. Trialiata (Ham. mss. ex D. Don, prod. fl. nep. p. 157.) leaves roundish-ovate, serrated, glabrous; petioles dilated, decurrent at the base; pedicels solitary, axillary, longer than the leaves; flowers somewhat racemose; segments of the calyx filiform; stem ascending, triguetrous, branched, winged, glabrous. Z. F. Native of Nipaul. L. micrantha, Hook. exot. fl. t. 44. Stem hardly a hand high, rooting at the base. Petals longer than the leaves. Corollas small, red. Very like L. gratioloides, Roxb., but in that species the leaves are sessile and corollate.

66. L. Trigona (Roxb. fl. ind. 2. p. 111.) glabrous; leaves subsessile, cordate, coarsely serrated; pedicels axillary, bipectate, longer than the leaves; stems creeping at the base, erect parts 3-sided. O. H. Native of the East Indies, delighting in pasture-ground, appearing in the wet season. L. stipularius, Roth. Flowers small, blue. Corolla inserted in the mouth of the calyx. Roth has mistaken the 2 small bracteae on the pedicels to be stipulæ.

Trigonal-stemmed Lobelia. Pl. ½ to 1 foot? 

68. L. Pyramidalis (Wall. in asiat. res. 13. p. 379.) smooth; leaves lanceolate, long-seccuminate, serrated; upper ones linear, attenuated; petioles petiolate; calyceine segments linear-subulate, about equal in length to the corolla; stems erect, branched. Z. H. Native of Nipaul, on the mountains at Narinithy. This is the most common and most ornamental plant in Nipaul, where it grows both in low and elevated situations. It is found from the entrance of that country at Bechiao, up to the mountains that bound the valley to the north, and where it grows at an elevation of at least 8000 feet. It is also found in the hilly country of Silhet. D. Don, in bot. mag. t. 2387. L. stimulans, Hamilt. mss. ex D. Don, prod. fl. nep. p. 157. Plant variable in height, and is often found altogether of a deep purple, but chiefly the floral branches and leaves. Stem pyramidal branching. Leaves downy beneath. Corollas purplish-violet. Anthers deep blue, pilose. Lobes of stigma hollow beneath.

69. L. Excelsa (Wall. in Roxb. fl. ind. 2. p. 114.) leaves oblong-lanceolate, acuminate, denticulated, attenuated at both ends, densely clothed with villi, on short petiolo; racemes terminal, erect, villous, leafy, dense-flowered; calyceine segments linear, as long as the tube of the corolla. O. H. Native of the Nelligherry mountains, near Coimbetore, where it was collected by Leschenault, and where it is called by the natives Oumari. Leaves 10 inches long, and 1 broad. Petioles marked by the decurrent base of the leaf. Flowers large. 

Tall Lobelia. Pl. 10 to 12 feet. 

70. L. Rosea (Wall. in Roxb. fl. ind. 2. p. 118.) plant covered with glaucous short dense villi; stem petiolate; leaves lanceolate, ensiform, acuminate, finely denticulated; racemes terminal, with unilateral flowers; calyceine segments equalling the tube of the corolla. O. F. Native of Nipaul, in the valley of Noakote. Leaves from 8-12 inches long; floral ones linear-lanceolate, rounded at the base. Flowers numerous, nodding, downy, like those of L. pyramidalis, but larger, of a pale rose-colour. Anthers connected into a long purple incurvated tube, bearded. Filaments downy. Ovarium bi-trilocular. Stigma pubescent. 

Rose-coloured-flowered Lobelia. Pl. 4 to 6 feet. 

§ 3. Species natives of Africa, particularly of the Cape of Good Hope. Flowers generally violaceous or blue, rarely white or yellow.

* Stems erect. Leaves entire.

74 L. scabra (Thunb. phyt. bl. p. 21. fl. cap. 2. p. 35.) leaves linear, emarginate, scabrous, quite entire; stems weak, filiform, hairy; pedicels axillary, solitary, flexuous, longer than the leaves. Ƥ. G. Native of the Cape of Good Hope. Leaves sessile, subsecund. Calyx and corolla hairy.

Scabrous Lobelia. Pl. ¾ foot.

75 L. commutata (Reem. et Schlutes. syst. 5. p. 36.) lower leaves ovate; superior ones oblanceolate; all sessile, retuse, and emarginate, with revolute margins, biseret with a few hairs on the nerves and on the edges; floriferous branches and stems naked at the apex; flowers racemose, on short pedicels, reflexed. Ƥ. G. Native of the Cape of Good Hope. Stems ascending, biseret with a few white bristles. Leaves rather distich. Calyx hispid. Corolla violaceous, with a long white hispid tube. Anthers bearded by white hairs. Changed Lobelia. Pl. ascending.

79 L. paniculata (Lin. spec. 1319.) leaves linear, quite entire; stems leafy at the base, and naked at the apex, branched, panicled; panicle dichotomous. Ƥ. or Ƥ. G. Native of Ethiopia. Burm. afr. t. 38. f. 3. Leaves short, sessile. Branches loose, furnished with 2 small opposite leaves under each fork. Flowers small, blue. Panicled Lobelia. Pl. ½ to 1 foot.

* * Stems erect. Leaves serrated or crenated.

80 L. bellidifolia (Thunb. prod. 1. p. 40. fl. cap. 2. p. 47.) leaves ovate, toothed, hairy, or obovate crenated, downy beneath; stems hispid at the base, simple, divided into a panicle at the top; lower pedicels the longest. Ƥ. G. Native of the Cape of Good Hope. Corollas blue. Leaves of the ramifications of the panicule subulate, smooth. Daisy-leaved Lobelia. Fl. May, Aug. C. 1790. Pl. 1/2 to ¾ foot.

81 L. rhizophylla (Spreng. nov. prov. 1818. ex Ræm. et Schultes, syst. 5. p. 44.) lower leaves petiolate, obovate, repandently toothed, glabrous, rather fleshy; superior ones lanceolate, sessile, rather decurrent. Uppermost ones ciliately, quite entire; pedicels short, axillary; capsules cylindrical, glabrous; stems radicant at the base, and ascending at the apex, triqueterous, glabrous. Ƥ. G. Native of the Cape of Good Hope. Sims. bot. mag. 2519. Flowers white, marked with blue. It differs from L. bellidifolia in the smoothness of its parts; and from L. cuneiformis, R. Br. in the deciduous radicant stems.

82 L. triquetra (Lin. mant. p. 120.) glabrous; leaves lanceolate, pinnatitudinously toothed, sessile; racemes terminal; branches and pedicels trigonal. Ƥ. G. Native of the Cape of Good Hope. Fl. May, Aug. C. 1794. L. capillata, Burm. prod. p. 25. Leaves as if they were agglutinated at the base. Racemes erect, pedunculate. Corollas blue.

Var. β, comosa; leaves linear, toothed; flowers terminal. Ƥ. G. Native of the Cape of Good Hope. L. corymbosa, Berg. cap. p. 344. Flowers blue.

Var. γ, alta; corollas leafy; flowers white. Ƥ. G. Native of the Cape of Good Hope. Triquetrous-stemmed Lobelia. Fl. May, Aug. C. 1774. Pl. 1 foot.

83 L. decumbens (Sims, bot. mag. t. 2277.) glabrous; stems decumbent; leaves obovate, toothed: superior ones dissimilar; pedicels axillary, shorter than the bracteas, which are linear, quite entire, and decurrent. Ƥ. G. Native of the Cape of Good Hope. L. bellidifolia, Hortul. Calycine teeth short, spreading, subulate. Flowers blue, smaller than in L. bicolor, with a white or yellowish throat.

85 L. tomentosa (Lin. fil. suppl. p. 394.) tomentose; leaves linear, toothed; peduncles terminal, very long, 1-2-flowered. Ƥ. G. Native of the Cape of Good Hope. Stems numerous, ascending, simple, having the leaves imbricated at the base. Leaves like those of Corophopis, having 4-6 obtuse teeth on each side, with revolute edges, clothed with hairy tomentum; peduncles clothed with adpressed hairs, bearing 2 small opposite leaves in the middle, or towards the base, and above these 2 opposite setaceous ones. Corolla blue or violaceous, half an inch long. Anthers beset with white hairs at the apex.

86 L. secunda (Lin. fil. suppl. p. 395. Thunb. fl. cap. 2. p. 45.) glabrous; lower leaves oblong, toothed: superior ones lanceolate, entire; peduncles racemose, second. Ƥ. G. Native
of the Cape of Good Hope, in sandy inundated places. The plant can hardly be said to be truly glabrous. There are floriferous branches in the axils of nearly all the leaves, and the flowers are all drooping to one side. Stems numerous, filiform, striated and downy, simple. Lower leaves obovate, oblongly denticulated, obtuse. Pedicels solitary, 1-flowered, shorter than the leaves. Corollas white, and are as well as the calyx downy outside.

87 L. Pátula (Thunb. prod. 1. p. 40. fl. cap. 2, p. 41.) leaves ovate, sinuate-toothed, villose; stems diffuse, spreading, filiform; pedicels solitary, axillary, capillary, downy, longer than the leaves. G. Native of the Cape of Good Hope. Leaves petiolate; superior ones lanceolate. In Lin. fl. suppl. p. 395. the plant is said to be glabrous.

Spreading Lobelia. Pl. 1 foot.

88 L. Férvens (Thunb. fl. cap. 2. p. 46.) leaves sessile, ovate-oblong; upper ones lanceolate: all serrated, glabrous; pedicels 1-flowered, much shorter than the leaves in the superior axils. G. Native of the Cape of Good Hope. Stems erecetis, brachiately, a little glabrous. Flowers blue.

Ferent Lobelia. Pl. ½ foot.

89 L. bifida (Thunb. prod. 1. p. 40. fl. cap. 2, p. 46.) leaves obovate, toothed, glabrous; stems filiform, downy, bifid or twice bifid at the apex; flowers terminal, solitary. G. Native of the Cape of Good Hope, on Mount Bockland. Stems erect, simple. Radical leaves subpetiolate, obovate, denticulated, hardly downy, a line long, but only a solitary cauline one on each stem, or 2 small alternate ones. Flowers blue. Bracteas lanceolate in the forks of the stem.

Bifid-stemmed Lobelia. Pl. 1 to 3 inches.

91 L. Minata (Linn. mant. p. 292.) leaves radical, ovate, obtuse, hardly crenated; scapes or pedicels capillary, 1-flowered, 2 inches long; corolla funnel-shaped. G. Native of the Cape of Good Hope, in fissures of rocks on Mount Taffelberg. Sims, bot. mag. t. 2390. Root throwing out off-ssets. Flowers pale blue. Habit of Montia fontana or Bellium minitum.

92 L. Minima (Sims, bot. mag. 2077.) stems prostrate; leaves ovate, crenated, petiolate, glabrous; pedicels long, axillary, 1-flowered, furnished with 2-3 linear hairy bracteas below the middle. G. Native of the Cape of Good Hope. Flowers white inside, and red outside, with a yellow throat.

Small Lobelia. Pl. 1 inch.

** Stems prostrate. Leaves cut or toothed.

94 L. Erinus (Lin. spec. 1321. Thunb. fl. cap. 2. p. 39.) leaves toothed; lower ones obovate, petiolate; superior ones almost sessile, narrow-lanceolate; pedicels 1-flowered, longer than the bracteas; stems spreading. G. Native of the Cape of Good Hope. Curt. bot. mag. 901. Rapúntium erinum, Mill. dict. no. 8.—Herm. lugdub. 110. t. 110. Stems branched at bottom. Leaves glabrous. Pedicels axillary, solitary, naked, much longer than the leaves. Flowers slender, blue, with a white or yellowish throat. Fruit 3-celled. According to Thunberg there is a variety of this, having numerous radical stems, which are as well as the leaves villous.

95 L. Alsinoides (Linn. dict. 3. p. 586. no. 29.) plant creeping, glabrous; stems branched; leaves roundish-oval, toothed; peduncles long, 1-flowered, axillary, much longer than the leaves. G. Native of the Cape of Good Hope. Stem erect at the top, but radicant at the base. Radical leaves like those of Sibthoropia; the rest ovate, toothed, and subpetiolate.

Chick-need-like Lobelia. Pl. ½ to ¾ foot.

96 L. Muscoïdes (Cham. in Linn.æa. 7. p. 215.) herb small, slender, trailing, quite glabrous; stems filiform, rooting at the nodi; leaves roundish, deeply 5-7-cleft, truncate or cuneated at the base: segments elliptic, acute, mucronulate; pedicels axillary, bracteate, erect, much longer than the leaves; ovarium obconical. G. Native of the Cape of Good Hope. Herb tufted, pale green. Corollas purple.

Moss-like Lobelia. Pl. tufted.

97 L. Munditia (Cham. in Linn.æa. 7. p. 215.) plant trailing; stems filiform, angular; leaves sessile, deciduous, lanceolate and elliptic, acute at both ends, with a few acute serratures; flowers axillary, solitary, on short pedicels; calycine segments lanceolate, acute, erect, more than one-half shorter than the tube of the corolla; anthers all bearded. G. Native of the Cape of Good Hope, at Gama, where it was collected by M. Mund. Ovarium, calyces, pedicels, stems, and outside of corolla beset with long spreading white hairs.

Mund's Lobelia. Pl. trailing.

98 L. Campionulata (Linn. dict. 3. p. 588. no. 30.) plant small; leaves linear-lanceolate, toothed; pedicels very long, 1-flowered; calyx hairy, a little reflexed. H. Native of the Cape of Good Hope. Stem simple, slender, leafy, glabrous. Leaves glabrous, sessile, hardly an inch long. Pedicels filiform, 2½ inches long, pilose at the apex, solitary in the axils of the superior leaves. Flowers erect, campionulata, blue. Limb spreading, hardly divided, rather irregular. Calycine segments narrow.

99 L. Breyni (Linn. dict. 3. p. 588.) leaves sessile, lanceolate, toothed, minute, usually unilateral; flowers almost sessile; the pedicels are short and alternate; stems procumbent. G. Native of the Cape of Good Hope. Breyn. cent. p. 175. t. 89. Stems long, filiform. Flowers blue. Bracteas much shorter than the flowers.

Breynius's Lobelia. Pl. procumbent.

100 L. Chaméphyta (Linn. dict. 3. p. 590.) leaves linear, channelled, numerous, bil dentate at the apex, clothed with hairy tomentum; pedicels very long, naked, axillary and terminal, furnished with narrow acute scales; stem sparsely, G. Native of the Cape of Good Hope. L. scabra. Spreng. neu. ent. ex syst. Habit of Lavandula, with the leaves of Ajuga chamaephytae. Stems leafy, slender. Pedicels longer than the stem, 6 inches long. Corollas of a pale violaceous colour, 6 lines long, inflated at the base.

Ground-pine-like Lobelia. Pl. ½ to 1½ foot.

101 L. Erinoides (Linn. mant. p. 291. Thunb. fl. cap. 2. p. 39.) leaves petiolate, oblong, toothed, bluntish, glabrous; pedicels axillary, solitary, shorter than the leaves; corolla funnel-shaped; stems prostrate or erectish. G. Native of the Cape of Good Hope. Rapúntium erinoides, Mill. dict. no. 9.—Herm. lugdub. p. 108. t. 109. Corollas funnel-shaped, an-
gular, equal, blue, with spreading segments. Filaments combined into a 5-striped, club-shaped tube. Stigma hairy.

**Erinus-like Lobelia.** Fl. June, Aug. Clt. 1759. Pl. prostrate, or \( \frac{1}{4} \) foot.

102. *L. bicolor* (Curt. bot. mag. t. 514.) leaves downy, serrated: lower ones oblong, nearly sessile: superior ones lanceolate; pedicels solitary, axillary, longer than the leaves. **G.** Native of the Cape of Good Hope. Willd. enum. 1. p. 218. Corollas blue, with a sulphur-coloured throat. Curtis says the leaves are downy and nearly sessile, while Willdenow says they are glabrous and petiolate.

**Two-coloured-flowered Lobelia.** Fl. June, Aug. Clt. 1755. Pl. \( \frac{1}{2} \) foot.

**Holly-leaved Lobelia.** Fl. May, Sept. Clt. 1815. Pl. \( \frac{1}{4} \) to \( \frac{1}{2} \) ft.

**Two-edged-stemmed Lobelia.** Fl. Ju. July. Clt. 1818. Pl. \( \frac{1}{2} \) ft.

**Downy Lobelia.** Fl. June, July. Clt. 1780. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) ft.

106. *L. Thermales* (Thunb. prod. 1. p. 40. fl. cap. 2. p. 42.) leaves ovate, serrated, attenuated at both ends, acute, glabrous above, and pilose beneath; pedicels solitary, axillary, shorter than the leaves, and are as well as the calyces clothed with stigose white hairs; stems decumbent, hairy. **G.** Native of the Cape of Good Hope, in the region of the hot springs near Elephants' river. *Corolla yellow.*

**Hot-spring Lobelia.** Pl. decumbent.

107. *L. Leptora* (Griess. in Linn. 5. p. 419.) stem herbaceous, decumbent, branched; branches flat; leaves ovate-lanceolate, sharply serrated, quite glabrous, with cartilaginous edges; pedicels axillary, solitary; capsule elongated, clavate, hispid from bristles. **G.** Native of the Cape of Good Hope. Branches beset with white hairs. Leaves sessile. Calyx bristly. Corolla downy, white, having the segments bearded at their tips, and ciliated on the margins. Filaments and style glabrous.

**Slender-fruited Lobelia.** Pl. decumbent.

108. *L. Hirsch* (Lin. spec. 1322.) leaves ovate, toothed, or crenated, hairy or woolly; pedicules lateral, solitary, very long, 2-3-flowered; stem shrubby, hairy, prostrate, or erect. **G.** Native of the Cape of Good Hope. Thunb. fl. cap. 2. p. 37. Rapuntium hirsutum, Mill. dict. no. 9.—Burm. afr. 105. t. 40. f. 2. Flowers blue, drooping, small.

**Hairy Lobelia.** Fl. May, Sept. Clt. 1759. Pl. \( \frac{1}{4} \) foot.

109. *L. Sépræns* (Lam. dict. 3. p. 588.) leaves ovate, crenated, glabrous; pedicels axillary, solitary, shorter than the leaves; stems prostrate, a little branched. **G.** Native of the Cape of Good Hope. Stems slender, flexuous. Leaves thin, hardly an inch long. Flowers small, blue.

**Creeping Lobelia.** Pl. prostrate.

**Pygmy Lobelia.** Pl. decumbent.

111. *L. Coronopifolia* (Lin. spec. 1322.) leaves lanceolate, toothed; pedicules long, few-flowered. **G.** Native of the Cape of Good Hope. Curt. bot. mag. 644.—Breyen. cent. t. 88. Stems and petioles hairy. The 3 segments of the lower lip of the corolla obovate, emarginate. Leaves with 3 or more teeth on each side. Flowers beautiful blue. Stems procumbent.

113. *L. Cerele* (Hook. bot. mag. 3701.) stem short, decumbent at the base, densely leafy; leaves lanceolate, dentately pinnatifid, downy, attenuated at the base; pedicels terminal, very long, bearing a few-flowered second racemes at the apex; segments of the corolla longer than the tube. **G.** Native of the Cape of Good Hope. Pedicels bracteolate. Corollas drooping, large, purplish blue; lower lip of 3 obovate emarginated mucrinate segments, having 3 small yellow raised marks at the base, the upper lip of 2 small bent back segments. Anthers purple, fringed at the top. Like *L. coronopifolia.* (f. 121.)*

**Blue-flowered Lobelia.** Pl. 1 foot.

114. *L. Sym* (Sweet, hort. brit. p. 247.) leaves petiolate, recurved, pinnatifid, with bifurcate lobes; pedicules elongated, lateral, 2-3-flowered; stem shrubby. **G.** Native of the Cape of Good Hope. L. pelluculata, Sims, bot. mag. t. 2251. Flowers blue, having the tube purple outside. Calycine segments short. Lower lip furnished with 2 yellow marks at the base.

**Sims' Lobelia.** Shrub 1 foot.

115. *L. Creata* (Thunb. prod. 1. p. 39. fl. cap. 2. p. 40.) leaves lanceolate, crenated, glabrous; stems herbaceous, filiform, decumbent; pedicels capillary, axillary, hardly the length of the leaves. **G.** Native of the Cape of Good Hope. Stems branched a little. Leaves about an inch long: lower ones acute: superior ones smaller and obtuse. Flowers blue?

**Crenated-leaved Lobelia.** Fl. April, May. Clt. 1794. Pl. decumbent.

§ 4. *Species natives of the Isle of France, the Society Islands, and New Zealand.*

116. *L. Arborea* (Forst. prod. no. 308.) stem arborescent; leaves petiolate, ovate-oblong, serrately toothed; pedicels axillary, solitary, 1-flowered. **G.** Native of the Society Islands.
Tree Lobelia. Tree.

117 L. supe'ra (Cham. in Linnaea. 7. p. 225.) arboreous, palm-formed; stem quite simple, straight, with a tuft of leaves at top; leaves glabrous, oblong-obovate, acuminate, narrowed into the petioles, undulated, denticulated, with reflexed edges, almost quite entire towards the base, and revolute; inflorescence and corollas tomentose. genu. S. Native of the Island of Oahu, in woods. Ribs of leaves thick, and prominent beneath; veins feathered and prominent. Peduncles longer than the leaves, declinate, nutiform, furnished with many oblong-elliptic sessile densely imbricated bracteas, bearing a globose head of flowers each. Corolla curved, cleft on the back, 2½ inches long. Column of stamens glabrous, exceeding the corolla. Two lower anthers bearded. Leaves 2½ feet long and 1 foot broad. This is a most superb species.

Superb Lobelia. Tree. 10 to 15 feet.

118 L. macrostachys (Hook. et Arn. in Beech. voy. pt. bot. p. 88.) glabrous; stem tall, straight; leaves linear-lanceolate, attenuated at both ends, suberect; racemes simple, terminal, very long; pedicels secund, horizontal; bracteas linear, shorter than the pedicels; tube of calyx hemispherical, with the segments obtuse; corollas twice the length of the pedicels. genu. S. Native of the Sandwich Islands. Calyx closely adhering to the ovary; with a free 5-parted limb, which is about equal in length to the tube. Corolla tubular, 3 inches long; tube cylindrical, 5-cleft, split on the back. Stamens with a free tube, and cohering anthers; the two lower ones bearded. Stigma 2-lobed; lobes flat, thick, cartilaginous, rounded, disarticulate, beardless. Fruit unknown.

Long-spiked Lobelia. Shrub tall.

Var. β, Luzoniënisis (Rœm. et Schultes, syst. 5. p. 61.) lower leaves ovate, very minute. — Native of the island of Luzon, near the town of Santa Cruz de la Laguna. L. filiformis, Cav. icon. 6. p. 7. t. 511. f. 2. Flowers pale blue.

Filiform Lobelia. Pl. ½ to 1 foot.

120 L. angulàta (Forst. prod. no. 309.) stem prostrate, quite simple; leaves roundish, repandly toothed; peduncles axillary, solitary, 1-flowered. genu. G. Native of New Zealand. L. repánda, Mart. Mill. no. 33. Perhaps a species of Pratia. Angular-leaved Lobelia. Pl. prostrate.

§ 5. Species natives of New Holland.

* Herbaceous plants, with axillary 1-flowered peduncles.

121 L. ala'ta (Labill. nov. holl. 1. p. 51. t. 72.) plant glabrous, erect; stem trigonal; angles a little winged; leaves linear or cuneate, decurrent, toothed; teeth divericate or reflexed; pedicels shorter than the leaves; ovary glabrous; capsules cylindrical. genu. G. Native of New Holland. Flowers blue?

Var. a. angustifolia (Rœm. et Schultes, syst. 5. p. 68.) superior leaves linear; angles of stem margined; radical leaves ovate-lanceolate. genu. G. Native of the south coast of New Holland, and about Port Jackson; and of Van Diemen's Land. Var. β, cuneiformis (Rœm. et Schultes, 1. c.) leaves cuneiform, toothed at top, decurrent; flowers axillary. genu. G. Native of the south coast of New Holland. L. cuneiformis, Labill. nov. holl. 1. p. 51. t. 73.

122 L. quadrangularis (R. Br. prod. p. 563.) glabrous; stem tetragonal, ascending; leaves ovate, toothed, almost sessile, 3 or 4 times shorter than the peduncles; segments of the superior lip of the corolla narrow, linear. genu. G. Native of New Holland, on the shore, within the tropic.

Quadrangular-stemmed Lobelia. Pl. ascending.

123 L. rugélosa (Graham. in edinb. phil. journ. Dec. 1829.) leaves roundish, repand, wrinkled with the nerves, glabrous; pedicels much longer than the leaves; calycine segments entire, glandular at the base; stem spotted, prostrate, rooting. genu. G. Native of New Zealand. L. maculátà, Penny. Plant glabrous. Corolla white, split on the upper side. Segments of corolla rather unequal, arranged like the radii of a semi-circle. Anthers leaded-coloured, with 2 short awns projecting downwards from their apex. Nearly allied to L. membranacea, R. Br. prod. Perhaps a species of Pratia.

Wrinkled-leaved Lobelia. Pl. creeping.

124 L. membranàceà (R. Br. l. c.) glabrous, procumbent; leaves roundish, repandy toothed, membranous, somewhat 3-nerved, shorter than the peduncles; segments of the calyx toothed a little. genu. G. Native of New Holland, within the tropic, on the shore. Flowers beautiful, purple.

Membranous-leaved Lobelia. Pl. procumbent.

125 L. purfura'scens (R. Br. l. c.) glabrous; stem ascending, tetragonal; leaves ovate-lanceolate, deeply serrated, one-half shorter than the peduncles; segments of the upper lip of corolla narrower, linear. genu. G. Native of New South Wales, about Port Jackson. Flowers purplish or blue.

126 L. fluviätilis (R. Br. l. c.) plant creeping, smoothish; branches ascending; leaves ovate, serrated on the outside, rather ciliated; pedicels bracteate, downy, as well as the calyces and ovaria; stamens epipetalous. genu. G. Native of New South Wales, at Port Jackson.

River Lobelia. Pl. ascending.

127 L. inunda'ta (R. Br. l. c.) plant creeping, glabrous, tufted; leaves roundish, repandly toothed, longer than the peduncles, which are bracteate and glabrous; segments of the calyx a little shorter than the tube of the corolla; stamens epipetalous. genu. G. Native of New South Wales, at Port Jackson. Flowers blue.

128 L. peduncula'ta (R. Br. l. c.) plant creeping, rather downy; branches ascending, filiform; leaves remote, ovate, angularly toothed, acute, a little ciliated; peduncles very long, furnished with 2 minute bracteas; stamens epipetalous. genu. G. Native of New South Wales, at Port Jackson. Flowers blue.

129 L. iri'sis (R. Br. l. c.) plant creeping, moss-like, glabrous; leaves roundish, thickish, dentately crenated, petiolate, longer than the peduncles, which are bracteate; tube of corolla cleft longitudinally, with the segments of the limb nearly equal; stamens epipetalous. genu. G. Native of Van Diemen's Land, and on the south coast of New Holland. Flowers purplish? Irrigated Lobelia. Pl. creeping.

* * Racemes or peduncles few-flowered, terminal. Tube of corolla cleft longitudinally, with the lips of the limb very unequal.

130 L. gra'cilis (Andr. bot. rep. t. 340.) plant glabrous, erect, branched a little; racemes rather secund; calyx length of filaments; superior lip of the corolla densely bearded; middle segment of the lower lip almost square, broader than long; lower leaves nearly ovate, deeply pinnatifid; superior ones

131 _L. dentata_ (Cav. icon. 6. p. 14. t. 522.) plant erect, glabrous; a little branched; racemes few-flowered, secund; calyx one-half shorter than the filaments; superior lip of corolla a little bearded; middle segment of the lower lip oblong; lower leaves ovate-lanceolate, deeply toothed on the outer side; superior ones lanceolate, toothed. 7. G. Native of New South Wales, about Port Jackson, and of Van Diemen's Land. Root fusiform, fibrous. Segments of the calyx subulate. Corolla blue, with a white throat. Two upper segments of the corolla very short.

132 _L. gibbosa_ (Labill. nov. holl. l. p. 50. t. 71.) glabrous; stem terete, simple; racemes secund, many-flowered; leaves linear, quite entire, rather fleshy; superior lip of corolla beardless; and with the segments of both lips lanceolate; capsule gibbous on one side. 7. G. Native of New South Wales, about Port Jackson, and of Van Diemen's Land. Root perpendicular, almost simple. Racemes very long, Bracteas subulate, hardly the length of the pedicels. Corollas blue. Anters biapicd at the apex.

133 _L. simplicicaulis_ (R. Br. prod. p. 564.) glabrous; stem quite simple, terete; raceme secund, few-flowered; leaves linear, toothed, remote; lower ones lanceolate; upper lip of corolla bearded, the segments of both lips acute; capsules gibbous on one side. 7. ? G. Native of Van Diemen's Land. Flowers blue?

_Simple-stemmed Lobelia._ Pl. 1 foot.

134 _L. Browniana_ (Rom. et Schultes, syst. 5. p. 71.) stem terete, a little branched; raceme secund; leaves linear, lower ones toothed; superior lip of corolla ciliolate: the segments of both lips acute; capsules gibbous on one side. 7. ? G. Native of New Holland, within the tropic, on the shore. L. stricta, R. Br. l. c. Flowers blue.

_Brown's Lobelia._ Pl. 1 foot.

135 _L. heterophylla_ (Labill. nov. holl. l. p. 52. t. 74.) plant smoothish; stem angular, simple; raceme secund; leaves thickish: lower ones dentately pinnatifid; superior ones linear, quite entire; middle segment of the lower lip of the corolla obcordate, and the lateral ones dimidiate. 7. ? G. Native of New Holland, in Van Lewin's Land. Root simple, perpendicular. Bracteas lanceolate, solitary or twin, shorter than the pedicels. Calyx inflat., with very acute segments.

_Variable-leaved Lobelia._ Pl. 1 foot.

136 _L. tenior_ (R. Br. in prod. p. 564.) plant rather pilose; stem filiform, divided; branches peduncle-formed, 1-flowered; lower leaves pinnatifid, of an ovate outline: superior leaves linear, trifid or quite entire; middle segment of the lower lip of the corolla obcordate: lateral ones dimidiate; capsule subcylindrical. 7. ? G. Native of New Holland, on the south coast, within the tropic. Flowers blue?

_Slender Lobelia._ Pl. 1 foot.

137 _L. parvifolia_ (R. Br. l. c.) glabrous; stem subpanicled, terete; branches usually 1-flowered, peduncle-formed; superior lip of corolla beardless: segments of the lower lip oblong, acutish. 7. ? G. Native of New Holland, on the south coast.

_Small-leaved Lobelia._ Pl. 1 foot.

§ 6. _Species natives of Europe._

139 _L. serrulata_ (Brot. fl. lus. p. 304.) glabrous; leaves linear-lanceolate, sharply serrated; racemes long; stem erect. 7. H. Native of Gibraltar, in sandy humid places. Bractes a little longer than the pedicels. Corolla rather roughish. Middle segment of the lower lip narrower than the lateral ones; segments of the upper lip linear. Flowers blue. Perhaps not distinct from _L. urens._

141 _L. salzmanniana_ (Presl. symb. bot. p. 31. t. 20.) plant quite glabrous; stem quite simple, erect, leafy; leaves lanceolate, obtuse, crenated, tapering into the petioles: uppermost ones dispersed in aggregate whorles; pedicels axillary, filiform, bifruncate in the middle. 7. H. Native of Corsica, at Ajaccio by the sea side. L. Laurénétia, Salz. pl. cors. exsic. Flowers blue?

_Salzmann's Lobelia._ Pl. 11/2 foot.

143 _L. fasteti_ (Vand. in Rom. script. pl. hisp. p. 66. Vitt. suppl. 1. p. 261.) lower leaves ovate-lanceolate, obsolescently toothed; floral leaves linear. 7. H. Native of Portugal, in humid places. Stem 2 hands high, many-angled, branched at the base. Leaves glabrous. Calyx gibbous, with linear spreading segments. Corolla pentagonal, blue, the segments of the lower lip the largest. In the base of the inner part of the limb there are two oblong parallel callosities, as in the genus _Dolichos._ Style longer than the stamens. Capsule ventricose.

_Var. a; leaves oval-oblong, acuminated, dentilicate; stem leafy, somewhat spiricate; anthers hairy, joined at the apex.

_Var. β; stem suffruticeus; leaves cordate, acute, serrated; flowers axillary, pedunculate._

_Farseti's Lobelia._ Pl. 1 to 11/2 foot.

† _Species not sufficiently known._

144 _L. cornuta_ (Lin. spec. 1519.) leaves ovate, petiolate;
stamens very long. 7. S. Native of Cayenne. Leaves said to be quite entire.

Horned Lobelia. Pl.?

145. L. kryoides (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 41.) stems tufted; leaves sessile, lanceolate, Quite entire, acute; stems terminal. 7. S. Native of South America, on Mount Antauna. Humb. et Bonpl. Habit of a moss or Arêta. Leaves imbricated, shining, coriaceous, dentilated. Flowers among the terminal concentive leaves. Perhaps a species of Lysiptoma.

Bryum-like Lobelia. Pl. 1/4 foot.

146. L. veronicifolia (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 57.) stem erect; leaves downy: radical ones obtuse, obovate; cauleine leaves lanceolate, dentate, acute; flowers terminal, racemose. 7. S. Native of South America. Humb. et Bonpl.

Speedwell-leaved Lobelia. Pl.?

147. L. amygdalina (Willd. l. c. p. 57.) stem erect; leaves ovate, acuminate, serrated; pedicels axillary; corolla cleft. Native of South America. Humb. et Bonpl.

Almond-like Lobelia. Pl.?

148. L. retbora (Willd. l. c.) stem arboreous; branches scabrous; leaves petiolate, elliptic, mucronate, with retrorsade serrations, wrinkled, veiny; flowers terminal, racemose. 7. S. Native of South America. Humb. et Bonpl.

Retrograde-serrate-leaved Lobelia. Shrub.

149. L. bonplandiana (Willd. l. c.) stem arboreous; leaves lanceolate, sharply serrated, flat, downy, on short pedioles; pedicels axillary, shorter than the leaves. 7. S. Native of South America. Humb. et Bonpl. L. dentata, Willd. herb.

Bonpland's Lobelia. Shrub.

150. L. elliptica (Willd. l. c.) stem arboreous; leaves elliptic, obtuse, ruged, veiny, denticulated; branches, pedioles, and peduncles clothed with hairy tomentum, as well as the leaves; calyxes reflexed; corollas downy. 7. S. Native of South America. Humb. et Bonpl.

Elliptic-leaved Lobelia. Shrub.

151. L. nivea (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 58.) stem arboreous; leaves elliptic, with revolute edges, toothed, shining and wrinkled above, but clothed with white tomentum beneath, as well as on the pedioles and corollas; flowers axillary. 7. S. Native of South America. Humb. et Bonpl.

Snowy Lobelia. Shrub.

152. L. reticulata (Willd. l. c.) stem arboreous; leaves ovate-lanceolate, acuminate, crenated, wrinkled from veins, downy beneath; corollas terminal, racemose. 7. S. Native of South America. Humb. et Bonpl.

Reticulated-leaved Lobelia. Shrub.

153. L. madagascarënsis (Rœm. et Schultes, syst. 5. p. 67.) lower leaves ovate: superior ones lanceolate, denticulated, decurrent; flowers axillary, length of leaves; stem prostrate. 7. H. Native of Madagascar. L. decurrensis, Willd. herb.

Madagascar Lobelia. Pl. prostrate.

154. L. phyteuemoïdes (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) leaves lanceolate, toothed, sessile, glabrous; racemes terminal; stem ascending, a little branched. 7. S. Native of South America. Humb. et Bonpl.

Phyteuma-like Lobelia. Pl. ascending.

155. L. humboldtiana (Rœm. et Schultes, syst. 5. p. 68.) leaves roundish, acute, sessile, with cartilaginosely serrated edges; flowers sessile, axillary; stem weak. 7. S. Native of South America. Humb. et Bonpl. L. sessilifolia, Willd. herb.

Humboldt's Lobelia. Pl.?

156. L. polystrophylla (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) stems prostrate; lower leaves serrated, oblong; superior ones quite entire, lanceolate; pedicels axillary, elongated. 7. S. Native of the island of Bourbon, Bory de St. Vincent.

Polyphygous Lobelia. Pl. prostrate.

157. L. loxënsis (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 72.) plant clothed with scabrous tomentum; leaves oblong, wrinkled, and shining above; flowers terminal, panicled. 7. S. Native of Brazil, at the banks of the Rio Grande, where it was collected by Sello.

Rio Grande Lobelia. Shrub.

Cult. All the species of this genus are truly ornamental when in blossom. The hardy herbaceous kinds thrive and flower best in light rich earth or peat soil; but in winter most of the kinds require to be protected by planting them in pots and placing them in a frame or green-house. They increase freely by the suckers from the roots or by seed. The green-house and stove perennial herbaceous kinds grow well in a mixture of peat and sand, and are easily increased by dividing, and by seeds. The shrubby, stow, and greenhouse kinds grow well in the same kind of soil recommended for the perennial herbaceous species, and are easily increased by cuttings in the same kind of soil. The seeds of annual species require only to be sown where they are intended to remain.

IX. DORTMANN (named after — Dortmann, a Dutch apothecary, according to Clusius.) Rubb, act. ups. ann. 1720. 97. t. 2. Neck. el. Lobelia species, Lin. and Nutt.

LIN. SYST. PENTADURIA, MONOGYNIA. Calyx of 5 deep segments. Corolla bilabiata, with a bearded mouth, cleft on the back; lower lip trifid; upper lip of 2 smaller segments. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half superior, 3-valved, 3-celled, 5angled, surrounded by the segments of the calyx below the summit, many-seeded. — Aquatic, smooth, fleshy plants. Leaves numerous, mostly radical, recurved. Scapes hollow, with a few leaves at the base, bearing a lax raceme of flowers at the top. Bracteas solitary at the base of the pedicels.

2 D. paludosâ; leaves flat, linear-oblong, with obsolescently crenated margins; scape nearly simple and naked, bearing a few remote flowers at the apex. 7. H. Native of North America, in deep sphagnum swamps, from Sussex county in Delaware to Georgia. Lobélia paludosa, Nutt. nov. gen. 2. p. 75. Leaves 4-6 inches long, and hardly 5 lines wide. Flowers pale blue, small. Corolla with the disk of the lower lip downy.

Marsh Dortmann. Pl. 2 feet.

Cult. The species of Dortmannia are singular, and beautiful plants, but difficult of culture. However, D. lacustris may be 4 y 2
grown for a time, if planted in a pot of gravel, and placed in a pond or cistern, so that the plants may be about 6 inches below the surface of the water; and D. paludosa may be grown in a pot half filled with peat earth, and the other half with sphagnum, in which the plants are to be set, and the pot placed in a shallow pan of water, or in a cistern or pond, but not so deep as to immerse the plants.

X. PARAESTRANTHUS (from παραστρέφω, parastraphe, to invert, or to distort, and ανθος, anthos, a flower; the flowers are upside down, compared with those of other genera of Lobelieae.)

Linn. sest. Pentândria, Monogy'nia. Calyx 5-cleft. Corolla bilabiate, with hardly any tube: upper lip of 3 segments, lower one of 2 segments, smaller. Staminode column upper the lower. Anthers and filaments come into a column; the latter bearded at the apex. Ovarium inferior, 2-3-celled. Stigma bifid or trifid.—Herbaceous plants, with toothed leaves, and terminal racemes of almost sessile yellow flowers.

1 P. simplex; glabrous; stems assurgent, simple; leaves lanceolate, serrated; flowers almost sessile, at the tops of the stems, forming a loose spike; bracteas toothed, shorter than the calyceous segments. 2. H. Native of the Cape of Good Hope. Lobelia corymbosa, Linn. spec. 1822. Sims, bot. mag. t. 1319.—Burm. afr. p. 101. t. 39. Flowers deep yellow.

Pl. ½ foot.

2 P. varifólia; stems erectish, branched at top; leaves linear, quite entire, and toothed, particularly the upper ones; flowers solitary, axillary, nearly terminal, almost sessile; stigma tripartite. 2. H. Native of the Cape of Good Hope. Lobelia variifólia, Sims, bot. mag. 1692. Flowers yellow.

Pl. ½ to 1 foot.

Pl. ½ foot.

Cult. Beautiful plants of easy culture. A mixture of loam, peat, and sand is the best soil for them; and they are easily increased by dividing at the root.

XI. ISO'TOMA (from ὀλος, holos, entire, and στεγα, stigia, a stigma; in reference to the entire stigma.)

Lindl. bot. reg. 964. Lobelia Isotoma, R. Br. prod. fl. nov. holl. p. 564.

Linn. sest. Pentândria, Monogy'nia. Liam of calyx 5-parted (f. 122. c), nearly equal. Corolla salver-shaped (f. 122. d) or funnel-shaped, with an entire or cleft tube, and a nearly equal 5-parted limb. Filaments combined into a tube. Anthers cohering, bearded; two lower ones mucronate. Stigma capitata, protruding beyond the anthers. Capsule 2-celled, many-seeded. —Herbaceous plants. This genus differs from all the other genera of Lobelieae plants, in the 2 lower anthers being mucronate, except Pratia.

1 I. axillâris (Lindl. bot. reg. 964;) plant rather downy; leaves sessile, pinnatifid, toothed; peduncles axillary, naked, elongated, 1-flowered; corolla salver-shaped, with an entire tube. 2. G. Native of New Holland, on the south coast. Lobelia seneioides, Cunn.ingh. L. seneioidis, Spreng. syst. add. p. 75. Coronavirus with green tube, and light blue linear-lanceolate segments. The segments of the calyx are narrow, distant, and at length reflexed. (f. 122).

2 I. bu'wni; glabrous; stems almost simple; leaves linear, quite entire; corolla salver-shaped, with an entire tube, and a somewhat unequal limb; flowers racemose. O. H. Native of New Holland, on the south coast. Lobelia hypocrepiformis, R. Br. prod. 564. Hook. bot. mag. t. 3075. Flowers beautiful purple.

3 I. scap'i gerâ; stems short; leaves lanceolate, a little toothed; corolla funnel-shaped, having the tube cleft above at the apex; peduncles scapes-formed, 1-flowered. 2. G. Native of New Holland, on the south coast. Lobelia scapigera, R. Br. prod. p. 564. Flowers blue or purple.

Var. a, bincâlìa (R. Br. l. c.) stem 6-10 lines long; leaves ovate-lanceolate, 4-6 lines long; scapes many, 2-3 inches long. 2. G.

Var. b, pusilla (R. Br. l. c.) stems almost wanting; leaves ovate, obtuse, 2 lines long; scapes almost solitary, 3-8 lines long. 2. G.

Scape-bearing Isotoma. Pl. 1 to 3 inch.

Cult. The species of this genus are very elegant while in blossom, and are of easy culture. A light soil suits them best; and they are easily increased by cuttings or seeds. They answer well if planted out during summer in the open border, with a south aspect.

XII. HOSLSTIGMA (from ὀλος, holos, entire, and στεγα, stigia, a stigma; in reference to the entire stigma.)

Lobelia, See. 3. H. R. Br. prod. p. 564.

1 I. dioica; male flowers corymbose and terminal; female ones axillary and solitary; calune leaves lanceolate, toothed or entire. 2. G. Native of New Holland, within the tropic, on the shore. Flowers blue.?

Dioecious-flowered Holostigma. Pl. ?

Cult. See Isotoma above for culture and propagation.

XIII. LYSIPOM'IA (from λυσι, luo, to solve, and πομα, pom, a lid; in reference to the capsule, which opens by an operculum at the apex). H. B. et Kunth, nov. gen. amer. 3. p. 318.

Linn. sest. Pentândria, Monogy'nia. Liam of calyx 5-parted. Corolla with a campanulate entire tube, and a 5-parted sub-bilabiate limb; the 2 lobes of the upper lip a little longer than those of the lower lip; lobes valvate in revulsion. Anthers cohering; the 2 inferior ones a little shorter than the rest, bearded at

FIG. 122.
the apex, or terminating in a membranous process. Stigma 2-
lobed, ciliated outside. Capsule somewhat 5-ribbed, 1-celled,
opening by an orbicular convex, unoblate, deciduous opercu-
num. Seeds numerous, adnate to parietal placents.—Small,
tufted, stemless or caulescent herbs, with the habit of Arélica
or Montia. Leaves alternate, linear or spatulate, quite entire,
stiff and crowded, or fleshy and remote. Flowers minute, axillary,
solitary, white, pedunculate. This genus is easily distinguished
from all the other genera of the present order.
1 L. mostioides (H. B. et Kunth, nov. gen. amer. 3. p. 320.
t. 266. f. 2.) stems creeping; leaves spatulate, rather fleshy;
peduncles axillary; calyces segments unequal, glabrous, 4 times
shorter than the tube of the corolla. 2. S. Native of Quito,
in humid places on the high plains of Mount Antisana, at
the altitude of above 6000 feet. Lobélia limosólioida, Willd. in
Rom. et Schultes, syst. 5. p. 41. Herb glabrous, with the habit
of Montia fontána.
Montia-like Lysipomia. Pl. procumbent.
2 L. reniformis (H. B. et Kunth, nov. gen. amer. 3. p. 320.
t. 266. f. 1.) stems creeping; leaves orbicularly reniform, emar-
ginate; flowers axillary; calyece segments equal, acute, gla-
brus, 3 times shorter than the tube of the corolla. 2. S. Native
of South America, near the Cave of Antisana. Herb
glabrous, with the habit of Viola palástris.
Reniform-leaved Lysipomia. Pl. creeping.
3 L. arétiloides (H. B. et Kunth, nov. gen. amer. 3. p. 321.
t. 267. f. 1.) plant tufted; stems short; leafy; leaves crowded
in a stellate manner, oblong-spatulate, acute, stiff; peduncles
axillary; segments of the calyx equal, acute, ciliated, one-half
shorter than the corolla. 2. S. Native of the Andes of Peru,
near Loxa, in Cerro de Vinijacu, at the altitude of about 4000
feet. Lobéliá glandulósa, Willd. in Rom. et Schultes, syst. 5.
p. 41. Plant glabrous, with the habit of a species of Arélica.
Arélica-like Lysipomia. Pl. tufted, an inch high.
4 L. acáutis (H. B. et Kunth, nov. gen. amer. 3. p. 321.
t. 267. f. 2.) plant tufted, stemless; leaves radical, crowded
in a stellate manner, linear, obtuse, stiff; peduncles radial; seg-
ments of the calyx unequal, obtuse, glabrous. 2. S. Native
of South America, on the high plains of Mount Antisana, and
roots of Chusquea, above the altitude of 6000 feet. Lobéliá
androsácea, Willd. in Rom. et Schultes, syst. 5. p. 41. Plant
glabrous, with the habit of Valériana rígida.
Stemless Lysipomia. Pl. tufted.
5 L. subulata; leaves radical, crowded in a stellate manner,
sulbulate, mucronate, hairy at the base; peduncles elongated;
calyces lobes acute. 2. F. Native on the Cordilleras of
Peru. Peduncles 1-flowered, an inch long. (v. s. in herb.
Lamb.)
Subulate-leaved Lysipomia. Pl. 1 inch.
Cult. The species of the Lysípomia are very remarkable little
plants, but none of them have been as yet introduced to our
gardens; but should they ever be, we would recommend their
being grown in a mixture of loam and peat, in small pots, well
drawn with sherdz. They will be easily increased by di-
viding.

XIV. MONOPSIS (from μονος, monos, one, and ωρίς, opis,
a face; in reference to the flowers being regular, not bilabiate).
Salis.—Lobélia spéculum, Andr. bot. rep. 664. Speculária,
Solaná. mss.
Lín. syst. Pentándria, Monogynía. Calyx tubular with 5
equal spreading linear-acute segments. Corolla salver-shaped,
with a terete tube, which is split on one side, allowing the sta-
mens and style to escape, and to rotate equal limb; segments
obuse, mucronate. Anthers cohering. Capsule inferior, 2-
celled, many-seeded.—A small elegant plant, with prostrate
branches; very long, solitary, axillary, 1-flowered, naked pedun-
cles; linear-lanceolate, irregularly toothed, or entire alter-
ate leaves; and showy deep blue flowers, with yellow anthers.

1 M. conspiécu (Salis.) 0. H. Native of the Cape of
Good Hope. Lobélia spéculum, Andr. bot. rep. t. 664. Sims,
bot. mag. t. 1499.

prostrate.

Cult. A little annual plant, worth cultivating in every col-
lection, for the sake of its neat, elegant, deep blue flowers.
The seeds should be raised in the hot-bed, and the plants, when
about an inch above ground, should be planted separately into
small pots, filled with a mixture of peat and sand, and others
may be planted out into the open border in May, in warm sheltered
situations.

XV. HIPPOBROMA (from ἵππος, hippos, a horse, and βρό-
mos, bronos, poison; the plant is a very strong poison, and
proves fatal to horses that eat it). Lobélia species of authors.

Lín. syst. Pentándria, Monogynía. Calyx of calyx 5-parted;
segments linear, ciliated. Corolla with a very long straight en-
tire tube, and a 5-parted nearly equal limb. Staminate tube
exserted beyond the throat of the corolla. Stamens and an-
ters connate; the latter bearded. Stigma 2-lobed. Capsule
2-celled, 2-valved, many-seeded.—A herbaceous plant, with
short axillary pedicels, runcinate or coarsely toothed leaves,
and long white flowers, resembling those of Mirabilis longífóra.

1 H. longífóra; leaves obvate-lanceolate, coarsely toothed;
tube of corolla very long and slender. 2. S. Native of Jamaica
and St. Domingo, and others of the West Indies Islands, on
the banks of rivers. Lobélia longífóra, Jacq. amer. 219. éd. pict.
Rapúntum longífórum, Mill. dict. no. 7.—Sloan, jun. 158, t. 101.
f. 2. Plant hairy. Ovarium turbinate, pentagonal. Tube of
anthers 10-versed. This is a very poisonous plant. If it be
handled, and the hand unawares be applied to the eyes, it brings
on an inflammation. The Spanish Americans call it Rehéneta
Caíallos, because it proves fatal to horses that eat it; it acts as
a violent cathartic. It is well known in St. Domingo under the
name of Quebec.

1 foot.

Cult. A mixture of peat, loam, and sand suits this plant, and
it is easily increased by cuttings, in the same kind of soil, under
a hand-glass in heat.

XVI. CLINTONIA (named in honour of the late De Witt
Clinton, governor of the State of New York, author of several
ingenious treatises on different branches of natural history).
Doug. in bot. reg. 1241.

Lín. syst. Pentándria, Monogynía. Calyx adhering to the
ovarium, with a 5-lobed equal limb. Corolla bilabiata, with
hardly any tube; lower lip cuneated, 3-lobed; superior one
straight, bipartite. Stamens combined into an incurved tube:
anthers cohering; the 2 lower ones bearded at the apex. Ova-
rion silique-formed, triangular, twisted, 1-celled, with 2 parietal
placentas. Capsule dry, chartaceous, many-seeded, opening by
3 thong-formed valves.—Herbaceous, procumbent, glabrous
plants, with small linear-lanceolate leaves: and axillary, solitary,
almost sessile blue flowers.

1 C. élégans (Doug. l. c.) glabrous; root annual; stem
procumbent, branched, rather angular; leaves sessile, ovate, 3-
veined; flowers solitary, axillary, sessile; ovarium sessile, long,
acuminated. 0. H. Native of North America, on the banks
of the Columbia river. Flowers blue; the lower lip having a large white streak on the base. Stigma girded by a papillose beard. Two lower anthers alone bearded.

2 C. Bergiana (Cham. in Linnaea. 7. p. 217.) glabrous; root perennial, creeping; stems erect or decumbent, branched, triangular at bottom; leaves linear-lanceolate, acute, remotely dentate, sessile: lower ones ovate; flowers axillary, almost sessile, at the tops of the branches; ovary elongated. 1.S. Native of the Cape of Good Hope, near Hangklih, where it was collected by Mundt. Capsule elongated, crowned by the segments of the calyx, which are spreading, fleshy, and stellately disposed; anthers all bearded. Corolla pale blue.

Bergiana's Clintonia. Pl. decumbent.

3 C. fusilla; we have not been able to see the work in which this plant is described, as it has not yet been received in this country. 1. H. Native of Chili. L. fusilla, Poepp. pl. chil. exsic. 3. no. 171. syn. pl. amer. austr. misc. diar. 731. Flowers blue.

Small Clintonia. Pl. decumbent.

Lin. syst. Penátridea, Monogynia. Calyx turbinate, 5-cleft. Corolla bilabiata; segments easily separated to the base, spreading at the apex. Filaments hairy, cohering; anthers free, bearded. Stigma drooping, hollow, gibbous. Capsule 2-celled, many-seeded.—Herbaceous plants, natives of the Cape of Good Hope, with alternate, undivided, pinnate, and pinnatifid leaves; and blue or red flowers.

Var. a. vulgaris (Cham. in Linnaea. 7. p. 224.) flowers nearly an inch long; genitals half an inch, one-half shorter than the tube; segments of corolla narrow-lanceolate.

Var. b. intermédia (Cham. 1. c.) flowers 9 lines long; throat of corolla more bearded; segments of corolla more elliptic; genitals shorter than the corolline tube.

Var. c. purpurea (Cham. 1. c.) flowers not half an inch long; genitals exceeding the corolline tube; filaments villous. Perhaps a proper species.

Digitate-leaved Cyphia. Pl. twining.

5 C. serrata (Spreng. syst. 1. p. 809.) leaves radical, oblong, attenuated at the base, sessile, crenately serrated, quite glabrous, as well as the scape, which is scaly; flowers racemose; segments of the calyx reflexed, serrated. 2.S. Native of the Cape of Good Hope.

Serrate-leaved Cyphia. Pl. 1/3 foot.

8 C. ? pinna t'ra (Rœm. et Schultes, syst. 5. p. 477.) stem shrubby, erect, branched at top; leaves pinnate, smooth; leaflets very narrow, capillary. 1.S. Native of the Canary Islands. Lobelia pinna t'ra, Lam. dict. 5. p. 591. no. 44. Shrub milky. Leaves like those of Isome ra Quamceli tis. Branches very leafy. Leaves shining; leaflets 1/2 inch long.

Pinnae Cyphia. Shrub 3 feet.

9 C. robusta (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 477.) leaves bipinnatifidly jagged; stem furred. Native of the Cape of Good Hope. There is a smoother and broader leaved variety of this, with larger pinnatifid bracteas, which are about the length of the flowers.

Racemed Cyphia. Pl. 1 foot.

Cult. The species of this genus thrive well in an equal mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass. Some of the species have large tuberous roots; these must be kept quite dry when not in a growing state, or they will rot. These tuberous-rooted kinds may be increased just as the stems begin to push out from the root, by cutting off as many of the shoots as are wanted, and planting them in a small pot, in the same kind of soil recommended for the species, keeping them dry till the wound has healed, but never covering them with glass; they will soon form tubers of themselves, and the old plant will make fresh shoots.

XVIII. CANONANTHUS (from κανών, kanonikos, regular, and ἀνθος, anthos, a flower; the flowers are regular, like those of Campanulaceae, not bilabiate, as in the rest of the Lobeliaceae genera). Lotelëa species, Cav. icon. 6. p. 11. t. 517.

1 C. Campanulatus; b. F. Native of Peru, on the road from Guaraná to Chimborazo. Lobélia campanulata, Cav. icon. 6. p. 11. t. 517.

Campanula-flowered Cananénthus. Shrub 8 feet.

Cult. See Tépa, p. 700. For culture and propagation.

ORDER CXXXV. STYLIDEÆ (plants agreeing with Stylidium in important characters). R. Br. prod. fl. nov. holl. p. 565.

Calyx superior, 2-6-parted, bilabiata or regular (f. 123. a), permanent. Corolla monopetalous, with a 5-6-cleft, irregular (f. 128. b), rarely equal limb, which is imbricate in aestivation, and at length falling off. Stamens 2 (f. 123. d); filaments combined with the style into a column. Anthers didymous (f. 123. d), and sometimes simple, lying upon the stigma. Pollen globose, simple, sometimes angular. Ovarium 2-celled, but sometimes almost 1-celled from the middle dissepiment being short, many-seeded; furnished with a gland in front, or crowned by 2 opposite glands. Style one; stigma undivided or bifid. Capsule 2-valved, 2-celled, with a partial dissepiment; or almost 1-celled from the dissepiment being short, or at length released from the inflexed margins of the valves. Seeds fixed to the axis of the dissepiment, erect, small, sometimes pedicellate. Albumen conforming to the seed, fleshy, and rather oily. Embryo inclosed, minute.—Caulescens scapigereous nonlactescent herbs or shrubs, beset with simple hairs, which are either tipped with capitate glands or acute. Leaves usually scattered, but sometimes verticillate, entire, with naked or ciliated edges; radical leaves crowded in the scapigereous species. Flowers spicate, racemose, corymbose, and solitary; terminal, rarely axillary; pedicels usually furnished with three bracteae.

This order is nearly allied to both Campanulaeæ and Goodevias, from both of which it is distinguished by the gymnandrous stamens, and from the latter by the want of an indusium to the stigma. The structure of the sexual organs is highly curious; the stamens and style are closely combined into a solid irritable column, at the top of which is a cavity, including the stigma, and bounded by the anthers.

Synopsis of the genera.

2 Levänohöki. Calyx 5-parted, bilabiate. Column erect, adnate to the lower side of the tube. Lobes of anthers one above the other, divaricate. Stigma 2. Capsule 1-celled.

LIN. SYST. Gymnădria, Diondra. Calyx bilabiata (f. 123. a). Corolla irregular, 5-cleft (f. 123. b); the fifth segment or label- lum dissimilar to the others, deflexed, smaller, rarely stretched out; the rest spreading, rarely joined by pairs. Column reclinate (f. 123. d.), with a double flexure. Anthers 2-lobed (f. 123. d.); lobes divaricate. Stigma obverse, undivided. Capsule 2-celled, having the dissepiment sometimes incomplete above.—Scapigerous or caulescens herbs or shrubs. Radical leaves crowded, sometimes attenuated into the petioles; caulin ones scattered, and sometimes verticillate, often small and bracteate, rarely ciliolate at the apex or loosened at the base. Inflorescence variable. Outer lip of calyx bidentate or bipartite, inner one tridentate or tripartite. Corollas purple, white, violaceous, rarely yellow, usually beset with pili on the outside, which are tipped with capitate glands: tube twisted at the base, sometimes very short; throat usually crowned by teeth or glands, but sometimes naked: the 4 larger segments of the limb approximating by pairs, one of the pair often smaller than the other. Labelium or lip narrower than the other segments, opposite the front of the calyx, but from the contortion of the tube has at length become lateral, with its disk often thickened, and rather convex inside, usually appressed by a small segment on each side, but sometimes simple. Column linear, longer than the base of the corolla. On the same side as the labelium, exserted, reclinate, having the outer bend so irritable that if touched with a pin it instantly starts from its place to the opposite side of the flower with great impetuousity. Anthers deliscing lengthwise. Stigma at first obsolete, and hidden by the incumbent anthers, but exserted at length, and sometimes hispid or papulose.

SECT. I. Ventenatia. Capsule ventricose, subovate, sometimes spherical or oblong.

§ 1. Scales scarious. Leaves radical, attenuated at the base. Outer lip of calyx 2-parted, inner one tripartite.—Scapigerous herbs, with racemose flowers.

1 S. Pilosum (Labill. nov. holl. 2. p. 63. t. 213.) scape a little branched, clothed with glandular pubescence; leaves flat, lanceolate-ensiform. 2. G. Native of New Holland, on the south coast. Flowers pale red.

Pilose Stylidium. Pl. 1 ½ foot.

2 S. Repulicate (R. Br. prod. p. 568.) scape beset with acute hairs; racemes a little branched; leaves narrow, ensiform, repulicate, with broader scales outside. 2. G. Native of New Holland, on the southern coast. Flowers red or pink? Repulicate-leaved Stylidium. Pl. ½ to 1 foot.

3 S. Hirsutum (R. Br. prod. p. 568.) scape beset with acute hairs; raceme nearly simple; leaves linear, with rather revolute edges; scales distinct. 2. G. Native of New Holland, on the south coast. Hook. bot. mag. t. 3194. Corolla of a purplish rose-colour.

§ 2. Leaves radical, crowded, without scales. Outer lip of calyx bidentate, inner one tridentate. Scapes leafless.

4 S. Umbellatum (Labill. nov. holl. 2. p. 66. t. 217.)
racemes of scape umbellate, involucriated. ụ. G. Native of Van Diemen's Land.

Umbellate-flowered Stylidium. Pl. 14 foot.

5 S. armenia (Labill. nov. holl. 2. p. 66. t. 216.) leaves linear, ensiform, with quite entire margins; scape glabrous; raceme simple, downy; lip of corolla appendixed. ụ. G. Native of Van Diemen's Land. Perhaps the same as the following.

Thrift-like Stylidium. Pl. 1 foot.

6 S. melastachys (R. Br. prod. p. 568.) leaves linear, with rather revolute smooth margins; scape rather pilose; spike simple, beset with glandular hairs; flowers imbricate, almost sessile; lip of corolla appendixed at the base. ụ. G. Native of Van Diemen's Land. The leaves are sometimes beset with a few denticulations.

Black-spiked Stylidium. Pl. 1 foot.

7 S. graminifolium (Swartz, in nov. act. scrut. berol. ex Willd. spec. 4. p. 146.) leaves linear, with denticulated edges; raceme subspicate, simple, and is as well the scape beset with glandular hairs; lip of corolla appendix at the base. ụ. G. Native of New South Wales and Van Diemen's Land. Ker. Bot. reg. t. 90. Ventenata major, Smith, exot. bot. 2. p. 13. t. 66. Candollea serrulata, Labill. in ann. mus. 6. p. 414. t. 64. f. 2. Flowers purplish red.

8 S. lineare (Swartz, l. c.) leaves compressed, filiform, 1-1/4 inch long, with denticulated margins; raceme simple; pedicels equal in length to the ovary; scape glabrous, filiform; lip of corolla appendix at the base. ụ. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 568. Ventenata minor, Smith, exot. bot. 2. p. 15. t. 67. Flowers purple or red.

9 S. setacea (Labill. nov. holl. 2. p. 65.) leaves setaceous, mucronate, an inch long; raceme simple, subspicate; scape quite glabrous; capsule clavate-oblong; lip of corolla inappendicate. ụ. G. Native of New Holland, on the south coast. Flowers red.

Setaceous-leaved Stylidium. Pl. 1 foot.

§ 3. Leaves radical, crowded, without scales. Scape leafless or with a few very small scattered leaves. Outer lip of calyx bipartit, inner one tripartit.

10 S. spinulosum (R. Br. prod. p. 569.) leaves linear, mucronate, attenuated at the base, with spinulous edges; scape clothed with glandular pubescence; raceme simple, rarely subcorymbose; throat of corolla crowned; lip inappendicate. ụ. G. Native of New Holland, on the south coast.

Spinulose-leaved Stylidium. Pl.

11 S. cespitum (R. Br. l. c.) leaves linear, glabrous, setaceous mucronate, with quite entire edges; raceme often divided; rachis and scape glabrous; throat of corolla naked; lip inappendicate. ụ. G. Native of New Holland, on the south coast.

Tufted Stylidium. Pl. tufted.

12 S. piliferum (R. Br. l. c.) leaves linear-lanceolate, glabrous, piliferous, with entire margins; raceme simple; rachis downy; scape glabrous; throat of corolla naked; lip inappendicate. ụ. G. Native of New Holland, on the south coast.

Piliferous Stylidium. Pl.

13 S. assimile (R. Br. l. c.) leaves narrow-spatulate, glabrous, thickish, with quite entire margins; raceme divided a little; rachis and scape downy; throat of corolla naked; lip inappendicate. ụ. G. Native of New Holland, on the south coast.

Similar Stylidium. Pl.

14 S. spatulatum (R. Br. l. c.) leaves spatulate, clothed with glandular pubescence on both surfaces, with quite entire edges; raceme many-flowered, and is as well as the radical scape glabrous; throat of corolla crowned; lip inappendicate. ụ. G. Native of New Holland, on the south coast.

Spatulate-leaved Stylidium. Pl. 3/4 to 1 foot.

15 S. glauccm (Labill. nov. holl. 2. p. 64. t. 217. R. Br. l. c.) leaves lanceolate-spatulate, clothed with glandular down on both surfaces, with quite entire edges; raceme few-flowered, subcorymbose, glabrous; scape furnished with a few leaves. ụ. G. Native of New Holland, on the south coast. Perhaps the plant of Labillardiere is referrible to the following.

Glaucescent Stylidium. Pl. 3/4 foot.

16 S. eriokhenum (R. Br. l. c.) leaves spatulate, setaceous mucronate, glabrous on both surfaces, but tomentose on the margins; raceme somewhat panicked, and is as well as the scape clothed with glandular down; root thick, woolly; throat of corolla naked; lip inappendicate. ụ. G. Native of New Holland, within the tropic.

Woolly-rooted Stylidium. Pl.

17 S. floribundum (R. Br. l. c.) leaves oblong, glabrous on both surfaces, with quite entire margins; scapes numerous, panicked, woolly from acute villi; throat of corolla naked; lip inappendicate. ụ. G. Native of New Holland, within the tropic.

Bunspike-flowered Stylidium. Pl.

18 S. jucxen (R. Br. l. c.) radical leaves linear, those of the scape minute, distant, and are as well as the bracteas adnate to the middle; calyce segments subulate, simple at the base; throat of corolla crowned by stipitate glands; lip inappendicate. ụ. G. Native of New Holland, on the south coast. Scape straight, glabrous.

19 S. violaceum (R. Br. l. c.) radical leaves narrow, linear, those of the scape, which is quite glabrous, small and adpressed, and are as well as the bracteas sessile; calyce segments gibbous at the base; throat of corolla crowned; lip inappendicate. ụ. G. Native of New Holland, on the south coast. Flowers violaceous.

Violaceus-flowered Stylidium. Pl.

§ 4. Leaves of scape or stem verticillate. Outer lip of calyx bipartit, inner one tripartit.

20 S. ilveum (R. Br. prod. p. 570.) scape inarticulate, glabrous; whorles of leaves 1-2 on each scape, besides some scattered leaves at the top; radical leaves linear; calyce segments rather gibbous at the base; throat of corolla crowned; lip inappendicate. ụ. G. Native of New Holland, on the south coast. Flowers yellow.

Yellow-flowered Stylidium. Pl.

21 S. ameneum (R. Br. prod. p. 570.) scape inarticulate, glabrous, furnished with one whorl of leaves beyond the middle, without any scattered leaves above the whorl; radical leaves scapate, acuminate; throat of corolla crowned; lip inappendicate. ụ. G. Native of New Holland, on the south coast. Flowers red?

Pleasant Stylidium. Pl.

22 S. articulatum (R. Br. l. c.) scape furnished with 2 joints, and 2 whorles of leaves; radical leaves spatulate, coriaceous; lip of corolla inappendicate. ụ. G. Native of New Holland, on the south coast.

Jointed-scape Stylidium. Pl. 3/4 foot.

23 S. diversifolium (R. Br. l. c.) scape straight, inarticulate, furnished with 3-4 whorles of filiform leaves; radical
leaves lanceolate; throat of corolla crowned; lip appendiculate.  721.

\subsection{40 S. \textit{breviscapum} (R. Br. prod. p. 572.) stem simple; leaves compressed, filiform; upper ones much crowded; raceme pedunculate, rather paniced, having the racis vilius; capsule lanceolate, equal-valved, downy.}  

\subsection{G. Native of New Holland, on the south coast.}  

\subsection{Short-scaled Stylidium.}  

\subsection{41 S. \textit{fasciculatum} (R. Br. l. c.) stem branched a little, glabrous; leaves linear; spikes pedunculate, subracemose, having the racis glabrous; capsule lanceolate, having both the cells seminiferous.}  

\subsection{G. Native of New Holland, on the south coast. Lindl. bot. reg. 1459.}  

\subsection{Flowers pink. (f. 123.)}  

\subsection{Fascicled-leaved Stylidium.}  

\subsection{Fl. Aug. Clt. 1830. Shrub 3 ft.}  

\subsection{42 S. \textit{falcatum} (R. Br. l. c.) stem nearly simple, and is as
well as the rachis downy; leaves linear; spike pedunculate, subracemose; capsule divaricate, lanceolate, with both the cells seminiferous, the superior one-half narrower than the other, and closed. ∆ G. Native of New Holland, on the south coast. Flowers pink?

**Falcate Stylidium.** Shrub ½ foot.  
43 S. adnatum (R. Br. l. c.) stem multiple; branches undivided; leaves linear; spike almost sessile, divided, with the divisions few-flowered; capsule linear, adnate at the base, having the neck shorter than the calyx: the superior cell empty, and very narrow. ∆ G. Native of New Holland, on the south coast. Lindl. bot. reg. t. 914. Flowers pink.  

44 S. proquinum (R. Br. l. c.) stem multiple; partial ones divided in an umbellate manner; leaves linear; spikes sessile, nearly simple; capsule adnate at the base, linear, having the neck equal in length to the calyx: the superior cell very narrow and empty. ∆ ? G. Native of New Holland, on the south coast. Flowers pink. Very nearly allied to the preceding.

**Allied Stylidium.** Pl. ½ foot.  

45 S. alpinoides (R. Br. prod. p. 572.) stem erect; leaves ovate; floral ones opposite; flowers axillary, sessile, solitary, bracteless. ∆ ? S. Native of New Holland, within the tropic.  

**Chickweed-like Stylidium.** Pl. ½ to ¾ foot?  

**Cult.** All the species of this genus are rare, elegant, and singular. The best soil for them is a mixture of sand, loam, and peat. Some of the species may be increased by parting at the root; but most of them by seed. Cuttings of the shrubby kinds strike root readily under a hand-glass either in sand or mould.

II. **Levenhookia** (named in memory of Anthony Van Leeuwenhoek, a celebrated micrographist, whose numerous works and observations on the structure of plants are still extant). R. Br. prod. p. 572.

**Lin. syst. Gymnandria, Diandria.** Calyx 5-parted, bilabiate. Limb of corolla 5-parted, irregular: the fifth segment or lip dissimilar to the others, arching, and longer than the column, articulated with the tube, moveable. Column erect, adnate to the side of the tube where the labellum is. Lobes of anthers one above the other, divaricate. Stigmas 2, capillary. Capsule 1-celled.—A small glabrous plant, with the habit of *Radiola willdegrana.* Leaves alternate, petiolate, crowded at the tops of the branches, intermixed with fascicles of flowers. The irritability of the joint of the lip is analogous to that of the column in *Stylidium,* and answers the same end, the protection of the sexual organs at the time of flowering. In *Levenhookia* the labellum is deflexed when the flower is expanded, but from its irritability when touched it rises up, and is applied with great force to the erect immovable column, which it covers by its spoon-shaped lamina.

1 L. fusilla (R. Br. prod. p. 578.) ∆ ? G. Native of New Holland, on the south coast.  

**Least Levenhookia.** Pl. 1 to 2 inches.  

**Cult.** See *Stylidium* above for culture and propagation.

III. **Forsteria** (in honour of John Reinald Forster, and his son George Forster, who both accompanied Captain Cook in his second voyage in the quality of naturalists). Lin. nov. act. ups. 3. t. 9. Swartz, in Schrad. journ. 1799. 1. t. 1, 2. f. 2.—Phyllachne, Forst. char. p. 58.

**Lin. syst. Gymnandra, Diandra.** Calyx superior, of 2-3 sepals, girded by an involucre composed of 2-3 leaves. Corolla tubularly campanulate, 5-6-parted. Column of genitils straight, bearing 2 2-celled anthers at top, which dehice transversely. Stigmas 2, roundish, covered by the revolute valves of the anthers. Capsule inferior, 1-celled, many-seeded. Placenta central, free.  

1 F. edifolia (Lin. nov. act. ups. 3. t. 9.) leaves imbricated, ovate-oblong, coriaceous, margined, smooth, recurved; peduncles terminal, solitary, elongated, 1-flowered; involucre short, spreading. ∆ G. Native of New Zealand.

**Edible-leaved Forsteria.** Shrub.  
2 F. muscicola (Swartz, in Schrad. journ. 1779. 1. t. 1, 2. f. 2.) leaves imbricated, erect, lanceolate, triquetrous, and micrornated at the apex, having the keel and margins serrulate; flowers terminal, solitary, sessile; involucre exceeding the calyx. ∆ G. Native of Terra del Fuego. Phyllachne uliginosa, Forst. char. p. 58. and Lin. fil. suppl.

**Moss-leaved Forsteria.** Shrub.  
**Cult.** See *Stylidium* above for culture and propagation.
Synopsis of the genera.

Tribe I.

GOODENIÆ. Seeds indefinite.

1. GOODENIA. Calyx superior; limb 5-parted (f. 124. a.), with equal segments. Anthers distinct. Style simple. Capsule 2-celled (rarely 4-celled), with a parallel dissepiment, which in some species is short. Seeds imbricated, compressed. Corolla bilabiata, rarely unilabiata (f. 124. c.).

4. EUThALES. Calyx inferior, with an unequal 5-cleft limb. Corolla adhering to the tube below the ovary, cleft on the upper side, with a bilabiata limb. Style undivided. Indusium of stigma bilabiata. Capsule 4-valved, 2-celled at the base. Seeds imbricated, compressed.

5. VELLEIA. Calyx inferior, of 3-5 unequal leaves. Corolla having the base of the tube adnate to the ovary, and cleft on the upper side at the apex; limb bilabiata. Anthers distinct. Style undivided. Gland epigynous between the 2 anterior filaments. Capsule 2-celled at the base; valves bipartite. Seeds imbricated, compressed.

6. LECHENAUTIA. Calyx superior (f. 125. a.). Corolla with the tube cleft on the upper side (f. 125. b.). Anthers at first cohering. Stigma obsolete, bilabiata (f. 125. d.), in the bottom of the indusium. Capsule prismatic, 2 celled, 4-valved. Seeds cubical or nucamentaceous.

7. ANTHOTIUM. Calyx superior, 5-parted. Corolla having the tube cleft on the upper side, and the limb bilabiata; segments of the upper lip auricled on the inner side. Anthers cohering. Ovary 2-celled, many-seeded. Indusium of stigma contrary to the lips of the corolla.

Tribe II.

SCEVÖLÆ. Seeds definite. Drupe inferior.

8. SCEVOLA. Corolla cleft on the upper side, exceeding the genitils; limb unilabiata, secund, 5-parted, with equal winged segments. Anthers free. Indusium of stigma ciliated.

Tribe III.

BRUNONIÆ. Utriculus superior, 1-seeded.

Tribe IV.

CAMPANIIÆ. Corolla campanulate, regular. Capsule 3-4-celled, many-seeded.

Tribe I.

GOODENIÆ (this tribe contains plants agreeing with Goodenia, in the capsules being many-seeded). Capsules 2-celled, containing an indefinite number of seeds.

I. GOODENIA (named in honour of Dr. Goodenough, bishop of Carlisle, a lover of natural history, and author of a Monograph of the genus Carex, published in the Linnean Transactions). Smith, in Lin. trans. 2. p. 347. Labill. nov. holl. 1. p. 52. t. 75. R. Br. prod. p. 575. LIN. SYST. PENTÁNTRIA, MONOGYMNIA. Calyx superior, with a 5-parted limb (f. 124. a.) and equal segments. Anthers distinct. Style simple. Capsule 2-celled (rarely 4-celled), with a parallel dissepiment, which is sometimes short. Seeds imbricated, compressed._—Herbs, rarely subshrubs, usually caulescent. Leaves alternate, entire, toothed or cut. Flowers...
ayilarly or terminal; pedicels bibracteate or bracteless. Corollas usually yellow, although sometimes blue and purplish, bilabiate, rarely unilabiate; segments winged, rarely wingless; wings induplicate in aestivation; tube sometimes furnished with a little nectariferous sack, which is opposite to the fissure of the corolla, adnate to the ovary. Anthers cohering before expansion, beardless, rarely bearded at the apex. Capsule variable in form, with the top for the most part superior; valves entire or bipartite.

Sect. I. Ochirosynthus (from oχρος, ochros, yellow, and ανθος, anthos, a flower; colour of flowers). Corolla bilabiate, yellow; segments winged. Capsule 2-celled, or almost 1-celled from the dissepiment being short. Stigma parallel with the lips of the corolla.

§ 1. Peduncles terminal, spicate or panicled; pedicels bibracteate.

1 G. bellidifolia (Smith, in Lin. trans. 2. p. 349.) stem naked; spike nearly simple, downy; corolla clothed with simple down outside; radical leaves flat, lanceolate-spatulate, toothed or cut. 2. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 573. Corolla yellow.

2 G. stellifer (R. Br. prod. p. 575.) stem nearly naked; spike almost simple, downy; corolla clothed with simple hairs and stellate down outside; valves of capsule bipartite; radical leaves fleshy, semi-terete or linear, glabrous, a little toothed at the apex. 2. G. Native of New South Wales, about Port Jackson. Corolla yellow.

Stellate-haired Goodenia. Pl. ½ to ¾ foot.

3 G. paniculata (Smith, in Lin. trans. 2. p. 348. R. Br. prod. p. 575.) stem few-leaved; panicle almost simple, downy; ovary bare with glandular and simple hairs; radical leaves long-lanceolate, a little toothed or cut. 2. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 5. t. 507. Corollas yellow.

4 G. humilis (R. Br. prod. p. 575.) stem few-leaved; panicle simple, downy; ovary bare with acute hairs; radical leaves long-lanceolate, a little toothed. 2. G. Native of New Holland, on the south coast. Corollas yellow.

Humble Goodenia. Pl. ½ foot.

5 G. graciles (R. Br. l. e.) plant glabrous; stem few-leaved; panicule simple; ovaries glabrous; corolla clothed with glandular down outside; radical leaves linear-lanceolate, elongated, thickish. 2. G. Native of New Holland, within the tropic. Lodg. bot. cab. t. 1032. Corollas yellow.

6 G. decurrens (R. Br. l. e.) plant quite glabrous; stem many-leaved; spike racemose, divided a little at the base; corolla downy outside; caulline leaves oblong, toothed, decurrent. 2. G. Native of New Holland, about Port Jackson. Corollas yellow.

Decurrent-leaved Goodenia. Pl. 1 foot.

§ 2. Peduncles axillary, trifid or simple; pedicels bibracteate.

7 G. acuminata (R. Br. prod. p. 575.) sufruticosus, erect, glabrous, painted; peduncles trifid or trichotomous; leaves ovate, acuminate, dentately serrated, with beardless axils; calycine segments flat, one-half shorter than the capsule, which is prismatic; seeds disposed in 2 rows. 2. G. Native of New South Wales, about Port Jackson. Corolla yellow. Like the following, and probably only a variety of it.

Acutinately-leaved Goodenia. Pl. 1 to 2 feet.

8 G. ova (Smith, in Lin. trans. 2. p. 347. R. Br. l. c.) suffruticosus, erect, glabrous, sometimes painted; peduncles trifid or trichotomous; leaves ovate, acute, dentately serrated, bearded in the axils; calycine segments subulate filiform, a little shorter than the capsule, which is linear; seeds disposed in one series. 2. G. Native of New Holland, about Port Jackson and the south coast, as well as of Van Diemen’s Land. Andr. bot. rep. t. 68. Vent. cels. t. 3. and in mem. de l’institut. sc. phys. 2. p. 391. pl. 10. Cav. icon. 6. p. 4. t. 506. Corollas yellow.

9 G. varia (R. Br. prod. p. 576.) sufruticosus, glabrous; peduncles trifid or simple; leaves ovate and obtuse, or ovate and acutish, toothed, coriaceous, with naked axils; calycine segments shorter than the stamens; corollas and styles glabrous; capsule ovate. 2. G. Native of New Holland, on the south coast. Corollas yellow.

Var. a; leaves ovate and oval, a little toothed, attenuated at the base; branches flexuous: stems diffuse.

Var. b; leaves roundish, almost sessile, toothed; peduncles usually 1-flowered; stems depressed.

Variable Goodenia. Shrub ½ to 2 feet.

10 G. grandiflora (Sims, bot. mag. 890. R. Br. prod. 576.) plant herbaceous, erect, clothed with glandular pubescence; peduncles triform, trichotomous or simple; branches angularly striated; lower leaves lyrate: rameal ones rather ovate, acute; style longitudinally woolly. 2. G. Native of New South Wales, about Port Jackson. Corollas yellow.

11 G. heterophylla (Smith, in Lin. trans. 2. p. 349. R. Br. prod. p. 576.) plant herbaceous, erectish, downy, intermixed with glandless hairs; leaves ovate, cut or lobed; bracteas one-half shorter than the upper half of the one-flowered peduncle; style glabrous. 2. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 6. t. 508. Corollas pale red.

12 G. rotundifolia (R. Br. prod. 576.) plant herbaceous, erectish; leaves roundish, deeply serrated, membranous; bracteas longer than the upper half of the one-flowered peduncle; styles glabrous; capsules ovate. 2. G. Native of New South Wales, about Port Jackson; and of New Holland, within the tropic. Corollas yellow.

Var. a; plant quite glabrous, erectish.

Var. b; plant downy; hairs simple, sometimes diffuse.

Round-leaved Goodenia. Pl. 1 foot.

13 G. barbata (R. Br. prod. p. 576.) plant herbaceous, erect, clothed with glandular down, scabrous; leaves lanceolate-linear, entire; peduncles 1-flowered; throat of corolla bearded; styles longitudinally hairy; capsule 2-celled, 2-seeded. 2. G. Native of New South Wales, about Port Jackson, and of Van Diemen’s Land. Corollas yellow.

Bearded Goodenia. Pl. 1 foot.

14 G. lanata (R. Br. prod. p. 577.) plant herbaceous, downy, glabrous, almost sternless; branches prostrate; leaves ovate or oval, obtuse, a little toothed, hairy; young leaves and ovaria woolly; peduncles scape-formed; corolline segments ciliatted on the margins. 2. G. Native of Van Diemen’s Land. Corollas yellow.

Woolly Goodenia. Pl. prostrate.

15 G. geniculata (R. Br. l. c.) plant herbaceous, downy,
Goodenia.

Goodenia. PL 1 foot.

19 G. elongata (Labill. nov. holl. 1. p. 52, t. 75.) pilose; peduncles solitary, axillary and nearly terminal, elongated, reflexed or nearly entire, attenuated at the base. 

Elongated-peduncled Goodenia. PL 1 foot.

20 G. hispidida (R. Br. prod. 577.) plant erect, beset with strigose hairs; caule leaves sessile, elongated, lanceolate, a little toothed; peduncles solitary, axillary, elongated, erect while bearing the fruit; calyces hispid. 

2. G. Native of New Holland, within the tropic. Corollas yellow.

Hispid Goodenia. PL 1 foot.

21 G. coronopifolia (R. Br. l. c.) glabrous; leaves linear; radical ones pinnatifidly toothed; caule ones quite entire, and the seminal ones permanent; peduncles almost solitary, alternate, erect while bearing the fruit. 

2. G. Native of New Holland, within the tropic. Corollas yellow.

Buck-horn-leaved Goodenia. PL

22 G. tenella (R. Br. l. c.) plant rather downy, intermixed with a few adpressed hairs; stem simple or wanting; radical leaves flat, lanceolate or spatulate; peduncles radical or terminal, elongated, erect while bearing the fruit. 

Slender Goodenia. PL 1/4 to 1/2 foot.

23 G. filiformis (R. Br. prod. p. 578.) plant smoothish; stem simple; radical leaves filiform: caule leaves smaller; peduncles terminal, subumbel late. 

2. G. Native of New Holland, on the South Coast. Corollas yellow.

Filiform-leaved Goodenia. PL 1/4 foot.

FIG. 124.

Sect. II. Tetrathylax (from terpae, tetras, four-fold; and

θυλακ, thylax, a cell: capsule 4-celled). Corolla bilabiata, yellow, having the segments winged. Capsule 4-celled.

24 G. quadrilocularis (R. Br. prod. p. 578.) plant glabrous, erect; leaves nearly oval, toothed; flowers spicate or axillary. 

2. G. Native of New Holland, on the South Coast.

Four-celled-fruited Goodenia. PL

Sect. III. Porphyranthus (from πορφυρος, porphyros, purple; and ανθος, anthos, a flower; colour of flowers). Corolla bilabiata, purple or blue, having the segments winged.

Capsule 2-celled, or half 2-celled. Stigma parallel with the lips of the corolla.

25 G. purpurea (R. Br. l. c.) plant glabrous; panicle effuse; stem naked; leaves radical, elongated-lanceolate. 

2. G. Native of New Holland, within the tropic. Corolla purple.

Purple-flowered Goodenia. PL 1/2 foot.

26 G. pterigospérima (R. Br. l. c.) plant glabrous; stem almost simple, few-flowered; flowers alternate; radical leaves linear, a little toothed: caly whole smaller, remote; calyx bluntish, and is, as well as the ovary, glabrous. 

2. G. Native of New Holland, on the South Coast. Corollas blue or purple.

Wing-seeded Goodenia. PL 1/2 foot.

27 G. cérunclea (R. Br. l. c.) plant glabrous; partial stems or branches nearly simple, few-flowered; radical leaves linear, a litt le toothed: caly whole smaller, remote; calyx bluntish, and is, as well as the ovary, glabrous. 

2. G. Native of New Holland, on the South Coast. Corollas blue or purple.

Hoary Goodenia. PL 1/2 foot.

Sect. IV. Monochila (from μονος, monos, alone; and χειλος, cheilos, a lip, in reference to the unilabiate corolla). Corollas unilabiate, having the segments winged. Stigma 2-lobed, having the indusium ciliated, and contrary to the lip of the corolla.

29 G. scapigerà (R. Br. l. c.) plant glabrous, erect; leaves toothed; spike terminal, pedunculate; segments of the calyx subulate, longer than the ovary, which is tubuliferous on one side. 

2. G. Native of New Holland on the South Coast.

Var. a; common peduncle elongated, scape-formed; leaves linear-lanceolate, elongated.

Var. β; common peduncle not elongated; leaves oval-lanceolate.

Scape-bearing Goodenia. PL 1/2 foot.

30 G. viscidà (R. Br. l. c.) plant glabrous, painted, erect; leaves lanceolate, toothed; peduncles axillary, 1-flowered, very short; stigma bifid. 

2. G. Native of New Holland, on the South Coast.

Viscid Goodenia. PL

Sect. V. Sellérâa (named after Natali Sellier, a Spanish artist). Selléria, Cav. icon. 5. p. 49. t. 47. f. 2. Corolla subumbilicate, purplish, having the segments wingless, and valvate in aestivation.

31 G. réfent (Labill. nov. holl. 1. p. 53. t. 76.) plant glabrous, creeping; leaves lanceolate, fleshy. 

2. G. Native of New Holland, on the South Coast, and about Port Jackson; and of Van Diemen's Land; and of Chili, about Talcahuana, in humid sandy places by the sea shore. Selléria radicans, Cav. icon. 5.
GOODENOVI. I. GOODENIA. II. DISTYLIS.

p. 49. t. 473. f. 2. G. radicans, Pers. ench. 1. p. 195. Lysimínia særpons, Kunz, Poeppig, pl. chil. 3. p. 34. no. 103. Perhaps a proper genus. Flowers variegated with white and blue. Stem woody, glabrous.

Creeping Goodenia. Pl. creeping.

32 fulvum (R. Br. prod. p. 579.) plant creeping, downy; leaves ovate, membranous: upper ones crowded; peduncles 1-flowered, from the axils of the upper leaves. 2. G. Native of New Holland, within the tropic. Corolla purplish. Perhaps the corolla is unilabiate, or probably nearly regular. Dwarf Goodenia. Pl. creeping.

Cult. All the species of this genus are worth cultivating for ornament. They grow freely in a mixture of sand, loam, and peat; and young cuttings of most of the species strike root freely in the same kind of soil, under a hand-glass; and all may be raised from seed, which ripen plentifully.

II. DISTYLIS (from δίς, dis, twice, and στυλός, stylus, a style; in reference to the style being bipartite). Gaud. in Freye. voy. pt. bot. p. 45. t. 50.

Lin. syst. Pentândria, Monogyónia. Calyx adnate to the ovary; limb free, 5-parted. Corolla deciduous, with the tube cleft behind, 5-parted, spreading, somewhat bilabiate; segments with winged margins. Stamens 5, distinct. Style bipartite. Indusium of stigma membranous, cup-shaped, and ciliated. Capsule crowned by the permanent calyx, semi-bilocular in consequence of the dissepiment being short; valves parallel. Seeds imbricate, compressed, orbicular, girdled by a membranous border.—An annual hairy plant, with almost simple stems. Leaves alternate, toothed. Flowers axillary, solitary, on long peduncles, racemose, bracteate, yellow.

1 D. Berardiána (Gaud. l. c.). O. G. Native of New Holland, on the Western Coast, in Sharks' Bay. Goodenia Berardiána, Gaud.

Berard's Distylis. Pl. ½ foot.

Cult. Rear the seeds in a frame in the spring, and about the end of May put the plants out into the open border in a warm situation.

III. CALOGYNE (from καλός, kalos, beautiful, and γυνή, gyné, a female; in reference to the stigma). R. Br. prod. p. 579.

Lin. syst. Pentándria, Monogyónia. Calyx superior; limb 5-parted, with equal segments. Corolla bilabiate. Anthers distinct. Style trifid. Gland epignous between the 2 lower filaments. Capsule subunilocular from the dissepiment being short. Seeds imbricate, compressed.—A pilose annual herb, with the habit of Goodenia, and when dry having an odor like that of vernal grass. Leaves toothed or cut; floral ones auriculated at the base. Peduncles axillary, 1-flowered, bracteate, reflexed while bearing the fruit.—This genus is separated from Goodenia alone from the trifid style; each division being furnished with an indusiate stigma.

1 G. pilosa (R. Br. l. c.). O. G. Native of New Holland, within the tropic.

Pilose Calogynae. Pl. ½ foot.

Cult. Sow the seeds of this plant in spring, in a pot filled with a mixture of sand, loam, and peat, and place it in a hot-bed; and when the plants are of sufficient size, plant them separately into other pots.

IV. EUThA'LES (from ἐυ, eu, well, and ἦλως, thallo, to sprout). R. Br. prod. p. 579.

III. CALOGYNE. IV. EUThA'LES. V. VELLEIA.

Lin. syst. Velleiá, Monogyónia. Calyx inferior, tubular, 5-cleft, unequal. Corolla adhering to the tube beneath the ovary, cleft on one side at the apex; limb bilabiate. Anthers distinct. Style undivided. Indusium of stigma bilabiate. Capsule 4-valved, 2-celled at the base. Seeds imbricated, compressed.—A stemless herb, with the habit and inflorescence of Velléia. The corolla in this genus and Velléia is semi-superior, and joined with the calyx at the base. The genus is intermediate between Goodenia and Velléia, but differs from them in the calyx being tubular.

Cult. A mixture of loam, peat, and sand is the best soil for this plant; and it must be but sparingly watered, as it is very delicate, and apt to damp off. It is increased, but sparingly, by dividing, and by seed.

Lin. syst. Pentándria, Monogyónia. Calyx inferior, 3-5-leaved, unequal. Corolla having the tube joined with the ovary at the base, and cleft on the upper side at the apex; limb bilabiate. Anthers distinct. Style undivided. Gland epignous between the 2 anterior filaments. Capsule 2-celled at the base; valves bipartite. Seeds imbricate, compressed.—Stemless herbs. Leaves radical, subspatulate, usually toothed, but sometimes lyrate. Scapes dichotomous, with the most of the axes floriferous. Bracteas opposite, foliaceous, sometimes large, and sometimes connate. Upper segment of the calyx broad, and often toothed at the base. Corolla yellow, adhering at the base, beneath the gibbosity or spur. Style somewhat tetragonal. Indusium of stigma large.

Sect. I. Menoceras (from μεν, meno, to abide; and κεφαλή, keras, a horn; in reference to the permanent spur). R. Br. prod. p. 580. Calyx 5-leaved. Corolla spurred at the base: spur permanent.

1 V. PARADOXÁ (R. Br. prod. p. 580.) plant downy; leaves bluntly toothed. O. G. Native of New South Wales, about Port Jackson; on the south coast of New Holland; and of Van Diemen's Land. Lind. bot. reg. 971. Corolla yellow.

2 V. ARVI'TA (R. Br. l. c.) plant glabrous; leaves sharply toothed. O. G. Native of New Holland, on the south coast. Corolla yellow.

Sharp-toothed-leaved Velleia. Pl. ½ foot.

Sect. II. Velle'ia-Velle'ia (this section is supposed to contain the true species of the genus). R. Br. prod. p. 580. Calyx 3-leaved. Corolla rather gibbous on one side at the base.

3 V. LYRÁTA (R. Br. l. c.) glabrous; bracteas of the forks distinct; leaves lyrate or deeply toothed at the base; segments of the calyx ovate- orbicular. O. G. Native of New South Wales, about Port Jackson. Ker. bot. reg. 551. Corollas yellow.

4 V. SPATULÁTA (R. Br. l. c.) glabrous; bracteas of the forks distinct; leaves spatulate, almost toothless, but quite entire at the base, with the axils bearded. O. G. Native of New South Wales, about Port Jackson; and of New Holland, within the tropic. Juss. ann. mus. 18. t. 1. Corolla yellow.

V. Velleia. VI. Lechenaultia. VII. Anthotium. VIII. Scaevola.

5. V. Fure'sca (R. Br. prod. p. 581.) downy; bracteas of the forks distinct; leaves toothed; segments of the calyx oblong-ovate, acute. 4. G. Native of New Holland, within the tropic. Corolla yellow.

Downy Velleia. Pl. 3(1.) foot.

6. V. Perfoliata (R. Br. l. c.) glabrous; bracteas of the forks large, connate, roundish, toothed. 4. G. Native of New South Wales, about Port Jackson. Corolla yellow.

Perfoliate-bracted Velleia. Pl. 3(1.) foot. Cult. The soil recommended for the two preceding genera is also suited for the species of Velleia; and they may be increased by seeds, which are sometimes produced in this country.

LIN. SYST. Pentandra, Monogynia. Calyx superior (f. 125. a). Tube of corolla cleft on one side (f. 125. b.); limb bilabiata (f. 125. i.). Anthers cohering (f. 125. c.) at the time the flower is expanded. Grains of pollen compound. Stigma obsolete, in the bottom of the bilabiata indusium (f. 125. f.). Capsule prismatic, 2-celled, 4-valved; opposite valves septiferous in the middle. Seeds cubic or cylindrical, loculicidate. — Small glabrous heath-like shrubs, rarely herbs. Leaves narrow, quite entire. Flowers axillary or terminal, almost solitary. The pollen in all the species is composed of 4 combined spores.

2. L. Oblata (Sweet, fl. austral. t. 46.) flowers axillary and terminal, solitary, bracteas, rather drooping; corollas bilabiata, downy outside; upper lip 2-lobed; lower one tripartite: segments oblate; filaments clothed with downy tomentum. 4. G. Native of New Holland, on the south coast. L. formosa, Lindl. bot. reg. t. 916. Hook. bot. mag. t. 2600. L. Baxtéri, G. Don, in Loud. Hort. Brit. p. 79. Flowers copper-coloured. (f. 125.)

Oblate Lechenaultia. Fl. April, Aug. Ch. 1824. Shrub 1 foot.

3. L. Tubiflora (R. Br. prod. 581.) flowers nearly terminal, solitary, almost sessile; corolla tubular, curved, with a conning limb; leaves subulate, ending each in a pellucid point. 4. G. Native of New Holland, on the south coast.

Tubeflowered Lechenaultia. Shrub 1 foot.

4. L. Expansa (R. Br. l. c.) flowers axillary, crowded into a few-flowered corymb; pedicels bibracteate; limb of corolla unilabiata, with ciliated segments. 4. G. Native of New Holland, on the south coast.

Expanded-flowered Lechenaultia. Shrub 1 foot.

5. L. Filiformis (R. Br. l. c.) leaves alternate, compressed, filiform. 4. G. Native of New Holland, within the tropic.

Filiform-leaved Lechenaultia. Pl. Cult. The species of Lechenaultia are elegant plants while in blossom. They thrive best in a mixture of furry loam, peat, and sand; and young cuttings strike root freely in the same kind of mould under a hand or bell-glass.

VII. ANTHOTIUM (from ἀνθός, anthos, a flower, and ove ὠς, ows otos, an ear; in reference to the segments of the superior lip of the corolla being auriculated on the inner margin). R. Br. prod. p. 582.

1. A. Hymalle (R. Br. l. c.) 4. G. Native of New Holland, on the south coast. There are two varieties of this plant, one twice the size of the other in all its parts.

Humble Anthotium. Pl. 3(1.) foot. Cult. See Velleia, above, for culture and propagation.

Tribe II.

Scaevoleae (this tribe contains plants agreeing with Scaevola in important characters). R. Br. prod. p. 582. Seeds definite. Drupes or nut inferior.

LIN. SYST. Pentandra, Monogynia. Corolla cleft longitudinally on the upper side; limb 5-parted, all to one side; segments winged, about equal in size and shape. Anthers free. Indusium of stigma ciliate.—Shrubs and herbs very variable in habit. Down on hairs simple. Leaves alternate, rarely opposite, hardly divided, often toothed. Inflorescence axillary or disposed in a leafy spike. Ovariis bibracteate, usually 2-celled (rarely 4-celled); cells 1-seeded; sometimes 1-celled and 1-seeded. Calyx 5-cleft, equal, sometimes obsolete. Corolla white or blue, rarely yellow, deciduous, for the most part downy outside; wings of the segments often fringed at the base, rarely longitudinally; the fringes for the most part floccosely branched at the top, and appears capitata to the naked eye; tube villous inside, and the throat bent with ramenate, which are disposed in continuous lines, with the fringes of the segments. Stamens flaccid after the dehiscence of the corolla, and falling off with it. Anthers for the most part beardless, but sometimes bearded at the apex.—This genus is divided into natural groups below. Those species with 1-celled ovaria will probably constitute a separate genus from those with 2-celled ovaria. —S. spinascens has a very different habit from the other species, and is probably a distinct genus, from the bracteas being deciduous, and the wings of the segments of the corolla being fringed lengthwise, but the mature fruit is not known.

SECT. I. Sarcocea (from sarco, sarx, sarks, flesh; and καρπος, karpos, a fruit; in reference to the baccate fruit of the species). Drupes baccate, 2-celled. Pedicels axillary, dichotomous, bearing flowers in the forks, rarely 1-flowered. Leaves alternate, bearded in the axils. Shrubs, natives of the sea shore.

1. S. Kenfigi (Vahl, symb. 2. p. 56.) cymes glabrous; flowers
pedicellate in the forks of the peduncles; calyx 5-parted, equal in length to the ovarium; leaves obovate, subepend at the apex, quite glabrous on both surfaces, as well as the branches. .startTime

Koenigii, Lamark, aus. p. 108. Very like the two preceding species, but differs in being tomentose. There are varieties of this with more or less tomentose entire and repandly toothed leaves, and with the style either glabrous or longitudinally villous.

Silky Scaevola. Shrub 2 to 3 feet.

8 S. CHAMMISONIA (Gaud. in Freyc. voy. pt. bot. p. 461. t. 82.) shrubby, erect, glabrous; leaves oblong, acuminated at both ends, sharply denticulated, with bearded axes; peduncles axillary, dichotomous, about equal in length to the leaves, with sessile flowers in the forks; calyx short, 5-toothed; corolla downy; drupe 2-celled. .startTime

9 S. TEMENTOSA (Gaud. in Freyc. voy. pt. bot. p. 460. t. 81.) shrubby, erect, clothed with brownish stellate tomentum; leaves soft, somewhat rhomboid-ovate, obtuse, minutely toothed; flowers axillary, solitary, pedunculate; calyx short, 5-toothed; corollas downy; bracteoles unilataral, half connate, quite entire; fruit 2-seeded. .startTime

Tomentose Scaevola. Shrub 2 to 4 feet.

10 S. MENZIESI (Cham. in Linnae. 7. p. 227.) shrubby, erect; leaves obovate or lanceolate, obtuse or acutish, quite entire, or a little serrated, narrowed into the petiole, bearded at the axils, rather fleshy, downy beneath or glabrous; peduncles shorter than the leaves, bearing 3 flowers at the apex, and often only one; bracteas linear; flowers sessile; calyces teeth short, ciliated; corolla pilose outside or glabrous, villous inside, having the segments hardly winged; style villous; drupe olive-formed, 1-2-seeded. startTime

Menzie's Scaevola. Shrub 2 to 3 feet.

11 S. GLabra (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, glabrous; leaves lanceolate-acuminate at both ends, entire, with a few almost obsolete teeth on the margins, narrowed into the short petiole, toothed at the base, with bearded axes; peduncles axillary, equal in length to the leaves or exceeding them, 5-8-flowered, cymosestichotonous; bracteas linear; flowers sessile; calyces teeth short, ciliated; corolla glabrous on the outside, and inside of the tube rather villous; segments winged; style villous; drupe olive-formed, containing one 2-seeded pyrene. .startTime

Glabrous Scaevola. Shrub 2 to 3 feet.

12 S. MONTANA (Labb. sert. cal. p. 41. t. 43.) cymes and corollas tomentose; flowers sessile in the forks of the corymb; leaves obovate-oblong, glabrous, rather coriaceous.  startTime

Mount St. Scaevola. Leaves entire, undulated or crenulated, with silky hairy axes.

Mountain Scaevola. Shrub 4 to 6 feet.

13 S. oppositifolia (Roxb. fl. ind. 2. p. 148.) leaves opposite, on short petioles, elliptic, entire, smooth; peduncles axillary, few-flowered.  startTime

Opposite-leaved Scaevola. Shrub.

Sect. II. Xerocarpa (from ἕξορος, xeros, dry; and καρπος, karpos, a fruit; in reference to the dry fruit of the species). Drupe usually dry, 1-4-celled. Bracteas foliaceous, lateral, permanent. Spikes terminal, but sometimes axillary.

§ 1. Leaves all or for the most part toothed or cut.

14 S. ATTENUATA (R. Br. prod. p. 583.) shrubby, erect; pilose; leaves lanceolate, toothed; bracteas stretched, quite entire; corolla hairy outside, with the margins naked above; styles very villous.  startTime

Attenuated-leaved Scaevola. Shrub 2 to 3 feet.

15 S. NITIDA (R. Br. prod. p. 584.) shrubby, erect, quite...
GOODENIÆ.

glabrous; leaves elliptic, sharply toothed; bracteas toothed; corollas glabrous outside, with the margins villous above; styles rather villous. 7. G. Native of New Holland, on the south coast.

Shining-leaved Scevolæ. Shrub 1 to 2 feet.

16 S. crassifolia (Labill. nov. holl. 1. p. 56. t. 79.) suffruticose, ascending, quite glabrous; leaves elliptic, sharply toothed, obovate-lanceolate, and are as well as the branches often painted; bracteas entire; indium of stigma with a naked border. 7. G. Native of New Holland, on the south coast. Flowers white.

17 S. globulifera (Labill. nov. holl. 1. p. 55. t. 78.) suffruticose, erect, glabrous? leaves lanceolate, few-toothed; bracteas entire; ovarium 4-celled. 7. G. Native of New Holland, on the south coast. The fringe at the base of the branches of the segments of the corolla, and the ramenta in the throat of the corolla, are floccosely branched at the tops; therefore they appear globular at the apex, hence the name.

Glabule-bearing Scevolæ. Shrub 1 to 2 feet.

18 S. ovalifolia (R. Br. prod. p. 584.) suffruticose, ascending; leaves oval or elliptic, toothed; bracteas rhomboid-elliptic, very acute, nearly entire; calyx obsolete; style bearded at the top on one side. 7. G. Native of New Holland, within the tropic.

Var. a. cinerascens (R. Br. l. c.) clothed with fine cinereous tomentum; corolla downy outside.

Var. B. glabra (R. Br. l. c.) glabrous; corolla beardless on the outside.

Oval-leaved Scevolæ. Shrub 1 to 2 feet.

19 S. ëzëula (R. Br. l. c.) plant herbaceous, erect; leaves cuneated or obovate, toothed, smoothish; spike simple; bracteas lanceolate, nearly entire; calyx lobed; style glabrous, below, furnished on one side at the apex with a straight coloured beard, which is equal in length to the indium of the stigma; ovarium 2-celled. 7. G. Native of New Holland, on the south coast. It agrees with the figure given of the next species, except in the lower bracteas of the spikes being many-flowered, while in the present plant they are always 1-flowered.

Emulating Scevolæ. Pl. 1 foot.

20 S. cuneiformis (Labill. nov. holl. 1. p. 56. t. 80.) plant herbaceous, erect? rather pilose; leaves cuneated, toothed; spike divided at bottom into 2-3-flowered spikelets; bracteas lanceolate, entire; calyx lobed; style glabrous below, but furnished with a straight beard on one side at the apex, which is equal in length to the indium of the stigma. 7. G. Native of Van Diemen's Land. Flowers blue?

21 S. sinuata (R. Br. prod. p. 584.) plant herbaceous, diffuse, downy, with the hairs adpressed; leaves obovate or cuneated, toothed or sinuated; spike compound; spikelets few-flowered; bracteas elliptic, entire; calyx lobed; style glabrous below, but furnished at the apex on one side with a straight, coloured beard, which exceeds the indium of the stigma. 7. G. Native of New Holland, on the south coast. An intermediate plant between S. ëzëula and S. cuneiformis.

Sinuated-leaved Scevolæ. Pl. diffuse.

22 S. hümëlis (R. Br. prod. p. 585.) plant herbaceous, ascending or diffuse, downy; leaves sharply toothed; lower ones obovate-cuneated: rameal ones lanceolate; spike simple; bracteas linear-lanceolate, a little toothed; calyx lobed; style furnished with a straight coloured beard on one side at top, which is equal in length to the indium of the stigma; ovarium 2-celled. 7. G. Native of New Holland, on the south coast.

Humble Scevolæ. Pl. ascending.

23 S. microcarpa (Cav. ñon. 6. p. 6. t. 509.) plant herbaceous. Vol. III.

VIII. SCEVOLA.

ceous, downy; leaves cuneated, oval, or orbicular, toothed, attenuated at the base; spike simple; bracteas toothed; calyx lobed; tube of corolla bearded inside; hairs in the throat of the corolla, acute, and capitate; style longitudinally villous; ovarium 1-celled, 2-seeded. 7. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. R. Br. prod. p. 585. Goodenia albida, Smith, in Lin. trans. 2. p. 347. Goodenia levegáta, Curt. bot. mag. 287. Wildl. spee. 1. p. 954. Flowers purple, with a white throat. This is a very polymorphous species, sometimes diffuse, and sometimes erect, varying much in the consistence and form of the leaves.

24 S. palüha (R. Br. prod. l. c.) plant herbaceous, diffuse, downy; leaves toothed, attenuated at the base, cuneate or lanceolate; spike simple; bracteas usually toothed; calyx lobed; tube of corolla almost naked inside; style glabrous; ovarium 1-celled, 2-seeded. 7. G. Native of New Holland, on the south coast. Like the preceding, but smaller in all its parts.

Pale-flowered Scevolæ. Pl. diffuse.

§ 2. Leaves all or for the most part quite entire.

25 S. suaveolens (R. Br. prod. p. 585.) plant herbaceous, diffuse, downy; leaves spatulate, fleshy, with bearded axils; bracteas linear-lanceolate; ovarium 2-celled; drupe baccate. 7. G. Native of New Holland, on the south coast, and within the tropic; and of New South Wales, about Port Jackson. Goodenia calendulacea, Andr. bot. rep. 22. Flowers blue.

26 S. esépíosa (R. Br. l. c.) plant suffruticose, erect, glabrous; leaves linear-lanceolate, with rather recurved margins, a little toothed, with beardless axils; calyx short, 5-lobed; ovarium 2-celled. 7. G. Native of New Holland, on the south coast. In many points this species agrees with S. globulifera, but differs in the ovarium being truly 2-celled.

Tufted Scevolæ. Shrub 1 foot.

27 S. révoluta (R. Br. prod. p. 586.) suffruticose, erect, downy, greyish; leaves oblong-lanceolate, sessile, with revolute edges; spike compact; bracteas lanceolate, rather concave; calyx obsolescently crenated; ovarium 2-celled. 7. G. Native of New Holland, within the tropic.

Revolute-leaved Scevolæ. Shrub 1 foot.

28 S. líneaëris (R. Br. l. c.) suffruticose, erect, much branched, pilose, and scabrous; leaves and bracteas linear, recurved on the margins; spike terminal; ovarium 1-seeded. 7. G. Native of New Holland, on the south coast.

Linear-leaved Scevolæ. Shrub 1 foot.

29 S. paludósa (R. Br. l. c.) plant subherbaceous, erect, a little branched, pilose, scabrous; leaves linear-lanceolate, flatish, about equal in length to the axillary spikes; ovarium 1-seeded. 7. G. Native of New Holland, on the south coast.

Marsh Scevolæ. Pl. 1 ft.

30 S. angulata (R. Br. l. c.) suffruticose, erect; branches angular; leaves sessile, oblong-lanceolate; spike simple; bracteas conforming to the rameal leaves; calyx 5-toothed, about equal in length to the 2-celled wrinkled ovarium. 7. G. Native of New Holland, within the tropic. There is a variety of this having few-toothed leaves, usually quite glabrous, but sometimes furnished with a few scattered hairs.

Angular-branched Scevolæ. Shrub.

Sect. III. POGONANTHEÆ (from πογόνος, pogon, a beard; and ἀνθηρα, anthera, an anther; the anthers are bearded). Calyx length of ovary. Anthers bearded at the apex. Drupe nearly dry. Herbaceous plants. Peduncle axillary, 1-flowered, elongated, each furnished with 2 foliaceous permanent bracteas.

5 A
GOODENOVI. VIII. SCEVOLA.

31 S. hispida (Cav. Icon. 6. p. 7. t. 510.) wings of the segments of the corolla veinless. \( \alpha \). G. Native of New South Wales, within the tropic. R. Br. prod. p. 586. Goodenia ramosissima, Smith, in Lin. Trans. 2. p. 349. new holl. 15. t. 5.

Flowers lilac.

32 S. striata (R. Br. prod. p. 586.) wings of the segments of the corolla furnished with parallel veins. \( \alpha \). G. Native of New Holland, on the south coast.

Striated Scevola. Pl. 1 foot?

SECT. IV. CROSSOTOMA (from κρόος, κρός, a fringe; and τομα, τόμα, a section; in reference to the fringed segments of the corolla). Calyx obsolete. Wings of the segments of the corolla fringed longitudinally. Peduncles axillary, 1-flowered, furnished with deciduous bracteas at the apex.

33 S. spinosensis (R. Br. prod. p. 586.) shrubby, spinescent; leaves ovate or obovate, quite entire. \( \gamma \). G. Native of New Holland, on the south coast.

Spinose Scevola. Shrub.

Cult. All the species grow freely in a mixture of turfy loam, turfy peat, and sand; and cuttings planted in the same kind of soil, with a hand-glass placed over them, strike root readily; those of the stoe sperma species in heat.

IX. DIASPASIS (from διασπάσις, diaspora, a pulling asunder; segments of corolla). R. Br. prod. p. 586.

1 D. filifolia (R. Br. prod. p. 587.) \( \gamma \). G. Native of New Holland, on the south coast.

Thread-leafed Diaspasis. Pl. 1 foot?

Cult. See Scevola above for culture and propagation.

Linn. syst. Pentandria, Monogynia. Corolla bilabiata (f. 126. a.), having the tube cleft on the upper side (f. 126. c.); segments of the upper lip auricled on the inner margin. Anthers closely cohering (f. 126. d.). Ovarium 1-seeded. Indusium of stigma with a naked border (f. 196. c.). Nut crustaceous. Arid downy subshrub or herbs: hairs usually of two forms; the longer ones in most of the species are branched, and rather plumose; and the shorter ones stellate. Leaves alternate, undivided, or a little toothed, coriaceous. Flowers axillary or terminal, sub-spicate or solitary; bracteas small or wanting. Calyx short, usually obsolete. Corolla blue or purple, 5-parted; with the margins of the claws truly inflexed, and the lamina hairy on the outside: deciduous, but sometimes with the base permanent and entire. Stamens remaining after the corolla has fallen; anthers beardless.

1 D. undulata (R. Br. prod. p. 587.) suffruticose, erect, tomentose; leaves petiolate, roundish, toothed, undulated, scabrous above, longer than the peduncles, which are axillary and 2-4-flowered; corolla bearded with black plumose villi outside. \( \gamma \). G. Native of New South Wales, about Port Jackson. Flowers blue.

Undulated-leaved Dampiera. Shrub 1 foot.

2 D. rotundifolia (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, roundish, entire, flat, scabrous above, very blunt at the base; peduncles axillary, usually 1-flowered, very short: terminal ones subcoriaceous; corolla bearded with black plumose villi outside. \( \gamma \). S. Native of New South Wales, about Port Jackson. Flowers blue.

Round-leaved Diaspasia. Shrub 1 foot.

3 D. ovalifolia (R. Br. pr. p. 588.) suffruticose, erect, clothed with scurfy tomentum; leaves petiolate, oval, nearly entire, flat, scabrous above; peduncles 2-4-flowered, axillary, about equal in length to the leaves: terminal ones coriaceous; corolla bearded with black plumose villi outside. \( \gamma \). G. Native of New Holland, about Port Jackson. Juss. ann. mus. 18. t. 2. no. 1. Flowers blue. (f. 126.)

4 D. purpurea (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutely toothed, scabrous above; peduncles axillary, 1-3-flowered; corolla bearded with black plumose villi outside. \( \gamma \). G. Native of New Holland, about Port Jackson. Flowers purple. In this and the preceding species the outside of the corollas, as well as the peduncles, are densely bearded with spreading plumose villi.

Purple-leaved Dampiera. Shrub 1 foot.

5 D. fimbriata (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutish, reedally toothed, 3-nerved at base, smooth above in the adult state; flowers almost terminal; corollas clothed with branched wool outside. \( \gamma \). S. Native of New Holland, on the tropic. Flowers blue.

Rusty Dampiera. Shrub 1 foot.

6 D. hederacea (R. Br. l. c.) plant herbaceous, procumbent, tomentose; leaves for the most part petiolate, somewhat coriaceous, angularly cut: superior ones quite entire, glabrous above in the adult state; corollas bearded on the outside by spreading plumose cinerous villi. \( \gamma \). G. Native of New Holland, on the south coast. Flowers blue.

Ivy-like Dampiera. Pl. procumbent.

7 D. icxa (R. Br. l. c.) suffruticose? erect? clothed with hoary tomentum; leaves sessile, ovate (leaves less), obovate, quite entire. \( \gamma \). G. Native of New Holland, on the western coast about Cape Lewin and Wit's Land, where it was collected by Dampier and Baudin. Hoary Dampiera. Shrub.

8 D. cuneata (R. Br. l. c.) plant herbaceous, erectish, downy; leaves sessile, toothed, obovate-cuneated, upper ones elliptic-lanceolate, adult ones smoothish; spikes pedunculate; bracteas opposite; flowers alternate; corollas woolly on the outside from simple spreading villi. \( \gamma \). G. Native of New Holland, on the south coast. Flowers blue.

Cuneate-leaved Dampiera. Pl. \( \frac{1}{2} \) to 1 foot?

9 D. linea (R. Br. l. c.) plant herbaceous, erect, downy; leaves sessile, for the most part linear and few-toothed, lower ones cuneate, adult ones smoothish; spikes pedunculate;
bracteas opposite; flowers alternate; corollas woolly outside from simple spreading villi.  

**2. G.** Native of New Holland, on the south coast. Flowers blue. In this and *D. cuneifolia* the calyx is obsolete, the base of the corolla entire and permanent, clothed with simple villi on the outside; and the inflorescence is peculiar in these two plants.

**Linear-leaved Dampiera.** Pl. ½ to 1 foot?

10. D. *fasciculata* (R. Br. 1. c.) plant herbaceous, erect; stem compressedly trigonial; leaves sessile, cuneate, a little toothed, upper ones crowded in a verticillate manner, adult ones glabrous and smooth on both surfaces; peduncles in fascicles, few-flowered; corollas clothed with adpressed hairs outside: branches of pili approximate and parallel.  

11. D. *oblonga* (R. Br. 1. c.) plant herbaceous, erect; stem compressedly trigonial; leaves sessile, oblong, entire, and few-toothed, glabrous and smooth on both surfaces; peduncles in fascicles, few-flowered; corollas clothed with adpressed pili on the outside: divisions of pili approximate and parallel.  

**Paciied-peduncled Dampiera.** Pl. 1 foot?

11. D. *oblonga* (R. Br. 1. c.) plant herbaceous, erect; stem compressedly trigonial; leaves sessile, oblong, entire, and few-toothed, glabrous and smooth on both surfaces; peduncles in fascicles, few-flowered; corollas clothed with adpressed pili on the outside: divisions of pili approximate and parallel.  

**2. G.** Native of New Holland, on the south coast. Flowers blue.  

**Oblong-leaved Dampiera.** Pl. ½ to 1 foot?

12. D. *stricta* (R. Br. pro. p. 589.) plant herbaceous, erect; stem compressedly trigonial; leaves sessile, cuneate, a little toothed, scabrous above in the adult state; peduncles few-flowered, auxiliary and terminal; corollas clothed with adpressed pili on the outside: divisions of pili parallel and approximate.  

**2. G.** Native of New South Wales, about Port Jackson. Flowers blue.  

**2. G.** Native of New South Wales, on the south coast. Flowers blue.  

**Small-leaved Dampiera.** Pl. 1 foot?  

**Cult.** See Scaevola, p. 730. for culture and propagation.

**Tribe III.**

**BRUNONIÆ.** (this tribe only contains the genus *Brunonia*.)

**UTRICULARIUS SUPERIOR, 1-seeded.**

**LIN. SYST.** Pentándria, Monogyinia. Heads of flowers involucrated. Calyx 5-cleft, furnished with 4 bracteas. Corolla monopetalous, funnel-shaped; limb 5-parted, the 2 superior segments more deeply divided than the rest. Stamens 5, hypogynous. Anthers connate. Ovary 1-seeded. Indument of stigma 2-valved. Utriculus inclosed within the indurated calyx, which spreads at top with plumose segments. Seed without albumen.—Stemless herbs, with the habit of *Scabiosa*, Jasionum, and *Globularia*, downy from glandless simple pili. Radical leaves quite entire, spatulate. Scapes undivided, bearing each one head. Head hemispherical, lobate: lobes involucrated by foliaceous bracteas. Flowers distinct, nigh a whorl of 5 membranous bracteas, the fifth bractea rather dissimilar. Tube of calyx very short when in flower. Corolla azure blue, marcescent, having the tube at length cleft. Filaments almost hypogynous, permanent, inserted in the very short stipe of the ovarium, which is only obvious after fecundation. Anthers inclosed in the tube of the corolla. Stigma fleshy, retruse, inclosed within the bifid indium, which has a naked border. This genus agrees in many points of structure with *Compositae*, *Campanulaceae*, *Dipsaceae*, and *Globulariae*.

1. B. *sibrica* (Smith, in *Linn. trans. 10. p. 366. t. 28. R. Br. prod. p. 589.) leaves as well as the scapes silky from adpressed villi: calyces segments ending each in a thick coloured nail point.  

2. G. Native of New Holland, within the tropic. Flowers azure blue.

**Silky Brunonia.** Pl. 1 foot.

2. B. *australis* (Smith, in *Linn. trans. 10. p. 366. t. 28. R. Br. 1. c.) leaves as well as the bottom of the scapes villous from spreading hairs; calyx segments plumose, with an acute apex.

**Southern Brunonia.** Pl. 1 foot.

**Cult.** See Scaevola, p. 730. for culture and propagation.

**Tribe IV.**

**CAMPANIALEÆ (from *campana*, a bell; shape of flowers).**

**C.** Corolla regular, campanulate. Capsule 3-4-celled, many-seeded.

**XII. PENTAPHRAGMA (from *penta*, five, and *phragma*, a disseipment; in reference to the 5 longitudinal septa, or processes, from which the stamens spring);** Wall. cat. no. 1818. Alph. D. C. mon. camp. p. 97.—Phyteuma, Wall.

**LIN. SYST.** Pentándria, Monogyinia. Calyx semi-superior, ovate, villous, 5-lobed; lobes obtuse. Corolla campanulate, permanent, inserted in the calyx; with a recurved 5-lobed limb; lobes obtuse. Stamens 5, short. Anthers distinct, linear. Ovarium surrounded by the calyx, and connected with it by 5 longitudinal septa or processes, from which the stamens spring, 3-4-celled, many-seeded. Placentae from the inner angle of the cells. Style short, thick. Stigma concave, surrounded by the thick fleshy 3-lobed indium. Capsule 3-4-celled, combined with the villous tube of the calyx in its lower part, and surrounded by the segments. Seeds adhering to long filiform free receptacles, which are attached to the apex of the capsule.—A creeping woolly herb. Leaves alternate, broad, semi-cordate, like those of some species of *Begonia*, petiolate, serrated, acute, pretty smooth. Racemes axillary, secund, recurved, twice the length of the petioles. Flowers unilateral, arrayed in 2 rows, nearly sessile. Corollas white.

1. P. *begoniacea*.  

**Begonia-leaved Pentaphragma.** Pl. creeping.

**Cult.** A mixture of vegetable mould and sand will be a good soil for this plant; and it will be easily propagated by dividing the creeping stems.

**ORDER CXXXVII. CAMPANULACEÆ (this order contains plants agreeing with the genus *Campanula* in the flowers being bell-shaped, and in other characters).**

CAMPANULACEÆ.

Calyx regular, of from 3 to 8 lobes, but usually of 5 lobes, very rarely destitute of the limb. Corolla monopetalous, regular, permanent, usually 5-lobed, rarely 3 to 8-lobed; lobes alternating with the calycine segments, each having a conspicuous central nerve, valvate in assertion. Stamens like the corolla, inserted in the margin of the disc of the ovary, and combined with it, distinct from the corolla, but equal in number to its segments, and alternating with them; filaments usually expanded at the base and membranous, and bending towards the base of the style above the disc; anthers fixed by the base, free, rarely more or less combined into a tube, 2-celled; cells dehiscing lengthwise when the flower is in bud; pollen copious, adhering, yellow or violaceous, and clothed with very short papillæ. Style one, more or less hairy; stigma naked (not covered by an indusium, as in the order Scrophulariaceæ,); rarely capitulate, but usually divided into from 2 to 8 lobes, or as many lobes as there are cells in the ovary; lobes erect while the flower is in assertion, pilose on the back, and hardly distinct, but they diverge and become recurved and glabrous on the expansion of the flower. Ovary combined with the tube of the calyx, sometimes half superior, many-celled; cells from 2 to 8 in number, but usually 2, 3 or 5, (never 4, unless a monstrosity) opposite the calycine lobes, and sometimes alternating with them. Capsule many-seeded, dehiscing at the sides or apex, having the valves usually septiferous in the middle. Seeds numerous, small, inserted in the placenta on the inner side of the cells. Albumen fleshy. Embryo slender, straight, with opposite, ovate or roundish small foliaceous cotyledons.—Usually milky herbs, rarely shrubs. Leaves extipulate, alternate, but sometimes opposite, rarely entire, usually toothed or crenated, never fleshy; the radical ones often different from the cauline ones. Flowers rarely involucrated, number and situation variable, terminal and axillary, racemose, paniced or spicate, and glomerate, usually drooping; pedicels always reflexed in those species in which the capsules burst at the base, but on the contrary they are erect in those species whose capsules burst at the apex.—Corollas usually blue or white, rarely yellow or purple.

Campanulaceæ differ from Compositæ in not having the flowers in heads, in their usually distinct anthers; in their polyspermy of fruit. It differs from Lobeliaceæ in the regular flowers, and in the usually distinct anthers, and from Goodeniaceæ in the flowers being regular, and in the want of an indusium to the stigma. All the plants are pretty, and some highly ornamental. The roots of Camp. Rapunculus are used as a vegetable under the name of Rampion.

** Synopsis of the genera. **

** Tribe I. **

1. ** Jasione. ** Capsule dehiscing at the apex. The plants contained in this tribe are most frequent in the southern hemisphere.

§ 1. Corolla 5-parted.

* Anthers combined.

1. ** Jasione. ** Capsule 2-celled, inferior; valves dehiscing but a very little way at top.—Herbs with capitate flowers.

2. ** Lightfootia. ** Stigmas filiform. Capsule 3-5-celled, half inferior; when 5-celled the cells are opposite the stamens and calycine segments.—African shrubs or herbs.

3. ** Cephalostigma. ** Stigma capitulate. Capsule 2-3-celled.—Herbs.

4. ** Campanulea. ** Calyx without a limb. Stigmas ovate, thick. Capsule 3-celled.—Herbs, with opposite leaves, and large involucrated flowers.

§ 2. Corolla 3-6-cleft or 3-6-lobed at the apex. Anthers always distinct.

* Capsule with the valves opening regularly.

7. ** Platycodon. ** Calyx and corolla 5-lobed. Stamens and stigmas 5. Capsule 3-5-celled; cells when 5 alternating with the stamens and calycine segments. Seeds ovate, flat.—Rather glaucous herbs, with alternate or subopposite leaves, and large campanulate corollas.

8. ** Microcos. ** Calyx and corolla 5-lobed. Stamens and stigmas 5. Capsule 5-celled; cells alternating with the stamens and calycine segments. Seeds small, ovoid.—Humble herbs, with narrow alternate leaves, and small cylindrical corollas.

9. ** Wahlenbergia. ** Calyx and corolla 3-5-lobed. Stamens 3-5; stigmas 2-5. Capsule 2-5-celled; cells when 5 opposite the stamens and calycine segments. Seeds small, usually ovoid. Herbs usually with alternate and narrow leaves.

** Capsule elongated, bursting at the top or opening by a pore. **

10. ** Prizmatocalyptrus. ** Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled, naked, at length bursting irregularly at the apex. Seeds angular, thick.—Herbs or subshrubs, with alternate narrow stiff leaves, and axillary sessile flowers.

11. ** Rotella. ** Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled, always terminated by the permanent calycine segments, dehiscing irregularly at the apex.—Small shrubs, with alternate narrow stiff leaves; and sessile, usually solitary, terminal flowers.

** Tribe II. **

** Campanulea. ** Capsule dehiscing at the sides.—The plants contained in this tribe are all indigenous to the northern hemisphere.

§ 1. Capsule dehiscing by valves, which are equal in number to the cells.

* Corolla 5-8-parted.

13. ** Petromeraula. ** Calyx and corolla 5-parted. Stigma
**Corolla 5-cleft or 5-lobed at the apex.**

1. **Camp'álua.** Corolla campanulate, funnel-shaped, or broadly tubular. Nectarium none. Capsule 3-5-celled, not elongated; cells when 5 opposite the stamens and calycine segments.—Herbs variable in habit.

2. **Svecula'ria.** Corolla rotate. Nectarium none. Capsule elongated, 3-celled.—Dwarf annual herbs, with sessile flowers.

3. **Trache'lium.** Corolla salver-shaped, with a very narrow elongated tube. Nectarium wanting. Style only pilose at the apex; stigmas small, hardly distinct. Capsule 2-3-celled, not elongated.—Herbs.

§ 2. **Capsule dehiscing laterally by numerous transverse fissions.**

4. **Mu'schel.** Calyx and corolla 5-cleft. Stamens 5. Capsule 5-celled; cells alternating with the lobes of the calyx and stamens.—A subshrub, with broad serrated leaves, and racemose yellow flowers.

† A genus doubtful whether it belongs to the order.

5. **Merci'ea.** Calyx 5-lobed, with a very hispid tube. Corolla 5-lobed, with a narrow tube as in *Trache'lium*. Stamens 5, free; filaments long and slender. Stigmas 2, very short. Capsule inferior, indehiscent? 1-celled, containing probably always 4 ovula in the bottom.—Cape shrubs, with the leaves of *Roëlla*, and slender lateral flowers.

**Tribe I.**

**JASIO'NEÆ** (this tribe contains plants agreeing with *Ja'sione* in the dehiscence of the capsule). Capsule dehiscing at the apex.

**Lin. syst. Pentanúria.** Calyx 5-cleft. Corolla deeply 5-parted; segments linear-lanceolate. Stamens 5, with slender filaments, and with the anthers combined into a tube at the base; pollen blue or purplish. Style pilose from the middle to the apex: the pili or hairs disposed in 10 rows; stigmas 2, short. Capsule 2-celled, spheroid or ovoid, dehiscing by a broad hole at top, with very short valves. Seeds small, ovoid, shining.

—Dwarf herbs, with the habit of *Scabiosa*. Leaves alternate, narrow. Flowers collected into terminal bracted heads: the flowers expanding from the top of the head.

**Var. γ, littorális** (Alph. D. C. mon. p. 102.) plant humble, tufted; stems simple, ascending; heads small; bracteas obtuse, rounded. O. H. Native of Sweden, in the sand by the sea-side. J. montana littoralis, Fries, nov. fl. succ. pt. 2. p. 29.

**Var. c, proliferá** (Alph. D. C. 1. c.) heads proliferous. O. H. Native of Piedmont, about Lytettia.

**Mountain or Common Sheep's Scabious, or Sheep's-bit.** Fl. June, July. Britain. Pl. ½ to 1 foot.

**Corymbose-flowered Sheep's Scabious.** Pl. ½ foot.

**Portugal Sheep's Scabious.** Pl. ¼ foot.

**Humble Sheep's Scabious.** Pl. ½ feet.

6. **J. folíosísa** (Cav. icon. 2. p. 38. t. 148. f. 1.) glabrous; stems ascending, simple; radical leaves rosulate, rather spatulate: cauline ones linear-lanceolate. ♀. H. Native of Spain; plentiful near the top of Mount Orosopia, on the north side, in the fissures of rocks; and in the boundaries of the kingdoms
of Valencia and Murcia. Phyteuma? rigidifolia, Duf. ined. in herb. D. C. Root simple. Heads globose, few-flowered. Flowers pedicellate, of a deep violet colour. This is a dwarf, but very elegant plant when in blossom.

2. H. Native of Spain, on Sierra Nevada, at a place called Valeta. Flowers of a greyish-blue colour.

Salad-coloured-flowered Sheeps' Scabious. Pl. prostrate.

Cult. The species of Jasione are all very elegant while in blossom, and they are, therefore, well fitted for decorating the front of flower-borders and rock-work. They grow best in light soil, and are readily increased by parting at the root, by seed, or by cuttings. Plants of all the kinds should be kept in pots, so as to be placed under shelter in severe weather in winter, or else they are liable to be killed, and the species lost to the gardens.

b. Lin. syst. Pententia, Monogynia. Calyx 5-cleft. Corolla usually 5-parted, sometimes 5-cleft. Stamens 5: filaments broad, ciliated; anthers free, caducous. Stigmas 3-5, short, filiform. Capsule 3-5-celled, usually half superior, dehiscing by the valves at the apex; cells, when 5, opposite the stamens and calycine segments. Seeds ovoid-trigonal, minute. Small shrubs, rarely perennial herbs. Leaves alternate, and sometimes opposite, sessile, small, scattered equally over the whole plant. Flowers usually racemose, and on short pedicels; pedicels erect after the flowers begin to fade, and usually stiff. All natives of the Cape of Good Hope, except one, which is a native of Madagascar.

§ 1. Capsule 3-celled.

1. L. subulata (Lher. sert. angl. t. 5.) stem ascending or erect, rather woody, simple or branched; leaves alternate, erectish, subulate, narrow, somewhat dentilicate; flowers racemose, on short pedicels; corolla 5-parted, with the segments rather longer than the calycine lobes; valves acute, longer than the entire base of the capsule. 2. G. Native of the Cape of Good Hope; very common on the mountains about Cape Town. Roem. et Schultes, syst. exclusive of the synonyme of Campânula capillacea. Campânula subulata, Spreng. syst. 1. p. 728.

§ 2. Capsule 5-celled.

2. L. Longifolia (Alph. D. C. mon. p. 108.) stem erect, quite simple, woody at the base; leaves alternate, erect, subulate, a little dentilicate; flowers subsessile; corolla 5-parted, having the segments twice longer than the calycine lobes; capsule almost wholly inferior, with very short valves. 2. G. Native of the Cape of Good Hope. L. linearia, Ekloë, ined. in herb. Dunant. Campânula sessiliflora, Lin. suppl. p. 139. Thumb. prod. p. 38. fl. cap. 2. p. 171. mem. acad. Petersb. 4. p. 367. t. 5. f. 1. Leaves stiff. Flowers numerous at the tops of the branches, on short pedicels, 1-3 from each leaf or bractea.

Var. ß. canescens (Cham. in Linnaea. 7. p. 192.) stem, leaves, and corollas clothed with hoary down; leaves 4 lines long, straight, with revolute edges; inflorescence more loose than in the species; axillary flowers nearly sessile: terminal ones on long pedicels.

Var. γ. lanuginosa, (Cham. l. c. p. 193.) corollas, inflorescence, and stem rather woolly from long white villi; leaves 2 lines long, with finely-revolute edges, densely imbricated; inflorescence contracted, subcapitulate.

Long-leaved Lightfootia. Pl. 1 foot.

One-toothed-leaved Lightfootia. Shrub 1 foot.

4. L. a. Æpressa (Alph. D. C. mon. p. 110.) stem erect, wooly, branched; leaves alternate, usually in fascicles, spreading, linear, very narrow, entire; flowers loosely racemose; corolla 5-parted, having the segments 3 times longer than the calycine lobes; valves acute, about in equal length to the base of the capsule. 2. G. Native of the Cape of Good Hope. Campânula dæpressa, Thumb. prod. p. 38. mem. acad. Petersb. 4. p. 368. t. 7. f. 2. Leaves a little decurrent, ciliated with white hairs at the base. Flowers panicked on the upper part of the stem, which is leafless.

Adpressa Lightfootia. Shrub 1 foot.

5. L. N. Æbens (Spreng. in Zeiher, fl. cap. exsic. p. 266.) stem erect, wooly, branched; leaves alternate, usually in fascicles, spreading, linear, very narrow, entire; flowers loosely racemose; corolla 5-parted, having the segments 3 times longer than the calycine lobes; valves acute, about in equal length to the base of the capsule. 2. G. Native of the Cape of Good Hope. Campânula Æbens, Burch. cat. geogr. pl. afr. no. 1729. Flowers terminal and axillary, loosely racemose at the tops of the branches.

Whitish Lightfootia. Shrub 1 foot.

Slender Lightfootia. Shrub 1 foot.

Fascicled-flowered Lightfootia. Shrub 1 foot.

8. L. oxyccocoides (Lher. sert. angl. t. 4. exclusive of the syn. Campânula Ætenilla, L.) stem erect or ascending, much
branched, woody at the base; branches diffuse; leaves alternate, reflexed, ovate-lanceolate, acute, thin, denticulated at the base: flowers loosely racemose; corolla 5-parted, having the segments hardly twice the length of the calyces lobes; valves acute, equal to the base of the capsule. \* G. Native of the Cape of Good Hope; on the Table Mountain. Smith, exot. fl. 2. 18. Alph. D. C. mon. p. 113. Lobélia tenellá, Lin. mant. p. 120. Thumb, prod. p. 40. Lobélia parviflora, Berg, cap. 345. Campánula Ottoniána, Rem. et Schultes, syst. 5. p. 113. Branches purplish. Flowers terminal and axillary, at the tops of the branches, white, with reddish nerves.

**Cranberry-like** Lightfootia. Fl. July. Clt. 1787. Shrub \( \frac{1}{2} \) to 1 foot.

9 L. lanceolátá (Link, enum. 1. p. 217.) stem decumbent, downy; leaves lanceolate, glabrous, furnished with 1 or 2 teeth; peduncles downy; calyx glabrous, one-half shorter than the corolla. \* G. Native of the Cape of Good Hope. L. oxycocéoids, var. Spreng. syst. 1. p. 809. Corollas white and bluish, larger than those of L. oxycocéoids.

10 L. muscósá (Link, enum. 1. p. 217.) stem decumbent, glabrous; leaves lanceolate, glabrous, quite entire: rameal ones opposite; peduncles glabrous; calyx shorter than the corolla. \* G. Native of the Cape of Good Hope. L. oxycocéoids, var. Spreng. syst. 1. p. 809. Leaves 3-5 lines long, and half a line broad. Corolla 2-5 lines long, whitish-blue.

**Mossy** Lightfootia. Shrub decumbent.

11 L. Loódíssé (Alph. D. C. mon. p. 114.) stem decumbent, woody at the base, branched; leaves alternate, somewhat reflexed, ovate-lanceolate, acute, entire; flowers loosely racemose; corolla 5-parted, having the segments 4 times longer than the calyces lobes. \* G. Native of the Cape of Good Hope. L. tenellá, Lodd. bot. cab. t. 1038. Branches purplish. Flowers axillary and terminal, disposed in loose racemes at the tops of the branches. Corolla bluish.

12 L. lycoforóides (Alph. D. C. mon. p. 114.) branches woody, simple, very leafy; leaves alternate, and sometimes subverticillate, erect, adpressed to the branches, linear, very narrow; flowers few, sessile; corolla 5-parted, with the segments 3 times longer than the calyces lobes. \* G. Native of the Cape of Good Hope. Leaves revolute on the margins. Flowers sessile, usually 3 on the top of each branch, the middle one expanding before the lateral ones.

**Club-moss-like** Lightfootia. Shrub 1 foot.?

13 L. oppósitifólia (Alph. D. C. mon. p. 115.) branches erect, slender, stiff, simple; leaves opposite, somewhat reflexed, linear, acuminate, narrow, slightly denticulated; flowers few, usually terminal; corolla deeply 5-cleft, twice longer than the calyces lobes. \* G. Native of the Cape of Good Hope, on the Table Mountain. Campánula ericóïdes, Lam. Lightfootia, Burch, cat. geog. pl. afr. austr. no. 606. Branches reddish. Flowers solitary, terminal, rarely axillary. Habit of L. oxycocéoids. L. muscósá and L. lanceolátá, Link, are probably hardly varieties of this species.

**Opposite-leaved** Lightfootia. Shrub 1 foot.?

14 L. ruóbióides (Alph. D. C. mon. p. 116.) branches procumbent, diffuse; leaves opposite, spreading, or a little reflexed, lanceolate, acute, remotely denticulated; flowers few, terminal and axillary; corolla 5-parted, with the segments longer than the calyces lobes. \* G. Native of the Cape of Good Hope. Campánula ruóbióides, Banks, herb. Plant trailing, much branched. Branches reddish. Leaves glabrous, or furnished with a few white hairs. Flowers axillary and terminal, solitary, at the extremities of the branches.

**Madder-like** Lightfootia. Pl. trailing.

15 L. Madagáscarisís (Alph. D. C. mon. p. 116.) stem erect, woody at the base, simple; leaves alternate, erect, linear-acuminate, remotely denticulated; flowers somewhat panicked; segments of the corolla, which is deeply 5-parted, about 3 times longer than the calyces lobes; capsule wholly inferior, with short valves. \* S. Native of Madagascar, where it was collected by Commerson. Campánula Madagáscarisésis, Juss. herb. Flowers at the top of the stem, and along one side of the peduncles, about 10 towards the upper part of the stem.

**Madagascar Lightfootia.** Pl. \( \frac{1}{2} \) to 1 foot.

**Cult.** All the species grow freely in a mixture of loam, peat, and sand; and young cuttings strike root readily in the same kind of soil, with a hand-glass over them.

**III. CEPHALOSTIGMA.**

(from Κέφαλος, kephale, a head, and στίγμα, stigma, a stigmas; in reference to the stigma, which is capitate.) Alph. D. C. mon. p. 117.—Campánula species, Wall. herb.—Wahlenbergia species, Perrott. et Lepr. herb. Lin. syst. Pentândria, Monogynía. Calyx 5-cleft. Corolla 5-parted; segments alternating with the calyces lobes, and longer than them. Stamens 5, free; filaments broadest at the base; anthers 2-celled. Style usually exerted, more or less hairy; stigma simple, capitate, pilose. Capsule 2-3-celled, desiccating by 2-3 short valves at the apex, which are septicid in the middle. Seeds numerous, small, ovoid, triquetrous.—The species of this genus have a habit intermediate between Wahlenbergia and Lightfootia, but differs from both these genera in the capitate stigma; but it has a capsule like that of the first, and a corolla like that of the latter.

\( \frac{1}{2} 1 \) **Capsule half superior, 3-celled. Style rather shorter than the segments of the corolla.**

1 C. paniculátá (Alph. D. C. mon. p. 117.) stem herbaeous, much branched, leafy; leaves ovate, acute at both ends, broad, subcompressed; flowers loosely panicked; segments of corolla 2 or 3 times longer than the calyces lobes; capsule obconical. \( \frac{1}{2} \) F. Native of Cape Verde, at Khana, in humid sandy places. Wahlenbergia, spec. herb. Lepr. et Perrott. Root simple. Stem leafy, and pilose at the base. Leaves rather pilose, with white undulate, edges. Peduncles and pedicles glabrous.

**Pérrotet's Cephalostigma.** Pl. 1 foot.

\( \frac{1}{2} 2 \) **Capsule 2-celled, almost wholly inferior. Style rather longer than the segments of the corolla.**

2 C. Pérrotettí (Alph. D. C. mon. p. 118.) stem herbaceous, simple, leafy at the base; leaves lanceolate; flowers disposed in a long raceme; segments of corolla 3 times longer than the calyces lobes; capsule obvoid. \( \frac{1}{2} \) F. Native of Cape Verd, at Khana, in humid sandy places. Wahlenbergia, spec. herb. Lepr. et Pérrott. Root simple. Stem leafy, and pilose at the base. Leaves rather pilose, with white undulate edges. Peduncles and pedicles glabrous.

**Pérrotett's Cephalostigma.** Pl. \( \frac{1}{2} \) foot.

3 C. Prieú'reí (Alph. D. C. mon. p. 118.) stem woody, humble, much branched, naked at the base; leaves small, linear; flowers panicked; segments of corolla hardly twice the length of the calyces lobes; capsule obconical. \( \frac{1}{2} \) S. Native of Senegal, about Jonal, where it was collected by Leprieux and Pérrottet. Root simple. Branches very slender, many-flowered, glabrous.

**Le Prieur's Cephalostigma.** Pl. \( \frac{1}{2} \) foot.

**Cult.** For culture and propagation see Microcèdon, p. 737.
LIN. SYST. PEN'TANDRIA, MONOGY'NIA. Flowers involucrated. Involucrum 5-parted. Calyx hemispherical, combined with the involucrum at the base, truncate at the apex, bearing the corolla. Corolla 5-parted? (5-petalled, ex Blum.). Stamens 5, free, opposite the lobes of the involucrum, inserted at the base of the corolla or top of the calyx, and in the ovarium; filaments broadest at the base; anthers 2-celled. Style inclosed, divided into 3 ovate thick stigmas at the apex, which are pilose before the expansion of the flower. Ovarium combined with the tube of the calyx, 3-celled. Capsule globose, terminated by a broad flat 5-angled umbilicus, which is girded by the cicatrices occasioned by the falling of the corollas and stamens, many-valved, ex Blum. Seeds very numerous, ovoid-cylindrical, dotted, inserted on the thick placenta, which are inflexed on both sides, and situated at the inner angle of the cells.—Quite glabrous lacistent herbs, with tuberous roots, ex Blum. Stems and branches terete. Leaves opposite, glaucous beneath. Peduncles axillary and terminal.

1 C. JAVA'NICA (Blum. bijdr. p. 727.) stem climbing; leaves on long petioles, ovate-cordate; flowers solitary, scattered. 2. S. Native of Java, in humid woods on the mountains of Salak and Gede. Leaves 1-2 inches long, and 6-12 lines broad. Flowers green, axillary, and terminal. Peduncles 1-flowered.

Java Campanulaceae. Pl. cl.

2 C. CÉLE'BICA (Blum. bijdr. p. 727.) stem erect; leaves on short petioles, oblong-lanceolate; flowers subcorymbose, terminal. 2. S. Native of Celebes. Leaves ovate, acute; superior ones lanceolate, nearly entire, or serrated.

Celebes Campanulaceae. Pl. 1 foot.

Cult. A mixture of sand, loam, and peat will be a good soil for the species of Campanulacea; and they are to be increased by cuttings or seeds.

V. CODONOPSIS (from κόδων, kodon, a bell, and α'ζυς, opsis, resemblance; in reference to the shape of the flowers). Wall. in Roxb. fl. ind. 2. p. 103. Alph. D. C. mon. p. 120.

LIN. SYST. PEN'TANDRIA, MONOGY'NIA. Calyx 5-lobed or truncate. Corolla inserted in the top of the calyx, 5-lobed; lobes alternating with the calycine segments when there are 5. Stamens 5, free, alternating with the lobes of the corolla; filaments broadest at the base; anthers 2-celled, length of filaments. Style inclosed; stigmas 5, thick. Ovarium 5-celled, almost combined with the whole of the tube of the calyx. Capsule dehiscing by 5 acute valves at the apex, which are septiferous in the middle. Seeds inserted in the inner angle of the cells to a thick placenta, furnished with albumen and a straight embryo.—Usually quite glabrous herbs, inhabitants of the north of India on the mountains. Stems erect or scendent, and even twining, branched, terete, rising from a woody root, probably always. Leaves usually strictly opposite, ovate, acuminate, not entire, on short petioles, glaucous, rarely hoary beneath. Branches usually opposite, more or less articulated at their origin. Flowers terminal and axillary, pedunculate, sometimes involucrated. Corollas whitish, yellowish or deep purple. The habit of the species is variable.

1 C. VI'RIDD (Wall. fl. ind. 2. p. 108.) stem ascending, twining; leaves alternate and opposite, downy, hoary beneath, a little crenulated; corollas large, yellowish-green. 2. G. Native of Nepal, about Gosaingthan, Kamaon, and in an obscure wood on the top of Sheepore. Plant scendent, much branched, with the habit of Convolvulus. Leaves ovate-oblong. Flowers axillary and terminal, solitary, often opposite the leaves, with an ungrateful scent.

2 C. PURPU'REA (Wall. in Roxb. fl. ind. 2. p. 105.) stems ascending, twining a little, manifestly articulated; leaves strictly opposite, glabrous, glaucous beneath, a little crenulated; corollas deep purple. 2. G. Native of Nepal, on the mountains towards the Himalaya. Leaves obovate-oblong. Flowers solitary, usually terminal, and terminating axillary branches.

Purple-flowered Codonopsis. Pl. twining.

SECT. II. MICRO'SANTHES (from μικρός, micros, small, and ανθος, anthos, a flower; in reference to the small flowers). Flowers small, white, involucrated. Calyx probably always truncate. Seeds rather lenticellate, small. Leaves strictly opposite, glabrous, glaucous beneath.

1 C. TRUSC'A'TA (Wall. cat. no. 1301.) stem erect; leaves sharply serrated; involucrum combined with the base of the calyx. 2. G. Native of the Burman Empire, at Pigue on the banks of the Irrawaddy. Stem branched; branches stiffish. Leaves ovate, acuminate. Flowers 2-6 on the top of each branch; pedicels terminal and axillary, 1-flowered.

Truncate-calyxed Codonopsis. Pl. 1 to 2 feet?

4 C. PARVIFLÓRA (Wall. cat. no. 1300. Alph. D. C. mon. p. 123.) stem erect; leaves remotely and setaceous denticulated; involucrum distinct from the calyx. 2. G. Native on the Pundu mountains, on the north-east of Bengal. Stem branched; branches opposite. Leaves ovate-acuminate. Flowers small, numerous, and as if they were panicked; pedicels trichotomous or dichotomous.

Small-flowered Codonopsis. Pl. 2 feet.

Cult. For culture and propagation see Campanína above.

LIN. SYST. HEX'ANDRIA, MONOGY'NIA. Calyx 6-cleft. Corolla 6-lobed at the apex, large, campanulate. Stamens 6, free; filaments thickest at the base, glabrous. Style inclosed, hispid above, the hairs disposed in 12 rows. Stigmas 6. Capsule 6-celled, dehiscing at the apex; cells opposite the calycine lobes and stamens. Seeds small, angular.—Large herbs, with thick perennial roots: having the stem, leaves, and corollas glaucous, and quite glabrous. Leaves opposite. Flowers terminal, solitary.

2 C. ? ZANQUE'RA'NICA (Alph. D. C. mon. p. 125.) stem shrubby, scandent, branched; leaves hastately cordate, quite en-
glabrous; flowers solitary, lateral. C. Native of Africa, on the coast of Zanjuebar. C. Zanjuebárica, Lour. coh. p. 195. Flowers pale. This plant agrees with the present genus in the calyx being 6-cleft, in the corolla being 6-cleft, in the stamens being 6, and in the capsule being 6-celled; but differs in the capsule dehiscing at the base, not at the apex, in the flowers being lateral, and in the leaves being alternate.

**Zanjuebar** Canarina. Shrub climbing.

**Cult.** C. campanulata is very desirable, as it flowers in autumn and winter, when few other plants are in bloom. After flowering the stem dies down, and the root continues dormant all the summer, when it needs but little water. When the stem begins to push forth the plants had better be removed to the stove, as they will not flower so abundantly in the green-house. A light loamy soil, or a mixture of loam and peat, is the best soil for it; and the plant is readily increased by dividing at the root or by cuttings, planted in the same kind of soil under a hand-glass. The C. Zanjuebárica being a stove shrub will grow in the same kind of soil recommended for the first species, and will be easily increased by cuttings.

**VIII. MICROCODON** (from μικρός, mikros, small, and κώδων, kodon, a bell; in reference to the shape and smallness of the flowers). Alph. D. C. mon. p. 127.—Campanula spec. Eklon.—Wahlenbergia spec. Schrad. Lin. syst. Pentándria, Monogónia. Calyx 5-cleft. Corolla 5-lobed at the apex, small, cylindrical, permanent. Stamens 5, free; filaments very slender, not expanded at the base. Style filiform; stigmas 5. Capsule 5-celled, dehiscing by 5 valves at the apex, cells alternating with the calycine segments and stamens. Seeds ovoid, small, shining, but not angular.—Humbie annual herbs, natives of the Cape of Good Hope. Leaves alternate or nearly opposite, small, narrow, sessile; superior ones rather the longest. Branches at the base of the plant opposite and diverging. Flowers almost sessile. Tube of calyx spherical and very hairy.

**Glomerate-flowered Microcodon.** Pl. ½ fo ½ foot.

**Cult.** The seeds of these plants should be raised on the hot-bed; and when the plants are of sufficient size they may be planted out into the open border in May in a warm sheltered situation.

**Lin. syst. Pentándria, Monogónia.** Calyx 3-5-cleft (f. 128. a.). Corolla 3-5-lobed at the apex (f. 128. b.), rarely divided to the middle. Stamens 3-5, free; filaments rather broadest at 5 B

**Vol. III.**
the base. Style inclosed, pilose, but most so towards the upper part. Stigma 2-5 (f. 128. c.). Ovarium combined with the tube of the calyx. Capsule 2-5-celled (f. 128.e) each opening by so many valves at the apex, which bear each a dissepiment in the middle. Seeds very numerous, minute.—Herbs, rarely shrubs, for the most part annual. Leaves usually alternate, rarely opposite, generally most numerous towards the lower part of the plant. Flowers for the most part on long peduncles; pedices drooping at first, but when bearing the capsules are perfectly erect. The species of this genus are mostly plentiful in the southern hemisphere, particularly at the Cape of Good Hope.

* Plants canescent. Flowers aggregate.

1 W. graminifolia (Alph. D. C. mon. p. 130.) stems and leaves clothed with soft down; leaves entire; radical ones linear or linear-spatulate; cauline ones linear, and somewhat stem-clasping; bracteas ovate, acute, entire, rather downy; tube of calyx smoothish; but the lobes are downy, and the sinuses are toothless. 2. H. Native of Sicily; south of Italy, even to Rome; and the Island of Zante. Campánula graminifolia, Lin. spec. 1. p. 234. Sibth. et Smith, fl. grac. t. 296. but not of Waldst. et Kit.—Barr. icon. t. 332.—Mor. ox. 2. p. 454. sect. 5. t. 1. f. 9. Cup. pamm. 1. p. 736.—Bocc. icon. rar. p. 78. f. 2. Mor. ox. 2. p. 461. sect. 5. t. 4. f. 41. Colum. phytt. p. 25. t. 26. ed. 2. p. 118. t. 34. Flowers disposed in solitary, bracteate, terminal heaps. Corolla blue; filaments white; anthers yellow.

2 W. Garganica; perennial, downy, canescent; stems diffuse or pendulous, simple; leaves roundish, cordate: lower ones on long petioles, deeply and unequally crenated: upper ones dentate; crenatures and teeth mucronate; racemes loose, leafy; pedicels filiform, 1-flowered; calycine segments lanceolate, acuminate, reflexed. 2. H. Native of Abruzzo, in the fissures of rocks on Mount Gangano, now St. Angelo. W. flaccida, Presl, synb. p. 29. t. 18. but not of Alph. D. C.

Gargano Wahlbergia. Pl. diffuse.

4 W. Tenuifolia (Alph. D. C. mon. p. 133.) stems pilose; leaves linear, entire, with bristly margins; bracteas ovate, acuminate, ciliated with bristles; tube of calyx rather pilose; lobes of calyx ciliated with bristles, and the sinuses toothless. 2. H.

Dalmatian Wahlbergia. Pl. 3/4 to 3/5 foot.

** Stems short. Flowers solitary.

6 W. pumilio (Alph. D. C. mon. p. 134.) plant tufted; stems short, very leafy; leaves linear, entire, glabrous beneath, revolute on the margins at top, and pilose in the middle: hairs adpressed, pencilled or in tufts at the tops of the leaves; upper leaves broadest at the base, and covering the flower; tube of calyx oboconical, glabrous; lobes of calyx entire, similar to the leaves. 2. H. Native of Dalmatia, in the higher alpine ranges of Mount Biocovo. Campánula sileniformia, Host, fl. austr. 1. p. 268. but not of Fisch. Campánula pumilio, Portenschl. ined. Rom. et Schultes, syst. 5. p. 135. Visian. stipr. dalm. spec. p. 29. Plant with the habit of Stélène acaulis. Flowers sessile, solitary, numerous. Corolla azure blue; anthers yellow.

Dwarf Wahlbergia. Pl. tufted.

§ 1 Capsule 5-celled. Seeds shining. Stems erect or ascending. Peduncles elongated, naked. Leaves alternate, sessile. All natives of the Cape of Good Hope.

8 W. diffusa (Alph. D. C. mon. p. 137.) stem weak, much branched, glabrous, or rather pilose; leaves linear, acuminate, somewhat dentilicate, calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calycine lobes; capsule spherical, glabrous. O. H. Native of the Cape of Good Hope. Campanula rubioides, Banks, herb.—Comm. hort. t. 37? Calyx quadriquadrifid.

9 W. linearis (Alph. D. C. mon. p. 137.) stem flexuous, erect, filiform, simple and glabrous at the base; leaves linear, entire, glabrous; calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calycine lobes; capsule spherical, glabrous. O. H. Native of the Cape of Good Hope, in sandy places. Campanula linearis, Lin. suppl. p. 140. Thunb. prod. p. 38. mem. acad. petersb. 4. t. 5. f. 5. Stem purplish. Flowers somewhat panicled, white; peduncles and pedicels capillary, drooping when bearing the flowers, and erect while bearing the fruit.

Linear-leaved Wahlenbergia. Pl. ½ foot.

§ 2. Capsule 3-celled. Seeds shining or dotted. Stems erect or procumbent. Peduncles naked, more or less elongated. Leaves alternate, rarely opposite.

* Seeds usually dotted. Stems branched, slender, usually procumbent. Leaves sessile or petiolate, and opposite or alternate in the same specimen.

10 W. flaccida (Alph. D. C. mon. p. 138.) plant rather pilose; stem erect, simple, rather leafy; leaves opposite and alternate, ovate, acute, entire; calyx pilose, with an ovoid tube; corolla 5-lobed, one-half longer than the calycine lobes; capsule ovoid, spherical. O. H. Native of the Cape of Good Hope, where it was collected by Masson. Campanula flaccida, Banks, herb. Flowers solitary, terminal. Peduncle not different from the stem, being leafy like it.

Placcid Wahlenbergia. Pl. ½ foot.

11 W. diversifolia (Alph. D. C. mon. p. 139.) stem pro- cumbent, branched, not very leafy, glabrous above, and pilose below; leaves alternate and opposite, smoothish: lower ones obovate-roundish, crenately toothed: the rest ovate-lanceolate, acute, toothed; calyx glabrous, with an ovный-spherical tube; corolla one-half longer than the calycine lobes; capsule obconically ovoid. O. H. Native of the Cape of Good Hope. Campanula Eklon, in herb. Dunant. Flowers on long pedicels, which are either terminal or axillary on the upper part of the plant.

Diverse-leaved Wahlenbergia. Pl. procumbent.

12 W. Madagascanis (Alph. D. C. mon. p. 139.) stem erect, branched, glabrous, not very leafy, rather pilose above; leaves strictly opposite, ovate, acute, crenated, glabrous; calyx rather pilose, with a spherical tube; corolla profoundly 5-cleft, length of the calycine segments; capsule spherical. O. ? H. Native of Madagascar. Stem branched from the base. Flowers solitary, pedicellate, situated in the axils of the forks of the branches.

Madagascar Wahlenbergia. Pl. ½ foot.

13 W. procumbens (Alph. D. C. mon. p. 140. t. 15.) plant glabrous or rather pilose; stems creeping, branched, very leafy; leaves opposite or verticillate, ovate or obovate, nearly entire; tube of calyx ovoid; corolla 5-lobed at top, 3 times longer than the calycine lobes; capsule ovoid, spherical. O. G. Native of the Cape of Good Hope, in watery places. Campanula procumbens, Thunb. fl. cap. p. 174. mem. acad. petersb. 4. p. 373. Lin. suppl. 141. Wahl. répens, Schrad. diss. de Blumenb. p. 57.—Burch. cat. pl. afr. austr. no. 355. Flowers solitary, usually terminal, but sometimes axillary, pedicellate. Corolla pale blue; anthers yellow.

Var. β, foliása (Alph. D. C. mon. p. 140. t. 15. f. 6.) stems shorter; leaves approximate and smaller. G. Camp-

nula, Burch. cat. pl. afr. no. 361. and no. 508. Procumbent Wahlenbergia. Pl. creeping.

* * Seeds dotted. Stems branched, slender, usually procumbent. Leaves petiolate, alternate.

** ** Seeds shining. Stems more or less erect. Leaves alternate, sessile, narrow.

a. Peduncles elongated.

15 W. gracilis (Alph. D. C. mon. p. 142.) stem simple or branched, glabrous or pilose; leaves alternate or nearly opposite, linear-lanceolate, sinuateely toothed, glabrous; calyx smoothish, with an ovoid tube; corolla funnel-shaped, 5-cleft; capsule obovate. G. Native of Van Diemen's Land; and of New Holland, about Port Jackson; and of New Caledonia and New Zealand. All the varieties grow in New Holland, except var. c, which only grows in New Zealand. Campánula gráciaís, Forst. prod. no. 64. Sins. bot. mag. 691. R. Br. prod. p. 561. Campánula vinceflora, Vent. malm. t. 12. Campánula capillaris, Lod. bot. cab. t. 1406. Peduncles terminal and axillary, elongated, 1-flowered. Corolla blue, with a white or yellowish bottom. Anthers yellowish.

Var. β, stricta (Alph. D. C. mon. p. 142.) stem branched, straight; leaves more numerous, opposite, linear-lanceolate; calycine segments linear, exceeding the tube of the corolla a little, which is discouloured on the outside. G. Campánula gráciaís, Smith, exot. fl. t. 45. Campánula gráciaís, β, stricta, R. Br. prod. p. 561.

Var. γ, littorális (Alph. D. C. 1. c.) stem simple, elongated; leaves few, alternate, linear, narrow; calycine lobes acuminate, length of the tube of the corolla. G. Cam-

pánula littorális, Labill. nov. holl. 1. p. 69. t. 70. Camp. gráciaís, γ, littorális, R. Br. prod. p. 561.

Var. ε, capillárís (Alph. D. C. 1. c.) stem capillary, paniculate; leaves linear, remote; segments of the calyx one-half shorter than the capsule, which is nearly globose. G. Campánula gráciaís, ε, capillárís, R. Br. prod. p. 561.

Var. ζ, polydóphora (Alph. D. C. 1. c.) lower leaves obovate, obuse; middle ones lanceolate; upper ones linear-lanceolate; calycine segments broadish, one-half shorter than the corolla.
CAMPANULACEÆ.

16 W. Chamissoniana; stems ascending, branched at the base, and leafy, but naked at the apex, and forming erect, few-flowered, elongated pedicels, which are furnished with a few bracteas; leaves ovate-lanceolate, sessile, margined by a nerve, obscurely few-toothed, situated and undulated, having the keel and margins running down the stem, sometimes beset with a few spreading, stiff, white hairs, and sometimes glabrous; sterile branches always pilose; bracteoles ovate, acut, ciliat. q. ?

17 W. macranitha (Cham. l. c.) plant taller and slenderer; stems erect, 2-3 feet high; leaves 15 lines long and 3 broad, less undulated and flatter; diameter of corolla half an inch.

Margaritine-leaved Wahlenbergia. Pl. 1/2 foot.

19 W. quadrifidis (Alph. D. C. mon. p. 144.) stem filiform, angular, striated; branches 1-3-flowered; leaves sessile, linear, obtuse, obsequtely and remotely serrulate; flowers quinquefida; corolla exceeding the ovarium a little. q. G. Native of Japan, on the mountains. Campánula lavandulifolia, Blum. bijdr. p. 726.

20 W. saxicoala (Alph. D. C. mon. p. 144.) glabrous; stem short; leaves crowded, lanceolate, a little toothed; peduncles 1-flowered, scape-formed; flowers quadrifida; capsule globose. q. ? G. Native of Van Diemen’s Land. Campánula saxicola, R. Br. prod. p. 561. This is very nearly allied to W. quadrifida.

21 W. Sieberi (Alph. D. C. mon. p. 144) stem branched, very hispid at the base; leaves somewhat denticulated, acute; lower ones obovate-lanceolate, pilose; superior ones linear-lanceolate, smoothish; calyx glabrous, with an ovoid tube; corolla tubular, nearly 3 times longer than the calycine lobes; capsule obovoid. q. H. Native of New Holland. Campánulaceæ, Sieb. fl. nov. holl. no. 577. Peduncles naked, divided into 1-flowered pedicels; the flowers are therefore somewhat panicked. Corolla blue, small. Stem angular at the base.

24 W. a. fulva (Alph. D. C. mon. p. 146.) stem branched, rather pilose on the bottom; leaves linear, rather pilose, entire, acuminate; tube of calyx obovate, glabrous; corolla one-half longer than the calycine lobes; capsule obovoid. q. H. Native of the East Indies, on the Nellygherry mountains, where it was collected by Leschenault, and where it is called Aleka. Habit of W. larioides. Peduncles 1-flowered, glabrous. Flowers terminal, nutant. Capsule erect.

25 W. ripa (Alph. D. C. mon. p. 146.) plant pilose at the base, and glabrous at top; leaves few, undulated toothed, rather hairy: lower ones obovate-lanceolate: the rest narrower, glabrous, and acuminate; calyx glabrous, with an ovoid tube; corolla one-half longer than the calycine lobes; capsule obovoid. q. H. Native of Senegal, in the regions called Podor and Walo, where it was collected by Leprieur and Perrottet. Campánula riparia Lepr. et Perrott. in lit. Stem simple or branched, leafy at the base, and naked at the top. Peduncles erect, divided into filiform 1-flowered pedicels.

26 W. ru'fullis (Alph. D. C. mon. p. 147.) plant pilose at the base, and glabrous at top; leaves much crowded at the bottom, linear-lanceolate; upper ones ligulate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calycine lobes; capsule ovoid. q. H. Native of the Cape of Good Hope. Campánulaceæ, Burch. cat. pl. af. no. 2769. Habit of W. Capensis. Stem erect, only leafy at the base. Leaves greyish-green, with white edges. Flowers solitary, terminal.

branched, pilose at the base; lower and middle leaves ovate, acute, irregularly toothed, and pilose: superior ones narrower, nearly entire, smoothish; tube of calyx glabrous and obconical; lobes of calyx with revolute serrately ciliated margins; corolla funnel-shaped, 2 or 3 times longer than the calyx lobes, somewhat 5-cleft at the apex; capsule obovate. O. H. Native of the Cape of Good Hope. Campanula cernua, Thunb. prod. p. 39. mem. acad. peterb. 4. p. 376. t. 7. f. 1.—Comm. hort. 2. t. 36. Stem very leafy at the base. Peduncles erect, elongated, terminating in numerous 1-flowered filiform pedicels. Corolla funnel-shaped, with a white base, and blue lobes, drooping in the bud state.

Undulated-leaved Wahlenbergia. Pl. 1 to 1 1/2 foot.

30 W. nudaefolia (Alph. D. C. mon. p. 149.) stem branched, rather pilose at the base; leaves obovate or lanceolate, undulately crenated, rather pilose; calyx glabrous, with a nearly spherical tube, and entire lobes; corolla broadly funnel-shaped, deeply 5-cleft, 3 or 4 times longer than the calyx lobes; capsule spherical. O.? G. Native of the Cape of Good Hope. Root cylindrical at its top, branched at the base. Stems numerous, branched, usually dichotomous. Leaves nearly all at the base of the plant, obtuse or acute. Flowers very numerous, terminating the slender naked pedicels. Corolla funnel-shaped, blue, 2 drooping in aestivation.

Var. β. Flowers larger.—Campanula elongata, Banks, herb.

Naked-stemmed Wahlenbergia. Pl. 1 foot.

31 W. androsaceae (Alph. D. C. mon. p. 150. t. 19. f. 1.) stem simple, naked, few-flowered, glabrous; radical leaves rosulate, ovate-lanceolate, on short petioles, acute, denticulated, pilose; calyx glabrous, with a hemispherical tube, and short broad entire lobes; corolla broadly funnel-shaped, profoundly 5-cleft, 2 or 3 times longer than the calyx segments; capsule spheroid. O. G. Native of the Cape of Good Hope. Campanulasceae, Burch. cat. geol. pl. afr. austral. no. 2273. Stem twice dichotomous at top, and nearly naked, except the bracteae at the base of the pedicels. Branches 2, divided into 2 1-flowered pedicels at the apex. Flowers erect in the expanded state, but drooping in the bud state, probably blue.

Androsace-like Wahlenbergia. Pl. 1/2 foot.

32 W. stellarioides (Cham. in Schlecht. in Linnaea. 7. p. 196.) stems ascending, a little tufted, filiform, tetragonals, glabrous; leaves opposite, somewhat connate approximately, lanceolate, acute, with revolute edges, and the nerve slender, pilose, or glabrous beneath; flowers terminal and lateral, on long pedicels; ovarium elliptic, short; calyx segments very like the leaves, but one-half shorter than the corolla; corolla funnel-shaped, 5-cleft to the middle, with acute ovate segments. 2. G. Native of Caffraria. Stem branched at the base. Stamens 5. Calyx segments reflexed.

Sticknort-like Wahlenbergia. Pl. 1 to 1 1/2 foot.

33 W. xutabunda (Alph. D. C. mon. p. 151.) plant pilose at the base; stem simple, or branched at the base; lower leaves lanceolate-ovovate, nearly entire, with the nerves and margins pilose; the rest lanceolate, acute, smoothish, and irregularly toothed; calyx glabrous, with an ovoid tube; corolla cylindrical, 5-lobed, hardly one-half longer than the calyx lobes; capsule obovate. O. H. Native of Calabria, near Reggio, on very arid hills; and of Sardinia, in the fields of Carbone and Tortote, ex Moris. Campanula nutabunda, Guss. in Ten. supp. p. 19. ad fl. neap. prod. p. 8. pl. rar. p. 94. t. 18. Mor. stirp. sard. elench. p. 30. Habit of W. lobelioides. Leaves numerous at the base of the plant. Peduncles nearly naked, elongated, drooping when bearing the flowers, but at length erect, 1-flowered, glabrous. Corolla white.

Nodding-flowered Wahlenbergia. Pl. 1/2 foot.

6. Peduncles shorter.

34 W. exilis (Alph. D. C. mon. p. 151.) stem much branched, rather pilose at the base; branches glabrous, filiform; leaves linear, subulate, entire, rather pilose; tube of calyx glabrous or roughish, obconical; corolla tubular, 5-cleft at the apex, scarcely one-half longer than the calyx lobes; capsule obovate, narrow. O. H. Native of the Cape of Good Hope. Burch. cat. no. 105. Stem quite glabrous at top. Pedicels mostly axillary, 1-flowered, reddish.

Slender Wahlenbergia. Pl. 1/2 to 1/4 foot.

35 W. denticulata (Alph. D. C. mon. p. 152. t. 16.) stem much branched, glabrous, but rather scabrous above; leaves narrow-linear, acuminate, glabrous, remotely denticulated; calyx glabrous or scabrous, with a hemispherical tube, and dentilolated lobes; corolla deeply 5-cleft; capsule spheroid. O. H. Native of the Cape of Good Hope, in the interior of the country. Campanula denticulata, Burch. cat. pl. afr. no. 2000. trav. 1. p. 538. Flowers numerous towards the tops of the branches. Pedicels axillary and terminal, 1-flowered, diverging much from the stem. Corollas blue?

Var. β. scabra (Alph. D. C. l. c.) peduncles and calyces rather scabrous.

Burch. cat. pl. afr. no. 2305.

Denticulated calyced Wahlenbergia. Pl. 1/2 foot. Var. β. 2 in.

36 W. krebsii (Cham. in Schlecht. Linnaea. 7. p. 195.) stems rather herbaceous, filiform, procumbent, very leafy at the origin of the fertile branches, tetragonal; angles beset with retrograde bristles; leaves crowded, spreading, rather stiff, liniage or obovate-oblong, obtuse or acute, sinuate-toothed, with reflexed margins, having the keel and margins pilose or glabrous; branches erect, naked above, elongated, divided into an irregular branched panicle; bracteoles quite entire, acute; ovarium globose; calyx segments oblong-triangular, bluntnish, almost nerveless, pilose, with scabrous edges; corolla funnel-shaped, quinquelid, 5 times longer than the calyx; lobes short. 2. G. Native of Caffraria. Stem tumid below the leaves. Stamens 5. Stigma bifid. Panicle 4-8-flowered. Pedicels half an inch long, furnished each with one bractea. Capsule half inferior, 3-celled, 3-valved. Seeds ovate or elliptic, smooth, shining brown.

Krebs's Wahlenbergia. Pl. procumbent.

37 W. dunanthi (Alph. D. C. mon. p. 152.) stem branched, stiffish; leaves linear-lanceolate, narrow, acuminate, entire, pilose; tube of calyx pilose, small, hemispherical; lobes of calyx long, subulate; corolla tubular, 5-lobed at the apex, rather longer than the calyx lobes. O. H. Native of the Cape of Good Hope, where it was collected by Eklon. Stem slightly pilose. Peduncles dichotomous, diverging, rather pilose. Pedicels 1-flowered. Flowers drooping.

Dunant's Wahlenbergia. Pl. 1/2 foot.

38 W. massonii (Alph. D. C. mon. p. 153.) plant small; stem branched, pilose; leaves linear, narrow, entire; calyx pilose, with a hemispherical tube and capillary lobes; corolla narrow,
funnel-shaped, 5-lobed at the apex, 2 or 3 times longer than the calycine lobes; capsule spherical. O. 2. Native of the Cape of Good Hope. Flowers racemose or panicled at the tops of the branches, numeros. Pedicels 1-flowered.

**Masson’s Wahlbergina.** Pl. ½ foot.

**39 W. Brasiliensis** (Cham. in Linnaea t. 7. p. 318.) glabrous; branches an直t; radical, simple, angular; leaves few, small, subulate, entire, concave, keeled, blanched; panicle terminal, subfastigiatly corymbose and spike-formed, coarctate; ovary obconical; calycine segments like the leaves; corolla 5-cleft to the middle. 24. S. Native of Brazil within the tropic. Very like W. liniariifolia. Flowers white. Corolla very like that of Campānula rotundifolia, but much smaller.

**Brazilian Wahlbergina.** Pl. ½ foot.

**Panicled-flowered Wahlbergina.** Pl. ½ to ¾ foot.

**41 W. Banksiana** (Alph. D. C. mon. p. 154.) stem glabrous, simple at the base, but panicled at the apex; leaves linear, narrow, remotely denticulated, acuminate; tube of calyx quite glabrous, spherical; calycine lobes linear, narrow, denticulated; corolla funnel-shaped, 5-lobed at the apex, one-half longer than the calycine lobes. O. G. Native of the Cape of Good Hope. Campānula banksiana, Smith, in herb. Banks. Pedicules and pedicels slender, but stiff and divaricate. Flowers erect, 6-10 in number.

**Banks’s Wahlbergina.** Pl. ¼ to ¾ foot.

**43 W. spinulosa** (Alph. D. C. mon. p. 155.) plant hum bolt, much branched; branches stiff, glabrous, or rather scabrous; leaves narrow-linear, glabrous or pilose, denticulated, stiff, ending each in a hard point; tube of calyx glabrous, spherical; lobes of calyx with revolute ciliate margins; corolla narrow, 5-lobed at the apex; capsule spherical. —Native of the Cape of Good Hope. Campānula spinulosa, Banks, herb. Flowers terminal and axillary, solitary; pedicels stiff, and appearing like spines after the capsules have fallen.

**Spinulose Wahlbergina.** Pl. 1 to 3 inches.

**Capillary-pediculed Wahlbergina.** Pl. 1 foot.

**Sect. III. Cervicina** (from cervix, the neck; because some plants of this order are called Throat-mort). Alph. D. C. mon. p. 156.—Cervicina, Del. fl. d’egypt. t. 7. f. 2, Calyx and corolla 3-5-lobed. Stamens 3, Capsule 2-celled. Seeds triquetrous, acute at one extremity, and truncated at the other. —An humble annual herb. Leaves alternate, sessile, narrow. Flowers on short pedicels.

**45 W. cervicina** (Alph. D. C. mon. p. 156.) plant small; stem much branched; branches diverging, rather pilose; leaves linear-lanceolate, a little denticulated; tube of calyx rather pilose, ovoid; corolla tubular, rather longer than the calycine lobes; capsule spherical. O. F. Native of Egypt and Sénégal, in sandy and arid places. Cervicina campalnuloides, Del. fl. egypt. t. 7. f. 5. f. 2. Leaves with white margins. Flowers numerous, pedicellate, solitary from the axis of all the leaves and tops of the branches.

**Throatwort Wahlbergina.** Pl. ¾ foot.

**Sect. V. Lasiocarpae (the species contained in this section have the habit of *Lvinaria*).** Alph. D. C. mon. p. 158. Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled. Seeds lenticular, shining.—Perennial herbs, with alternate, sessile, narrow leaves. Flowers on long peduncles and pedicels.

**47 W. lasiocarpa** (Alph. D. C. mon. p. 158,) stem erect, simple at the base, glabrous or scabrous; leaves linear, acuminate, narrow, glabrous, subdenticulated; tube of calyx glabrous, obconical; corolla funnel-shaped, deeply 5-cleft, one-half longer than the calycine segments; capsule obconical. 2. G. Native of South America, about Monte Video; and of Chili. Campānula lavioides, Lam. dict. 1. p. 580. Rœm. et Schultes syst. 5. p. 107. Campānula Chilensis, Presl. in herb. Hantke. Stem more or less panicked at top. Flowers panicked, terminating the branches and peduncles, and also axillary. Branches naked. 1-3 flowered. Flowers drooping when open. Corollas blue.

G. Native of St. Helena, in the fissures of rocks in Sandy Bay. Flowers pure white, erect, and rather large. Roella angustifolia, Roxb. in Beats. St. Hel. p. 320. Perhaps the same as \textit{W. cliviosa}.

**Narrow-leaved Wahlbergia.** Pl. procumbent.

**Flax-leaved Wahlbergia.** Shrub.

54 \textit{W. ensifolia} (Alph. D. C. mon. p. 162.) plant frutescent, simple; stem thick, erect, naked at the base, but very leafy in the middle; leaves long-lanceolate, acuminate, ciliate, sharply serrated; teeth setaceous; calyx with a glabrous obconical tube, and entire ciliated lobes; corolla large, campanulate, somewhat 5-cleft, one-half longer than the calyce lobes. \(\delta\). S. Native of Bourbon, on the Burning Mount. Campanula ensifolia, Lam. dict. 1. p. 582. ill. no. 2518. Bracteas ciliated. Flowers 1-5 at the top of each peduncle. Corollas large, an inch long, dirty yellow, marked with 5 purple spots at bottom. Between \textit{Miaschium} and \textit{Hedl. foliosa}.

**Sword-leaved Wahlbergia.** Shrub 1 foot.

† \textit{A doubtful species.}

**Ovate-leaved Wahlbergia.** Pl. \(\frac{1}{2}\) foot.

**Cult.** For the culture and propagation of the annual species of this genus, see \textit{Microcodon}, p. 737. The frame and greenhouse perennial and shrubby species, as \textit{Lichtsottonia}, p. 755. The hardy perennial species should be grown in pots, in a mixture of peat and loam, and kept rather moist; and they are easily increased by division.

**X. PRISMATOCA R PUS (\textit{Pi}\textit{sa n} \textit{p} \textit{u} \textit{m} \textit{a} \textit{t} \textit{o} \textit{m} \textit{a} \textit{t} \textit{o} \textit{m} \textit{a} \textit{t}, a prism, and \textit{k} \textit{o} \textit{r} \textit{t} \textit{o} \textit{s}, \textit{k} \textit{a} \textit{r} \textit{t} \textit{o} \textit{s}, a fruit; in reference to the long prismatical form of the fruit).** Alph. D. C. mon. p. 164. Prisomatocarpus species, Lher. tert. angl. p. 1. exclusive of the European species. — Campanula, sect. Legouisia, Pers. euch. 1. p. 192. exclusive of the European species.

**LIN. SYST. PENTANDRIA, MONOGLANIA.** Calyx 5-lobed, with a cylindrically elongated tube. Corolla 5-lobed at the apex. Stamens 5, alternating with the lobes of the corolla. Anthers distinct. Style permanent at the base; stigmas 2. Capsule 2-celled, wholly inferior, prismatic or cylindrical, elongated, splitting from the top towards the base into 5 segments. Seeds inserted the whole length of the central placenta, ovoid, somewhat compressed, obtuse, dotted. — Subslipubs and stiff herbs, all natives of the Cape of Good Hope. Leaves alternate. Flowers sessile, solitary or approximate, always inserted in the axils of the leaves or bracteas.

* Corolla narrow. Style exerted. Leaves few on the upper parts of the plants.

1 \textit{P.} diffusus (Alph. D. C. mon. p. 164.) suffrutescent; leaves linear, very narrow, entire; flowers in loose panicles; peduncles diverging, stiff; bracteas subulate; calyce lobes

* * * Corolla funnel-shaped. Style inclosed. Leaves few on the upper part of the plant.

Panicled-flowered Prismatocarpus. Shrub 1 foot.

Subulate-leaved Prismatocarpus. Shrub ½ foot.

5 P. Alíflórus (Lher. sert. angl. p. 1. Alph. D. C. mon. p. 167.) suffrutescent; leaves linear-subulate, entire, ciliate; flowers few, approximate at the tops of the peduncles; bracteas subulate; lobes of calyx ovate, acute, velvety.试剂. G. Native of the Cape of Good Hope. Roella erecta, Banks, herb. Campânula alíflóra, Poir. suppl. 2. p. 66.—Habit of P. paniculatus. Stem nearly simple, glabrous, naked at the base and top, but leafy in the middle, divided at the top into 2 peduncles. Leaves often having fascicles of smaller ones in their axils.

High-flowered Prismatocarpus. Shrub 1 foot.

7 P. Eklòni (Alph. D. C. mon. p. 168.) suffrutescent; leaves linear-subulate, long, erect, entire, glabrous; flowers disposed in loose spikes; bracteas subulate, broader than the leaves at the base; calyce lobes linear-lanceolate, glabrous.试剂. G. Native of the Cape of Good Hope. Eklòni frutícósus, Eklon, in herb. Dunant, but not of Lher. Stem branched; branches erect, leafy at the base and rather velvety, and reddish at top. Flowers solitary in the axils of the bracteas.

Eklon's Prismatocarpus. Shrub ¼ foot.

Curl-ed-leaved Prismatocarpus. Pl. 1 to 2 feet.

9 P. Linarílepólius (Alph. D. C. mon. p. 169.) stem herbaceous; leaves few, linear, narrow, ciliate a little at the base; flowers spicate, solitary or twin; bracteas broad-ovate, acuminate, ciliate; calyce lobes oblong-linear, glabrous.试剂. G. Native of the Cape of Good Hope. Stem erect, simple, furnished with a few floriferous leafy branches, striated with white nerves. Flowers disposed in loose spikes.

Toad-flax-leaved Prismatocarpus. Pl. 1 to 2 feet.

10 P. Stáctus (Alph. D. C. mon. p. 169.) plant herbaceous, simple; leaves linear, acuminate, erect, glabrous, serrately toothed; flowers in fascicles; bracteas ovate, acute, setaceous ciliate; lobes of calyx linear, acuminate, glabrous.试剂. G. Native of the Cape of Good Hope. Líghtfôtia sessíllifóra, Spry. in Líghfôt. Fl. cap. no. 203. and probably of Spreng. syst. 1. p. 809. Stem simple, stiff, furnished at top with few-flowered peduncles, glabrous, very leafy from the base to the middle, but naked at top. Leaves decurvent. Flowers sessile, usually 2-3 in a fascicle, from the axils of the bracteas, at the upper part of the stem.

Straight Prismatocarpus. Pl. 1 foot.

** * * Corolla funnel-shapped. Style inclosed. Leaves scattered equally over the whole plant.

12 P. Sesílis (Eklon, in herb. Dunant. ex Alph. D. C. mon. p. 171.) plant rather woody, glabrous; leaves spreading, linear, narrow, entire; flowers solitary, in the axils of the upper leaves; calyce lobes subulate, glabrous.试剂. G. Native of the Cape of Good Hope. Stem much branched; branches diffuse, erect or ascending, reddish. Flowers small.

Sessile-flowered Prismatocarpus. Pl. ¼ foot.

Cult. All the species of this genus are rather showy when in flower. A mixture of sand, loam, and peat is the best soil for them. They are readily increased by seed; or young cuttings grow freely if planted in the same kind of soil, with a handglass placed over them.

Linn. syst. Pentándria, Monogynia. Calyx 5-cleft. Corolla funnel-shaped or tubular, large, 3-lobed (129. b). Stamens 5; filaments broadest at the base. Anthers free. Stigmas 2, thick. Capsule cylindrical, 2-celled, wholly inferior, perforated by the permanent base of the style, and therefore appearing as if it was covered by an operculum, and at length dehiscing by a large hole at the apex, without valves. Seeds angular, sebaceous, thick.—Sub-shrubs, rarely herbs. Leaves numerous, always alternate, scattered over the whole plant, usually narrow and stiff. Flowers sessile, terminal, and sometimes axillary. All the species are natives of the Cape of Good Hope.

* Plants perennial. Stem woody, more or less erect. Leaves stiff. Tube of calyx covered by the leaves.

1. R. incú'rva (Banks, herb. ex Alph. D. C. mon. p. 172.) leaves linear, acuminate, incurved at the apex: lower ones setaceous ciliated: superior ones lanceolate or toothed; flowers solitary; lobes of calyx glabrous, linear, toothed; corolla variegated, length of the calyzone lobes. * G. Native of the Cape of Good Hope. Flowers solitary, terminal, surrounded by imbricate leaves.

** Incised-leaved Roella. Shrub 1 foot.

2. R. ciliá'ta (Lin. spec. 1. p. 241.) leaves erect, linear, acuminate, ciliated: superior ones longer and entire; flowers solitary; lobes of calyx ciliated, and lanceolate or toothed; corolla variegated, large, longer than the calyzone lobes. * G. Native of the Cape of Good Hope and Barbary. Geertr. fruct. 1. p. 154. t. 21. f. 3. Lam. ill. t. 129. f. 1. Curt. bot. mag. t. 378. Lodd. bot. cab. 1156. Delaun. herb. amat. 56. fasc. t. 382. Roella, Lin. hort. clif. p. 499. t. 35. Flowers solitary, terminal, surrounded by imbricate leaves. Corollas white at bottom, even to the base of the lobes, where there is a deep purple circle, and above the circle pale violet, girded by white, and lastly the lobes themselves are rose-coloured (f. 129).

3. R. reticulá'ta (Lin. spec. 1. p. 241.) leaves erect, subulate, ciliated; flowers solitary; lobes of calyx ciliated, entire, white; corolla white, twice the length of the calyzone lobes. * G. Native of the Cape of Good Hope. Lam. ill. 2577.—Petiv. mus. 21. f. 157. ex Lin.—Roy. lugd. 248. Stems or branches pilose, very leafy. Flowers solitary, terminating the branches, and axillary at the top of the stem.

Reticulated-leaved Roella. Shrub ¾ to 1 foot.

** Perennial, trailing, branched plants. Branches filiform, very leafy. Leaves stiff. Tube of calyx naked, filiform.

Dunant's Roella. Shrub 1 foot.

6. R. ciné'rea (Alph. D. C. mon. p. 175.) leaves erect, linear, subulate, remotely denticulated, rather ciliolate at the base; flowers solitary or in fascicles; lobes of calyx entire, glabrous; corolla twice the length of the calyzone lobes. * G. Native of the Cape of Good Hope. Campánula cinérea, Thunb. prod. p. 38. mem. acad. petersb. 4. p. 356. t. 6. f. 4. R. glabrélía, Banks, herb. Stem simple. Leaves usually furnished with smaller ones in their axils. Flowers sessile, 4-6 at the top of each stem, surrounded by leaves.

Cinerous Roella. Shrub 1 foot.

Spiked Roella. Shrub decumbent.

8. R. squarro'sa (Thunb. in Lin. suppl. p. 134.) leaves ovate, acute, decurrent, cuspidate at the apex, and recurved, with ciliated and setaceous toothed margins; flowers glomerate; bracteas broad, ovate, acuminate; lobes of calyx ovate, acuminate, ciliated, one-half shorter than the corolla, which is white. * G. Native of the Cape of Good Hope. Lam. ill. 2579. Ait. hort. kew. ed. 2d. vol. 1. p. 354. Stem branched, reddish; branches diffuse, reddish. Flowers disposed in terminal fascicles.

** Plant annual. Stem herbaceous, erect. Leaves thin, broad. Tube of calyx naked, ovoid.

9. R. musc'ósá (Thunb. in Lin. suppl. p. 143. prod. p. 38.) leaves spreading, ovate, acute, remotely serrate, glabrous; flowers solitary; lobes of calyx ovate-acuminate, entire, glabrous, or a little ciliated, 3 or 4 times shorter than the corolla, which is blue. * G. Native of the Cape of Good Hope, in a large ditch in front of the Table Mountain. Röem. et Schultes, syst. 5. p. 75. Alph. D. C. mon. p. 177. R. caespítosa, Banks, herb. Burch. cat. pl. afr. no. 636. A humble trailing plant, with diffuse branches. Flowers terminal, sessile.

** Plant annual. Stem herbaceous, erect. Leaves thin, broad. Tube of calyx naked, ovoid.

10. R. decú'rens (Lher. sert. angl. p. 2. t. 6.) leaves spreading, decurrent, ovate-oblong, ciliated at the base, nearly entire; flowers solitary; lobes of calyx acuminate, ciliated, 3 times shorter than the corolla. * G. Native of the Cape of Good Hope. Ait. hort. kew. ed. 1st. vol. 1. p. 226. Lam. ill. no. 2589. Röem. et Schultes, syst. 5. p. 74. exclusive of syn. bot. rep. t. 238. Stem branched, very leafy, pilose. Flowers terminal, blue?

5 C
CAMPANULACEÆ. XI. Roella. XII. Phyteuma.

† Doubtful species.

Peduncled-flowered Roella. Shrub 1 foot.

Bracteate-flowered Roella. Shrub 1 foot.

Cult. For culture and propagation, see Prismatocarpus, p. 744.

Tribe II.

CAMPANULÆ (this tribe contains plants agreeing with the genus Campæula in the fruit dehiscing laterally). Capsules dehiscing at the sides.

Lin. syst. Pentândria, Monogynia. Calyx 5-cleft. Corolla 5-parted; segments cohering together a long time, and in one species always. Stamens 5, alternating with the lobes of the corolla; filaments long, filiform, broadest at the base; anthers free; pollen violaceous or reddish. Style filiform, pilose. Ovarium inferior, 2-3-celled. Capsule dehiscing laterally by 2-3 valves at the base or middle part. Seeds ovoid, sometimes a little compressed, usually shining. — Perennial herbs. Leaves alternate; radical ones petiolate, different from the caulinne ones, larger and broader. Flowers sessile, or on short pedicels, disposed in spikes or heads. — Natives of the temperate parts of Europe, or nearly in the same latitudes in Asia.

Sect. I. Synótoma (from σύν, syn, together; and τομα, toma, a section; in reference to the cohesion of the segments of the corolla). Segments of corolla always cohering at the apex. Filaments hardly broader at the base. Stigmas 2. Capsule 2-celled.

Sect. II. Hедranthum (from ἴκεπα, hedra, a seat; and αὐθος, anthos, a flower; in reference to the flowers being sessile). Segments of corolla cohering a long time at the apex, but at length becoming free. Filaments expanded at the base. Stigmas 2-3. Capsule 2-3-celled. Flowers sessile, densely crowded, usually many from the axil of each bractea.

§ 1. Heads at the time of blossoming hemispherical or globose, but at length either globose or somewhat egg-shaped.

* Bracteas numerous, equal, and broad.

2 P. globularifolium (Stenrb. in Hopke, denk. bot. in gensb. 2. p. 100.) radical leaves crowded, obovate, broad, a little toothed at the apex: caulinne leaves few, sessile, obovate-lanceolate, somewhat ciliated; heads few-flowered; bracteas very broad, ovate-roundish, ciliated, a little toothed at the apex. § H. Native of Illyria, Carniola, and Carinthia, on the alps, and on the alps of Salisburgh. Rchb. icon. bot. cent. 4. p. 49. t. 360. Rem. et Schultz, syst. 5. p. 76. exclusive of syn. All. Vill. Lam. and D. C. Hall. and Bauh. P. pauciflorum, Hænke, in Jaqc. coll. 2. p. 63. Host. fl. austr. 1. p. 274. but not of Lin.—Mor. oxon. 2. p. 464. sect. 5. t. 5. f. 50. Plant glabrous, except the ciliate at the base of the leaves. Corollas blue.

Var. ? Flowers white or yellow. § H. Native of Switzerland.

5 P. Carestîle (Birok, in act. taur. 5. p. 315. with a figure) radical leaves crowded, lanceolate, on long petioles, nearly quite entire: caulinne leaves linear-lanceolate, somewhat serrated; bracteas spreading or reflexed, broad-ovate, acuminate, acutely serrated, glabrous. § H. Native of Corsica, on the moun-
Brugnat. 

747

CAMANULACEÆ. XII. PHYTLEUMA.

Var. ε, Colixma (Alph. D. C. mon. p. 183.) radical leaves small, ovate-cordate; lower caule leaves lanceolate, serrated.—

Column. ephr. pt. 1. p. 223. t. 224.

**Bracteas few, unequal, narrow.**

§ 2. Heads cylindrical, conical, or ovate at the time of flowering, but at length they become more elongated.

Var. β; flowers deep blue. 2. H. P. scorzonerifolium, Sims, bot. mag. t. 2271.

12. P. MICHELI (All. pedem. 1. p. 115. no. 427. f. 7—3.) Pl. c 2

---

Leaves few, unequal, narrow.

15 P. **Betonicaefolium** (Vill. dauph. p. 2. 518. t. 12. f. 3.) lower leaves oblong, acuminate, simply serrulate: superior ones linear-lanceolate, nearly entire; spikes ovoid, almost bracteas less; stigmas 3. **H.** Native of the Pyrenees, Provence, alps of Dauphiné, Savoy, Switzerland, Appennines, Carniola, Bohemia, &c. Rchb. icon. bot. t. 250. but not of Sims, bot. mag. Stems glabrous. Leaves glabrous or pilose. Corollas blue.

**Speedwell-leaved Rampion.** Fl. June, July. Cl. 1818. Pl. 3, 4 to 1 foot.

**Peach-leaved Rampion.** Pl. 1 to 2 feet.

**Spiked-flowered Rampion.** Fl. July, Aug. Cl. 1597. Pl. 1 to 3 feet.

**Haller’s Rampion.** Fl. July, Aug. Cl. 1822. Pl. 2 to 3 feet.

**Black-flowered Rampion.** Fl. June, July. Cl. 1820. Pl. 1 to 2 feet.

**Balbis’s Rampion.** Pl. 3/4 foot.

**Sect. III. Podántium (from ποδός, pous, podo, a foot; and ἄνθως, anthis, a flower; in reference to the flowers being pedicellate).** Segments of corolla cohering a long time at the apex, but at length free. Filaments expanded at the base. Stigmas 3. Capsule 3-celled.—Flowers on short pedicles, disposed in loose spikes, 2 or 3 rising from the axil of each bracteas.

**Fine-leaved Rampion.** Fl. Aug. Pl. 1 ft.

21 P. **Limoniifolium** (Sibth. et Smith. fl. grac. t. 218.) stem branched; radical leaves on long petioles, quite glabrous, lanceolate, a little toothed; spikes long, interrupted; calyxes glabrous; capsules ovoid, glabrous. **H.** Native of the Levant, on the top of Mounts Olympus and Lebanon; and of Caucasus on the Tâlsh mountains. P. stricta, Sims. bot. mag. 2145. P. virgata. Lodd. bot. cab. t. 667. P. stylosum Schrank, pl. rar. mon. fasc. 5. t. 49. Campânula limoniifolia. Lín. spec. p. 239. Stems twiggy. Plant glabrous. Flowers sessile, blue. **Limonium-leaved Rampion.** Fl. June, July. Cl. 1819. Pl. 2 to 3 feet.

22 P. **Collinum** (Guss. pl. rar. p. 97. t. 19.) stem nearly simple; radical leaves lanceolate, attenuated at both ends, roughish, repandly denticulately; spikes somewhat interrupted; capsules turbinate, sebaceous. **H.** Native of Japayia, on and hills, by the sea side. Campânula virgata, Ten. fl. heasp. 1. p. 66. but not of Labill. Stems downy, simple or a little branched. Leaves glabrous or downy. Corollas blue.

**Hill Rampion.** Pl. 1 foot.

23 P. **lobelioides** (Willd. phytl. 1. no. 20. t. 4. f. 2.) stem
nearly simple, roughish; leaves scabrous, petiolate, linear-lanceolate, acutely dentilicate; flowers scattered, on short pedicels; calyxes scabrous. 4. H. Native of Armenia.—Tourn. cor. p. 4. Flowers solitary or in twin, blue.

*LOBELIA*-like Ramop. Pl. $\frac{1}{2}$ foot.

24 P. LANCEOLATUM (Wild. spec. 1. p. 924. Desf. in ann. mus. 11. p. 55. t. 5, or choix. des. pl. 34. t. 24.) glabrous; stems branched; radical leaves crowded, on short petioles, lanceolate, serrated; flowers scattered, solitary, on short pedicels. 4. H. Native of Armenia. Alph. D. C. mon. p. 204.—Tourn. cor. p. 4. Stems 2-3, rising from the middle of the radical leaves, almost naked. Flowers scattered on the tops of the stems. Corollas white, with red nerves.

*LANCEOLATE*-leaved Ramop. Fl. June, July. Clt. 1826. Pl. $\frac{1}{2}$ to 1 foot.

25 P. REPA'NDUM (Sibth. et Smith, prod. fl. grec. 1. p. 143.) stem glabrous; radical leaves crowded, petiolate, elliptico-oblong, repand, glabrous; petioles imbricated at the base; flowers spicate; bracteate fringed. 4. H. Native of Mount Olympus. Leaves rosulate, very like those of *Globularia acaulis*. Flowers disposed in a loose spike.

*REPAND*-leaved Ramop. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

26 P. ALZIUM (Wild. spec. 1. p. 925. exclusive of the syn. of Tourn.) stem very simple, glabrous; radical leaves linear-lanceolate, furnished with very minute teeth on the edges; flowers scattered. 4. H. Native of the Levant. Peduncles branched a little, 3-flowered.

*STIFF* Ramop. Pl. $\frac{3}{4}$ foot?

27 P. CANESCENS (Waldst. et Kit. pl. hung. 1. p. 12. t. 14.) plant scabrous; stems simple; cauleine leaves sessile, ovate-lanceolate, crenulat; flowers disposed in long spikes. 4. H. Native of Hungary, Transylvania, Galicia, Podolia, Tauria, and Caucasus. Leaves greyish. Flowers 1-3 from the same bractea, sessile. Corolla of a violet blue colour. Plant yielding a yellow viscid juice.

28 P. SALICIFOLIUM (Waldst. et Kit. ind. Bess. prim. fl. gal. 1. p. 368. Alph. D. C. mon. p. 203.) stem quite simple, glabrous; lower leaves ovate-lanceolate, serrate-toothed; superior ones sessile, lanceolate, acutely serrated; spikes short; calyxes glabrous. 4. H. Native of Hungary, on calcareous rocks. Leaves glabrous, except the margins, which are a little hairy. Spike almost an inch long. Flowers solitary, sessile. Corollas blue or violaceous?

*WILLOW*-leaved Ramop. Pl. $\frac{1}{4}$ to 1 foot.

30 P. AMPLEKICAULE (Wild. spec. 1. p. 925.) glabrous; stems simple; cauleine leaves somewhat stem-clasping, ovate-acute, broad, acutely serrated; spikes dense, fascicled; calyceae lobes capitellary. 4. H. Native of Armenia. Sibth. et Smith, fl. grec. t. 219.—Tourn. cor. p. 4. Flowers sessile, 1-3 from the same bractea. Corollas blue.

*STEM-CLASPING*-leaved Ramop. Pl. 1 to $\frac{1}{4}$ foot.

† Species little known.

31 P. SINNIRUM (Vest. ex Roem. et Schultes, syst. 5. p. 77.) heads many-flowered; flowers all bracteate; bracteas oblong, stiff, acute; leaves all linear-cuneated, toothed; stem erect, leafy. 4. H. Native of Siberia. P. pauciflorum, Johann. herb. ex Roem. et Schultes. Stem 2 inches high. Leaves 3-4 lines long. Heads of flowers like those of some species of *Scabiosa* or *Globularia*.

*Siberian* Ramop. Pl. 2 inches.

32 P. INEQUATUM (Kit. ex Schultes, fl. austr. ed. 2d. no. 883.) heads nearly globoso; radical leaves lanceolate, unequal at the base, cordate, serrated: cauline leaves linear; superior leaves sessile, quite entire. 4. H. Native of Austria. Roem. et Schultes, syst. 5. p. 80. Very nearly allied to *P. Charneelli*.

*UNEQUAL*-leaved Ramop. Pl. $\frac{1}{4}$ to 1 foot.

33 P. FISTULOSUM (Reich. fl. desd. fl. bot. zeit. 5. p. 534.) leaves lanceolate, a little toothed, acuminate; stem erect, simple, pilose, striped; heads cylindrical. 4. H. Native of Austria. P. Scheuchzeri, Schmidt. fl. bohem. fig. fl. desd. ed. 2. P. orbiculare, Buch. fl. desd. fig. desd. ed. 1. P. orbiculare alpinum, Jacq. fl. aust. 437. left-hand figure. This plant has a very peculiar habit, but the flowers have not been seen.

*TISTULAR* Ramop. Pl. 1 foot.

34 P. STYLOSUM (Bess. cat. hort. crem. 1816. Roem. et Schultes, syst. 5. p. 88.) Nothing is known of this plant but this.

*Long-styled* Ramop. Pl.

*Minute* Ramop. Pl. decumbent.

36 P. SUTILIS (Sich. in Spreng. syst. 1. p. 810.) stem creeping, diffuse; leaves spatulate, suberenate; heads terminal; bracteas ovate, crenated, equal in length to the flowers. 4. H. Native of Asia Minor.

*SUPTINE* Ramop. Pl. creeping.

 Cult. All the species of *Phyteuma* being hardy and ornamental, they are well fitted for decorating flower-borders, or rock-work. They grow in any common garden soil, and are readily increased by division or by seeds.

XIII. PETROMARA'ULA (from πετρος, petros, a rock; and μαρο, maren, a bitter herb; the plant is bitter, and grows on rocks by the sea side). Bellus. epis. 1. in Clus. hist. pt. 2. p. 299. Alph. D. C. mon. p. 209. Phyteuma species, Lin. LIN. SYST. PENNANDIRIA, Monogynia. Calyx 5-cleft. Corolla 5-parted. Stamens 5, alternating with the lobes of the corolla; filaments broad at the base, longer than the anthers; pollen violaceous. Style glabrous; stigma capitate, 3-lobed, rather pilose. Ovarium 3-celled, inferior. Capsule erect, dehiscing laterally by 3 pores in the middle part.—An herb, native of Candia.—First radical leaves petiolate, ovate, acute; those afterwards pinnate, with the petioles marginalised and lobed. Flowers pedicellate, disposed in loose racemes.

1 P. PINNATA (Alph. D. C. mon. p. 209.) 4. or 5. H. Native of Candia, on rocks by the sea side. Sweet, fl. gard. n.

Var. β. pubescens (D. C. prod. 4. p. 299.) panicle and calyces downy.

Cult. A light rich soil, and a warm sheltered situation, are the best for this plant. It is increased slowly by division, but plentifully by seed. The plant requires shelter in severe weather in winter.

LIN. SYST. Octandria, Monogyonia. Calyx 8-10-cleft, having the sinuses usually covered by appendages. Corolla 5-lobed or 5-cleft at the apex, usually bell-shaped. Stamens 5, free; filaments broad at the base and membranous. Style covered by foliage, except at the base; stigmas 3-5, filiform. Ovarium wholly inferior, 3-5-celled. Capsule 3-5-valved, dehiscing laterally. Seeds usually ovate, flattened, sometimes ovoid, and small.—Herbs usually perennial, rarely annual or biennial. Radical leaves usually different in form from the cauline ones, especially in size. Flowers for the most part pedunculate, usually racemose, rarely spike or glomerate, blue or white.—All the species are inhabitants of the northern hemisphere.

The names Trachelium and Cervicaria are the oldest names used for this genus, which were given to it on account of its supposed efficacy in the cure of disorders of the neck and trachea; hence it has the name of Halskraut or Halstwurt in German, Haltsurt in Danish, and Throatwort in English; and some European species have the name of Rapunclus, from the resemblance of the root to that of a turnip; hence they have the names Rupins, Rapuntins, Rapunsels, &c., from whence spring the French name Raiponce, the German Rapunzel, and the Spanish one of Rapunchigo, and the English one of Rampion.

§ 1. Capsule 5-celled. Stigmas 5.—Stems many-flowered. Radical leaves on long petioles.—Inhabitants of Greece and the adjacent regions.

* Lower leaves irregularly lyrate or jagged; petioles margined and lobed.

1 C. crispa (Lam. dict. 1. p. 581.) glabrous; stems simple; leaves smooth, coarsely and crenately toothed: radical ones oblong or elliptic, ovate, acute; flowers pyramidal racemose; calyx scabrous, and the appendages of the sinuses small and tooth-formed; corolla broad, campanulate, roughish on the outside.

2 C. Ceilii (Alph. D. C. mon. p. 217.) plant velvety; stem ascending; lower leaves irregularly lobed; terminal lobe crenated, ovate, acute: superior leaves sessile, obovate crenated; flowers disposed in long panicles; appendages of the sinuses of
the calyx small, tooth-formed; corolla tubular, velvety, 4 times longer than the calyceous lobes.  3. H. Native of Greece. C. tomentosa, Vent. hort. cels. t. 18. Stem branched. Corollas pale violet.

Celtis Bell-flower. Pl. 2 feet.

4 C. AUTRATIS (Sibth. et Smith. prod. 1. p. 142. fl. greec. t. 215.) stems ascending, pilose; leaves hoary; radical ones irregularly pinnate, crenately toothed; terminal lobe roundish; cauline leaves sessile, ovate, a little toothed; flowers disposed in loose racemes; lobes and appendages of calyx triangular; corolla velvety, tubular, twice longer than the calyceous lobes.  3. H. Native of Spain and the Morea, among rocks. C. lanuginosa, Willd. in hort. berol. 1. p. 213. but not of Lam. Stems branched. Corolla pale blue, with a white throat.

Rock Bell-flower. Pl. ascending.

5 C. LYRATA (Lin. dict. 1. p. 588.) plant hispid; lower leaves petiolate, cordate, ovate, acute, crenated; superior ones sessile, ovate-lanceolate, serrate-toothed; flowers racemose; appendages of the sinuses of the calyx ovate-lanceolate, one-half shorter than the lobes, which are long-acuminated; corolla tubular, silky, hardly twice the length of the calyceous lobes.  3. H. Native of the Levant. C. lanuginosa, Willd. in hort. berol. 1. t. 213. but not of Lam. Stem branched. Peduncles 1-5-flowered. Corollas white.

6 C. ANDREWSII (Alph. D. C. mon. p. 220.) plant villous; radical leaves lyrata-pinnatifid: lobes cut; lower cauline leaves petiolate, subcordate, roundish, coarsely toothed; upper ones sessile, obuciuneiform, toothed; flowers disposed in loose racemes; appendages of the sinuses of the calyx ovate, obtuse, length of lobes; corolla tubular, with rather pilose nerves, twice longer than the calyceous lobes.  3. H. Native of the Levant, and about Constantinople. Stem branched. Flowers disposed in a long, many-flowered, loose raceme, violaceous.

7 C. ALCIRII (Lin. spec. 1. p. 237.) stems rather velvety; leaves rather pilose: radical leaves ovate-lanceolate, coarsely jagged; petals margined and lobed; flowers disposed in loose panicles; appendages of the recesses of the calyx ovate, acute, one-half shorter than the lobes; corolla large, campanulate, 3 times longer than the calyceous lobe.  3. H. Native of the Archipelago, among rocks in the island of Cardiottis. Lam. dict. 1. p. 588. Stem branched. Cauline leaves ovate-lanceolate, sessile; smaller and less jagged than the radical ones. Corollas pale blue.

8 C. ANCHUSAFLORA (Sibth. et Smith, prod. 1. p. 141. fl. greec. t. 212.) stems branched, rather velvety; leaves pilose, ovate-lanceolate; radical leaves petiolate, jagged; cauline ones sessile; flowers disposed in loose panicles; calyces smooth; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes.  3. H. Native of Greece, in the island of Polycandro, and among rocks by the sea side in the island of Hydra. Primordial leaves ovate, crenated. Flowers copious, rather nutant, fine blue.

Anchusa-flowered Bell-flower. Pl. 1 foot.

9 C. TUBVLOSA (Lam. dict. 1. p. 586.) plant pilose; stems terete; petals of the lower leaves long, shortly lobed: limb ovate, acute, crenately toothed: superior leaves ovate-lanceolate, serrate-toothed; appendages of the sinuses of the calyx obtuse, one-half shorter than the lobes; corolla velvety, tubular, twice the length of the calyceous lobes. 3. H. Native of the Island of Candia. Flowers few, axillary and terminal, of a greyish violet colour.

Var.  β; petals of radical leaves less lobed.  3. H. Native of Candia. C. tubulosa, Desf. pl. cor. in ann. mus. 11. p. 142. t. 17.—Tourn. cor. p. 3.

Tubular-flowered Bell-flower. Pl. 1 to 2 feet.

** Lower leaves regularly ovate or lanceolate; petals not margined.

10 C. BETONICEFOLIA (Sibth. et Smith, prod. 1. p. 141. fl. greec. t. 210. but not of Bieb.) stem erect; leaves elliptic-oblong or ovate, acute, crenately-oblong or ovate, acute, crenately-toothed: radical leaves on short petioles; calyceous lobes ovate-acute, having the sinuses reflexed and length of the lobes; corolla tubular.  3. H. Native of Mount Olympus, in Bithynia. Plant pilose. Stem branched. Flowers terminal and axillary; the branchlets usually bearing 3 flowers. Corollas purplish-blue, with a pale yellow base.

11 C. CORYMCIBA (Desf. pl. cor. in ann. mus. 11. p. 139. i. 15. choix. p. 40. t. 30.) stem erect; leaves ovate-acute, crenate-toothed: radical ones petiolate: cauline ones sessile; lobes of calyx long-acuminated; appendages of the sinuses of the calyx ovate-acute, one-half shorter than the lobes; corolla campanulate-tubular.  3. H. Native of Candia.—Tourn. cor. 3. Plant pilose. Stem branched. Flowers disposed in loose corymbs, 1-3 at the top of each branch. Corolla bluish violet.

Corymbosa-flowered Bell-flower. Fl. May, July. Cit. 1820. Pl. 2 feet.

12 C. PELYRIFOLIA (Lam. dict. 1. p. 586. Desf. choiox. in ann. mus. 11. p. 141. t. 16.) stems ascending; radical leaves petiolate, ovate, crenately-toothed: cauline ones nearly sessile, ovate-acute; calyceous lobes ovate-acuminated; appendages of the recesses of the calyx length of lobes, ovate-roundish; corolla large, campanulate.  3. H. Native of Candia.—Tourn. cor. nat. p. 3. Plant hairy. Flowers 1-4 at the extremity of each branch. Corollas large, of a greyish-blue colour.

Bowser-shaped Bell-flower. Pl. 1 foot, ascending.

13 C. MESEMIA (Lin. spec. 1. p. 236.) stem erect; leaves sessile, ovate-lanceolate, crenately-toothed; calyceous lobes ovate-acuminated, with the appendages of the sinuses reflexed and large, but one-half shorter than the lobes; corolla campanulate, inflated.  3. H. Native of the south and east of Europe, as about Naples, Carniola, about Constantinople, north of Italy, Provence, Dauphiny at a place called Grande-Chartreuse, Bavaria, Thuringia, Austria, Transylvania, &c., on the mountains; and of Caucasus and Tauria, Hill. syst. 8. t. 7. St. Hil. pl. de. fr. t. 72. C. grandiflora, Lam. fl. fr. 3. p. 354. Μηδεν, Dioec.—Debry, flor. nov. t. 75. Tabern. icon. 315.—Svert, flor. t. 16. f. 6.—Park. parad. 555. f. 3.—Lob. icon. 324.—Besl. hort. syst. 1. t. 3. f. 2-3.—Mor. oxon. 2. p. 459. sect. 5. t. 3. f. 30.—Garid.
CAMPANULACEAE. XV. CAMPAANULA.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliate; radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. Allionii**. Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. pallasiiana** (Röem. et Schultes, syst. 5. p. 138.) stem 1-flowered, glabrous; leaves glabrous, lanceolate, serrated, petiolate; flower nutant; calyces segments acute. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

**C. saxatilis** (Lin. spec. p. 237.) glabrous; stems erect; leaves ciliated: radical ones on long petioles, cuneate-spatulate, ciliated, at the base: lobes of calyx broad, acuminate, glabrous, twice shorter than the lobes; appendages of the sinus of the calyx acuminate, doubly shorter than the lobes. **C. H. Native of Siberia.** Like **C. Allionii.** Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long. **Pallas's Bell-flower.** Pl. ½ foot.

31. C. molis (Lin. spec. 1. p. 237.) plant velvety from greyish down; stems ascending; leaves nearly entire; radical ones rosulate, spatulate: calyces one ovate, or ovate-roundish, on short petioles; flowers approximate; calyx acutum lobes, with subdentate sinuses. 2. H. Native of Greece, on the walls of Jupiter’s temple, in the island of Deli. Stems numerous. Flowers 2–6, crowded at the top of each stem. Corolla funnel-shaped, blue.

**Var.  3. microphylla (Alph. D. C. mon. p. 238.)** calyces small, ovate, acute, a little toothed. 2. H. Native of Spain; in Murcia, about Ellin.

32. C. stricata (Lin. spec. p. 238.) stem branched, pilose; leaves ovate-lanceolate, acute, serrated, pilose; flowers almost sessile, few, solitary; lobes of calyx glabrous, lanceolate, 4 times shorter than the corolla, which is tubular; appendages of the sinuses of the calyx ovate, length of lobes, but broader. 2. H. or 3. H. Native of Armenia; Syria, about Damascus, at the mountains called Djebel-cher; and of the island of Cois, on the mountains, and elsewhere in Greece. Desf. cor. in ann. mus. 11. t. 12. Flowers spicate. Corollas blue.

**Var.  3. leaves narrower, and nearly entire. 2. H. Native of Syria. C. stricata. Labill. pl. syr. dec. 5. t. 4. C. stricata, var.  3. Röm. et Schultes, syst. 5. p. 149.**

**Var.  3. glabra (Alph. D. C. mon. p. 240.)** stems gla-
brous, as also the calyx.  2.  H. C. Sarmática, Sims, bot. mag. t. 2019. Lodd. bot. cab. t. 581.

34  C. aliarifolia (Willd. spec. 1. p. 910. Salisbury. par. Lond. t. 26.) stems simple, terete, downy; leaves crenulated, hoary beneath: lower ones petiolate, somewhat reniform: upper ones sessile, ovate, acute; flowers spicately racemose; lobes of calyx velvety, hoary inside, lanceolate, acuminated, 4 times shorter than the corolla, which is downy outside; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes.  2.  H. Native of Siberia, Georgia, and Caucasus. Räum. et Schultes, syst. 5. p. 193. C. lamifolia, Bieb. fl. cauc. 1. p. 154. Räum. et Schultes, syst. 1. p. 754.—Buxb. cent. 5. p. 10. t. 18. Flowers sessile, secund, disposed in a long, racemose, loose spike, with a few short floriferous branches at its base, the lower flowers often 3 from each bracteae. Leaves hirsut, and green above, but clothed with hoary tomentum beneath. Corolla white or cream-coloured.

35  C. violeifera (Lam. dict. 1. p. 587.) plant humble, few-flowered, pilose; radical leaves petiolate, ovate-roundish, corollate, crenated: cauline leaves ovate-oblong, toothed; lobes of calyx lanceolate, ciliated, long-acuminated; appendages of sinuses of the calyx ovate, acute, one-half shorter than the lobes; corolla much longer than the calycine lobes.  2.  H. Native of Siberia. C. viola, Pers. ench. 1. p. 192. Leaves rather pilose. Flowers 2–3, large, drooping, white, about the size of those of *C. Médium*.

**Violet-leaved** Bell-flower.  Pl. 1/2 to 1/2 foot.

36  C. punctata (Lam. dict. 1. p. 256.) plant pilose; stems simple, few-flowered, terete; leaves ovate, acute: radical ones on long petioles, corulate-ovate, acute, crenated: cauline ones almost sessile, toothed; lobes of calyx ciliated, long-lanceolate, 3 times shorter than the corolla; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes.  2.  H. Native of Siberia, in the provinces called Okotsk and Jakutsk; and of Dahuria, even to the Eastern Ocean; also of Japan. Sims, bot. mag. t. 1725. Schrank, pl. rar. fasc. 9. t. 87. C. Trachèium, Thunb. fl. jap. p. 88.—Gmel. sib. 3. p. 155. t. 30. no. 23. Stem usually downy, panicked at top. Flowers large, pendulous. Corolla dirty-white, spotted with purple inside.

**Dotted-flowered** Bell-flower.  Fl. May, June. Clt. 1813.  Pl. 1/2 to 1 foot.

37  C. divèngens (Willd. enum. 1. p. 212.) plant pilose; stem panicked; radical leaves subspatulate, crenulated, narrowed at the base: cauline ones sessile, lanceolate, acuminated; peduncles many-flowered, diverging; lobes of calyx bristy, long-acuminated, 4 times shorter than the corolla: appendages of the sinuses ovate, obtuse, one-half shorter than the lobes.  2.  H. Native of Siberia, alps of Transylvania, and Hungary.

41  C. affinis (Räum. et Schultes, syst. 5. p. 140.) stems hispid with deflexed bristles; calyx leaves linear-lanceolate, setae especially ciliated, very long.  2.  H. Native of Spain, on Mount Lujo. Root horizontal. Stems numerous, simple. Leaves glabrous, but ciliated with reflexed bristles. Flowers at first erect, but at length drooping. Corolla above an inch long, blue.

42  C. barbata (Lin. spec. 236.) stems nearly simple, terete, pilose; leaves villous, nearly entire; radical leaves crowded, lanceolate: calyx leaves few, ligulate; racemes loose, few-flowered; calyx pilose, with triangular acuminated lobes; appendages of the sinuses of the calyx ovate, one-half shorter than the lobes; corolla bearded in the mouth.  2.  H. Native of the alps of Dauphiny, Piedmont, Savoy, and even to the alps of Salisbury and Austria; in the south towards Mount Baldo; as well as of Siberia, Saxony, Transylvania, &c. Jacq. obs. pt. 2. p. 14. t. 37. Krok. syl. t. 38. Sims. bot. mag. t. 1258. ex-
 elusive of the synonyms. Lodd, bot. cab. t. 788.—C. Bahn.
 prod. p. 36, with a figure.—Moris. oxon. 2. p. 460. sect. 5. t.
 3. f. 53, and f. 55. Root thick, white. Flowers mutant, dis-
 posed in a loose, often second raceme; pedicels 1-flowered, 
 rising from the axils of the superior leaves. Corolla pale rose,
 or white, glabrous outside, but woolly in the mouth. Pl. ½
 foot high.

\textit{Var. \beta, uniflora} (Alph. D. C. mon. p. 247.) plant small. \(\textit{\gamma}.\)
 H. Native of Switzerland, on Mount Rossboden, and on Mount
 Unbril.—C. barbata, var. \(\gamma\). Röm. et Schultes, syst. 5. p.

 Pl. ½ to 1½ foot.

43 C. Alpina (Jacq. enum. vind. 210.) humble; stem nearly
 simple, furrowed; leaves linear-lanceolate, repandly-crenate,
 woolly; radial ones crowded, narrowed at the base; flowers
 pyramidal racemose; calyces lobes long-acuminated, woolly:
 appendages of sinuses ovate-acute, woolly, much shorter than
 the lobes. \(\textit{\gamma}.\)
 H. Native of Europe, on the alps, especially
 Austria, Salisburgh, Germany, Silesia, Transylvania, and
 the Carpathian mountains. Jacq. fl. austr. 2. t. 118. Sims, bot. mag.
 t. 957.—Clus, hist. 5. p. 171. Root spongy, fusiform. Stem
 glabrous or woolly. Flowers few or numerous, scattered in a
 pyramidal manner along the whole of the stem. Corollas deep
 blue.

44 C. speciosa (Pourr. act. tol. 3. p. 309.) stem simple;
 leaves sessile, repandly crenated: radial leaves rosulate, linear-
lanceolate: calyces linear: flowers pyramidal racemose;
 lobes of calyx long-acuminated, ciliated: appendages of the
 recesses ovate-triangual, ciliated, one-half shorter than the
 lobes. \(\textit{\gamma}.\)
 H. Native of France, in the olive region, and in central and
 eastern Pyrenees, and in that part of the Cevennes
called Capodoulous. D. C. fl. fr. ed. 3. no. 2854. C. longifolia,
 abr. pyr. 106.? C. Allioni, Lakey. l. c. p. 107. C. barbata,
 Lakey. l. c. p. 107.? C. médium, Lakey. l. c. 107.? Root
 simple, tuberculate. Stem glabrous or pilose, furrowed.
 Flowers pedicellate, disposed in a pyramidal raceme, each pedi-
cel furnished with 2 bracteas. Corolla an inch long, smooth
 outside, but often villous inside, blue, purple, or white.

\textit{Var. \beta, bicaulis} (Alph. D. C. mon. p. 248.) plant humble,
 few-flowered; stigmas 2. \(\textit{\gamma}.\)
 H. Native of the Pyrenees. C. bicaulis, Lakey. fig. pyr. t. 13. t. 7.

\textit{Showy Bell-flower.} Fl. June, Sept. Chlt. 1820. Pl. ½ to 1½
 stem.

\* \* \* Flowers capitate.

45 C. cichoraecae (Sibth. et Smith, fl. grec. t. 209.) plant
 pilose; stem angular, branched: leaves undulated crenated:
 radial ones obovate, irregularly jagged, petiolate: calyces
 leaves sessile, linear-oblong, obtuse; bracteas ovate, cordate;
 calyx pilose, with ovate acute lobes; appendages of sinuses of
 the calyx obtuse, very like the lobes; corolla tubular, 3 times
 longer than the calyx. \(\textit{\gamma}.\)
 H. Native of Thessaly. C. capitâta, Sims, bot. mag. t. 811.? Root
 fusiform. Leaves undulated. Flowers capitate, terminal, and
 from the axils of the leaves. Corollas purplish blue.

 Pl. 3 feet.

46 C. linguatula (Willd. et K.J. pl. hung. 1. p. 65. t. 64.)
 plant hispid; stem nearly simple; leaves sessile, undulate-
 crenated: lower ones lingulately spatulate: superior ones linear-
lanceolate; bracteas ovate, acute; calyces lobes oblong, ob-
tuse, setaciously ciliate: appendages of sinuses similar to the
 lobes; corolla tubular, twice longer than the calyx. \(\circ\)
 H. Native of Hungary, Croatia, and Dalmatia, in woods. Alph.
 D. C. mon. p. 250. Root branched. Stems many from the
 same root. Flowers in dense terminal heads, surrounded by
 setaciously ciliate bracteas.

 Pl. 1 ft.

\section{II. Eucôbox (from \textit{ev}, \textit{ev}, well; and \textit{kôdon}, \textit{kodon}, a
 bell; this section is considered to contain the true species of
 Trachelium, Cervicia, and Rapunculus of most of the old
 authors. Trachelium and Rapunculus, Lin. gen. no. 290.
 Sinuses of calyx not covered by appendages. Capsule 3-
celled, dehiscing laterally by the valves, sometimes at the base,
 and sometimes at the apex.

\ § 1. Capsule erect, dehiscing at the base. Flowers sessile,
 capitate, or spicate.—All the species are inhabitants of
 Europe. *

\* Style exerted. Stems ascending, simple. Lower leaves
 petiolate. Flowers glomerate, sub-pedicellate.

47 C. jacquinii (Alph. D. C. mon. p. 251.) glabrous; stem
 firm, glabrous; leaves remotely serrated: lower ones on short
 pedioles, ovate; pedicels of the short ovate, blumint and larger;
 heads of flowers loose, bracteate; calyx velvety, with acuminated
 lobes much shorter than the corolla. \(\textit{\gamma}.\)
 H. Native of the island of Caudia, on walls on the Sphacetoce
 mountains. Phyteuma, Jacquinii, Sieb. herb. cret. Flowers
disposed in a loose, terminal, spherical head, on short pedicels.
 Corollas blue?

\textit{Jacquin’s Bell-flower.} Pl. ½ to ¾ foot.

48 C. foliosa (Tenor, fl. neap. I. p. 71. t. 18.?) rather pilose;
 stem terete; leaves doubly serrated: radial ones ovate, acute,
 subcordate: calyces one acuminated, bracteas ovate, acumina-
ted; calyces lobes long-acuminated, ciliated, denticulated,
 one-third shorter than the corolla, which is tubular; lobes of
 corolla velvety inside. \(\textit{\gamma}.\)
 H. Native of the kingdom of Naples, on the Appenines and

\textit{Leafy Bell-flower.} Pl. 1 foot.

49 C. petraea (Lin. spec. 236.) stem rather woody, hoary;
 leaves crenulated, hoary beneath: radical leaves petiolate,
 ovate-lanceolate: calyces one sessile, linear-lanceolate;
 heads of flowers dense, surrounded by obtuse bracteas;
 calyx hoary, with linear obtuse lobes, doubly shorter than
 the corolla, which is campanulate. \(\textit{\gamma}.\)
 H. Native of Mount Baldo, on rocks, in the wooded region;
 and of the south of France, at a place called Les Escalles d’Eglon.
 Poll. elem. bot. 2. p. 150. t. 5. f. 1.—Moris. oxon. 2. p. 462. sect. 5. t.
 t. 44.—J. Bahn. hist. 2. p. 802, with a good figure. Barcel.
 pl. gall. p. 10. t. 890.—Pluk. phyt. t. 132. f. 5. Pomo, de-
scrip. mont. bald. p. 62, with a good figure. Stems ascending,
 simple. Leaves green, and pilose above. Flowers dis-
 posed in a terminal bracteate head. Corollas white.

\textit{Rocky Bell-flower.} Fl. May. Pl. 1 foot, ascending.

50 C. glomerata (Lin. spec. 235.) downy; stems terete;
 leaves serrulated: radial ones ovate, acute; bracteas ovate,
 acuminated; calyces lobes acuminated, twice shorter than
 the corolla, which is funnel-shaped. \(\textit{\gamma}.\)
 H. Native nearly throughout the whole of Europe; especially
 from Arragon, Pyrenees, south of France, Piedmont, northern
 part of the kingdom of Naples, Greece, even to Scotland, Sweden,
 \&c.; and collected also in Caucasus, Persia, Altaiun mountains,
 and almost throughout Siberia, even to Kamtschatka, \&c. \&c.;
 in shady rocky places, by river sides, and in dry, open, chalky
 pastures; plentiful in Britain, in like situations. Smith, engl.
 bot. t. 90. Gibb. demonstr. bot. t. 30. Oed. fl. dan. t. 1328.
 Gentiana collina, With. 282. t. 11. f. 3. C. bartabes, Spreng. ex Steud.

5 D 2

Var. \( \epsilon \), elliptica (Alph. D. C. mon. p. 255.) leaves on long petioles, elliptic, less cordate; flowers large, capitate; bracteas large, often longer than the flowers. 2. H. C. elliptica, Kit. ex Schultes, fl. austr. ed. 2. p. 918. C. glomerata, Spreng. syst. 1. p. 731. C. glomerata \( b \), Willd. spec. 1. p. 904.—Bœc. mus. t. 58.

Corollas bluish-violet.

Var. \( \theta \), pusilla (Alph. D. C. mon. p. 255.) plant 1-2 inches high; leaves round, cordate; flowers few, capitate. 2. H.

Var. \( \iota \), flore pleno; flowers double, blue or white. 2. H. C. glomerata \( \varepsilon \), Rœm. et Schultes, syst. 5. p. 124.

51 C. Cer\( v \)icaria (Lin. spec. 1. p. 235.) plant beset with stiff pili; stems furrowed; leaves crenately serrated; radical ones linear-lanceolate, bluish, on short petioles: cauline leaves linear, acuminate; bracteas ovate, acute; calyce lobes oblong, obtuse, doubly shorter than the corolla, which is campanulately funnell-shaped. 2. H. Native of the temperate parts of Europe, as of the Pyrenees, south of France, Piedmont, and as far north as Sweden, but not of Britain; of Russia, about Moscow and Petersburg; also of Transylvania, Galicia; and Siberia, about the Janc and Jenesse, and about Barnaul, and near Ridders and Alexandrovs. Oed. fl. dan. t. 787. Lod. bot. cab. 452. C. speci\( c \)a, Gners, scep. no. 192.—Gmel. sib. 3. p. 157. t. 31.—Weim. phyt. t. 288. f. 6.—Mor. oxon sect. 5. t. 3. f. 34. Stem simple. Upper stem leaves half stem-clasping.

Heads of flowers terminal, round, bracteate. Corollas blue, usually pale, pilose outside.

52 C. multi\( f \)lora (Walde. et Kit. pl. hung. 3. p. 292. t. 265.) plant pilose; stem striated; leaves undulate-crenate; lower ones ovate-lanceolate; calyce ones acuminate; spikes interrupted from the flowers being in fascicles; calyce lobes obtuse, 3 times shorter than the corolla, which is tubular funnel-shaped; capsule bluntly triangular. 2. H. Native of Hungary, on the mountain on which the town of Versiitz is built. C. macrostachya, Willd. enum. 1. p. 213. C. cervicaria imbricata, Rochel, herb. ex Rœm. et Schultes. Stem simple. Corollas glabrous, of a pale bluish-violet colour.

53 C. spic\( \alpha \)ta (Lin. spec. 1. p. 294.) hairy; stem striated; leaves nearly entire; radical leaves crowded, linear-lanceolate; calyce ones linear-acuminate; spike long, interrupted at the base; calyce lobes ovate, acuminate, 5 times shorter than the corolla, which is funnel-shaped; capsule spheroid. 2. H. Native of Europe, frequent on the south side of the Alps about Nice, Fenestrella, and Turin; and in the region of Mount Baldo; of Italy, Provence, Dauphiny, Valais, Carniola, Croatia, Portugal, &c. All. pedem. 1. p. 112. t. 46. f. 2.—Pluk. phyt. t. 153. f. 3. Stem simple. Leaves sessile. Flowers sessile, 1-3 from each bractea. Corolla glabrous, blue.

Var. \( \gamma \), spicata interna (Alph. D. C. mon. p. 261.) leaves elliptic-lanceolate; spike interrupted. 2. H. C. spicata var. All. pedem. no. 414. t. 47. f. 1. Lam. fl. fr. ed. 3. no. 2855.

Var. \( \epsilon \), Presschicka (Alph. D. C. mon. p. 261.) plant small; leaves obovate-lanceolate; corolla ovoid. 2. H.

54 C. thyrs\( o \)idea (Lin. spec. 1. p. 235.) plant pilose; stem furrowed; leaves entire; pilose; lower ones lanceolate, obtuse; calyce ones linear-lanceolate, acute; flowers disposed in a dense pyramidal spike; calyx with a glabrous tube, and linear-lanceolate ciliated lobes; corolla oblong, doubly longer than the calyce lobes; style exserted; capsule spherical. 2. H. Native of the Alps of Europe, from Provence, Dauphiny, Savoy, even to Carniola and Lower Austria; frequent on the Alps of Jura and Dola. Stem simple, covered with leaves and flowers. Flowers sessile. Bracteas often reddish. Corolla cream-coloured, hairy.

* Flowers on more or less elongated pedicels. Radical leaves usually cordate, petiolate.—Species almost all perennial.

55 C. latif\( o \)lolia (Lin. spec. 283.) stems simple, smooth; leaves large, doubly serrated; radical ones petiolate, cordate, ovate-oblong; calyce ones sessile, ovate-acuminate; flowers disposed in spicate racemes; peduncles erect, 1-flowered; calyce lobes long-acuminate, broad at the base, 3 times shorter than the corolla, which is campanulately funnel-shaped and large. 2. H. Native of Europe, from the Pyrenees and north of Italy, even to Scotland; of Caucasian, Lapland, Nordland, Carpathian Mountains, Altaia, Mountains, and Nipaul, always in moist woods and thicket. Frequent in the Alps of France and Switzerland. Not uncommon in Scotland and the north of England, but

1
more rare in the south: in moist woods and thickets, by the sides of rivulets. Oed. fl. dan. t. 85. and t. 788. Smith, engl. bot. 302. C. urticaefolia, All. pedem. 1 p. 110. C. Brunonis, Wall. cat.—Weinn. phyt. t. 287.—Park. par. 355. f. 2.—Lob. icon. 2. t. 278. Stem glabrous, rarely a little hairy. Leaves glabrous, rarely rather scabrous. Flowers solitary, rising from the axils of the superior leaves. Corollas large, blue, but sometimes white, or white-yellow, glabrous outside, but sometimes bearded inside. Lobes of calyx often dentilicated.

**Var. **β, macrantha (Alph. D. C. mon. p. 265.) stem and leaves rather pilose: teeth of leaves more distinct; calyx glabrous; corollas larger. **γ.** H. C. macrantha, Fisch. ined. V. latifolia, var. macrantha, Sims, bot. mag. 2553.

**Broad-leaved Bell-flower.** Fl. July, Britain. Pl. 2 to 3 ft. 56 C. trachelium (Lin. spec. 255.) stems angular, pilose; leaves scabrous, acuminate, coarsely and crenately toothed: radical ones petiolate, cordate; flowers disposed in loose racemes; peduncles 1.3-flowered; calyx rather pilose, with triangularly acuminate erect lobes, 3 times shorter than the corolla, which is campanulate. **γ.** H. Native of Europe, from Spain, Portugal, Piedmont, Naples, and Greece, even to Scotland, Sweden, Russia, and the Carpathian Mountains; of Caucasus, Tauria, Siberia, and even to Japan, in shady places. In Britain, in groves, thickets, and hedges frequent. Smith, engl. bot. t. 12. Oed. fl. dan. t. 1026. Hook. fl. lond. t. 109. C. ganteltæ. Jaum. St. Hilt. fl. fr. t. 47. C. urticaefolia or urticifolia, Schmidt, fl. bohem. no. 173. p. 73. Bieb. fl. cauc. 1. no. 374. Tenor. fl. neap. 1. p. 68.—J. Bauh. hist. 2. p. 805. with a figure. C. Cervicifia, Fuchs, hist. p. 431. with a figure.—Moris. oxon. 2. p. 499. sect. 5. t. 3. f. 28. Stem simple or branched, red-dish. Leaves often doubly toothed, roughish. Flowers drooping a little, 1-4 together, terminating the branches. Corolla blue-violet, white and violet, and all the shades between these two colours, bearded inside. The name *Trachelium* is from τραχέος, the throat; alluding to the reduced virtues of this plant in disorders of the throat, to which the other apppellations of old authors allude. A decoction of the herb, which is bitter and somewhat acrid, was used as a gargle.

**Var. **δ, flower solitary, terminal. Bieb. fl. taur. t. 1. p. 149. C. trachelium, var. dense folio, floribus pleno, flowers double, blue, white and violet, and all the shades between these two colours. Theatr. flor. t. 69.

**Var. **ε, enipontana (Alph. D. C. mon. p. 268.) flowers few, disposed in loose racemes; peduncles long, erect, usually 1-flowered; calyceine lobes broader. **γ.** H. C. enipontana, Morett, ined. **Var. **ζ, nabana (Alph. D. C. mon. p. 269.) stem abortive, 1-3-flowered. **γ.** H. **Rampion-like Bell-flower.** Fl. June, July. England. Pl. 2 to 4 feet. 58 C. Bononip. nisiss (Lin. spec. 1. p. 234.) scabrous; stems simple; leaves sessile, ovate, acuminate, dark green above, pale beneath: radical leaves cordate, petiolate: superior leaves stem-clasping; flowers numerous, small, disposed in long racemes; calyceine lobes acuminate, 4 times shorter than the corolla, which is funnel-shaped. **γ.** H. Native of the east of Europe and west of Asia, from lat. 40° to 59°, and long. 15° to 15° west. even to 60°; particularly in the northern elevated valleys in the kingdom of Naples; Upper Italy, Piedmont, Saxony, Prussia, Bohemia, Silesia, Caucasus, the Ukraine, and near the Volga, &c. Rebh. icon. cent. 2. t. 112.—Bauh. hist. 2. p. 806.—Moris. oxon. 2. p. 461. sect. 5. t. 4. f. 38. Tube of calyx blackish. Flowers smaller than in any other nearly allied species, numerous, disposed in a simple raceme, or the raceme is branched at the base. Corollas blue-violet, glabrous. Plant dark green. Leaves pale beneath. **Var. **β; radical leaves very long. **γ.** H. Native of the kingdom of Naples. C. obliquifolia, Tenore, fl. neap. prod. p. 15. fl. neap. 1. p. 69. t. 17. Flowers blue-violet.

CAMPANULACEÆ. XV. CAMPAULANA.

b. Stems few-flowered or 1-flowered. Corollas nearly always glabrous. Capsule ovoid, rarely spheroid.

59 C. collina (Bieb. fl. taur. 1. p. 152.) stems simple; lower leaves on long petioles, ovate-oblong, crenulated; middle ones lanceolate; superior ones linear-acuminated; flowers few, second, disposed in a long raceme; calyces lobes erect, lanceolate, acuminated, doubly shorter than the corolla, which is funnel-shaped. 2. H. Native of Caucasus and Tauria, on grassy hills. Bieb. pl. rar. Ross. 1. t. 42. Stem rather pilose. Leaves smoothish. Flowers distant. Calyx pilose. Corolla deep blue, twice the length of the calyceous segments.

Var. a. Plant larger; petioles very long; germen hispid.

2. H. Native of Iberia, on the mountains, and of Tauria.

Var. a, Bieb. l. c.

Var. b. Plant larger; leaves shorter, and on shorter petioles; calyces glabrous. 2. H. Native of Caucasus and Iberia.

Var. y. plantâris;—Tourn. cor. p. 4. C. Iberica, angustifolia, &c. var. y, Bieb. l. c.

Var. 2; flowers white. 2. H.—Tourn. cor. p. 4.

60 C. fæciélora (Desf. choix. du. cor. p. 36. t. 26. ann. mus. 11. t. 57. t. 7.) stems branched; leaves dentate-serrated: radical ones ovate-roundish, petiolate; cauline ones ovate, on short petioles; flowers few, terminal; calyceal segments subulate, erect; corolla funnell-shaped, twice the length of the calyceous segments.

2. H. Native of Canidia, on the mountains, among bushes. Stem slender. Plant glabrous. Flowers hanging one way, solitary, terminating the branches and stem. Corolla campanulate, blush-violet. The capsule is said to be 5-celled.

Few-flowered Bell-flowel. Pl. 1 to 1½ foot.

61 C. nemêbona (Alph. D. C. mon. p. 274.) stems simple; radical leaves on long petioles, cordate, ovate-oblong, crenated; cauline leaves sessile, long-acuminated, serrated; flowers disposed in loose racemes; calyceal segments subulate; corolla funnell-shaped, twice longer than the calyceal lobes. 2. H. Native of Austria and Moravia, in woods. C. elongàta, Portenschl., but not of Wildl. nor others. Plant glabrous. Racemes often furnished with few-flowered peduncles at the base. Corolla blue.

Grove Bell-flowew. Pl. 1½ foot.

62 C. rihomôboiâ'is (Lin. spec. p. 233.) stems almost simple; leaves sessile, ovate, acute, serrated; flowers few, disposed in loose racemes, pedunculate; segments of calyx subulate, erect; corolla campanulate, twice longer than the calyceal segments; capsule ovoid. 2. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, mountains of Auvergne, Alps of Provence, Dauphiny, Savoy, Switzerland, Germany, Carniola, &c.; and of Russia and Tauria. C. rhomboides, Lin. spec. 233. Gilib. demonstr. bot. t. 27. Lodde. bot. cab. t. 603. C. azíurea, Sims, bot. mag. t. 551. Ait. hort. kew. ed. 2d. vol. 1. p. 348. C. venêsa, Wildl. enum. suppl. p. 10.—Barrel. icon. 78. t. 567.—Boiss. mus. p. 75. t. 61.—J. Bauh. hist. 2. p. 798. with a figure. Stem glabrous, or a little pilose, furnished with flower-bearing branches at top. Flowers usually drooping, but sometimes looking upwards, very like those of C. rotundifölia. Corollas hardly one-half longer than the calyceal lobes, blue, glabrous.

Var. γ, reflêxâ (Alph. D. C. l. c.) leaves broader; calyceal lobes reflexed. 2. H. Flowers blue.

Var. δ, polyétâlta (Alph. D. C. l. c.) leaves long-lanceolate, nearly entire; corollas 5-parted. 2. H. Flowers blue.

63 C. trichocalyçina (Ten. fl. neap. prod. p. 16. fl. neap. p. 67. t. 16.) stems simple; leaves on short petioles, ovate, acute, coarsely serrated; flowers few, racemose; calyceal segments reflexed, long-capsillary, nearly equal to the corolla, which is profusely 5-cleft, and funnel-shaped; capsule ovoid. 2. H. Native of the kingdom of Naples, on the mountains: of Sicily, on the Nebrodes; and of Candia. C. Alburnica, Brigtan. stirp. rar. in germ. encyc. sept. 1817. Root simple, fusiform. Stems glabrous, but hairy at the base. Flowers disposed in an almost simple terminal raceme, approximate at the top, 1-5 rising from each axil, at the time of flowering erect, but afterwards dropping. Corolla pale violet.

64 C. Car'níca (Schiédé, ms. ex Alph. D. C. mon. 277.) stems ascending, weak, few-flowered; leaves glabrous; lower ones ovate or lanceolate; upper ones linear; calyceal segments very long, reflexed; corolla tubular, elongated. 2. H. Native of Carniola and Carinthia, on the mountains. Root slender. Plant glabrous. Flowers few, on long peduncles, solitary, inclined. Corolla blue, glabrous.

Carniola Bell-flowew. Pl. ½ to ⅔ foot.

65 C. hóstii (Baumg. enum. 3. p. 342.) stems few-flowered; leaves with scabrously ciliate margins: radical ones few, roundish, cordate, broad, toothed: cauline leaves lanceolate and linear; flower-buds drooping; calyceal segments subulate, spreading or reflexed; corolla funnell-shaped. 2. H. Native of Transylvania, Austria, and Carinthia, in pastures, woods, and on the mountains; and on the alps of Jura. Stems glabrous or scabrous, simple or branched at top. Flowers more or less numerous, pedunculate and pedicellate, as in C. rotundifölia, drooping. Corolla blue. Very like C. rotundifölia.

Var. β, unifölia (Alph. D. C. mon. p. 277.) stem 1-flowered, ascending, weak; cauline leaves few, linear-lanceolate, petiolate. 2. H.

Host's Bell-flowew. Pl. 1 foot.

66 C. petiol'âta (Alph. D. C. mon. p. 278.) quite glabrous; stems simple, few-flowered; radical leaves on long petioles, corotdate-roundish, toothed; petals margined; lower cauline leaves lanceolate, remotely toothed, petiolate: upper cauline leaves linear, entire; calyceal lobes erect, subulate; corolla campanulate, twice longer than the calyceal lobes. 2. H. Native of North America, near Slave Lake. Plant with the habit of C. rotundifölia. Root slender. Flowers 3-4, at the top of the stem, erect, but at length becoming recurved. Corollas blue.

Pediolute-leaved Bell-flowew. Pl. 1 foot.

67 C. linitifölia (Lam. dict. 1. p. 579.) stems erect; radical leaves few, petiolate, ovate, sinuated: cauline leaves linear, entire; calyceal segments long, erect, 2 or 3 times shorter than the corolla, which is large and campanulate. 2. H. Native of Europe, on the mountains; as of the Pyrenees, Auvergne, Dauphiny, Vallais, Alsacia, alps of Italy, Austria, Transylvania, and the Carpathian Mountains; but wanting in the more northern regions of Europe. Scop. carn. 1. p. 144. C. angustifölia, Lam. ill. 2499. C. Schleichéri, Sut. fl. helv. 1. p. 184. C. rotundifölia limifölia, β et γ, Lapeyr. abr. p. 104. C. rotundifölia, β, Wahl. helv. p. 30, but not of his fl. lapp. C. virgâta, Rafin. in Roem. et Schultes, syst. 5. p. 100.—J. Bauh. hist. 2. p. 797. with a figure. Root slender, creeping. Plant quite glabrous, rarely a little downy. Flowers few at top of
Flax-leaved Bell-flower. Fl. June, Aug. Clt. 1813. Pl. \(\frac{1}{2}\) to \(\frac{3}{4}\) foot.

68 C. rotundifolia (Lin. spec. 335.) radical leaves petiolate, cordate, roundish, crenately toothed: cauline leaves linear or lanceolate; flower-buds erect; calyx segments subulate, short, erect, 3 times shorter than the corolla, which is campanulate. \(\mathcal{V}\). H. Native throughout Europe, Siberia, and North America; plentiful everywhere in Britain. Cav. var. t. 2. All. pedem. 1. p. 108. t. 47 f. 2. (Edwards. fl. dan. t. 1086. Drev. et Hayne, term. bot. t. 5 f. 9. Smith. engl. bot. 866. Curt. lond. fusc. 4. t. 21. Jaume St. Hil. pl. fr. t. 418. C. uniflora, Huds. angl. ed. 1st. p. 81. but not of Lin. C. minor, Lam. fl. fr. 3 p. 339. C. variifolia, Sibth. prod. p. 126. C. minuta, Savi, fl. etrusc. p. 554. C. scheuchzeri, Lodd. bot. t. 485. but not of others. C. heterophylla, Gray, brit. arr. 2. p. 408. C. alliophylla, Rafn. ms. Root creeping. Stems numerous. Plant glabrous. Flowers drooping, solitary, pedunculate, few on each stem. Corollas deep blue. In France the plant is called Glochette; in Germany, Weisen-Busch, Grass-gras, or Milch-Glocken, and Kleine Wilde Rappenste; in Denmark, Gnomme Smag Klockler; in Sweden, Angblacker and Blakacker; and in Britain, Blue-Bells and Milkwort. The juice expressed from the flavedoes is often a very good blue ink, and a good green colour mixed with alum. The roots are eaten by children in many parts.

Var. \(\epsilon\), albiflora; flowers white. Round-leaved Bell-flower. Fl. June, Aug. Britain. Pl. \(\frac{1}{2}\) to 1 foot.

69 C. espirita (Scop. carn. 1. p. 143. t. 4.) plant humble, few-flowered, glabrous; radical leaves crowded, on short petioles, ovate, glandularly toothed, shining; buds, flowers, and capsules drooping; calyx segments linear, erect, 3 times shorter than the corolla, which is campanulate; pollen violaceous.

Var. \(\gamma\), imbricata (Alph. D. C. mon. p. 284.) flowers crowded at the base, imbricated, linear-lanceolate; flowers numerous; corollas narrow. \(\mathcal{V}\). H. Native of Carinthia, and about Vienna. C. Boccioni, Vil. dauph. 2. p. 502. exclusive of the syn. of Gmel. C. imbricata, Heyne, ined.—Bocc. mus. t. 103. Flowers blue.

Tufted Bell-flower. Fl. May, Aug. Clt. 1813. Pl. \(\frac{1}{2}\) to \(\frac{3}{4}\) foot.

70 C. arista (Wall. in Roxb. fl. ind. 2. p. 98.) plant quite glabrous; stems erect, 1-flowered; radical leaves petiolate, lanceolate, acute, undulate: cauline leaves sessile, narrow-linear, glandularly denticulate; calyx segments long-subulate, twice longer than the corolla; capsule very long, obconical. \(\mathcal{V}\). H. Native of the north of India, about Laddock. Root thickish, rather fusiform, divided at top. Flowers small, solitary, terminal, drooping. Tube of calyx very much elongated. Corolla funnel-shaped, pale blue.

Amen-calyx Bell-flower. Pl. 1 foot.

71 C. sylvestris (Wall. in Roxb. fl. ind. 2. p. 97.) plant解锁从short stiff hairs; stems erect, straight, few-flowered; cauline leaves linear, narrow, nearly entire; calyx segments erect, subulate; corolla campanulate, downy, twice longer than the calyx segments. \(\mathcal{V}\). H. Native of Nipa, in shady humid places. C. stricta, Wall. asiatic. res. 13. p. 374. C. integerrima, D. Don, prod. fl. nep. p. 155. Habit of C. rotundifolia, but probably without any roundish radical leaves. Stems simple or branched. Flowers terminal, on long peduncles, disposed like those of C. rotundifolia. Corollas blue.

Wood Bell-flower. Pl. \(\frac{1}{2}\) to 1 foot.

72 C. vesula (All. pedem. 1. p. 108. no. 397. t. 7 f. 1.) stems 1-flowered; leaves glabrous, oval, toothed; stems nearly naked; calyx glabrous. \(\mathcal{V}\). H. Native of Piedmont, on Mount Vesuvius. Leaves many at the roots, petiolate, with a few scattered hairs beneath. Flowers campanulate, spreading.

Vesulus Bell-flower. Pl. \(\frac{1}{2}\) foot.

73 C. duhia (Alph. D. C. mon. p. 286.) glabrous; stems 1-flowered; cauline leaves erect, narrow: lower ones linear-lanceolate, petiolate: superior ones long-acuminated; calyces lobes subulate; corolla tubularly funnel-shaped, twice longer than the calyces lobes. \(\mathcal{V}\). H. Native of Newfoundland. Flowers erect, terminal, very like those of C. rotundifolia.

Doubtful Bell-flower. Pl. \(\frac{1}{2}\) to \(\frac{3}{4}\) foot.

74 C. frate (Syl. ined. ex Alph. D. C. mon. p. 287.) stems humble, 1-flowered, most leafy above; leaves all petiolate, ovate, acute, suberated; calyx segments long-acuminated, one-third shorter than the corolla. \(\mathcal{V}\). H. Native of Newfoundland, by the sea side. Plant glabrous. Corollas funnel-shaped.
Meadow Bell-flower. Fl. Pl. 3/4 foot.

76 C. eccisa (Schleich. pl. excis. Mur. guide en Vall. p. 33. and 35.) plant glabrous, humble; stems slender, 1-flowered; lower leaves linear-acuminate; calyces lobes setaceous, spreading, at length reflexed, 3 times shorter than the corolla, which is funnel-shaped; sinuses of corolla cut; capsule obconical. 2. H. Native of Switzerland, on the higher Alps in the valley of St. Nicholas; at Saas; and about Simpol, &c. Lodd. bot. cab. t. 561. Rchb. icon. cent. 1. t. 75. Re. fl. pedem. alt. p. 193. in mem. acad. turin. t. 31. Gauld. fl. helv. 2. p. 147. t. 2. Stems numerous, erect, slender, simple, naked at top. Leaves entire, or remotely denticulate. Flowers drooping before and at the time of expansion. Corollas blue.

77 C. Waldsteinia'na (Roem. et Schultes, syst. p. 5. p. 99.) glabrous; stems erect, flexuose, stiff, simple, few-flowered; leaves sessile, lanceolate, serrated: lower ones obtuse: superior ones long-acuminate; calyces lobes subulate, subdenticulate, spreading, 4 times shorter than the corolla, which is campanulate. 2. H. Native of Croatia, on the mountains, in the fissures of rocks. Rchb. icon. bot. cent. 1. t. 55. C. flexuosa, Waldst. et Kit. pl. rar. hung. 2. p. 145. t. 136. C. rupéstris, Host. fl. austr. 1. p. 263. Stems numerous from the same root, stiff. Flowers 3-4 at the top of each stem, one of which is terminal, and the others from the axis of the superior leaves, always looking upwards. Corollas of a violaceous blue colour.

78 C. apar'inoides (Pursh. fl. amer. sept. 1. p. 159.) glabrous; stems weak, ascending, simple, few-flowered, having the angles beset with short retrograde bristles; lower leaves linear-ovate: the rest linear and acuminate: all remotely denticulate, and beset with retrograde short bristles; calyces lobes triangular, twice shorter than the corolla, which is campanulate; capsule spherical. 0. H. Native of North America, in humid meadows about Elizabeth Town, on the banks of the Hudson, near Boston; Philadelphia, and West Chester in Pennsylvania. C. aparinoides, Nutt. gen. amer. 136. but not of Lin. and Will., Root slender. Flowers 2-4, terminal, pedunculate, small, erect. Corollas white.

79 C. flexuosa (Michx. fl. bor. amer. 1. p. 109.) glabrous; stems panicled at top, with erectish branches; leaves most frequent in the middle and above, almost sessile, lanceolate, acuminate at both ends, coarsely serrated; calyces lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted. 2. H. Native of Carolina, on high mountains. Stems erect, angular. Leaves very few at the base, but crowded at top. Flowers panicled, terminal and axillary. Corolla blue.

80 C. divarica'ta (Michx. fl. amer. bor. 1. p. 109.) glabrous; stems panicked at top, with the branches diverging; leaves equally scattered over the stem, nearly sessile, ovate-lanceolate, acuminate at both ends, coarsely serrated, with rather sebaceous edges; calyces lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted. 2. H. Native of Carolina and Virginia, on the mountains; and of Kentucky, &c. Stems leafy to the middle, and almost naked in the upper part. Flowers small, drooping, terminating the branches and branchlets. Corolla azure blue.

Divaricate-panicled Bell-flower. Pl. 2 to 4 inches.

c. Plants few-flowered, pilose. Corolla downy outside. Capsule usually turbinate, and probably always drooping. — All natives of Nipaul.

81 C. ca'na (Wall. in Roxb. fl. ind. 2. p. 101.) tomentose; stems ascending, branched; leaves sessile, approximate, lanceolate, toothed, hoary beneath; flowers terminal; segments of calyx lanceolate, toothed, twice shorter than the corolla, which is funnel-shaped and pilose: capsule turbinate. 2. H. Native of Nipaul, on the mountains near Gosaingthanh. Root fibrous. Stems many, ascending, densely covered with white hairs, as well as the upper surfaces of the leaves. Flowers on short peduncles, terminating the stem and branches. Corollas blue.

82 C. canesc'ens (Wall. cat. no. 1289.) plant hispid; stem erect; radical leaves crowded, lanceolate, crenulately: cauline leaves remote, narrower, repandly denticulate; flowers racemose, often approximate, on short pedicels, small: tube of calyx spherical: lobes linear, entire; corolla tubular, pilose. 0. H. Native of Nipaul; and Hindostan, about Rampore. Alph. D. C. mon. p. 292. C. Benthamii, Wall. cat. no. 1390. Root slender. Stem branched from the base and simple. Flowers numerous, small, 4-6 at the top of each branchlet, the whole forming a many-flowered loose raceme.

Canaescent Bell-flower. Pl. 1 foot.

83 C. color'a'ta (Wall. in Roxb. fl. ind. 2. p. 101.) stem branched, downy; leaves scattered, lanceolate, acute, repandly denticulate; peduncles elongated, terminal and axillary; calyx with a very pilose obconical tube, and triangular entire lobes, which are about equal in length to the corolla, which is tubular and velutty; capsule turbinate. 2. F. Native of Nipaul. Leaves variable in size, acuminate at both ends, sessile, downy. Peduncles nearly naked, or bearing a large bracteae each.

Coloured Bell-flower. Pl. 1/2 foot.

84 C. fa'li'da (Wall. in asiat. res. 13. p. 375.) plant clothed with canescent pil, stem erect, branched; leaves elliptic, subulately crenated, petiolate: upper ones sessile; calyx bristly, with linear-lanceolate segments, which are about equal in length to the corolla. 2? F. Native of Nipaul, in sterile places. Wall. in Roxb. fl. ind. 2. p. 100. D. Don, prod. fl. nep. p. 156. Branches slender, simple, subfasciately. Flowers solitary, terminating the stem and branchlets, white, forming a terminal fasciately panicled. Corolla pilose.

Pale Bell-flower. Pl. 1 to 2 feet.

85 C. rama'losa (Wall. in Roxb. fl. ind. 2. p. 100.) stem erect, pilose, branched; leaves lanceolate, sessile, crenately
toothed, with the nerves rather prominent beneath; flowers pedicellate, terminal and axillary; calyx pilose, with broad, acute, subdentate lobes, twice or thrice shorter than the corolla, which is cylindrical and velvety; capsule turbinate. \( \U 1 \). H. Native of Nipal. Root short, slender, simple or branched. Flowers ineminate, pedicellate. Leaves pilose. Corolla of a violaceous blue colour.

**Branched Bell-flower.** Pl. 1 to 2 feet.

86 C. Alphonsii (Wall. Cat. no. 1296. Alph. D. C. mon. p. 294.) stems humble, simple, 1-flowered, donn; cauleine leaves sessile, lanceolate, acute, toothed a little, rather pilose above, and hoary beneath; calyx downy, with acute segments, twice shorter than the corolla, which is campanulate and downy. \( \U 1 \). H. Native of the south of India, on the Nilgherry Mountains. Stems very leafy at top. Flowers drooping, terminal, large for the size of the plant.

Alphonse De Candolle's Bell-flower. Pl. 2 to 3 inches.

* * * Flowers very short pedicel, opposite the leaves. Capsule turbinate. Branches more or less dichotomous. Leaves small, sessile, oblong.—All annual humble herbs, inhabitants of the region of the Mediterranean.

87 C. Erineus (Lin. spec. 240.) plant hispid; leaves obovate or ovate, toothed; flowers sessile; calyceous lobes triangular, acuminate, erect, at length spreading, about equal in length to the corolla, which is small and tubular. \( \U 1 \). H. Native of the Mediterranean Sea; very plentiful throughout the whole Spanish Peninsula, south of France, Provence, Sardinia, throughout the whole of Italy, Sicily, Dalmatia, Grecian Islands, Teneriffe, \&c. on rocks and rocky places. Sibth. et Smith, fl. grce. t. 214. Cav. valenc. t. 2. Roueèna erineus, Dumont, comm. bot. t. 14. —J. Bauh. hist. 2. p. 799. with a good figure.—Mor. oxon. sect. 5. t. 3. f. 25.—Column. phyt. t. 28. pl. nov. hist. p. 29. t. 31. Stem much branched. Flowers terminal and axillary, and situated in the angles of the forks of the branches. Corollas tubular, of a pale bluish rosy-colour or white, pilose at the base.

Erisina-like Bell-flower. Fl. May, Aug. Ct. 1768. Fl. \( \frac{3}{4} \) to \( \frac{1}{2} \) foot.

88 C. Drapefolia (Sibth. et Smith, fl. grce. t. 11. p. 215.) plant hispid; leaves elliptico-oblong, toothed; flowers pedicellate; segments of the calyx always erect; corolla inflated, much longer than the calyx. \( \U 1 \). H. Native of the Island of Samos, and near Athens, in cotton plantations and vineyards. Habit of C. erineus. Stem many times forked, erectish. Corolla with a white tube, and a violaceous blue limb.

89 C. Rhodsexis (Alph. D. C. mon. p. 297.) plant pilose; leaves entire, ovate; flowers terminal; calyceous lobes triangular, erect, at length spreading; corollas large, campanulate. \( \U 1 \). H. Native of the Island of Rhodes. Root simple. Stems many from each root, reddish. Flowers numerous, erect, terminating the branches. Corollas elegant.

Rhodes' Bell-flower. Pl. 1 \( \frac{1}{2} \) to 3 inches.

§ 3. Capsule erect; valves dehiscing at the base.—Flowers pedicellate. Radical leaves pedicellate, usually coriaceous, having the base of the petioles usually expanded and permanent.

* Corolla downy or velvety, tubular, 5-lobed at the apex. Radical leaves crowded. Stems few-flowered.—Species all natives of the Levant.

90 C. Damace'na (Labill. pl. syr. dec. 5. p. 7. t. 5.) downy; radical leaves ovate-ovobovate, acute, nearly entire, hoary; calyceous ones few, ovate, acute; calyx velvety, with subulate lobes, twice shorter than the corolla; capsule ovoid. \( \U 1 \). F. Native of the Levant, near Damascus, on the mountain called Dgebel-cher. Root woody. Stems slender, 1 or few-flowered. Flowers erect, pedicellate. Corollas cylindrical.

Damas'cus Bell-flower. Pl. ascending.

91 C. Arge'nte'a (Lam. dict. t. p. 584.) humble; radical leaves linear-obovate, clothed with silvery tomentum, nearly entire; upper leaves few, oblong; calyce silvery, with triangular lobes, 3 times shorter than the corolla; capsule turbinate. \( \U 2 \). F. Native of Armenia.—Tourn. cor. 3. Root hard, blackish. Stems erect, velvety, with short branches. Flowers 1 or few on the top of each branch, erect. Corollas velvety.

Silvery Bell-flower. Fl. \( \frac{3}{4} \) foot.

92 C. Syri'aca (Roum. et Schultes, syst. 5. p. 133.) radical leaves oblong-spataulate; calyceous leaves oval, sessile, somewhat sinuated; stem simple, few-flowered at top. \( \U 2 \). F. Native of Syria. There is nothing said of the flower and capsule by the authors.

Syrian Bell-flower. Fl. \( \frac{3}{4} \) foot.

* * * Corollas rotate, deeply 5-lobed, usually downy outside. Style exerted.—All natives of Italy.

93 C. Garga'ntica (Ten. fl. neap. prod. 1827.) radical leaves reniform, on long petioles; calyceous ones coriaceous, all crenately toothed, downy; flowers axillary, in fascicles; corollas 5-parted. \( \U 1 \). H. Native of Apulia, on Mount St. Angelo. Sweet, fl. gard. n. s. t. 252. C. elatinus, Ptenag. inst. bot. 2. p. 367. Plant pale green. Corollas blue. Habit of C. Carpatica.

Garganus Bell-flower. Fl. May, Sept. Ct. 1832. Fl. \( \frac{3}{4} \) to \( \frac{1}{2} \) foot.

94 C. Elatino'ides (Morett. pl. ital. dec. 5. p. 5.) plant tormentose; leaves acutely toothed, petiolate; lower ones oblong; superior ones ovate-acute; flowers disposed in dense racemes; tube of calyx ovoid; lobes subulate, spreading, about equal in length to the corolla. \( \U 1 \). H. Native of Italy, on the mountains about Pisa, among stones and on rocks. C. elatinus, Ptenag. inst. bot. 2. p. 307. Plant pale green. Corollas blue. Habit of C. Carpatica.

Elatine-like Bell-flower. Fl. \( \frac{3}{4} \) to \( \frac{1}{2} \) foot.

95 C. Elatino'nes (Lin. spec. 1. p. 240.) stem ascending; leaves coriaceous, coarsely and acutely toothed, ovate-acute; lower ones roundish; flowers in loose racemes; tube of calyx spherical; lobes of calyx spreading; linear-lanceolate, twice shorter than the corolla. \( \U 1 \). H. Native of the Alps of Piedmont, Liguria, Naples, \&c. in shady, rocky places. All. pedem. no. 422. t. 7. f. 2. Plant downy. Stem branched. Flowers scattered over the upper part of the plant, sometimes racemose, and sometimes panicled. Corollas bluish-purple, hardly one-half longer than the calyceous lobes.

Var. \( \beta \), glaberrima (Alph. D. C. mon. p. 301.) plant quite glabrous.

Elatine Bell-flower. Fl. June, Aug. Ct. 1823. Fl. \( \frac{3}{4} \) to \( \frac{1}{2} \) foot.

* * * Corolla campanulate, funnel-shaped, or tubular, 5-lobed at the apex, glabrous.—Roots for the most part thick. All natives of Italy.

96 C. Macb'orni'a (Gay, ind. ex Alph. D. C. mon. p. 593.) root thick; stems ascending; radical leaves petiolate, small, roundish-coriaceous, toothed; lower cauline leaves on short petioles, ovate, acute, toothed; superior ones sessile, linear-acuminate; flowers terminal and axillary; alabastra erect; calyceous lobes acuminate, spreading or reflexed, twice shorter than the corolla, which is campanulate. \( \U 1 \). H. Native of Nice, on dry rocks; Provence, on the mountain called Cousse; and near
CAMPANULACEÆ. XV. Campanula.

San Marco, in Calabria. C. Nicolénsis and C. rupestris, Risso, in herb. D. C. Root thick, marked by the vestiges of the fallen leaves, creeping among rocks. Stem simple or branched, glabrous. Leaves glabrous. Flowers more or less numerous, solitary, pedunculate and pedicellate, as in C. rotundifolia, looking upwards. Corolla broader than those of C. rotundifolia.

Long-rooted Bell-flower. Pl. ¼ to 1 foot.

Portenschlag’s Bell-flower. Pl. ½ foot.

98 C. Billardieri (Alph. D. C. mon. p. 303.) glabrous; stems ascending; radical leaves on long petioles, small, cordate, 3-5-cleft: lobes toothed; flowers few, in loose racemes; calyce segments filiform, rather unequal, two shorter than the corolla, which is tubular. 2. H. Native of Syria. Flowers few, second, drooping. Corollas small, blue. Radical leaves numerous; cauline ones few. Habitat of Wahlenbergia hederacea.

La Billardière’s Bell-flower. Pl. ¼ foot.

99 C. Morettinum (Rehbr. icon. rar. cent. iv. p. 18. t. 320.) plant pilose, humble; stems 1-flowered; leaves crenately toothed, small; radical leaves petiolate, cordate, roundish: cauline leaves smaller, ovate, acute; calyce lobes lanceolate, 4 times shorter than the corolla, which is funnel-shaped. 2. H. Native of Dalmatia, on Mount Biococeo; and of Tyrol, on Mount Vodai, above Vigo, in the valley of Fosia. C. pilla, Parol. hort. sic. ined. but not of Lin. nor Jacq. C. filiformis, Morett. pl. italic. dec. p. 8. giorn. di. fisic. &c. di. Pavia. 1826. vol. 9. p. 156. bot. italic. no. 11. p. 21. no. 4. Flowers erect, blue.

Moretti’s Bell-flower. Pl. 1 to 3 inches.

100 C. Raineri (Perpenti, in bibli. italic. 1817. 5. p. 134. with a figure) stems erect, firm, branched: branches 1-flowered; leaves almost sessile, ovate, remotely serrated: lower ones the smallest, obovate; calyce lobes long-acuminate, erect, twice shorter than the corolla, which is funnel-shaped; capsule obovate. 2. H. Native of Italy, on the Alps in the province of Brixio, and on the mountains surrounding Lake Cosmo; on the Alps of Biondi and Tremare, above Mandello and Ressione, from the termination of the Beech Woods, even to the elevation of 6000 feet and upwards. C. Perpentia, Morett. in herb. D. C. Plant tufted. Caudex creeping. Leaves leafy, rather pilose. Leaves glabrous or downy. Flowers erect, blue.

*** Corollas large, campanulately rotate, somewhat 5-cleft, glabrous. Roots usually thick.

101 C. isophylla (Moretti, append. to Schouw, prospekt. fl. italic. p. 22. Rehbr. icon. pl. cent. 3. t. 292. f. 344.) stems erect, short leaves all about the same size, petiolate, roundish, crenately toothed; flowers corymbose; calyce lobes acuminate, broad, twice shorter than the corolla; style exserted; capsule ovoid. 2. H. Native of Liguria, at Cape Nauli and Caprazoppa. C. floribunda, Viv. fl. lyb. append. fl. italic. p. 67. Caudex woody. Plant glabrous or velvety. Flowers numerous, erect, disposed in a corymbose. Corollas blue, rotate.

Equal-leaved Bell-flower. Pl. ¼ to ½ foot.

102 C. praegillis (Cyril. pl. fasc. 1. p. 32. t. 11. f. 2.) stems ascending, diffuse, branched; radical leaves on long petioles, roundish-cordate, bluntly crenate-lobed: calyce leaves smaller, ovate and lanceolate; flowers panicled; calyce lobes linear-lanceolate, erect, about equal to the corolla; style exserted; capsule ovoid. 2. H. Native of the south of Italy, in the valley of Ananà; near Naples, in Goat’s Island, about Cava; on Mount Pollino and elsewhere in Calabria; and probably of Sicily. C. diffusa, Vahl, symb. p. 18. C. coehleriifolia, Vahl, symb. p. 18. C. crassifolia, Nees, synl. rathb. 1. p. 6. and amon. bot. fasc. 2. p. 9. t. 4.—Barrel. icon. rar. p. 54. t. 27. Root thick. Plant glabrous. Flowers numerous, racemose paniced, terminating the branchlets, erect, pedicellate. Corollas large, pale blue.

103 C. Barrelii (Persib. symb. bot. bo. t. 19. ex Lin. nov. 7. f. 7.) villous; stems diffuse, procumbent, very simple, 1-flowered; leaves roundish-cordate, crenated; flowers terminal; segments of the calyx lanceolate, acute, longer than the tube, which is glabrous. 2. H. Native of Naples, on rocks by the sea side. C. diffusa, var. Rom. et Schultes, syst. 5. p. 92. Corollas blue.

Barrelieri’s Bell-flower. Pl. procumbent.

104 C. versicolor (Sibth. et Smith, prod. fl. græc. 1. p. 138. fl. græc. t. 207.) glabrous; stem ascending; leaves serrated; radical leaves petiolate, ovate, acute, rather cordate: calyce leaves on short petioles, ovate-lanceolate, acuminate; flowers disposed in long spicate racemes; calyce segments acuminate, spreading, at length reflexed, twice shorter than the corolla, which is variegated; style exserted; capsule spheroidal. 2. H. Native of Greece. C. planifóra, Willd. enum. 1. p. 215. but not of Lam. C. Wildenowiana, Rome et Schultes, syst. 5. p. 107. Root tuberous, thick, white, subdivided at top. Stems erect. Corollas campanulately rotate, of a deep violaceous colour at bottom, pale in the middle, and the lobes pale violet. Flowers disposed in long spikes, like those of C. pyramidalis, of which this species has the habit.

Tenore’s Bell-flower. Pl. ½ to 1 foot.

233. Glabrous; leaves glabrously tomentose: lower ones petiolate, ovate-oblong, somewhat cordate; cauline leaves sessile, ovate-lanceolate; flowers numerous, pyramidally racemose; calyces lobes acuminate, spreading; capsule spheroid, deeply furrowed. 2. H. Native on rocks and on walls in Carinthia, Carniola; of Dalmatia, in the island of Viso; on the walls of Venice and Verona. The plant has been cultivated a long time in gardens, and consequently has become, as it were, indigenous in many parts of the south of Europe. Jaun St. Hil. pl. fr. t. 416. — Weimann. phyt. t. 289. f. b. — Moris. oxon. 2. p. 452. sect. 5. t. 1. f. 1. — Beal. hort. eyst. t. 7. f. 1. — Tabl. icon. 317. — Swert. floril. t. 16. f. 2. — Lob. hist. p. 177. icon. 327. — Dod. pempt. 166. with a figure. Root large, turpini-like, oblong, usually divided into fusiform branches. Stem nearly simple, but furnished with floriferous branchlets. Flowers very numerous, pedicellate, usually 3 altogether from the same bractea, the whole disposed in a large pyramidal raceme, which is loose at the base. Corolla pale blue, with a dark base. There is also a white variety of this species.

Variety. (Lin. spec. 233.) Plant monstrosus, 1-flowered, dwarf; leaves all petiolate; calyces segments changed into large leaves. 2. H. — Weimann. phyt. icon. t. 294.

§ 4. Capsule dehiscing laterally by the valves towards the apex, erect. Lobes of calyx usually denticulated. — Radical leaves usually ovate, on short petioles, but never coriaceate. Flowers pedicellate.

* Valves situated between the middle and upper part of the capsule. — Branches not dichotomous.

108 C. Scouleri (Alph. D. C. mon. p. 312.) stem simple, few-flowered; leaves ciliated, sharply serrated; lower leaves ovate, acute, petiolate; middle ones ovate-lanceolate, sessile: superior ones linear-lanceolate; flowers racemose; calyx glabrous, with capillary erect lobes, which are 3 times shorter than the 5-lobed, funnel-shaped corolla; style exerted; capsule ovoid. 2. H. Native of North-west America, about Fort Van Couver, on the banks of the Columbia river. Stems ascending at the base, glabrous or a little hairy, simple at the bottom, and furnished with floriferous peduncles at top. Flowers 4 to 10 on each stem, terminal and axillary, loosely racemose. Habitat of a species of Adenophora. Scouler's Bell-flower. Pl. ½ foot.

* * * Valves situated near the top of the capsule. Flowers usually on long peduncles, terminal or axillary. Brachies not dichotomous.

Var. (Lin. spec. 233.) Ait. hort. kew. 1. p. 220.) stem simple, petiolate; leaves ovate; calyces lobes acuminate at both ends, on short pedicels, serrulate; flowers almost sessile, in a raceme, crowded at the top; calyces segments linear-subulate, erect, entire, rather longer than the corolla, which is funnel-shaped; capsule ovoid, 10-nerved. 2. H. Native of Upper Nipai, on the more elevated mountains. Root simple, glabrous. Stems usually undivided, but sometimes furnished with a few simple branches, angular. Leaves hispid. Petioles pilose. Flowers small, blue, in fascicles, from the axils of the upper leaves, the whole forming an oblong terminal raceme.

Fulgent Bell-flower. Pl. 1 foot.

112 C. perierina (Lin. syst. p. 301.) plant hispid; stem simple, many-flowered, angular; leaves crenated: lower ones ovate: superior ones ovate, acute; flowers disposed in a spicate raceme; calyces lobes acuminate, nearly entire, rather shorter than the corolla, which is spreading; capsule ovoid. 2. H. Native of Mount Lebanon, and near Aleppo. Jacq. hort. schoenbr. 3. p. 337. Sims. bot. mag. t. 1257. Hoffm. and Link. fl. port. 2. p. 15. t. 83. C. lanuginosa, Lam. dict. 1. p. 584. but not of Willd. C. hissittissima, Guss. ined. Flowers sessile, solitary, disposed in a long dense spike. Corollas funnel-shaped, hardly one-half longer than the calyces lobes, of a violet color, at the base, of a less deep color in the middle, and paler towards the margins.

113 C. Primulefòlia (Brot. fl. lus. 1. p. 288. phyt. lus. 1. t. 20.) stem hispid, many-flowered, simple; leaves unequally and doubly crenated: radical ones lanceolate, bluntish; cauline
leaves ovate-oblong, acute; flowers disposed in a spicate raceme; calyceine lobes acuminate, broad at the base, denticulated; corolla campanulately rotate, twice longer than the calyceine segments; capsule long, obconical. 2. H. Native of Portugal, in shady, humid places of the Algarves and Beira, and near Coimbra; above Punheira, and about Monchica. C. Trachéillum, Broit. fl. lus. 1. p. 287. Root oblique, branched, thickened into tubers at top. Leaves hispid on the ribs and veins. Flowers erect. Corollas nearly glabrous, blue, rarely purple, with a whitish downy bottom.

Primrose-leaved Bell-flower. Pl. 1 to 2 feet. 114 C. ALATA (Desf. fl. atl. 1. p. 178, t. 50.) stem few-flowered, simple, glabrous; leaves irregularly toothed, glabrous; lower ones ovate, acute; calyceal leaves lanceolate; flowers few, disposed in racemose heads; calyx with a hispid tube, and liocar-lanceolate, acute, rather ciliated segments; corolla broadly campanulate, twice longer than the calyceine segments; capsule spherical. 2. H. Native of the north of Africa, near Mairal. Stem angular. Flowers sessile on the top of the stem. Corolla blue, size of that of C. pyramidalis.

Wingèd Bell-flower. Pl. 2 to 3 feet. 115 C. PFRNCEFOLIA (Lam. dict. 1. p. 579.) stems simple, many-flowered; radical leaves crowded, linear-lanceolate, serrated; flowers sessile, disposed in a loose spike; calyx with a spherical tube and triangular lobes, which are thrice shorter than the tubularly-campanulate corolla. 2. H. Native of Armenia. Desf. choix. cor. p. 55. t. 25. or in ann. mus. 11. p. 56. t. 6. Radical leaves rosalate. Plant glabrous. Flowers erect, violaceous.

Sneezewort-leaved Bell-flower. Pl. 1/2 to 1/2 foot. 116 C. CAPRANCA (Jacq. hort. vind. 1. p. 22. t. 57.) plant glabrous, branched; lower leaves on long petioles, ovate-roundish, cordate, toothed: superior ones on short petioles, ovate, acute; flowers disposed in loose panicles, on long peduncles; calyceine lobes eretic, triangular, acuminate, thrice shorter than the corolla, which is broadly campanulate; capsule ovoid-cylindrical. 2. H. Native of Transylvania, and at the sides and bottoms of the mountains of Liptovia, to the south of the Carpathian mountains; among calcareous alpine rocks. Curt. bot. mag. t. 117. Root fibrous. Stems leafy. Branches or peduncles elongated, naked, each terminated by an erect flower. Corollas blue, about the size of those of C. persicefólia.

119 C. PERSICEFOLIA (Lin. spec. ed. 1. p. 164.) stems nearly simple; leaves glabrous, still, crenulate: radical leaves lanceolate-obovate: calyceal leaves linear-lanceolate; flowers racemose; calyceal lobes acuminate, broad at the base, entire, twice shorter than the corolla, which is broadly campanulate; capsule ovoid, trilobate, dehiscing by broad pores. 2. H. Native of the south and temperate parts of Europe; from Spain, Italy, Greece, even to Scotland; south of Sweden; about Petersburg and Moscow, and throughout Siberia, especially towards the east, and the Altaian mountains; constantinople; tolerating in subalpine shady places, and woods; in Scotland, in woods near Cullen. Bull. herb. t. 367. Oed. fl. dan. t. 1677. Sibyth. et Smith, fl. geac. t. 205. C. decurrens, Lin. spec. ed. 2. p. 222. C. speciosa, Gilib. plth. p. 10. but not of Horn. C. amygdalifolia, Salisb. prod. p. 126.—Weinm. phyt. icon. t. 291. f. and b. and t. 290. f. et d.—Swert. florl. pt. 2. t. 16.—Besl. hort. syst. 1. t. 8. f. 2. and 3.—Tab. icon. t. 317.—Lob. icon. t. 327.—Moris. oxon. 2. p. 452. sect. 5. t. 1. f. 2. Plant glabrous. Flowers terminal and axillary, pedunculate, solitary, inclined, the whole forming a raceme. Corollas large, broad, campanulate, blue, and all the intermediate shades to white.

120 C. PYREXIA (Alph. D. C. mon. p. 324.) stems simple, 1-flowered, beset with soft hairs; leaves rather pilose: radi-
cal leaves roundish, a little crenated, on short petioles: cauline leaves sessile, lanceolate, nearly entire, acute at both ends; calyx glabrous: with subulate, spreading, entire lobes, which are rather shorter than the corolla. 2. H. Native of the Pyrenees, and of the Balearic Islands. Flowers terminal, erect. Corolla blue?

Pyrenean Bell-flower. Pl. 1 to 1 1/2 foot.

121 C. Rapiicolus (Lin. spec. p. 323.) stem almost simple; lower leaves ovate, on short petioles, nearly entire: cauline leaves sessile, linear-lanceolate, entire; flowers spicate race-mose, solitary; calycine lobes erect, long-subulate, very slender, rather shorter than the corolla, which is funnel-shaped; capsule obconical, trilaciate. 3. H. Native of Morocco and Barbary; as also of the south of Europe, and extending as far north as the county of Norfolk, in England; as well as of Transylvania and Caucasus. In Britain, on banks and at the borders of fields; not common. About old Buckingham Castle, Norfolk. In many parts of Kent and Surrey, as well as in other places on a gravelly soil; having formerly perhaps escaped from gardens. Smith, engl. bot. t. 283. Schrank, enc. no. 406. t. 39. Oed. fl. dan. t. 1326. Svenk, bot. t. 629. C. fastigiata, Gmel. reis. 1. p. 153. t. 33. but not of Dufour. C. coecatata, Gilib. pl. lth. p. 8. C. esculenta, Salisb. prod. p. 126. C. elatior, Link, et Hoffm. fl. port. 2. p. 11. t. 80. C. glandulosa, Banks, herb. Tourn. inst. 111. Morand. hist. p. 69. t. 39. f. 3.—Moris, oxon. sect. 5. t. 2 f. 20. and f. 1. Column. phyt. 192. with a figure. Lob. icon. t. 328. Root fusiform, thick, white. Stem simple, but sometimes furnished with a few branches towards the top, furrowed, glabrous, but pilose at the base. Leaves usually glabrous, but sometimes hairy. Flowers nearly sessile, or pedicellate, erect, forming a long raceme, which is branched at the base. Corollas blue or white. This plant varies in the stem being glabrous or pilose, in the length of the pedicels, in the tube of the calyx being glabrous or strigose, in the calycine teeth being entire or a little denticulated at the base. The root is milky, thick, and edible, and, with the leaves, is mixed in salads; and, therefore, it was formerly cultivated for that purpose. In France and Italy the roots are boiled and eaten hot with sauce, or cold with vinegar and pepper. The seed is sown in the spring on deep light soils, in drills, and the plants are ready for use in the autumn of the same year. It is called Rupuncule in Italy; Rapunzelo, in Portugal; Raiponce, petite Raiponce, in France; Rampion, and Small Rampion, in England; Rapunzel, Ruben, or Blau Bluhende Wurzel, Rapunzel, Purwitzlein, in Germany; Rzepka, in Bohemia; and Akla Rapunzel, in Sweden.

122 C. Lambertiana (Alph. D. C. mon. p. 327.) stem simple, many-flowered, pilose; calamine leaves sessile, oblong- acuminate, irregularly denticulated, rather pilose; flowers disposed in a spicate raceme; calyx glabrous, with acuminate, spreading, coarsely, and acutely-toothed lobes, rather shorter than the corolla, which is obconical. 3. H. Native of Persia, in the province of Ghilan. Flowers disposed in a spike-formed raceme, furnished with a few branches at its base, as in C. Rapiicolus. Corollas white?

Lambert’s Bell-flower. Pl. 1 1/2 to 2 feet.

123 C. virgata (Labill. pl. syr. dec. 2. p. 11. t. 6.) stem simple, many-flowered; radical leaves lanceolate, crenulated, petiolate: calamine ones sessile, linear-lanceolate; flowers spicate, usually twin or tern; calyx with a scabrous tube, and erect subulate lobes, which are twice or thrice shorter than the funnel-shaped corolla; capsules obconical. 3. H. Native of Mount Lebanon. Root thick. Stem hardly leafy, rather scabrous below, but smooth at top. Leaves scabrous. Flowers sessile, erect, 1-3 from each axil, forming a long interrupted spike. Corollas blue?

Twygge Bell-flower. Pl. 1 1/2 to 2 feet.

124 C. Herminii (Hoffm. et Link, fl. port. 2. p. 9. t. 79. Roem. et Schultes, syst. 5. p. 328.) glabrous; stem ascending, simple; leaves nearly entire: radical ones lanceolate: calamine ones linear-lanceolate; petioles ciliated at the base; calycine lobes long, capillary, reflexed, rather shorter than the corolla, which is funnel-shaped. 3. H. Native of Portugal, at the high mountains called Serra d’Estrella. Root rather thick, creeping. Stem panicked at the top, as in C. rhomboidealis. Pedicels 1-flowered. Corollas pale blue.

125 C. falata (Lin. spec. ed. 1. p. 163.) stem branched; branches diverging; radical leaves crowded, obovate, crenated; calamine leaves linear-lanceolate, sessile, nearly entire; calycine lobes long-acuminated, spreading, serrated at the base, twice shorter than the corolla, which is funnel-shaped; capsule ovate-cylindrical. 3. H. Native of the south and temperate parts of Europe; as of the Pyrenees, Spain, throughout Italy, the Morea, and also in the region of Tunis. Root, to the Carpathian Mountains, but not below them; Transylvania; about Petersburg and Moscow, but is never to be found in Europe beyond lat. 61. In England, in pastures, borders of fields and hedges; rare in several parts in Kent; in many places about Alcestor; in Worcestershire, and Staffordshire, &c. Oed. fl. dan. t. 573. Smith’s engl. bot. t. 42. Hook. fl. lond. t. 51. C. bellidifolia, Lapeyr. abr. p. 36. C. decurrens, Lin. spec. ed. 1. p. 164. Diffuse Bell-flower, Hill. veg. syst. 8. t. 1. —Weldr. phyt. Icon. t. 290. f. R. Dil. Hort. Eth. t. 58. f. 68. Resl. syst. ord. 1. 5. t. 8. Root small, slender, branched. Stems glabrous, or scabrous from pili on the angles. Branches divaricate, nearly naked. Leaves glabrous. Flowers panicked, terminal, and axillary, on long pedicels, large, erect. Corollas blue or white. This is a very polymorphous plant.

Var. γ. latifolia (Alph. D. C. l. c.) stem branched, glabrous, scabrous on the angles; calamine leaves lanceolate, broad, serrated; calycine segments very long, rather longer than the corolla.

Var. ε. paciflora (Alph. D. C. l. c.) stem humble, branched a little, almost naked; flowers terminal, and axillary, few, large; corolla campanulate, one half longer than the calycine segments. Column. ecphr. p. 24. with a figure. Tourn. inst. 111.

Var. ε. neglecta (Alph. D. C. l. c.) calyxine lobes reflexed, serrulated, toothed at the base, acuminated, a half or a third the length of the corolla. C. neglecta, Roem. et Schultes, syst. 5. p. 104.

126 C. erinoides (Lin. mant. p. 64.) Cav. ann. cienc. 3. p. 20.) stem humble, few-flowered, with scabrous angles; leaves small, linear-lanceolate, glabrous, crenulated: lower ones obtuse: superior ones acuminated; calycine lobes long, subulate,
entire, rather shorter than the corolla, which is funnel-shaped; capsule long-obconical, nearly terete.  

127 C. Matrænæsis (Alph. D. C. mon. p. 532.) stem humble, few-flowered; leaves linear-lanceolate, nearly entire: lower ones obtuse: superior ones acute; calycine lobes long-subulate, erect, entire, rather shorter than the corolla, which is narrowly funnel-shaped; capsule obconical, elongated, having the nerves rather prominent. . H. Native of Spain, about Madrid. Root slender, filiform. Stem simple, but furnished at top with 1-flowered peduncles, which diverge more or less. Flowers erect, blue.

Madrid Bell-flower. Pl. 1/2 to 1/4 foot.

128 C. ramosissima (Sibth. et Smith, fl. græc. t. 204.) stem branched, many-flowered, pilose; leaves ovate-lanceolate, created: lower ones obtuse: upper ones acute; calyx with a pilose tube, and acuminate entire lobes, which are pilose outside, and rather shorter than the spreading corolla; capsule obconical, pilose, having the nerves rather prominent. . H. Native of the province of Verona, near Valleggio, where it was first collected by Lory; and on Mount Baldero by Rainer. C. Loreiæna, Loreiæ, or Lorei, Poll. elem. bot. t. 2. p. 148. ultimate table, f. 1. Poll. fl. ver. 1. p. 271. t. 2. f. 4. Sims, bot. mag. t. 2581. C. Baldensia, Balb. cat. hort. taur. 1813. p. 20. C. ramosissima, Host, fl. austr. 1. p. 264. but not of Sibth. et Smith. Root slender, fibrous. Stem glabrous or hispid. Peduncles long, naked, glabrous, bearing each an erect flower at the apex; but the alabastrum is drooping before expansion. Corolla with a white base, middle part or base of the lobes pale blue, and the lobes bluish-violet.

Decumbent Bell-flower. Pl. decumbent.

131 C. Loefflingii (Brot. phyt. fasc. 1. no. 10. fl. lus. 1. p. 237.) stem much branched, many-flowered, rather scabrous on the angles; leaves crenulated: lower ones ovate-reiniform, or roundish-cordate: superior ones ovate, stem-clasping; calyx glabrous, with an obconical tube, and long-acuminated spreading lobes, which are rather shorter than the corolla; capsule obconical, with prominent nerves. . H. Native throughout Portugal, in sandy places; of Spain, about Madrid; and of the territory of Mogodor. Broth. phyt. lus. sel. p. 41. t. 18. Hoffm. et Link, fl. port. 2. p. 14. t. 82. C. Broussonetiæana, Lem. et Schultes, syst. 5. p. 104. Root slender, fibrous. Leaves glabrous. Flowers solitary, terminating the naked branchlets, loosely panicked, drooping. Corolla funnel-shaped, blue, or violaceous, with a deeper coloured zone beneath the middle, white at the base, both inside and outside. In one variety, the calyx is downy.

132 C. retrorsa (Labill. fl. syr. dec. 5. t. 3.) stem few-flowered, angular, scabrous from retrograde prickles or bristles on the angles; lower leaves roundish-obovate, petiolate, somewhat sinuated, glabrous: superior leaves ovate-lanceolate, entire, with scabrous edges; calycine lobes long-acuminated, spreading, scabrous from serrulations, longer than the corolla, which is funnel-shaped; capsule obconically elongated. . H. Native on Mount Lebanon. Root slender, fibrous. Branches elongated, naked, each terminated by an erect flower. Corolla drooping before expansion. Corolla mixed with white and violet.

Retrograde-bristled Bell-flower. Pl. 1/2 to 1/4 foot.

133 C. Zosyni (Wulf. in Jacq. coll. 2. p. 122.) plant tufted; stems erect, few-flowered; leaves entire: radical ones crowded, petiolate, ovately-obovate, obtuse; cauline leaves obovate-lanceolate, and linear; calycine lobes subulate; corolla long-cylindrically veiny; capsule ovoid-spherical. . H. Native of the Upper Alps of Styria, Carniola, Carinthia, &c. Jacq. icon. rar. 2. t. 334. Plant small, glabrous, tufted. Root creeping, throwing out many small stems, which bear from 1 to 3 flowers each. Leaves crowded at the base. Flowers pedicellate, drooping. Corolla cylindrical, elongated, pale blue, with 5 deeper coloured lines; rarely white.

134 C. Cenista (Lin. spec. suppl. p. 1669.) plant tufted; stems ascending, 1-flowered; leaves entire: radical ones obovate, obtuse, obtuse: cauline leaves ovate-oblong; calyx hairy, with linear-lanceolate lobes; corolla 5-cleft, hardly twice the length of the calycine lobes; capsule ovoid. . H. Native of the Higher Alps of Provence, Piedmont, Dauphiny, Savoy, Vallas; on Mount Cenis; and of Switzerland, on the mountains called Diablerets, &c. All. pedem. no. 295. t. 6. f. 2. Rehb. icon. bot. cent. 1. p. 85. All. rar. stirp. spec. 35. t. 5. f. 1. Root creeping, blackish. Stems numerous, glabrous, or slightly pilose. Flowers solitary, terminal, erect. Corolla deep blue, hardly one half longer than the calycine lobes.

Far. ß, angustifolia (Schrad. prim. salisb. p. 70.) leaves narrow. . H. Native of the Alps of Salzburg.

135 C. spatula (Sibth. et Smith, prod. fl. græc. 1. p. 137. fl. græc. t. 203.) stem ascending, 1-flowered, pilose; lower leaves petiolate, obovate, crenated: superior ones lanceolate; calyx with an obconical tube, and linear-acuminated toothed lobes; corolla subcampanulate, hardly longer than the calycine lobes; capsule spheroid. . H. Native on Mounts Olympus and Parmassus. Root slender, twisted. Stem solitary, angular. Leaves rather pilose, but becoming more smooth and entire as they ascend the stem. Flowers terminal, erect, blue.

136 C. A’lóid’a (Fisch. miss. ex Alph. D. C. mon. p. 338.)
plant humble; stems nearly naked, 1-flowered; radical leaves crowded, obovate-lanceolate, setaceaously denticate; tepaloles ciliate; calyx with a villous tube, and denticulated acuminate lobes; corolla campanulately funnel-shaped, twice longer than the calycine lobes; capsule somewhat cylindrical.  2. H. Native of Kamtschatka, Unalaska, Kotzebue’s Sound, Cadiak, and Sedge Island, as well as of the Rocky Mountains in America. C. lasiocarpa, Cham. in Linnæa. 4. p. 39. exclusive of the syn. Camp. Sayénensis, Fisch. Root slender, white. Stem glabrous, or slightly pilose. Flower terminal, erect. Corolla large for the size of the plant, blue.  

A'gigid Bell-flower. Pl.  ½ to 4 foot.  

137 C. uniflóra (Lin. spec. p. 251. but not of Vill.) stems 1-flowered; leaves nearly entire; lower ones obovate, petioloate; middle ones obovate-lanceolate; upper ones few, linear-flattened; calyx rather villous, with linear acuminate lobes, about equal in length to the corolla, which is funnel-shaped; capsule cylindrical.  2. H. Native of the polar region of America, as in the Island Unalaska; north side of the Rocky Mountains; between Point Lake and the Arctic Sea; Kotzebue’s Sound, Melville Island, Greenland; and of the north of Europe, as in Lapland, Sweden, Norway, &c. Svenk. bot. t. 526. Rothb. pl. greenl. in act. hafn. x. p. 522. t. 6. f. 19. Oed. fl. dan. t. 1512.  

—Lin. fl. lap. no. 85. t. 9. f. 5-6. Root simple, blackish. Stems simple, glabrous. Leaves glabrous. Flower drooping; deep azure blue.  

* * *  

Valves situated near the apex of the capsule. Flowers on short pedicels. Leaves opposite. Branches usually more or less dichotomous.  

138 C. fastigı’ata (Dufr. in herb. D. C. ex Alph. D. C. mon. p. 340. t. 12. f. B.) plant scabrous, humble; lower leaves obovate, nearly entire; middle ones obovate-lanceolate, coarsely 3-5-toothed; upper ones linear-lanceolate; corolla one half shorter than the calycine segments, which are linear-lanceolate; capsule obconical.  2. H. Native of Spain, in Arragon and about Aranjuez. Plant of a greyish colour. Stem branched, erect; branches diverging. Leaves rather small or glabrous. Flowers sessile, erect, terminal, rising from the axils or above the axils of the branches, always opposite the leaves, particularly terminating the stem and branches. The flowers situated in the lower axils expand before the rest. Corollas small, blue.  

Fastigate Bell-flower. Pl.  ½ foot.  

† Species not sufficiently known.  

139 C. ligula’ris (Lam. dict. 1. p. 585. ill. no. 5247.) leaves numerous, alternate, oblong, narrow, obtuse, entire, and ciliate; flower erect, terminal, middle-sized; calyx hispid, with nearly linear segments and covered sinuses; corolla tubularly campionate, bearded a little; stem leafy, nearly glabrous, 1-flowered.  

—Native of the Alps of Europe.  

Ligula’-leaved Bell-flower. Pl.  ½ foot.  

140 C. asper’a’ma (Zuccagni in Rœm. coll. p. 128.) leaves hastate, tomentose, spiny-toothed; flowers axillary; corolla tomentose and hispid outside.—Native country unknown. Stem solitary, erect, tomentose. Caluine leaves imbricate, hasteately cordate, reticulated and tomentose, especially beneath. Flowers axillary, sessile, solitary. Calyx spiny, shorter than the corolla. Corolla tubularly campionate, violaceous.  

Very rough Bell-flower. Pl.  ½ foot.  

141 C. decú’rerens (Zuccagni in Rœm. misc. p. 128.) stem winged; leaves decurrent, toothed, hispid; corolla tomentose and hispid on the outside.—Native country unknown. Stem flexuous, winged from the leaves being decurrent. Leaves spatulate, reticulated and tomentose, especially beneath. Flowers axillary, crowded, seated on a common peduncle. Bracteas cordate. Calyx hispid.  

Decurrent-leaved Bell-flower. Pl. 2 feet.  

142 C. aspera (Mœch. suppl. p. 188.) stem terete, straight, quite simple; leaves oblong, sessile, crenated; peduncles 3-flowered.  2. H. Native country unknown. Plant hispid from pili. Leaves obtuse, stiff; radical ones petioloate; caulescent ones sessile, remote. Racemes loose, terminal. Flowers axillary; intermediate one pedunculate, lateral 2 adnate to the common peduncle. Corolla blue. Stigma trifid. Capsule 3-celled.  

Rough Bell-flower. Pl. 3 feet.  

143 C. cymbalá’ria (Sibth. et Smith, prod. fl. græc. 1. p. 139.) leaves reniform, cut, quite glabrous, shining; stems diffus.  2. H. Native of Mount Olympus, in Bithynia. Camp. foliis cymbalariarum erat montis Olimpi Bithyni, Tour. cor. Perhaps this is either C. frigidia, or C. Bellardii.  

Cymbalária-leaved Bell-flower. Pl. diffus.  

144 C. Want’eri (Roch. pl. banat. var. t. 5. f. 12.) C. hetrophyllia, Baumg. fl. trans. suppl. ex Feruss. bull. sc. febr. 1829. Nothing is known of this species.  

Wanner’s Bell-flower. Pl.  

145 C. lanceolata (Presl. ex Wanderoth, beitr. zu. fl. Von Hessen. p. 37. but not of Lapeyr.) Nothing more is known of this plant.  

Lanceolate-leaved Bell-flower. Pl.  

146 C. monta’na (Delarb. fl. auvergn. p. 40.) Native of Auvergne. Nothing is known of this plant but the name.  

Mountain Bell-flower. Pl.  

147 C. rige’scens (Pall. ex Rœm. et Schultes, syst. 5. p. 102.) leaves lanceolate; radical ones attenuated into the petioles, crenated; caluline ones sessile; stem straight, simple, downy; flowers terminal, racemose; calyces ciliated. Native of Siberia, about Lake Baical, in frigid places. Corolla ½ inch long, twice the length of the calyx, with the segments a little. Style a little longer than the calyx. Stem a spain high, few-flowered.  

148 C. adsc’nedens (Vest, in Rœm. et Schultes, syst. 5. p. 90.) leaves scattered; lower ones on short petioles, ovate-toothed; superior ones oblong, quite entire, glabrous as well as the stem, which is ascendent; flowers solitary, drooping; calycine leaflets subulate, a little shorter than the corolla. Native of Siberia. C. rotundifolia, Pall. ex herb. Lamb. Very nearly allied to C. uniflóra.  

Ascending Bell-flower. Pl. ascending, ½ foot.  

149 C. hetero’doxá (Vest, in Rœm. et Schultes, syst. 5. p. 98.) leaves oblong, glabrous; flowers axillary, pedunculate, spreading; calyx short, with lanceolate-subulate segments, which are a little shorter than the corolla.  2. H. Native of Siberia. C. rotundifolia, Pall. herb. Peduncles axillary, capillary, 1-flowered, roughish, furnished with bracteoles.  

Heterodox Bell-flower. Pl.  ½ to 1 foot.  

150 C. lunár’éfóliá (Wild. rel. ex Rœm. et Schultes, syst. 5. p. 92.) leaves ovate, deeply cordate, petioloate, doubly serrated; flowers secund.  2. H. Native of Caucasus.  

Lunaria-leaved Bell-flower. Pl. 1 foot.  

151 C. kitaibelli’ana (Rœm. et Schultes, syst. 5. p. 90.) lower leaves obovate-cuneiform, crenated: superior one linear, quite entire; stem quite simple, 1-flowered.  2. H. Native of Austria. C. microphylla, Kit. in Schultes, fl. austr. 2. ed. no. 400.

153 C. e'legans (Rom. et Schultes, syst. 5. p. 105.) leaves linear-lanceolate, quite entire; lower ones the broadest, smooth, and tapering into the petioles; stem downy; flowers axillary, at length spicate; calyces segments saccate, divaricate, rather punkent, length of corolla. 2. H. Native of Siberia. C. speciosa, Willd. rel. ex Rom. et Schultes, l. c. Stem simple, terete, weak. Flowers terminal, and rising from the axille of the superior leaves, forming an interrupted spike, hardly pedunculate.

Kamtschatka Bell-flower. Pl. ½ foot?

Cult. All the species are elegant and handsome when in blossom, and are well adapted for decorating flower borders. They are general thrive well in common garden earth. The seeds of the biennial and annual kinds should be sown in the open border in spring. The perennial species may either be propagated by division or by seed. Some of the perennial and biennial species, natives of the warmer latitudes, require a little protection in winter, when the weather is severe. Some of the smaller perennial kinds answer well for decorating rockwork, or to be grown in pots, among other alpine plants.

XVI. SPECULARIA (so called from the ancient name of one of the species, Speculum Veneris, or Venus's Looking-glass).

Lin. syst. Pentámória, Monogénia. Calyx 5-lobed, with an elongated, prismatic, or long-obconical tube. Corolla rotate, 5-lobed. Stamens 5, free, one-half shorter than the corolla; anthers longer than the filaments, which are short, membranous, and pilose. Style inclosed, pilose: hairs secund, disposed in 10 rows; stigmas 3, filiform. Capsule long, prismatic, 3-celled, dehiscing by 3 valves at the apex, or a little above the middle part. Seeds ovoid or lenticular, rather compressed, shining. — Dwarf annual herbs, natives of the region of the Mediterranean, and the temperate parts of Europe; one species alone a native of America. Leaves alternate, equally scattered over the stem, small; lower ones unlike the rest. Flowers terminal and axillary, erect, always sessile. Corollas blue; rose-coloured, white, grey, or variegated, shining in the sun; hence the generic name.

* Tube of calyx very long, prismatic, and angular. Capsule dehiscing towards the top, near the lobes of the calyx. Seeds ovoid. Leaves ovate-oblong or lanceolate, nearly entire, not stem-clapping.

1 S. pentágonia (Alph. D. C. mon. p. 344.) stem branched, larger; flowers terminal, solitary; calyx beset with a few stiff hairs, having a long prismatic tube, and long linear-lanceolate, spreading lobes; corolla the length of the calyce lobes. 2. H. Native of the Levant, about Aleppo; in Caramania, Candia, Thrace, &c. Campánula pentágonia, Lin. spec. 1. p. 239. Desf. choix. cor. p. 44. t. 33. or ann. mus. 11. p. 143. t. 18. Ker. bot. reg. t. 56. Prisimato-carpus pentágonius, Lher. sert. angul. p. 2. Stem glabrous or pilose on the angles. Leaves glabrous, nearly entire or crenulated, with revolute edges; lower leaves obovate; middle cauline ones lanceolate-ovabote; upper cauline ones linear-lanceolate. The corolla before expansion is blunt and pentagonal, but when expanded large, white at the base, blue to the middle part, and violaceous at the extremity of the lobes.

2 S. falca'ta (Alph. D. C. mon. p. 345.) stem nearly simple; flowers disposed in long spikes, or approximate at the tops of the branches; calyx glabrous or scabrous on the margins, with a prismatic tube, and very long lanceolate acuminate lobes, which are reflexed at the apex, and are twice the length of the corolla. 2. H. Native of the region of the Mediterranean; as of the Island of Chalès or Euba; of Dalmatia; about Naples; and of Sicily, Corsica, and Sardinia; among corn, and on dry hills. Campánula falcata, Rom. et Schultes, syst. 5. p. 154. Guss. pl. rar. p. 96. Prisimato-carpus falcatus, Tenere, prod. p. 16. fl. neap. 1. p. 77. t. 20. Sebas et Maur. fl. rom. prod. 1. p. 102.—Buxh. cent. 4. p. 24. t. 35.—Cupan. panph. 2. t. 20. Stem glabrous or a little scabrous on the angles. Leaves glabrous, rarely pilose, with rather revolute edges, crenulated. Flowers sessile, solitary, axillary, the whole forming a leafy spike. Corolla rose-coloured. Lobes of calyx falcate.

3 S. spec'ulum (Alph. D. C. mon. p. 346.) stem branched; branches 3-flowered; calyx glabrous or downy, with a prismatic tube, which is narrow at the apex, and linear-lanceolate spreading lobes, which are at length reflexed; corolla length of the lobes of the calyx. 2. H. Native of the temperate parts of Europe, and throughout the region of the Mediterranean Sea, in corn-fields; in Germany, Transylvania, Pyrenees, Spain, Italy, Greece, Syria, Barbary, &c. Campánula speculum, Lin. spec. p. 238. Curr. bot. mag. t. 102. Smith, fl. gracc. t. 216. Lagozizia arvensis, Durand. fl. bourg. 1. p. 37. Prisma-carpus speculum, Lher. sert. angul. p. 2. Campánula pulchella, Salisb. prod. p. 137. Lagozizia Durandii, Delarb. fl. avuergni. p. 45. Campánula miróre de Venus, Jaume, pl. fr. t. 73. Camp. cordata, Visiani. strirp. dalm. spec. p. 5. t. 2.—Weim. phyt. t. 286. Besl. syst. 7. t. 1. f. 1.—Gesen. tab. phyt. 9. t. 76.—Lob. icon. 418.—Dodd. pempt. p. 168. t. 1.—Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 21. Branches glabrous or scabrous on the angles. Leaves crenulated, glabrous or scabrous; lower ones obovate; middle ones ovate-acute; superior ones lanceolate, nearly entire. Flowers terminal and axillary, showy. Corolla greenish-white at bottom, deep violet towards the middle part, and the lobes less violaceous, paler on the outside. There is also a variety with white flowers.

**CAMPANULACEÆ. XVI. Speculatia.**

*Var. č Libánica* (Alph. D. C. mon. p. 347.) stem humble, simple, erect; leaves erect; flowers approximate at the apex.

4 S. *hybrida* (Alph. D. C. mon. p. 348.) stem nearly simple; flowers approximate at the top of the stem; calyx subriform, with a prismatic tube, which is narrower at the apex, and short erect ovate-lanceolate lobes; corolla one-half shorter than the calycine lobes. O. H. Native of the region of the Mediterranean, and the temperate parts of Europe, and of Cauca-
 cusus, in corn-fields; from Barbary, Spain, Sardinia, Italy, Sicily, and Morea, even to England, Germany, and Siberia; in Taunus, Georgia, and Transylvania. Campánuła híbrida, Lin. spec. 259. Smith, engl. bot. t. 375. Platycocarpus híbridos, Léer. ser. angl. p. 2. Ten fl. neap. 1. p. 77. Platycocarpus conjunctus, Moench, meth. p. 496. Leucozúa híbrida, Delarb. fl. auvergn. 47. Camp. spária, Wall. ind. Rœm. et Schultes, syst. 5. p. 154. Leucozúa parviflóra, Gray, nat. arrang. brit. fl. p. 410.—Cupani. panph. 1. t. 100. Raf. t. 100. f. 2.—Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 22. Stem more or less scabrous from pli on the angles. Leaves ovate, more or less pilose; lower ones obovate; middle ones ovate, acutish; superior ones smaller and ovate-lanceolate. Flowers 3-6, crowded towards the top of the stem, sessile, rising from the axils of the upper leaves and top of the stem. Corollas rose-coloured, or of a bluish rose-colour.

5 S. *Cia* (Alph. D. C. mon. p. 350.) stem humble, nearly simple; flowers few, approximate towards the top of the stem; calyx downy, with prismatic tube, and erect lanceolate-sulcate lobes; corolla twice longer than the calycine lobes. O. H. Native of the Island of Cois, in the sand by the sea side. Campanula spéculum, var. D'UrTu enum. pl. arch. in mem. Lin. par. 1. p. 280. Platycocarpus híbridos? or a new species? D'UrTu in herb. D. C. Stem pilose, downy at top. Leaves pilose, greyish; lower ones obovate; middle ones sessile, ovate-acute; superior ones narrower and lanceolate. Flowers 3-6 towards the top of the stem, sessile, axillary, and terminal. Corolla blue or white.

Cois Venus's Looking-glass. Pl. ½ to ½ foot.

6 S. *Ghiłanënsis* (Alph. D. C. mon. p. 350.) stem simple or a little branched; leaves lanceolate, acuminate, serrated; flowers subracemos; segments of the calyx acuminate, serrated, longer than the corolla. O. H. Native of Persis, in the province of Ghiłan. Campanula Ghiłanënsis, Pall. ind. ex Rœm. et Schultes, syst. 5. p. 154. Very like S. spéculum, but differs in the stem being simple and much higher, in the calycine segments being serrated, and ending each in a long setaceous twisted mucrone.

**Ghiłan Venus's Looking-glass.** Pl. 1 foot.

* Tube of calyx long, obconical, smooth. Capsule dehiscing towards the middle part. Seeds rather lenticular. Leaves ovate- 
roundish, clasping the stem.

Cult. All the species are showy border annuals, and are therefore worth cultivating in every garden. The seeds only require to be sown in the open ground, where the plants are intended to remain. By sowing the seeds in the autumn, the plants will blossom early in summer, and by successive sowings in spring, at intervals of a fortnight or three weeks, a succession of blossoming plants may be kept up.

**Lin. syst. Pentándria, Monogynía.** Calyx 5-lobed at the apex, with a very long tube. Stamens 5, free; filaments very long, filiform, glabrous, much longer than the anthers. Style twice longer than the corolla, glabrous, pilose only at the apex about the stigmas; stigmas 2-3, small, obtuse. Capsule 2-3-celled, wholly inferior, spheroidal, dehiscent at the base by lateral pores. Seeds ovoid, small, bay-coloured, shining.—Herbs with erect, glabrous stems, alternate leaves, and corymbose erect small flowers.—Inhabitans of the north of Africa.

1 T. *coriælum* (Lin. hort. ups. 41. spec. 243.) leaves ovate, acute, cosseted serrated, on short petiolo; corolla violaceous, salver-shaped, with a very long narrow tube; stigma trifid. 24. H. Native of the region of the Mediterranean, among rocks; in Spain, Mogod, Sicily, Calabria, Italy, but not farther north than lat. 45°, as about Rome. Hill. veg. syst. 8. t. 16. Boissieu, fl. europ. t. 137. Ker. bot. reg. t. 72.—Barrel. Icon. 693.—Mor. oxon. sect. 5. t. 5. f. 12. Stem glabrous. Leaves glabrous or ciliated. Flowers very numerous on the tops of the stem and peduncles, forming a wide-spread corymb. Corollas violaceous.

**Narrow-leaved Throat-wort.** Pl. 1 foot.

Cult. The species are very showy when in blossom. They grow best in a light soil, against a south wall, or in front of a hot-house; and they may either be increased by seed or by cuttings, planted under a hand-glass in spring.

5 F
CAMPANULACEÆ.

Lin. syst. Pentandria, Monogynia. Calyx 5-cleft. Corolla campanulate or funnel-shaped, 5-lobed at the apex. Stamens 5, free; filaments erect, membranous, long, very much ciliated, convining so closely as to appear coherent. Nectary cylindrical, girding the base of the style. Style usually exerted, pilose while in the bud, the hairs disposed in 10 rows, but afterwards it becomes glabrous; stigmas 3. Capsule 3-celled, dehiscing laterally at the base by 3 valves. Seeds ovate, more or less flat. —Perennial, rarely biennial herbs, with usually edible roots (ex Fisch.). Stems erect. Leaves alternate, very rarely subverticillate; radical ones roundish, petioled; cauline ones usually sessile, becoming narrower and shorter to the top of the stem. Flowers racemose or panicled, terminal and axillary, pedicellate, drooping; clavate while in bud.—Natives of Siberia, China, and Japan, and one of the east of Europe.

* Leaves broader, ovate-lanceolate, more or less coarsely serrated.

1 A. Sinsénis (Alph. D. C. mon. p. 354.) leaves alternate, ovate-lanceolate, glabrous, acutely serrated; flowers disposed in spicate racemes; calyce lobes linear-lanceolate, entire, glabrous; corolla funnel-shaped; style a little exerted. ² H. Native of China. Stem branched, glabrous or velvety. Leaves glabrous, deep green above. Flowers disposed in a loose few-flowered raceme, which is furnished with branchlets at the base. Corolla blue, glabrous.

Var. β, pilosa (Alph. D. C. l. c.) tube of calyx hairy.

China Adenophora. Pl. 1 foot.

† A species hardly known.

XIX. SYMPHYANDRA (from συμφύος, symphyo, to combine, and ἄροι, aner, a male; in reference to the anthers being combined into a tube). At D. C. mon. p. 365.—Campânula species, Bieb. fl. taur. 1. p. 153. ex Roth.

LIN. syst. Monadophylla, Pentanöria. Calyx 5-cleft. Corolla 5-lobed at the apex, usually velvety, and cream-coloured. Stamens 5; filaments free, membranous, ciliated; anthers combined into a long tube, which is 5-lobed at top. Style cylindrical, pilose; stigma 3, filiform. Capsule 3-celled, dehiscing by 3 valves at the base. Seeds ovate, more or less flattened, shining.—Herbaceous perennial or woody plants. Leaves alternate, petiole, coriace; lower ones larger and on longer petioles. Flowers terminal and axillary, pedicellate, usually racemose, rather large.—Three of the species inhabit the region of Caucasus, and one the Island of Candia.

SECT. I. Sinuses of calyx not covered by the appendages.

1 S. CRETA'CA (Alph. D. C. mon. p. 366. t. 8.) quite glabrous; stems erect, herbaceous; leaves ovate, acute, irregularly serrated; flowers drooping, racemose; calyces lobes long-acuminate; corolla campanulate-funnel-shaped. 2. H. Native of Candia, on the Spaceotic Mountains near Araden. Campânula martiana, Sieb. herb. cret. but not of Lam. Leaves disposed in a loose raceme at the top of the stem. Peduncles thick, 1-3-flowered. Corollas 15 lines long, white? Creten Sympyandra. Pl. 1 1/2 foot.

SECT. II. Sinuses of calyx covered by the appendages.

Camp. Vandessii, G. Don, in Loud. hort. brit. p. 77. Roots rather creeping, throwing out many stems. Flowers drooping, showy, cream-coloured, disposed in a loose panicle, intermixed with the leaves; peduncles 1-3-flowered.

4 S. ? OSSET'ICA (Alph. D. C. mon. p. 368.) stem humble, simple; leaves petiolar, cordate, doubly serrated; calyces glabrous, with the segments long and denticulate, much shorter than the sinuses, which are reflexed; corolla somewhat 5-cleft, having the segments pilose inside. 2 H. Native of Iberia, in Ossetia, on Mount Kaishaur. Campanula Ossetica, Beib. fl. taar. suppl. p. 145. Habit of S. pendula, but is destitute of branches, and is wholly glabrous. Flowers solitary, axillary, erect, disposed in a crowded raceme from the middle of the stem to its top. Corollas blue.

Ossetian Symphyandra. Pl. $ to 1 foot.

Cult. These plants have much the habit of the large bell-flowered species of Campanula, as C. punctata and C. medium. They are of easy culture, and are increased by dividing at the root, or by seed; and being showy, are worth cultivating as border-flowers.

Lin. syst. Pentandría, Monogy'nia. Calyx 5-cleft. Corolla deeply 5-cleft, of a golden yellow colour. Stamens 5, cuspidate at the apex, free; filaments broadest at the base, glabrous. Stigma 5. Capsule 5-celled, 10-nerved, dehiscing by numerous transverse lateral fissures between the nerves; cells alternating with the calypic lobes and stamens. Seeds numerous, small, ovoid, shining.—A small glabrous shrub, native of Madeira and Teneriffe, altogether different in habit to any other campanuleaceous plant. Stem thick. Leaves alternate, large, serrated. Flowers numerous, pyramidal racemose, yellow.

Verr. \( \beta \), angustifolia (Alph. D. C. mon. p. 369.) leaves very narrow. \( \frac{1}{3} \) G. Native along the coast of Madeira, on rocks. Campánula áurea, Jacq. hort. schoenbr. 4. t. 472. Golden-flowered Musschia. Fl. July, Sept. Ct. 1777. Shrub 1 to 2 feet.

Cult. This remarkable shrub thrives very well in a mixture of loam and peat; but is only to be increased by seed, of which abundance is produced in the gardens.

† A genus not sufficiently known, and it is not quite certain whether it belongs to Campanulacea.

Lin. syst. Pentandría, Monogy'nia. Calyx 5-cleft, with an ovoid tube. Corolla 5-lobed, caducous, with a very narrow tube. Stamens 5, free; filaments very slender at the base, much longer than the anthers. Style filiform, usually exserted, glabrous; stigmas 2, very short. Ovarium inferior, 1-celled, probably always. Ovula usually 4, placed in the bottom of the ovarium. Capsule indehiscent.—Small Cape shrubs, with the habit of Roëlla. Stems erect, branched; leaves very leafy, downy, rather woody, reddish. Leaves sessile, alternate, crowded, linear-subulate, more or less ciliate, stiff, and very similar to those of Roëlla. Flowers sessile, solitary, spicate, always axillary. Inflorescence centripetal. Calyx with a very hispid tube, and lanceolate acute smooth segments. Corolla like that of Trachelium, long, tubular, and narrow. The character of the capsule still remains unknown; this is, however, without doubt inferior, and probably 1-celled, and contains 4 ovula in the bottom. The capsule is without any indication of dehiscence in the specimen examined by Alph. D. C.

1 M. TENIFÍÓLIA (Alph. D. C. mon. p. 370. t. 5.) leaves much ciliatus; corolla blue, longer than the leaves, 5-lobed at the very apex; lobes lanceolate, spreading, pilose on the back; style a little exserted. \( \frac{1}{3} \) G. Native of the Cape of Good Hope. Trachelium tenifolium, Thunb. prod. fl. cap. p. 38. Lin. suppl. p. 143. Roëlla compacta, R. pinifolia, and Trachelium tenifolium, Thunb. in herb. Banks. Habit of Roëlla ciliata. Stem erect, branched. Flowers very numerous, always lateral, solitary and sessile in the axis of the leaves.

Fine-leaved Merciera. Shrub 1 foot.

2 M. BREVI-FÓLIA (Alph. D. C. p. 371.) leaves ciliatus; corolla white, length of leaves, 5-lobed at the apex; lobes lanceolate, spreading, glabrous; style doubly longer than the corolla. \( \frac{1}{3} \) G. Native of the Cape of Good Hope. Roëlla lateriflora, Banks, herb. Very like the preceding. Flowers numerous, lateral, solitary, in the axis of the leaves.

Short-leaved Merciera. Shrub 1 foot.

3 M. LEPTÔLÓBA (Alph. D. C. mon. p. 371.) leaves ciliatus; corolla rather shorter than the leaves, white, 5-cleft; lobes linear, erectish, glabrous; style length of corolla. \( \frac{1}{3} \) G. Native of the Cape of Good Hope. Habit of the preceding species. Flowers sessile, solitary, among the leaves.

Slender-lobed-flowered Merciera. Shrub 1 foot.

Cult. A mixture of peat and sand is a good soil for the species of Merciera; and they may be increased either by cuttings under a hand-glass, or by seed.

† Plants referred to the genus Campánula, but it is doubtful to what genera they belong.

1 CAMPÁ'NULA STELLÁTA (Thunb. phyto. bl. p. 20. mem. acad. petersb. 4. p. 373. with a figure) leaves 3 in a whorl, linear, entire; flowers axillary, pedunculate; stem frutescent, terete, glabrous, branched, erectish, a hand high; branches alternate, simple, a little curved; leaves sessile, acute, imbricated, unguicular; flowers solitary, at the tops of the branches; peduncles
capillary, flexuous, an inch long. H. G. Native of the Cape of Good Hope. This is certainly not a species of Campánula, but it may be a species of Lightfoiüa, Roëlla, or Prismatocarpus.

**Stellate Bell-flower.** Shrub ½ to 1 foot.

2 **Campanula lancinata** (Roxb. fl. ind. 2. p. 96.) branched, glabrous; leaves alternate or nearly opposite, on short petioles, lanceolate, serrated, acuminate; flowers terminal; calyce segments lanceolate and jagged; capsule obovate, 5-celled. O. H. Native of Chittagong, in humid valleys. Plant delicate, ½ to 1½ foot high, simple or branched at the top, sending out 2 or 3 1-flowered peduncles. Flowers inclined, size and form of C. rotundifolia. Radical leaves not seen. Perhaps this plant is allied to Platycodon.

**Lanceolate-leaved Bell-flower.** Pl. 1 to 1½ foot.

3 **Campanula phrymente** (Zuccagni, cent. 1. obs. bot. in Rem. et Schultes, syst. 1. p. 84.) plant small; radical leaves numerous, lanceolate, obtuse, running down the petioles, undulated; cauline leaves few, remote, sessile, stem-clasping, mucronate; flowers sessile, crowded into a short spike or in a head; calyx with a tetragonal base, and erect, lanceolate, smooth segments; corolla campanulate, violaceous, larger than the calyx; style elevated, exserted; capsule tetragonal.—Native of Mount Olympus, in Bithynia. Perhaps a species of *Phyteuma*.

**Phyteuma-like Bell-flower.** Pl. small.

4 **Campanula glauca** (Thunb. fl. jap. p. 88.) leaves sessile, ovate, serrated, glaucous beneath; stem angular, panicked; peduncle 1-flowered.—Native of Japan, near Nagasaki; also cultivated. Kekko Kämpf. amoen. v. p. 822. Stem suffruticosus, angular, glabrous, paniculately branched at top. Leaves green above, with rather reflexed edges. Flowers axillary, and on the tops of the branches solitary. Peduncles bracteate. Corollas large, blue. The roots are esculent, like those of *Rampion*. It is, perhaps, a species of *Campanula*, but more probably of *Platy- codon* or *Adénophora*.

**Glaucus Bell-flower.** Pl. 2 feet.

5 **Campanula montevideensis** (Spreng. syst. 1. p. 788.) stem erect, downy, branched; leaves opposite, entire; lower ones spatulate; superior ones cordate, stem-clasping; flowers solitary, sessile; calyce segments ovate, cuspitate.—Native of Monte Video, where it was collected by Sello.

**Monte-Video Bell-flower.** Pl. erect.

6 **Campanula cornosa** (Wall. in Roxb. fl. ind. 2. p. 102.) plant smooth, fleshy, procumbent; leaves ovate, cuspidately serrated, petiolate; flowers axillary, on capillary peduncles, which are about equal in length to the leaves; filaments linear, not dilated at the base. 4. H. Native of Nipaul on Mount Sheopore, towards the middle, on rocks near rivulets. Stems creeping, obscurely 3-cornered. Flowers very small, of a pale blue. Calyce segments entire, erect. Corolla funnel-shaped, more than twice the length of the calyx, with a quinquefid sub-bilabiate limb; segments oblong, acute, equal; the two uppermost ones more parallel and erect; the rest spreading. Stamens distinct, a little shorter than the corolla; filaments flat, not valvate at the base, inserted together with the corolla on the disc of the ovariwm; anthers erect, linear. Ovarium oblong, obscurely triangular, 3-celled, many-seeded; its vertex not elongated, as is usual in the genus, but covered by a fleshy yellowish disc. Style filiform; stigma 3, linear. Capsule club-shaped, prismatic, bursting towards the base by 3 round valves. This is certainly not a species of *Campanula*, but from the characters given, it appears to be a new genus, connecting *Campanulaceae* with *Lobeliaceae*.

**Fleshy Bell-flower.** Pl. creeping.

**Order CXXXVIII. Epacridae.** (This order contains plants agreeing with *Epacris* in important characters.) R. Br. prod. p. 535.

Calyx 5-parted, (rarely 4-parted), usually coloured, permanent. Corolla hypogynous, monopetalous, with the tube sometimes divisible into 5 parts; limb 5-cleft, rarely 4-cleft, equal, and sometimes bursting transversely from the segments, cohering, valvate or imbricate in astivation, deciduous or marcescent. Stamens equal in number to the segments of the corolla, and alternating with them, rarely fewer; filaments epipetalous or hypogynous; anthers simple, with a single polliniferous receptacle, constituting a complete, rarely a marginate dissepiment, undivided, dehiscing longitudinally. Pollen subglobose, rather angular, or composed of 3 combined globules. Ovarium sessile, usually girded by 5 distinct or combined scales, many-celled, rarely 1-celled. Seeds solitary or indefinite. Style 1; stigma 1, sometimes toothed. Fruit drupaceous, baccate, or capsular. Seeds albuminous. Embryo straight, slender, longer than the half of the albumen.—Shrubs or small trees. Leaves alternate, very rarely opposite, entire, rarely serrated, usually petiolate, or with a simple base; having the bases broader, imbricated, cucullate, and sheathing a little. Flower spicate or racemose, terminal: or solitary and axillary. Calyces or pedicels furnished with 2 or more bracteas, which are of the same texture as the calyx. Flowers white or purple, rarely blue. This order is chiefly distinguished from *Ericaceae* in the anthers being awnless and 1-celled. The shrubs are all elegant, of a dry prickly habit, with tubular or campanulate flowers.

**Synopsis of the genera.**

**Tribe I.**

**Styphyleae.** Cells of ovary 1-seeded. Pericarps closed, rarely capsular.

1 **Styphylea.** Calyx with 4 or more bracteas. Corolla long, tubular; tube furnished on the inside near the base with 5 fascicles of villi: segments of the limb revolute, bearded. Filaments exerted.

2 **Astroloma.** Calyx imbricated by 4 or more bracteas. Corolla with a ventricose tube (f. 132. b.), furnished with 5 fascicles of villi near the base, inside; limb short, spreading, bearded (f. 132. c.). Filaments inclosed.

3 **Stenanthëa.** Calyx many-bracteate. Corolla tubular, ventricose, without any fascicles of hairs inside; limb short, spreading, bearded a little. Filaments inclosed.

4 **Melichirus.** Calyx many-bracteate. Corolla rotate or urnecolate, furnished with 5 fascicles of glands near the base inside; segments half bearded.

5 **Cathodes.** Calyx many-bracteate. Corolla funnel-shaped, without any fascicles of villi or glands inside; limb spreading, a little bearded. Filaments inclosed. Drupe bacate.

6 **Lissaëthe.** Calyx bibracteate or bractless. Corolla funnel-shaped: limb beardless. Drupe bacate.
Placentas

Placentas g. Leucopogon. truncate Clt. branchlets tube stems segments.

15 Epacris. Calyx coloured, many-bibracteate (f. 133. a.); bracteae texture of calyx. Corolla tubular (f. 133. c.), with a beardless limb. Stamens epipetalous (f. 133. b.). Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

16 Lysiméa. Calyx coloured, many-bibracteate; bracteae texture of the calyx. Corolla salver-shaped: with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

17 Priaosotes. Calyx bibracteate. Corolla tubular, with an open throat, and a beardless limb. Stamens hypogynous; filaments half adhering to the tube. Anthers with a complete dissepiment. Hypogynous scales 5.

19 Andersónia. Calyx coloured, imbricated by 2 or more foliaceous bracteae. Corolla length of calyx; segments of the limb bearded at the base. Stamens hypogynous. Anthers fixed beneath their middle. Hypogynous scales 5. Placentas adnate to the central column.

20 Poncelet'ia. Calyx foliaceous. Corolla short, campanulate, 5-cleft, beardless. Stamens hypogynous; anthers peltate beneath the middle, with a marginate dissepiment. Hypogynous scales wanting. Placentas adnate to the central column.

24 Dracophyllum. Calyx bibracteate, with a rather ventricose tube, and a 5-parted spreading acutish beardless limb. Stamens hypogynous. Hypogynous scales 5. Placentas hanging from the top of the central column.

25 Spénótea. Calyx bibracteate. Corolla salver-shaped, with a slender tube, a coarctate throat, and a blunt beardless limb. Stamens epipetalous. Hypogynous scales 5. Placentas hanging from the top of the central column.

Tribe I.

STYPHELIEÆ. Cells of ovary 1-seeded. Pericarp closed, rarely capsular.

1 S. Longífolia. Calyx bibracteate, with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

2 S. Latifolía. Calyx bibracteate, with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

3 S. Ascédens. Calyx bibracteate, with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

4 S. Viridisflóra. Calyx bibracteate, with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

5 S. Viridisflóra. Calyx bibracteate, with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.
oblong, obtuse, mucronulate, flat, smooth above, with the margins rather scabrous, and are, as well as the flowers, divaricate. 

Fl. May, Aug. Ch. 1796. Shrub 3 to 4 feet.

5 S. triplóória (Andr. bot. rep. 72.) leaves elliptic or oblong-lanceolate, flat, mucronate, rather scabrous above, with revolute edges; flowers drooping. ꞏ G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Sims, bot. mag. 1297. Flowers pink, with a cream-coloured limb.

6 S. tubifóória (Smith, new hol. 45. t. 14.) leaves linear, obvate, mucronate, rather scabrous above, with revolute edges; flowers drooping. ꞏ G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Lodde, bot. cab. 1298. Flowers scarlet.

7 S. glaucéscens (Sieb. pl. nov. hol. ex Spreng. syst. add. p. 67.) leaves lanceolate, mucronate, quite entire, smooth, finely striated, glaucous; peduncles short, I-flowered. ꞏ G. Native of New South Wales.

Glaucous Stenanthera. Shrub.

Cult. This is a very handsome genus of shrubs. A mixture of one-third sandy loam, and two-thirds sandy peat, answers the species best; and young cuttings, planted in sand under a bell-glass, will strike root.

II. ASTROLOMA (ἀστρον, astron, a star, and λαμία, loma, a fringe; in reference to the beard of the corolla. R. Br. prod. 538.). Ventenátia species, Cav. Stéphylía, Spreng. syst. 1. pp. 657, 658.

Lin. syst. Pentándria, Monogy'nia. Calyx imbricated by 4 or more bracteas (f. 132. a). Corolla with a ventricose tube (f. 132. b.), which is doubly longer than the calyx, and furnished with 5 fascicles of hairs near the base inside; limb short, spreading, bearded (f. 132. c.). Filaments linear, inclosed. Ovarium 5-celled. Drupe nearly dry; containing a solid bony putamen.—Humle, usually diffuse shrubs. Leaves scattered, usually ciliated. Flowers axillary, erect. Hypogynous disk cup-shaped, almost entire.

4 A. pa'lídum (R. Br. l. c.) shrub diffuse; branches ascending; leaves lanceolate, sessile, ciliated, imbricated, rather concave above. ꞏ G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Sims, bot. mag. 1297. Flowers pink, with a cream-coloured limb.

Pale Astroloma. Shrub diffuse.

5 A. compa'ctum (R. Br. l. c.) shrub diffuse; branches ascending, very short; leaves obvate-lanceolate, ciliated, tapering into the petioles, rather concave above. ꞏ G. Native of New South Wales, on the north coast. Flowers pale red. ꞏ G. Native of New South Wales, on the north coast.

Compact Astroloma. Shrub diffuse.

6 A. te'te'mum (R. Br. l. c.) erect, a little branched; leaves obvate-lanceolate, flat, imbricated, with scabrous edges; denticulations very short, obtuse. ꞏ G. Native of New Holland, on the south coast.

Cult. This genus contains dwarf glaucous shrubs, bearing large scarlet or red flowers. They are, therefore, desirable plants for all collections. They thrive best in an equal mixture of sand, loam, and peat; and cuttings from young wood root readily, if planted in a pot of sand under a bell-glass.

III. STENANTHERA (στενός, stenos, narrow; and ἀνθέρα, anthera, an anther; the filaments are broader than the anthers, which makes them appear narrow). R. Br. prod. p. 538.

Cult. This is a beautiful shrub when in blossom. A soil composed of one-third very sandy loam, and two-thirds sandy peat, suits it best. The pot in which it is grown should be well drained with shers, or the mould is apt to get soddened from too much wet. It should not be too much exposed to the sun in summer. Cuttings from the young shoots root readily in sand, under a bell-glass.

IV. MELICHIRUS (from μέλις, melichros, honey-coloured; in reference to the colour of the glands of the flowers). R. Br. prod. p. 539.

Lin. syst. Pentándria, Monogy'nia. Calyx with many bracteas. Corolla rotate or urceolate, furnished near the base with 5 fascicles or glands; segments bearded. Ovarium 5-celled. Drupe nearly dry, containing a solid bony putamen.—Procumbent or erect shrubs. Leaves lanceolate. Flowers erect. Hypogynous disk cup-shaped, nearly entire.

1 M. rota'tus (R. Br. prod. p. 539.) corollas rotate; calyx villous; leaves lanceolate-linear, pilose on both sides and on the margins. ꞏ G. Native of New South Wales, and of tropical New Holland. Ventenátia procumbens. Cav. icon. 4. p. 28. t. 349. f. 1. Flowers scarlet.
2 M. ureolatus (R. Br. l. c.) corollas ureolatae: calyces glabrous; leaves lanceolate, attenuated at the apex, with shortly dentilicate edges. ½. G. Native of New South Wales. Flowers scarlet.
Ureolata-flowered Melichrus. Shrub erect.
3 M. meadii (Cunningh. in Fields, New South Wales, p. 314.) erect; corolla ureolata; calyces ploose; leaves lanceolate, attenuated, very acute, mucronate, concave, many-nerved, with membranous dentilicate edges. ½. G. Native of New South Wales, on the plains of Bathurst. Intermediate between the two preceding species.

V. CYATHODES (from κυάθoς, kyathos, a cup; and δόχος, odous, a tooth; in reference to the disk, which is cup-shaped and 5-toothed). R. Br. prod. p. 539.—Cyathodes species, Labill.—Styphelia species, Labill. Solander, and Spreng.
LIN. SYST. Pentándia Monogyña. Calyx with many bracts. Corolla funnel-shaped; tube hardly exceeding the calyx, without any fascicles of villi or glands; limb spreading, with or without any beard. Filaments inclosed. Ovarium 5-10-celled. Drupes baccate.—Erect branched shrubs, with the habit of small trees. Leaves striated on the under sides. Flowers axillary, erect, or drooping a little, small. Hypogynous disk cup-shaped, 5-toothed.

§ 1. Segments of the corolla bearded; axis usually inside.
1 C. glauca (Labill. nov. holl. 1. p. 57, t. 81.) drupe 8-10-celled; leaves crowded at intervals, somewhat verticillate, spreading or divaricate, linear-lanceolate. ½. G. Native of Van Diemen's Land. R. Br. prod. p. 539. Trochocarpá glauca, Spreng. syst. 1. p. 660.
2 C. stellánea (R. Br. prod. p. 539.) drupe 5-celled; leaves crowded at intervals, somewhat verticillate, oval, obtuse, awnless, spreading, many-nerved beneath; stem erect. ½. G. Native of Van Diemen's Land.
Starrv Cyathodes. Shrub.
3 C. dealbáta (R. Br. prod. p. 539.) drupe 2-5-celled; leaves linear, erectly spreading, margined with very short cilia, 5-nerved beneath: nerves all simple. ½. G. Native of Van Diemen's Land.
Whitened Cyathodes. Shrub procumbent.
4 C. Tanetálae (Cham. et Schlecht. in Linnaea, 1. p. 539.) drupe 5-8-celled; leaves narrow, cuneate-ovooblate, petiolate, mucronate, many-nerved beneath. ½. G. Native of the Sandwich Islands. Habit of Leucopogón obovátus, Labill. Cy. Banksii, Gaud. in Freyc. voy. pt. bot. p. 365. is perhaps the same as this. Dr. R. Brown speaks of 2 other species from the Sandwich Islands, having the segments of the corolla naked, while this is bearded.
Tane miałae Cyathodes. Shrub or small tree.

5 C. farívóllá (R. Br. prod. p. 540.) leaves linear-lanceolate, not half an inch long, spreading, margined with very short cilia, 5-nerved beneath: nerves all simple. ½. G. Native of Van Diemen's land.
Small-leaved Cyathodes. Shrub or small tree.

6 C. oxyče'drus (R. Br. l. c.) leaves linear, more than half an inch long, spreading, with naked margins, 3-5-nerved beneath: nerves all simple. ½. G. Native of Van Diemen's land. Styphélia Oxycedrus, Labill. nov. holl. 1. p. 49. t. 69. Flowers white?
7 C. abietína (R. Br. l. c.) leaves linear-lanceolate, flat, much crowded, imbricated. ½. G. Native of Van Diemen's land. Styphélía abietina, Labill. nov. holl. 1. p. 48. t. 68.
Fir-like Cyathodes. Shrub or small tree.

VI. LISSA'NTHE (from λισσός, lissos, smooth, and ἀνθός, anthos, a flower). R. Br. prod. p. 540.

§ 1. Calyx bracteless. Racemes axillary, few-flowered; pedicels bibracteate at the base. Tube of corolla villous inside.
1 L. să'pida (R. Br. prod. p. 540.) racemes 2-3-flowered, recurved; leaves oblong-linear, mucronate, with revolute margins, whitened and striated beneath. ½. G. Native of New South Wales. Lindl. bot. reg. 1275. Hook. bot. mag. t. 3147. Flowers white, tipped with green. The berries are red and acid, and are made into tarts in New South Wales, under the name of cranberries.
2 L. subula'ta (R. Br. l. c.) racemes 4-5-flowered, erect; leaves linear-subulate, half an inch long; branchlets glabrous; drupe 10-striped. ½. G. Native of New South Wales.

§ 2. Calyx bibracteate. Corolla urceolate, having the tube and throat naked. Spikes axillary, few-flowered.
4 L. montá'na (R. Br. l. c.) leaves oblong-linear, obtuse, mucic, glaucous beneath. ½. G. Native of Van Diemen's Land.
Mountian Lissanthe. Shrub.

§ 3. Calyx bibracteate. Corolla funnel-shaped, having the throat closed by deflexed villi. Flowers axillary, solitary.

1 L. lanceolatus (R. Br. prod. p. 541.) spikes nodding, aggregate; ovaries 2-celled; drupes oval; leaves lanceolate, flat, 3-nerved; branchlets glabrous. ș. G. Native of New South Wales, on mountains. Sweet, fl. austral. t. 47. Styphélia lanceolata, Smith, new holl. p. 49. exclusive of the synonyms. Styphélia parviflora, Andr. bot. rep. 287. Flowers white.

2 L. malayanus (Jack, mal. misc. vol. 1. Wall. in Roxb. fl. ind. 2. p. 301.) spikes axillary, many-flowered, erect, short; drupes globular, 5-celled; leaves lanceolate, mucronate, nearly veinless, glaucous beneath. ș. S. Native of the plains of Singapore, abundant; where it is called by the Malays Mentada. A small, branching, dry shrub, exhibiting the peculiar habit of the family. Corollas funnel-shaped, downy, having the segments bearded above beyond the base. The discovery of this species is remarkable as forming an exception to the general geographical distribution of the order Epacrideae, a family almost exclusively confined to Australia, or at least to the southern hemisphere. Singapore, situated at the extremity of the Malay peninsula, and forming as it were the connecting link between continental or Western India and the plains of the great Eastern Archipelago, partsake of this character in its Flora, which exhibits many remarkable points of coincidence with the Flora of both regions. A resemblance has been observed between its productions and those of the northern frontier of Bengal, on the one hand, and of the Moluccas on the other, while the present plant connects it with the still more distant range of New Holland.

Malayan Leucopegon. Shrubs 3 feet.

3 L. australis (R. Br. l. c.) spikes erect; drupes depressed, globose, 5-celled; leaves linear-lanceolate, more than an inch long, 3-5-nerved, with recurved smooth margins. ș. G. Native of the south coast of New Holland and Van Diemen's Land. Flowers white.

Southern Leucopegon. Shrubs.

4 L. richeri (R. Br. l. c.) spikes erect, many-flowered, a little shorter than the leaves; drupes ovate, 5-celled; leaves glabrous, oblong-lanceolate, hardly an inch long, broadest beyond the middle, 3-5-nerved, convex above, with subrecurved margins. ș. G. Native of New South Wales, the south coast of New Holland, and Van Diemen's Land. L. polystachys, Lodd. fl. cab. t. 1436. L. apiiculatus, Smith in Rees, cycly. L. parviflorus, Lindl. bot. reg. 1560. Styphélia Richeri, Labill. nov. holl. 1. p. 44. t. 60. Styphélia parviflora, Andr. bot. rep. 287. Styphélia Gnidium Vent. malm. t. 23. Flowers white.

5 L. affinis (R. Br. l. c.) spikes erect; drupes oval, 2-3-celled; leaves long-lanceolate, more than an inch long, flat. ș. G. Native of Van Diemen's Land. Flowers white.

Allied Leucopegon. Shrubs.

Boat-leaved Leucopegon. Shrubs 1 to 2 feet.

8 L. verticillatus (R. Br. l. c.) spikes nearly terminal, aggregate, nodding while bearing the fruit; drupes 5-celled; putamen pentagonal; leaves oblong-lanceolate, attenuated at the apex, disposed in interrupted whorles, 2 to 4 inches long. ș. G. Native of the south coast of New Holland. Flowers white.

Whorled-leaved Leucopegon. Shrubs.

§ 2. Spikes axillary, but sometimes terminal. Flowers three or more together. Calyx and bracteae coloured. Drupe nearly dry. Leaves never cordate.

9 L. apiiculatus (R. Br. prod. p. 542.) spikes terminal, rather aggregate, 5-7-flowered; bracteae lanceolate; leaves lanceolate-oblong, erect, rather concave, with smooth margins, ending each in a callous point; drupe ciliate, crowded, depressedly turbinate, shorter than the calyx. ș. G. Native of the south coast of New Holland. Flowers white.

Var. a, branchlets and leaves glabrous.

Var. b, branchlets and leaves pubescent. Perhaps a distinct species.

Apiculate-leaved Leucopegon. Shrubs.

10 L. polystachys (R. Br. l. c.) spikes axillary or terminal, aggregate, 7-10-flowered; leaves linear-lanceolate, mutic, convexly concave; branchlets glabrous, twiggy; drupes dry, oval, depressed at the apex. ș. G. Native of the south coast of New Holland. Flowers white.

11 L. multiflorus (R. Br. l. c.) spikes axillary, shorter than the leaves; leaves lanceolate, a little acuminate, mucronate, imbricated, rather convex beneath, with smooth edges; calyx and bracteae with woolly margins. ș. G. Native of the south coast of New Holland. Flowers white.

Many-flowered Leucopegon. Shrubs.

12 L. rubricaulis (R. Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyxes and bracteae smoothish; leaves linear-oblong, obuse, mutic, smooth, rather convex above, with somewhat recurved denticulated edges; branchlets glabrous; drupes oblong. ș. G. Native of the south coast of New Holland. Flowers white.

Red-stemmed Leucopegon. Shrubs.
13. *L. villòsus* (R. Br. l. c.) spikes nearly terminal, aggregate; leaves linear-oblung, bluish, mucric, erectly spreading, villous on both surfaces as well as on the branches, with denticulated subrecurred margins. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Very nearly allied to *L. rubricalea*.

Villosus Leucopogon. Shrub.

14. *L. obovátus* (R. Br. l. c.) spikes terminal, nearly simple; leaves obovate-oblung, obtuse, mucronulate, with subrecurred margins; drupes nearly globose, 5-celled. \( \gamma \). G. Native of New Holland, on the south coast. Stylòphila obovata, Labill. nov. holl. 1. p. 48. t. 67. Flowers white.

15. *L. revolutus* (R. Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyces and bracteas clothed with fine down; leaves moderately spreading, linear-oblung, obtuse, mucric, tips of a callous obtuse point, convex and scabrous above, lined and glabrous beneath, with recurved naked margins; branchlets clothed with minute down; drupes dry, 5-celled, obovate. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Reculved-leaved Leucopogon. Shrub.

16. *L. margaródes* (R. Br. l. c.) spikes axillary, usually 3-flowered; leaves moderately spreading, linear-oblung, obtuse, mucric, with recurved smooth margins; drupes 2-celled, dry and compressed above. \( \gamma \). G. Native of New Holland, within the tropic. Flowers white. Pearl-toothed Leucopogon. Shrub.

17. *L. muticus* (R. Br. prod. p. 543.) spikes axillary, erect, 3-6-flowered; leaves linear-oblung, obtuse, rather mucric, erectly spreading, with smooth rather recurved margins; drupes 5-celled, angular, glabrous. \( \gamma \). G. Native of New South Wales, in rocky situations. Flowers white. Very nearly allied to the following. AWNLESS-leaved Leucopogon. Shrub.

18. *L. trichocárpus* (R. Br. l. c.) spikes axillary, nodding a little, 3-flowered; leaves linear-oblung, obtuse, mucronulate; drupes 5-celled, angular, pilose. \( \gamma \). G. Native of Van Diemen's Land. Stylòphila trichocárpa, Labill. nov. holl. 1. p. 47. t. 66. Flowers white. Hair-fruited Leucopogon. Shrub 3 feet.

20. *L. froníquus* (R. Br. l. c.) spikes axillary, usually 3-flowered, pedunculate; leaves lanceolata-linear, setaceous mucronate, smooth above, with revolute margins, which are denticulated from without; bracteas cuspitate. \( \gamma \). G. Native of the south coast of New Holland Allied Leucopogon. Shrub.

21. *L. attenuátes* (Cunningh. in Field's New South Wales, p. 341.) peduncles very short, erect, usually 1-flowered; leaves ovate-lanceolate, moderately spreading, rather convex, striated, setaceous mucronate, when young imbricate and ciliately denticulated. \( \gamma \). G. Native of New South Wales, on hills at Cox's River. Attenuated-leaved Leucopogon. Shrub.

22. *L. vibóatás* (R. Br. l. c.) spikes terminal and axillary, almost aggregate, few-flowered; calyces and bracteas rather membranous; leaves linear-lanceolate, attenuated at the apex, very acute, convexly concave, imbricate and spreading, with ciliated margins; branchlets glabrous. \( \gamma \). G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. Stylòphila virgata, Labill. nov. holl. 1. p. 46. t. 64. Flowers white. Twiggy Leucopogon. Fl. May, July. Ct. 1824. Shrub 2 feet.

23. *L. collinus* (R. Br. l. c.) spikes terminating the short lateral branches; lower bracteas sheathed a little, foliaceous, equalling the calyx in length; leaves oblong-linear, acute, mucric, erect, smooth and rather convex above, with recurved denticulated edges. \( \gamma \). G. Native of Van Diemen's Land. Stylòphila collina, Labill. nov. holl. 1. p. 47. t. 65. Flowers white. Hill Leucopogon. Fl. May, June. Ct. 1824. Shrub 1 foot.

§ 3. SPIKES AXILLARY AND TERMINAL. Leaves cordate. Calyces and bracteas membranous and foliaceous.

25. *L. amplexícaulis* (R. Br. l. c.) spikes axillary and terminal, spreading, pedunculate, exceeding the leaves; leaves cordate, stem-clasping, mucric, clothed with minute down beneath; with recurved margins, which are as well as the branches villous; drupes lenticular, 2-celled. \( \gamma \). G. Native of New South Wales. Stylòphila amplexícaulis, Rudge, in Lin. trans. 8. p. 292. t. 8. good. Flowers white. Stem-clasping-leaved Leucopogon. Ct. 1815. Shrub.

26. *L. alternífolius* (R. Br. l. c.) spikes axillary and terminal, few-flowered; leaves alternate, reniform, stem-clasping, acute, mucric, a line and a half long, and are as well as the branchlets glabrous; drupes crustaceous, lenticular, 2-celled. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Alternate-leaved Leucopogon. Shrub.

27. *L. distans* (R. Br. prod. p. 544.) spikes terminal, aggregate, flexuous; flowers distant; leaves ovate, subcordate, divaricate, mucric, one line long, convex above and downy beneath; drupes crustaceous, 5-celled, obovate, depressed. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Distant-flowered Leucopogon. Shrub.

28. *L. reflexus* (R. Br. prod. p. 544.) spikes terminal, crowded, few-flowered; flowers imbricate; leaves ovate, almost cordate, divaricate, mucric, a line long, convex above, and concave beneath, pilose, lined; drupes crustaceous, 5-celled. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Reflexed-leaveded Leucopogon. Shrub.

29. *L. glabéllus* (R. Br. prod. p. 544.) spikes terminal, almost solitary; bracteas foliaceous, and are as well as the calyces glabrous; leaves alternate, broadly cordate, acute, mucric, divaricate, flatish, and are, as well as the branchlets, glabrous. \( \gamma \). G. Native of the south coast of New Holland. Flowers white. Smooth Leucopogon. Shrub.

§ 4. SPIKES TERMINAL. Calyx and bracteas somewhat foliaceous. Drupes dry. Leaves not cordate.—Orojóa, Cav.

30. *L. micróphyllus* (R. Br. l. c.) spikes crowded, few-flowered; leaflets of calyx acuminate, semi-foliaceous; bracteas foliaceous, nestled; leaves ovate, obtuse, mucric, flat, of the same colour on both surfaces; drupes crustaceous, 1-2-celled.
779

EPACRIDEÆ. VII. LEUCOPOGON.

§ 1. Pedunciles axillary, 2-flowered, or 1-flowered wherever from abortion: when this is the case, the calyx is many-bracteate. Drupe dry.

39. L. pendulus (R. Br. prod. p. 545.) pedunciles usually 2-flowered, recurved; tube of corolla exceeding the calyx; leaves oblong-linear, erectly spreading, ending in an innocuous point, with recurved smooth margins; drupes elavate, ventricose, smooth, glabrous. § 5. G. Native of the south coast of New Holland. Flowers white.

Pendulous-flowered Leucopogon. Shrub.

40. L. biflorus (R. Br. l. c.) peduncles 2-flowered, recurved; tube of corolla equal in length to the calyx; leaves spreading, linear-lanceolate, flat, 3 lines long, each ending in a pungent point, with smooth margins. § 5. G. Native of New South Wales. Flowers white.

31. L. tamariscinus (R. Br. l. c.) spikes aggregate or solitary, many-flowered; calyxes and bracteas foliaceous, glabrous; leaves imbricated, adpressed, ovate, mutic, concave-convex, lined beneath, and are as well as the branchlets glabrous. § 5. G. Native of the south coast of New Holland. Flowers white.

Tamarisk-like Leucopogon. Shrub.

32. L. graciosus (R. Br. l. c.) spikes crowded, 4-6-flowered; calyxes and bracteas subfoliaceous, glabrous; leaves lanceolate-linear, erect, concave-convex, mutic, nerved and 3-lined beneath; branchlets glabrous, filiform. § 5. G. Native of the south coast of New Holland. Flowers white.

33. L. denudatus (Sieb. pl. nov. holl. ex Spreng. syst. add. p. 67.) leaves linear acute, erect, glabrous, quite entire; flowers terminal, aggregate. § 5. G. Native of New Holland. Styphelia denudata, Spreng. l. c.

Naked Leucopogon. Shrub.

34. L. striatus (R. Br. l. c.) spikes aggregate; bracteas and calyxes subfoliaceous, with naked margins; leaves elliptic, mutic, erect, rather convex beneath and nerved, and somewhat concave above; branchlets glabrous; drupes crustaceous, 2-celled. § 5. G. Native of the south coast of New Holland. Flowers white.

35. L. nervosus (R. Br. l. c.) spikes crowded, few-flowered; bracteas and calyxes foliaceous and quite glabrous; leaves elliptic, imbricated, on short petioles, mutic, flat above, and rather convex beneath, with elevated nerves; branchlets downy. § 5. G. Native of the south coast of New Holland. Flowers white. Nearly allied to the preceding.

Nerved-leaved Leucopogon. Shrub.

36. L. carinatus (R. Br. prod. p. 545.) spikes solitary or aggregate; bracteas and calyxes foliaceous, quite glabrous; leaves lanceolate, mutic, imbricated, flat above, and keeled beneath, with the lateral nerves obsolete, and the margins denticulated; branchlets downy. § 5. G. Native of the south coast of New Holland. Flowers white.

37. L. assimilis (R. Br. prod. p. 545.) spikes aggregate; leaves lanceolate-linear, imbricated, adpressed, mutic, convex and striated beneath, of the same colour on both surfaces, with denticulated margins; ovary 5-celled. § 5. G. Native of New Holland, on the south coast. Flowers white.

Similar Leucopogon. Shrub.

38. L. cucullatus (R. Br. l. c.) spikes aggregate, 4-6-flowered; bracteas foliaceous; leaves ovate, obtuse, mutic, cucullate, imbricated, sessile, lined, with naked margins; drupes 5-celled. § 5. G. Native of the south coast of New Holland. Flowers white.

Cucullate-leaved Leucopogon. Shrub.

41. L. setigerus (R. Br. l. c.) peduncles 2-flowered, recurved, longer than the calyx; leaves spreading, lanceolate-linear, acuminated, half an inch long, ending in a seateous pungent mucrone, with recurved obsolely denticulated margins. § 5. G. Native of New South Wales. Flowers white.

42. L. acuminateus (R. Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectish, linear-lanceolate, very acute, flat, ending in a seateous mucrone, with scabrous denticulated margins. § 5. G. Native of New Holland, within the tropic. Flowers white.

Acuminated-leaved Leucopogon. Shrub.

43. L. cuspidatus (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves moderately spreading, ovobato-oblong, acute, cuspidate, flat, with scabrous denticulated edges. § 5. G. Native of New Holland, within the tropic.

Cuspidate-leaved Leucopogon. Shrub.

44. L. imbricatus (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves imbricate, oval, obtuse, cuspidate, rather concave, with smooth toothless edges. § 5. G. Native of New Holland, within the tropic. Flowers white.

Imbricated-leaved Leucopogon. Shrub.

45. L. ruscirolius (R. Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectly spreading, ovobato-elliptic, acutish, rather concave, mucronate, with smooth obsolescent denticulated edges. § 5. G. Native of New Holland, within the tropic. Flowers white.

46. L. lepto sperma (R. Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves narrow-lanceolate, moderately spreading, flat, ending each in a very short callous mucrone, with smooth margins; stem arborescent. § 5. G. Native of New Holland, within the tropic. Flowers white.

Few-flowered Leucopogon. Shrub.

47. L. leptospermoides (R. Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves linear-lanceolate, moderately spreading, flat, very acute, with minutely denticulated scabrous edges, ending each in a stiff mucrone. § 5. G. Native of New Holland, within the tropic. Flowers white.

Leptospermum-like Leucopogon. Shrub.

48. L. rotundifolius (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves roundish or ovobavel, petiolate, spreading moderately, flat, mucronate, with pellucid finely ciliate stigmas. § 5. G. Native of the south coast of New Holland. Flowers white.

Round-leaved Leucopogon. Shrub.

49. L. adiposus (R. Br. l. c.) peduncles very short, erect, 1-3-flowered; leaves imbricated, adpressed, lanceolate, sub-acuminated, mucronate, concave, with denticulated margins. § 5. G. Native of New South Wales. Flowers white.

50. L. fastigiatus (Sieb. l. c.) leaves lanceolate, cuspidate, serrulatus at the apex, striated; calyx glabrous; flowers axillary, almost solitary. § 5. G. Native of New Holland. Styphelia fastigiata, Spreng. l. c.

Fastigiate Leucopogon. Shrub.

§ 5. 2
51 L. juniperinus (R. Br. l. c.) flowers almost sessile, solitary or twin; leaves divaricate, lanceolate-linear, ending in a setaceous mucrone, with recurved slightly denticulated margins; bracteas 3-5, and are as well as the calyxes mucronate. ʃ. G. Native of New South Wales. Lodd. bot. cab. 447. Flowers white.

52 L. deformis (R. Br. l. c.) flowers almost sessile, solitary, many-bracteate; leaves erectly spreading, lanceolate-linear, rather concave, mucronate, with oblately denticulated edges; ovarium 3-celled. ʃ. G. Native of New South Wales. Flowers white.

Deformed Leucopogon. Shrub.

53 L. esquamat us (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves scattered, erectly spreading, lanceolate, subacuminate, mucronate, flat, turned, with scabrous margins; ovarium 2-celled; hypogynous disk wanting. ʃ. G. Native of New South Wales. Flowers white.

Scaleless-flowered Leucopogon. Shrub.

54 L. flexifolius (R. Br. l. c.) flowers almost sessile, solitary; leaves much crowded, imbricated, linear, mucronate, twisted, with scabrous denticulated edges; ovarium 5-celled. ʃ. G. Native of New Holland, within the tropic.

Bent-leaved Leucopogon. Shrub.

55 L. forsteri; arboreous; leaves scattered, linear, cuspidate, serrululate; flowers sessile, solitary, terminal. ʃ. G. Native of New Zealand. Epacris juniperina, Forst. char. gen. 10. no. 2. ins. austral. p. 13.

Forster’s Leucopogon.

Cult. The species of this genus are very pretty when in blossom; they grow best in an equal mixture of sandy loam and peat; and the tops of the very young shoots taken off and planted in sand, with a bell-glass over them, strike root readily.

VIII. MONOTOC A (from μόνος, monos, alone, and τοκός, tokos, a birth; in reference to the fruit being one-seeded). R. Br. prod. p. 546.

1 M. elliptica (R. Br. prod. p. 546.) spikes erect, nearly terminal and aggregate, or axillary and solitary; leaves elliptic-oblong, 4 times longer than broad. ʃ. G. Native of New South Wales. Styphealia elliptica, Smith, new holl. 49.

2 M. aleens (R. Br. prod. p. 547.) spikes erect, solitary, terminal and axillary; leaves oblong-linear, acute, mucronate, white beneath, 5 times longer than broad. ʃ. G. Native of New South Wales.

3 M. lineata (R. Br. l. c.) spikes axillary, few-flowered, nodding, pedunculate; leaves oblong, and often obovate, acute, flat-tish, mucronate. ʃ. G. Native of Van Diemen’s Land. Styphealia glauca, Labill. nov. holl. 1. p. 45. t. 61, where the plant is represented as having erect spikes, and a 5-celled ovarium.

VIII. MONOTOC A. IX. ACROTIRICHE.

§ 2. Bracteas extending, permanent. Shrubs with hermaproditic flowers.

4 M. scoparia (R. Br. l. c.) spikes axillary, nearly sessile, nodding; leaves oblong-linear, with revolute edges; stem erect. ʃ. G. Native of New South Wales. Styphealia scoparia, Smith, new holl. p. 48.

5 M. empetrifolia (R. Br. l. c.) spikes axillary, nodding, 2-3-flowered; leaves oblong-oval, mucronate, divaricate, convex above, white and striated beneath; stem prostrate. ʃ. G. Native of Van Diemen’s Land.

Empetrum-leaved Monotoca. Shrub.

Cult. For culture and propagation see Leucopogon, above. The pots in which the species are grown require to be well drained with shers.

IX. ACROTIRICHE (from ἀκρός, akros, the uttermost, and τίχος, tychos, a hair; the tips of the corolla segments are bearded). R. Br. prod. p. 547. Styphealia species. Spreng.

1 A. divaricata (R. Br. prod. p. 547.) leaves lanceolate, mucronate, divaricate, flat, green on both surfaces; spikes axillary. ʃ. G. Native of New South Wales.

Divaricate-leaved Acrotiriche. Fl. May, Clt. 1824. Shrub ½ to 1 foot.

2 A. aggregata (R. Br. l. c.) leaves oblong-lanceolate, rather concave, glaucous beneath, with smooth margins. ʃ. G. Native of New Holland, within the tropic.

Aggregate Acrotiriche. Shrub 1 foot.

3 A. ramiflora (R. Br. l. c.) leaves linear-lanceolate, mucronate, divaricate, of a different colour beneath, nerved, with recurved margins; spikes on the branches. ʃ. G. Native of New Holland, on the south coast.

Branch-flowered Acrotiriche. Shrub 1 foot.

4 A. serrulata (R. Br. l. c.) leaves linear-lanceolate, cuspidate, spreading, pilose or smoothish, with serrulately ciliated edges; spikes axillary. ʃ. G. Native of the south coast of New Holland, and Van Diemen’s Land.

Serrulata-leaved Acrotiriche. Shrub 1 foot.

5 A. patula (R. Br. l. c.) leaves ovate-lanceolate, acuminate, mucronate, flatish, and are as well as the branches divaricate: spikes axillary. ʃ. G. Native of New Holland, on the south coast.

Spread Acrotiriche. Shrub.

7 A. cordata (R. Br. l. c.) leaves coriaceous, flat, striated below; flowers axillary, twin or solitary. ʃ. G. Native of New Holland, on the south coast. Styphealia cordata, Labill. nov. holl. 1. p. 46. t. 63. Perhaps belonging to a different genus.
8 A. defressa (R. Br. l. c.) leaves ovate, rather cordate, mucronate, divergate, convex above, and veiny beneath; stem depressed; spikes on the branches. ą G. Native of New Holland, on the south coast.
Depressed Acrotriche. Shrub depressed.
 Cult. For culture and propagation see Leucopogon, p. 780.

X. TROCHOCARPA (from τροχός, trochos, a wheel, and κάρπος, karpos, a fruit; in reference to the putamen of the fruit, which is wheel-shaped and 10-lobed). R. Br. prod. p. 548.
Lin. syst. Pentandria, Monogynia. Calyx bibracteate. Corolla funnel-shaped; limb spreading, bearded. Ovarium 10-celled. Drupe baccate, containing a wheel-shaped, 10-lobed putamen, which is at length divisible into as many parts.—A small glabrous tree, with very hard wood. Leaves scattered, petiolate, nerved, very like those of a species of Laurus. Spikes slender, terminal and axillary, solitary or aggregate. Flowers small, white. Hypogynous disk cup-shaped, 5-lobed. Drupe depressedly globose, smaller than a pea. The genus approaches Decaspora in character and habit.
 Cult. See Leucopogon, p. 780. For culture and propagation.

XI. DECASPORA (from εἶκα, deca, ten, and σπόρα, spora, a seed; the fruit contains 10 pyrenæ or seeds). R. Br. prod. p. 548.
1 D. distichæ (R. Br. prod. p. 548.) leaves lanceolate, very acute, flat, nervèd beneath, 8 times longer than the petals; branchlets glabrous. ą G. Native of Van Diemen's Land. Cyathodes distichæ, Labill. nov. hell. 1. p. 58. t. 82.
Distich-leaved Decaspora. Shrub 4 to 6 feet.
2 D. thyrsifolia (R. Br. prod. p. 548.) leaves ovate, acutish, matic, hardly 4 times longer than the petals, obliquely 5-nerved beneath; branchlets downy. ą G. Native of Van Diemen's Land.
Thyme-leaved Decaspora. Shrub.
 Cult. For culture and propagation see Leucopogon, p. 780.

XII. PENTACHONDRA (from πέντε, pente, five, and χιλιοπος, chondros, a grain; in reference to the berry containing 5 pyrenæ or seeds). R. Br. prod. p. 549.
1 P. involucrata (R. Br. prod. p. 549.) filaments exerted; calyxes ciliated, furnished with 8 bractæae; leaves elliptic-lanceolate, flattish, many-nerved; branchlets downy; stem erect.
Involucrated-flowered Pentachondra. Shrub.
2 P. fumila (R. Br. l. c.) stamens inclosed; calyx furnished with 4 bractæae; leaves nearly elliptic, 3-nerved, with naked margins; branchlets glabrous; stem prostrate, much branched. ą G. Native of Van Diemen's Land. Epacris fumila, Forst. prod. no. 70. Styrphëa fumila, Spreng. syst. 1. p. 656.
Dwarf Pentachondra. Shrub prostrate.
 Cult. For culture and propagation see Leucopogon, p. 780.

1 N. fumila (R. Br. l. c.) ą G. Native of New Holland, on the south coast. Monotoca fumila, Spreng. syst. 1. p. 654.
Dwarf Needhamia. Shrub.
 Cult. For culture and propagation see Astroloma, p. 775.

XIV. OLIGARRHENA (from ὀλιγος, oligos, few, and αὕρρην, arrhen, a male; in reference to the few stamens). R. Br. prod. p. 549.
Lin. syst. Diandria, Monogynia. Calyx 4-parted, bibracteate. Corolla 4-cleft, permanent, valvate in aestivation. Stamens 2, inclosed. Ovarium 2-celled. Capsule 2-celled.—An erect much-branched shrub. Leaves scattered, imbricate, small. Spikes terminal, erect. Flowers small, white. Hypogynous scales 4. This is a very paradoxical genus; it agrees in the artificial character with the order Olénæ, but the habit is wholly distinct.
1 O. micranthæ (R. Br. prod. p. 549.) ą G. Native of New Holland, on the south coast.
Small-flowered Oligarrhena. Shrub.
 Cult. See Astroloma, p. 775. for culture and propagation.

Tribe II.

EPACRIDEÆ (the genera contained in this tribe agree with Epacris in many particulars). Cells of ovary many-seeded. Fruit capsular.

Lin. syst. Pentandria, Monogynia. Calyx coloured, many-bracteate; bractæae of the same texture as the calyx. Corolla tubular; limb beardless. Stamens epipetalous. Anthers petalate above the middle. Hypogynous scales 5. Capsule having the placenta adnate to the central column.—Small branched, usually glabrous shrubs. Leaves scattered, petiolate or simple at the base. Flowers axillary, white or purplish, usually disposed in leafy spikes.
Leaves cordate.

1 E. purpurascens (R. Br. prod. p. 550.) segments of calyx acuminated, about equal in length to the tube of the corolla; leaves cuculate, nearly sessile, ending each in a recurved mucrone, which exceeds the base of the leaf; floral leaves equaling the corollas in length. ♂ G. Native of New South Wales. E. pungens, Sims, bot. mag. t. 844. E'pacris attenuatum, Link. Lodd. bot. cab. t. 38. Corollas purplish.

Var. β, rubra (Lodd. bot. cab. 876.) flowers red.

2 E. pulchella (Cav. icon. 4. p. 26. t. 345. Sims, bot. mag. t. 1170. R. Br. prod. p. 550.) segments of the calyx acuminated, equaling the tube of the corolla; leaves rather concave, ending each in a spreading point, which is not so long as the base of the leaf; floral leaves shorter than the corollas. ♂ G. Native of New South Wales. Lodd. bot. cab. 154. Flowers pale red or pink.

Neat E'pacris. Fl. April, June. Clt. 1804. Shrub 1 to 3 feet.

3 E. microphylla (R. Br. prod. p. 550.) segments of calyx bluntish, equaling the tube of the corolla; leaves cuculate, acute, spreading; spike terminal. ♂ G. Native of New South Wales. Flowers almost white.

Small-leaved E'pacris. Fl. April, June. Clt. 1822. Shrub 1 to 2 feet.

4 E. riparia (R. Br. l. c.) segments of calyx setaceous acuminated, about equal in length to the tube of the corolla; leaves flat, acuminated, spreading. ♂ G. Native of New South Wales.

River-side E'pacris. Shrub.

6 E. campanulata (Lodd. bot. cab. 1925.) leaves ovate, reflexed; flowers axillary, the whole forming a spike; corolla twice or thrice longer than the calyx, campanulate. ♂ G. Native of Van Diemen's Land. Corollas red.

Var. β, alba (Lodd. bot. cab. 1931). Flowers white.

7 E. apiculata (Cunningh. in Field's New South Wales, p. 340.) calycine segments lanceolate, acuminated, about equal in length to the tube of the corolla; leaves cuculate, hairy, sessile, auricled at the base; superior leaves imbricated, ending each in a callous obtuse point; branchlets downy. ♂ G. Native of New South Wales, on boggy moist declivities, in the ravines of King's Table Land.

* Leaves simple at the base, not cordate.

8 E. russifolia (R. Br. prod. p. 550.) flowers scattered, pendulous; leaves elliptic-lanceolate, petiolate, acuminated; corollas cylindrical, having the tube twice longer than the calyx. ♂ G. Native of Van Diemen's Land.

9 E. rivularis (Sieb. pl. nov. hol. ex Spreng. syst. add. p. 64.) leaves almost sessile, ovate, acuminated, reflexedly spreading; calyces acute, about equal in length to the corolla. ♂ G. Native of New Holland.

Rivellet E'pacris. Shrub.

10 E. impressa (Labill. nov. holl. 1. p. 43. t. 58.) flowers pendulous, spicate, leaning all one way; leaves lanceolate, nearly sessile, attenuated at the apex, mucronate, with sebaceous edges; peduncles 3 times shorter than the calyx; corollas cylindrical; tube of corolla prismatic, twice longer than the acute ciliate calyx. ♂ G. Native of the south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Sweet, fl. austr. t. 4. Lodd. bot. cab. 1691. Flowers beautiful crimson.

Impressed E'pacris. Fl. April, July. Clt. 1824. Shrub 1 to 3 feet.

11 E. variabilis (Lodd. bot. cab. 1818.) leaves ovate, sessile, tapering to the apex; corolla tubular, 3 or 4 times longer than the calyx. ♂ G. Native of Van Diemen's Land. Flowers drooping, pale red or blush, spicate. Like E. impressa.

12 E. nivalis (Lodd. bot. cab. 1821. Lindl. bot. reg. 1531. Graham, in bot. mag. 3253.) leaves ovate-lanceolate, spreading much, nakedish, nerve beneath, attenuated at the apex, mucronate, with sebaceous margins; flowers axillary, solitary, secund, disposed in a leafy raceme or spike; tube of corolla campanulate, much longer than the segments of the calyx, which are ciliated, as well as the bracteas. ♂ G. Native of New Holland. Flowers white.

Snowy E'pacris. Fl. April, May. Clt. 1829. Shrub 2 to 3 feet.

13 E. cerefolia (Graham, in bot. mag. t. 3243.) leaves lanceolate, spreading much, nakedish, attenuately mucronate at the apex, with sebaceous edges; flowers spreading, axillary, solitary, secund; tube of corolla ovate, exceeding the acute ciliated segments of the calyx. ♂ G. Native of Van Diemen's Land. Flowers white, collected near the extremities of the branches, much shorter than those of E. nivalis.

Wax-leaved E'pacris. Fl. April, May. Clt. 1831. Shrub 1 to 3 feet.

14 E. sparsa (R. Br. prod. p. 551.) flowers unknown; peduncles scattered, about equal in length to the acute calyx; leaves oblong-lanceolate, petiolate, mucronate, veinless. ♂ G. Native of New South Wales. Flowers white.

Scattered-flowered E'pacris. Shrub.

15 E. nigida (Sieb. l. c.) leaves ovate-oblong, bluntish, nearly sessile, carilaginous, spreading, keeled; calyces obtuse, about equal in length to the tube of the corolla. ♂ G. Native of New Holland.

Stiff E'pacris. Shrub.

16 E. obtusifolia (Smith, exot. bot. p. 77. t. 40.) flowers nodding; leaves lanceolate, erect, a little imbricated, ending in a bluntish callous point; segments of the calyx obtuse, length of the tube of the corolla; stamens incolesced. ♂ G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Lodd. bot. cab. 295. Flowers white.

Blunt-leaved E'pacris. Fl. April, June. Clt. 1804. Shrub 2 to 3 feet.

17 E. heteroneura (Labill. nov. holl. 1. p. 42. t. 56.) leaves elliptic-lanceolate, acuminated, rather concave, striated beneath; segments of calyx very acute, naked, length of tube of the
corolla; stamens inclosed; style glabrous; branches hairy: 

18. E. petalota (R. Br.  prod. p. 551.) leaves narrow-lanceolate, acuminate, flat, striated beneath with sebaceous margins; calyccine segments very acute, naked, length of tube of the corolla; stamens inclosed; style glabrous. 

19. E. lanuginosa (Labill. nov. holl. 1. p. 42. t. 57.) leaves lanceolate, acuminate, with sebaceous margins; calyccine segments very acute, length of tube of the corolla, with the margins woolly; stamens inclosed; style hairy. 

20. E. sesquipediflora (Cunningh. in Field's New South Wales, p. 340.) leaves elliptic-lanceolate, acuminate, cuneately lanceolate, 6- or 7-nerved, mucronate, petiolate, with ciliated margins: branches hoary; calyccine segments cylindrical, ventricose, with the tube exceeding the calyx, which is very acute. 

21. E. myrtifolia (Labill. nov. holl. 1. p. 41. t. 55.) leaves ovate, acute, mucronate, flat, thick: floral ones about equal in length to the corolla; calyccine segments acutish, naked, length of tube of the corolla; bracteoles bluntish; stamens inclosed. 

22. E. exserta (R. Br. prod. p. 551.) leaves lanceolate, acute, erect, flat above, and rather convex beneath; calyccine segments bluntish, equalling the tube in length; anthers clearly exerted. 

23. E. mucronulata (R. Br. prod. p. 552.) leaves lanceolate, very acute, erectly spreading, ending each in a pungent pullicated mucron; calyccine segments acute, with naked margins. 

24. E. crassifolia (R. Br. l. c.) leaves oval or ovobovate, obtuse, munit, flat, cartilaginous, acute at the base; calyccine pendent, with woolly margins; stem procumbent, with ascending branches. 

25. E. mucronulata (R. Br. prod. p. 552.) leaves lanceolate, very acute, erectly spreading, ending each in a pungent pullicated mucron; calyccine segments acute, with naked margins. 

26. E. crassifolia (R. Br. l. c.) leaves oval or ovobovate, obtuse, munit, flat, cartilaginous, acute at the base; calyccine pendent, with woolly margins; stem procumbent, with ascending branches.
minutely bracteate at the base, and naked above. Flowers showy, pendulous. The placenta of the capsule are loose and pendulous, and the leaves sheathing, according to Labillardiere.

Cerithie-like Prionotes. Shrub 4 to 5 feet.

Cult. This is an elegant and delicate shrub, bearing showy pendulous flowers. For culture and propagation, see *E. pacis*, p. 783.

**XVIII. COSMELIA (from κοσμεω, kosmeo, to adorn; beauty of flowers.) R. Br. prod. p. 561.**

**Lin. syst. Pentandria, Monogynia.** Calyx foliaceous. Corolla tubular. Stamens epipetalous. Anthers adnate to the filaments, which are ciliated at top. Hypogynous scales 5. Placentae of capsule adnate to the central column.—An erect much branched shrub, but the branches when naked are not marked by cetrices. Bases of leaves ciliate, half sheathing. Flowers solitary, drooping, terminating the short lateral branches. Calyx imbricated by smaller leaves. Corollas deep red. Stamens inclosed. Anthers lessened at the base. Placentas free at both extremities.

Cult. See *E. pacis*, p. 783. for culture and propagation.

**XIX. ANDERSONIA (named in memory of William Anderson, a surgeon of the Royal Navy, who accompanied Captain Cook; he paid great attention to botany. Descriptions of the genera of Van Diemen’s Land plants, written by him, are still in the Banksian Library. The genus is also intended to commemorate the late Alexander Anderson, formerly Director of the Botanic Garden at St. Vincent; and William Anderson, the present Curator of the Apothecaries’ Botanic Garden at Chelsea.) R. Br. prod. p. 558.**

**Lin. syst. Pentandria, Monogynia.** Calyx coloured, imbricated by 2 or more foliaceous bracteae. Corolla length of calyx; segments of the limb bearded at the base. Stamens hypogynous; anthers fixed beneath the middle. Hypogynous scales 5, sometimes connate. Capsule with the placenta adnate to the central column.—Small squarrose shrubs, having the branches not annulated while naked. Bases of leaves ciliate, half sheathing. Flowers terminal, spicate, or solitary, erect. Placentas short, rising from the bottom of the capsule. Seeds few when mature, erect.

* Flowers bracteate, spicate.

2 A. farifolia (R. Br. l. c.) leaves adpressed, ending in a triquetrous joint each. ½ G. Native of the south coast of New Holland.

Small-leaved Andersonia. Shrub.

* * Flowers many-bracteate; terminating the short branchlets.

3 A. cerulea (R. Br. l. c.) leaves moderately spreading; young leaves and outside of calyces downy. ½ G. Native of New Holland, on the south coast. Flowers blue.

**Blue-flowered Andersonia. Shrub.

4 A. squarrosa (R. Br. prod. p. 554.) leaves squarrose, divaricate or recurved, glabrous, with naked margins; calyces and styles glabrous; stem erect. ½ G. Native of New Holland, on the south coast.

Squarrose-leaved Andersonia. Shrub.

5 A. depressa (R. Br. l. c.) leaves squarrose, divaricate or recurved, downy, with ciliated margins; calyces glabrous; style pilose in the middle; stem depressed. ½ G. Native of New Holland, on the south coast.

Depressed Andersonia. Shrub depressed.

6 A. microantha (R. Br. l. c.) leaves adpressed; style downy beneath the middle. ½ G. Native of New South Wales. Flowers perennating, see, p. 783.

**XX. PONECELEIA (to the memory of Mr. Ponecleat, author of treatise on Triticum or Wheat.) R. Br. prod. p. 554.**

**Lin. syst. Pentandria, Monogynia.** Calyx foliaceous. Corolla short, campanulate, 4-cleft, beardless. Stamens hypogynous. Anthers peltate beneath the middle, with a marginate dissepiment. Hypogynous scales wanting. Capsule having the placenta adnate to the central column.—A small, erect, twigg marsh shrub, having the branches not annulated while naked: floriferous branches brittle. Bases of leaves ciliate, half sheathing. Flowers solitary, erect, terminating the branchlets. Calyx imbricated by smaller leaves. Anthers free, beardless.

1 P. sprengeloides (R. Br. prod. p. 554.). ½ G. Native of New South Wales. A suffruticoso dense habited plant, adhering to rocks perpetually damp.

Cult. For culture and propagation, see *E. pacis*, p. 783.

**Lin. syst. Pentandria, Monogynia.** Calyx coloured a little. Corolla 3-parted, rotate, beardless. Stamens hypogynous. Anthers connate or free, with an inmarginate dissepiment. Hypogynous scales wanting. Capsule having the placenta adnate to the central column.—Small, erect, branched shrubs; branches hardly annulated while naked. Bases of leaves ciliate, half sheathing. Flowers terminating the short lateral branchlets. Corolla purplish, length of calyx: with the tube very short, and at length cleft into 5 to the base.

* Flesh-colour-flowered Sprengelia. Fl. April, June. Cht. 1793. Shrub 1 to 2 feet.

2 S. montana (R. Br. l. c.) anthers free, beardless; calyx half coloured; leaves short-acuminate. ½ G. Native of Van Diemen’s Land. Flowers purplish.
Mountain Sprengelia. Shrub 1 foot.

Cult. These are elegant and delicate shrubs, with much the habit of *Andersonia*, which see, p. 784, for culture and propagation.

XXII. CYSTANTHE (from κυστόν, kiste, a box or coffer, and αἰθός, anthos, a flower; in reference to the closed hood-formed flowers.) R. Br. prod. p. 555.

**Lin. syst.** Pentändria, Monogynia. Calyx foliaceous. Corolla closed, calyptraeform, dehiscing transversely; with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales wanting. Capsule having the placenta loose, and hanging from the top of the central column.—A shrub with the habit of *Sprengelia*, *Cosmélia*, and *Poncèlia*; unless the branches are branched while naked.

Var. α, leaves elongated, spreadingly recurved. Growing on the shady sides of mountains.

*Sprengelia-like* Cystanthe. Shrub 1 to 2 feet.

**Cult.** For culture and propagation, see *Andersonia*, p. 784. It is an elegant and delicate shrub.

XXIII. RICHEA (named in memory of M. Riche, one of the naturalists who accompanied the expedition in search of La Perouse). R. Br. prod. p. 555, but not of Labill.

**Lin. syst.** Pentändria, Monogynia. Calyx membranous, bractless. Corolla closed, calyptraeform, dehiscing transversely; with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales 5. Capsule having the placenta loose and hanging from the top of the central column.—A shrub with the habit almost of *Dracophyllum montanum*, Labill., but differing in the singular economy of the flower. It comes nearest to *Cystanthe*, in the corolla being calyptraeform; but that genus differs in the inflorescence, foliaceous calyx, and want of hypogynous scales. Richea of Labill. vol. 1. p. 187. t. 16. in Craspédia, Forst. prod. no. 306. and Wild. spec. 3. p. 2393.

1 R. DRACOFLYLLA (R. Br. prod. p. 555.). H. G. Native of Van Diemen’s Land. This shrub differs much in stature according to stations of its natural growth; for on the tops of mountains it is an humble shrub, 1½ foot high; but on the sides of the mountains it grows to 10 feet high.

**Cult.** For culture and propagation, see *Andersonia*, p. 784.

XXIV. DRACOFLYLLUM (from ὁδρακόν, drakon, a dragon; and φύλλον, phyllon, a leaf; so named because the leaves have some resemblance to those of *Dracaena Dráco*, or Dragon’s Blood Tree.) Labill. in itin. 2. t. 40. R. Br. prod. p. 555. Rechb. hort. 2. t. 108.

**Lin. syst.** Pentändria, Monogynia. Calyx bracteal. Corolla tubularly funnel-shaped; with a 5-parted acutish spreading beardless limb, a somewhat ventricose tube, and a hardly contracted throat. Stamens 5, hypogynous. Hypogynous scales 5. Capsule having the placenta loose, and hanging from the top of the central column.—Shrubs or small trees having the branches annulated while naked. Leaves imbricate, cuculate, at the base, and half sheathing. Spikes or racemes terminal, simple, or compound. Bracteas subtending the pedicels, caducous.

**Secund-flowered Dracophyllum.** Fl. April, Aug. Clt. 1823. Shrub 1 to 2 feet.

**Long-leaved Dracophyllum.** Shrub.

**Rosemary-leaved Dracophyllum.** Shrub.

**Cult.** See *Andersonia*, p. 784. for culture and propagation.}

**XXV. SPHENOTOMA** (from σφιννω, sphenoo, to cleave, and τος, tome, a section; in reference to the deep divided limb of the corolla). Sweet. fl. austr. t. 44. Dracophyllum, sect. Sphenotoma. R. Br. prod. p. 555.

**Lin. syst.** Pentändria, Monogynia. Corolla salver-shaped, with a slender tube, a coarctate throat, and an obtuse beardless limb (f. 134. c.) Stamens epipetalous. Hypogynous scales 5. Capsule having the placenta loose, and hanging from the top of the central column.—Shrubs having the branches annulated when naked. Leaves imbricate, cuculate and half sheathing at the base. spikes simple, terminal. Bracteas stretched out, permanent.

1 S. SQVÁRRÓSA; floriforous branches hardly the length of the spikes; leaves squarrose, ensiform, lanceolate. h. G. Native of New Holland, on the south coast. Dracophyllum squarrosum, R. Br. prod. p. 556.

**Squarrose Sphenotoma.** Shrub.

2 S. CAPITÁTA; floriforous branches much longer than the spikes, which are ovate; cauleine leaves lanceolate-ensiform, erectish, of the branches adpressed. h. G. Native of New Holland, on the south coast. Dracophyllum capitatum, R. Br. prod. p. 556.

**Capitate-flowered Sphenotoma.** Shrub.

3 S. GRÁCILIS (Sweet. fl. austr. t. 44.) floriforous branches much longer than the spikes, which are ovate; cauline leaves lanceolate-subsulate, spreading, or recurved; of the branches adpressed. h. G. Native of New Holland, on the south coast. Dracophyllum gracilis, R. Br. prod. p. 556. Flowers white. Leaves fringed with long hairs. (f. 134.).

**Slender Sphenotoma.** Fl. April, May. Clt. 1823. Shrub 1 to 2 feet.

**Cult.** For culture and propagation, see *E’pacris*, p. 783. or *Andersonia*, p. 784.

**FIG. 134.**

**Flowers hermaphrodite, subsymmetrical, regular. Calyx 4-5-cleft. Corolla 4-parted, rarely 5-parted. Stamens 4-5-8-10, 5 H**
alternating with the segments of the corolla; their insertion various. Style and stigma undivided. Capsule free, or adhering to the fleshy calyx, therefore baccate; cells for the most part many-seeded. Albumen fleshy. Embryo erect, slender. Shrubs variable in habit, scattered over the surface of the earth in every direction.

Among the numerous families which compose the vegetable kingdom, few surpass the Ericaceae in the diversity of their forms, beauty of their flowers, or in the extent of their geographical distribution, which verges upon the ultimate limits of vegetation in both hemispheres. The direction of mountain chains, more especially of particular strata, such, for example, as siliceous and micaceous deposits, appears to exercise an equally important influence on the distribution of this family, with the circumstances of latitude and elevation. Species of the groups of Andromedeae and Vaccinieae traverse the Andes from one extremity to the other; and in Asia they extend from the Frozen Ocean to within the tropics, colonies of them being found in almost every branch of the Indian Alps. The similarity of the vegetation of North America and Central Asia is strikingly exemplified in the groups of this family, which are peculiar to both regions, such as Rhododendron, Monotropa, Pyrola, Vaccinieae, and the aberrant Ericaceae. Some species are common to both continents, such as Pjro/a picta, Monotropa Morisoniana, Bryanthus Stellari, Cassiope tetragona, and Andromeda polifolia: the two last forming likewise part of the European Flora. Europe and Africa alone contain the normal Ericaceae, well characterized by their permanent corolla, the maximum of which is at the Cape of Good Hope, a spot where so many families of plants are found huddled together in strange confusion, as if nature had at length deprived herself of sufficient space for their equal distribution. The most easterly point to which this last group extends is the Mauritius, where the various species of Salalix are found. The maximum of Rhododendron, Vaccinieae, Pyrola, and Monotropa, and the aberrant Ericaceae, is found in North America; these tribes are also common to Asia. Van Diemen's Land may be regarded as comprehending the majority of the Epacridaceae. Of all the genera of Ericaceae, that of Gaultheria is, however, the most extensively diffused, being met with in almost every region of America, in New Zealand, Van Diemen's Land, and other places of the South Pacific, and in the East Indies. The greater development of the calyx in this genus, and its more or less adherence to the ovary, considerably lessens the importance of the discriminating character of the Vaccinieae, and most satisfactorily shows that they constitute but a group of Ericaceae, rather than a distinct order. As happens in other very natural families, the characters of the general groups of Ericaceae are not so strongly marked as in those that are less so; but we are not on that account to give up the idea of dividing them, and to retain four or five hundred species in one genus, as has been done in the case of Ericaceae, which we have here attempted to subdivide into a number of minor groups; and, whatever opinion may be formed of their title to rank as separate genera, the arrangement of the species will we trust be found more natural than any hitherto proposed.

Synopsis of the genera.

Tribe I.

1 Erice. Calyx 4-parted, naked at the base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; with capillary filaments and bifid anthers; cells of anthers short, opening by an oblong hole, awned or crested at the base, rarely mutic. Stigma peltate. — Leaves acerose. Pedicels scaly.

2 Gypsacalis. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated 4-lobed mouth. Stamens exerted, with flattened filaments and bipartite anthers; cells of anthers mutic at the base, distinct, subinclosed, opening by an oblique hole. Stigma simple. — Leaves acerose.

3 Bleeria. Calyx 4-parted. Corolla short, tubular, with a 4-cleft limb. Stamens 4-6, with linear flattened glabrous filaments, and bipartite anthers; cells of anthers attenuated at the base, mutic, dehiscing by an oblong foramen at the apex. Stigma obtuse. — Leaves whorled. Flowers terminal, glomerate.

5 Pachysa. Calyx deeply 4-parted, coriaceous. Corolla nearly globose, coriaceous, with a contracted 4-lobed mouth. Stamens inclosed, with dilated filaments, and bifid anthers; cells of anthers short, crested at the base, opening by an oblique foramen. Stigma obtuse. — Leaves loosely imbricated, compressed. Pedicels bracteolate.

6 Ceramia. Calyx 4-parted, glumaceous. Corolla urceolate, with a 4-lobed limb. Stamens inclosed, with dilated flat filaments and bifid anthers; cells of anthers short, horned at the base. Stigma capitate. — Leaves scattered, bluntish, flat.

7 Desmia. Calyx 4-lobed. Corolla globose, with a contracted 4-toothed mouth. Stamens exerted, with flat filaments; cells of anthers short, opening by an oblong hole, simple at the base, and confluent in the filament. Stigma capitate. — Leaves scattered, subulate.

8 Euryleighpis. Calyx 4-parted, coriaceous, bibracteolate at the base. Corolla tubular, coriaceous, ventricose at the base, with an erect 4-parted limb. Stamens inclosed, with dilated channelled filaments, and bipartite anthers; cells of anthers coriaceous, opening by an oblong hole, auricled at the base. Stigma clavate. — Leaves scattered. Flowers terminal, solitary.

9 Eurystepgia. Calyx 4-parted, large, glumaceous. Corolla
urceolate, with a contracted 4-toothed mouth. Stamens inclosed, with dilated flat filaments and bipartite anthers; cells of anthers opening by an oblong foramen, biappendiculate at the base; appendages flat, crested, cremated. Stigma capitata.—Leaves subulate. Flowers suberect, pendulous.

10 Lopha'ndra. Calyx 4-parted, furnished with 4 bracteas at the base: segments scarious, rounded, ventricose outside. Corolla campanulate, 4-lobed. Stamens inclosed, with dilated flat filaments and bifid anthers; cells of anthers beaked at the apex, winged, crested, and crenulated at the sides, dehiscing by an oblong hole in the middle. Stigma truncate.—Leaves short, obtuse, glaucous. Flowers terminal.

11 Lampró'tis. Calyx 4-parted, large, glumaceous, colourless, bibracteate at the base. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic, or crested at the base. Stigma capitata.—Leaves adpressed, opposite, or 3 in a whorl. Flowers terminal.

12 Callis'ta. Calyx 4-parted, foliaceous. Corolla salver-shaped, with a cylindrical or ventricose tube, and a dilated, spreading, 4-cleft limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic at the base. Stigma capitata.—Leaves acerose. Flowers terminal.

13 Euynló'ma. Calyx 4-parted, foliaceous. Corolla salver-shaped, with an elongated, filiform or ventricose tube, and a 4-parted dilated limb. Stamens inclosed, with dilated, membranous, channelled filaments, and bipartite anthers; cells of anthers membranous, dehiscing lengthwise, drawn out at the base into a short tumid spur. Stigma with an elevated 4-lobed disk.—Leaves adpressed, denticulate. Flowers terminal.

14 Chö'na. Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a revolute 4-lobed limb. Stamens exerted, with capillary filaments, and truncate anthers; cells of anthers elongated, parallel, awned at the base. Stigma simple, obtuse.—Leaves 3 in a whorl, linear, awned. Flowers terminal.

15 Syrín'góde'a. Calyx 4-leaved, glumaceous. Corolla long-tubular, with a short 4-lobed limb. Stamens usually inclosed, with capillary filaments, and bipartite anthers; cells of anthers short, obtuse, mutic or awned at the base, dehiscing by an oblong foramen. Stigma simple or capitata, in some annulated by an elevated disk.—Leaves loose, acerose. Flowers crowded at the tops of the branches.

16 Dayá'sthîes. Calyx 4-parted, bibracteate at the base. Corolla tubular, hispid, with a 4-lobed erect limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells of anthers mutic at the base, dehiscing lengthwise. Stigma large, peltate.—Leaves loosely imbricatid, hispid. Flowers in terminal fascicles.

17 Ec'tâ'mis. Calyx 4-leaved, glumaceous. Corolla tubular, a little ventricose at the base, with a 4-toothed limb. Stamens much exerted, with dilated filaments and bipartite anthers; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, having the base continuous in the filament, and mutic. Stigma clavate, truncate.—Leaves loosely imbricatid. Flowers terminal or lateral.

18 Eríôđe'mia. Calyx large, 4-parted, bibracteate at the base. Corolla campanulate, with a 4-lobed revolute limb. Stamens exerted, with dilated filaments, and bifid obtuse scabrous anthers; cells of anthers dehiscing by an oblong pore, continuous in the filament at the base.—Leaves 3 in a whorl, obtuse, hairy. Flowers terminal.

19 Octoe'ra. Calyx 4-parted, reflexed, naked at the base. Corolla globose, with a contracted bluntly 4-lobed mouth. Stamens inclosed, with flattened filaments; cells of anthers very short, dehiscing by an ample hole, and furnished at the base by a solitary lanceolate acuminate appendage.—A downy procumbent shrub. Leaves verticillate. Flowers terminal, subumbellate. Pedicels scaly.

20 Eë'mia. Calyx 4-parted, with imbricate bracteas at the base; segments orbicular, coriaceous, ciliolate. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells short, mutic at the base, dehiscing by an oblong hole. Stigma capitata. Cells of capsule 1-seeded.—Leaves spreading, bristly. Flowers globose.

21 Salá'xis. Calyx 4-leaved, irregular. Corolla campanulate, 4-cleft. Stigma peltate. Capsule drupaceous, 3-celled, 3-seeded.—Leaves 3-6 in a whorl. Flowers subracemose at the tops of the branches.

22 Callû'nâ. Calyx 4-parted, membranous, colourless, furnished with 4 bracteas at the base. Corolla shorter than the calyx, campanulate, 4-lobed. Stamens inclosed, with dilated filaments, and bipartite anthers, which are biappendiculate at the base; cells mucronulate, dehiscing lengthwise. Stigma capitata.—Leaves short, imbricate, in 4 rows. Flowers terminal, spicately racemose.

Subtribe II. Androméd'eae. Corolla deciduous.

23 Andrómë'da. Calyx 5-cleft; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed, with bearded filaments; cells of anthers short, one-awned. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

24 Cassió'pe. Calyx 5-leaved; segments imbricate at the base. Corolla campanulate, 5-cleft. Stamens 10, inclosed, with glabrous filaments; cells of anthers short, tumid, one-awned. Style dilated at the base; stigma obtuse. Capsule with a loculicidal dehiscence; valves bifid at the apex; placenta 5-lobed.

25 Cassã'ndra. Calyx 5-leaved, bibracteate at the base; segments imbricate at the base. Corolla oblong, with a contracted 5-toothed mouth. Stamens 10, inclosed, with glabrous filaments; cells of anthers elongated at the apex, tubular, mutic. Stigma annulated. Capsule with a loculicidal dehiscence; placenta 5-lobed.
ERICACEÆ.

26 Zenòbia. Calyx 5-toothed. Corolla campanulate, with a revolute 5-lobed limb. Stamens 10, with very short glabrous filaments; cells of anthers elongated, tubular, biairiate at the apex. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

27 Lyònia. Calyx 5-parted. Corolla ovate or tubular, with a contracted 5-toothed mouth. Stamens inclosed, with short, flattened, downy filaments; cells of anthers membranous, dehiscing lengthwise, mutic. Style pentagonal; stigma obtuse. Capsule pentagonal, with a loculicidal dehiscence.

29 Pê'ria. Calyx 5-parted. Corolla tubular or ovate, with a contracted, 5-toothed, revolute mouth. Stamens 10, inclosed, with dilated filaments, which are bisetose at the apex; cells of anthers short, incumbent, dehiscing lengthwise. Style pentagonal; stigma truncate. Capsule with a loculicidal dehiscence.

31 Bria'nthus. Calyx 5-leaved, imbricated. Corolla deeply 5-parted, spreading. Stamens 10, shorter than the corolla, with flattened glabrous filaments; cells of anthers short, mutic, or awned behind, dehiscing by a terminal faramen. Stigma obtuse. Capsule with a septicidal dehiscence.

32 Dâ'cia. Calyx 4-parted. Corolla oval, ventricose, with a 4-toothed mouth. Stamens 8, inclosed, with dilated glabrous filaments, and linear anthers, which are sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma truncate. Capsule 4-celled, with a septical dehiscence.

33 Enki'nthus. Calyx small, 5-parted. Corolla campanulate, with a 5-parted limb, and 5 nectarial pits at the base. Stamens inclosed; anthers 2-horned. Berry 5-celled, many-seeded.

34 A'rbutus. Calyx small, 5-parted. Corolla globose or ovate, with a small, contracted, 5-cleft, reflexed border. Stamens 10, inclosed, with flattened filaments; anthers compressed at the sides, dehiscing at the apex by 2 pores, fixed by the back beneath the apex, and there furnished with 2 reflexed awns. Stigma obtuse. Berry globose, granular.

35 Arcosta'phiyllos. All as in Arbutus, except that the fruit is 5-celled, and the cells 1-seeded, and not granular on the outside.

36 Perne'ttya. Calyx 5-parted. Corolla globose, with a contracted 5-parted revolute limb. Stamens 10, inclosed, having the filaments thickened at the base; anthers 2-celled, 2-lobed at the apex; lobes bifid. Hypogynous scales 10, 3-lobed, surrounding the ovary. Stigma convex. Berries globose, 5-celled, many-seeded.

37 Aga'kista. Calyx 5-lobed. Corolla ovate, with a contracted 5-toothed mouth. Stamens 10, inclosed, with flattened villous filaments, and biairiate anthers; cells of anthers short, mutic at the base, diverging at the apex, and dehiscing by a terminal pore. Capsule globose, 5-celled, with a loculicidal dehiscence; placenta thick, oblong.

38 Dyplecosia. Calyx girded by a calyculus, which is composed of 2 combined bracteas, 5-cleft. Corolla campanulate, with a 5-cleft reflexed limb. Stamens 10, inclosed, inserted in the disk of the calyx. Anthers bifid at the apex. Stigma truncate. Capsule nearly globose, depressed, inclosed in the baccate calyx, 5-celled, many-seeded.

39 Gaulthe'ria. Calyx 5-cleft or 5-toothed, bibracteate at the base. Corolla ovate, ventricose, with a 5-cleft revolute border, diaphanous at the base. Stamens 10, inclosed, with flat filaments; anthers bifid at the apex; lobes biairiate. Hypogynous scales 10, usually united at the base. Ovarium half inferior. Capsule 5-celled, with a loculicidal dehiscence.

40 Epig'e'a. Calyx large, 5-parted, furnished with 3 bracteas at the base. Corolla salver-shaped, with a 5-parted spreading border, and with the tube villous inside. Stamens 10. Capsule 5-celled; placenta 5-parted.

42 Cle'thra. Calyx 5-parted. Corolla so deeply 5-parted as to appear 5-petalled. Stamens 10, with membranous filaments; anthers at length inflexedly pendulous, obverse, and cordinate at the base, and mucronate at the apex, but mutic. Stigma trifid. Capsule 3-celled, many-seeded, with a loculicidal dehiscence.

Tribe II.

44 Vire'ya. Calyx obsoletly 5-toothed. Corolla subcampanulate, or funnel-shaped, regularly 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calyctic disk; anthers dehiscing by terminal pores, mutic. Stigma capitade, 5-furrowed. Capsule sillage-formed, 5-angled, 5-celled, 5-valved. Placenta 5-lobed. Seeds numerous, expanded at both ends into a bristle-formed awn.

46 Hymena'nthes. Calyx small, obscurely denticulated.
Corolla subcampanulate, with a short compressed tube, and a 7-parted limb. Stamens 14, hypogynous; anthers mutic, opening by two terminal pores. Stigma obtuse, with 7 crenatures. Capsule oblong, 7-valved, 7-celled, many-seeded.

47 Kāl'mia. Calyx 5-parted. Corolla salver-shaped; border producing 10 protuberances on the under side, and a corresponding number of cavities on the upper side, in which the anthers are concealed. Capsule 5-celled; disseminations marginal.

50 Leiophyllum. Calyx deeply 5-parted, permanent. Corolla 5-petalled. Stamens 10, exserted; anthers lateral, dehiscing lengthwise inside. Capsule roundish, 5-celled, 5-valved, dehiscing at the apex.

51 Lē'dum. Calyx minute, 4-toothed. Corolla 5-petalled, spreading. Stamens 5-10, exserted; anthers opening by 2 pores at the apex. Capsule subovate, 5-celled, 5-valved, pedicellate, dehiscing at the base. Seeds ending in a wing at both ends.

TRIBE III.

52 Vaccinium. Limb of calyx 4-5-toothed. Corolla urceolate or campanulate, 4-5-cleft. Stamens 8-10, hypogynous. Berry globose, 4-5-celled, many-seeded.

53 Oxye'cucus. Calyx 4-cleft. Corolla 4-petalled, with the segments somewhat linear and revolute. Stamens 8; filaments connivent; anthers tubular, bipartite. Berry 4-celled, many-seeded.

54 Gyaluss'cia. Limb of calyx 5-cleft. Corolla tubular, with a ventricose base and a 5-cleft limb. Stamens 10, inserted in the limb of the calyx; anthers mutic, drawn out into 2 little tubes from the top. Stigma capitate. Berry nearly globose, 10-celled; cells 1-seeded.

55 Thiba'udia. Calyx urceolar, 5-lobed. Corolla tubular, with a contracted 5-toothed mouth. Stamens 10, inserted in the calyx, inclosed; anthers elongated, mutic, drawn out into 2 little tubes at the apex. Berry 5-celled, many-seeded.

56 Agapet'es. Limb of calyx 5-cleft. Corolla tubular, with a 5-cleft limb. Stamens 10, with very short flattened filaments; anthers mutic, very long, auricled at the base, exserted, narrow, emarginate at the apex, with the cells confluent. Stigma clavate. Berry 5-celled, many-seeded.

57 Ceratost'emma. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, contracted and 5-lobed at the apex. Stamens 12, with very short, flattened, hairy filaments; anthers bluntly spurred at the base, having the cells elongated at the apex and filiform, dehiscing by a terminal pore. Stigma simple. Berry 5-celled, many-seeded.

TRIBE IV.

58 Py'ro'la. Calyx 5-cleft or 5-parted. Petals 5. Stamens 10, slightly united at the base. Style exserted. Stigma 5-lobed. Capsule 5-celled, dehiscing at the angles near the base, having the margins of the valves connected by intricateomentum.

TRIBE V.

62 Hyp'ó'tys. Calyx 3-5-parted. Corolla 4-5-petalled; petals or segments each with a cucullate nectariferous base. Anthers small, horizontal, at length opening flat. Stigma orbicular, with a bearded margin. Capsule 5-celled, 5-valved, many-seeded.

63 Monōtros'pa. Calyx none. Corolla 5-petalled; petals or segments each with a cucullate nectariferous base; anthers reniform, horizontal. Stigma orbicular, naked. Capsule 5-celled, 5-valved, many-seeded.

64 Pterog'spora. Calyx 5-parted. Corolla ovate, with a reflexed 5-toothed border. Anthers peltate, adnate to the filaments by the margin, bisetose. Capsule 5-celled; placenta 5-lobed. Seeds terminated each by a wing.

I. ERICA (Erica of Pliny is altered from ἐρικα of Theophrastus, which is derived from ἐρικός, erikos, erike, eriko, to break; from the supposed quality of some species in breaking the stone in the bladder). D. Don. in edinb. phil. journ. 17. p. 152.—Erica species of Lin. and other authors.

Lin. syst. Oećandria, Monogynia. Calyx 4-parted, with a naked base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; filaments capillary; anthers bident; cells of anthers opening by an oblong hole, awned or crested at the base, or mutic. Stigma peltate. Capsule 4-celled, many-seeded.—Shrubs, natives of Europe and Africa. Leaves scattered or verticillate, acerate. Flowers terminal, fascièd or racemose. Pedicels scaly.

§ 1. Anthers awned at the base. Normal species.

* Leaves 3 in a whorl. Corollas campanulate.

1 E. laevis (Andr. heath. 3. t. 6.) leaves glabrous, 3–4 in a whorl, spreading; branches slender; flowers terminal by threes, drooping; corollas small, bell-shaped; awns of anthers falcate. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1893. E. electricus, Sal. in Lin. trans. 6. p. 376. Flowers white. Plant glabrous. Anthers black. Perhaps only a variety of E. persicata.

2 E. callitosa (Wendl. eric. ex Spreng. syst. 2. p. 194.) leaves 3 in a whorl, linear-oblong, with revolute edges, spreading, white beneath; flowers terminal, usually by threes, erectish; calyx colored, viscid; corollas campanulate; awns of anthers short. G. Native of the Cape of Good Hope. E. canaliculata minor, Andr. heath. 3. t. 39. Corollas red.

3 E. depressa (Thumb. diss. no. 50. with a figure); leaves glabrous, 3 in a whorl, linear, revolute; flowers terminal; corolla bell-shaped; spurs of anthers long, subulate and hairy; anthers remote from the calyx. G. Native of the Cape of Good Hope. E. rupestris, Andr. heath. 2. t. 9. E. hübmillis, Salisb. in Lin. trans. 6. p. 329. Branches decumbent. Flowers small, white.

4 E. nobile (Bedl. eric. wob. p. 16. but not of Sal.) leaves 3 in a whorl, slightly hispid; flowers subaxillary; anthers remote from the calyx; corollas campanulate, with deep segments; anthers awned. G. Native of the Cape of Good Hope. Erica glomerata, Hort. Flowers white.

5 E. sicetiosa (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, mucronate; corolla 1½ lines long, hairy outside, with a cup-shaped tube; flowers terminal; spurs of anthers linear; fruit glabrous. G. Native of the Cape of Good Hope.

6 E. montana (Bedl. eric. wob. p. 15.) leaves 3 in a whorl, flowers axillary, by threes; flowers terminal, subaxillary, approximating the calyx, loose, angular; corolla bell-shaped; anthers awned; style inclosed. G. Native of the Cape of Good Hope. E. confertifolia, Wendl. Flowers purplish-red.

7 E. villosuscula (Lodd. bot. cab. 1844.) hairy; leaves acicular, ciliated with long hairs; flowers disposed in racemose terminal fascièd; corollas campanulate. G. Native of the Cape of Good Hope. Flowers small, pale red. Anthers unknown.

Rather-villous Heath. Fl.? Clt.? Shrub.

8 E. amena (Sal. in Lin. trans. 6. p. 329.) leaves lanceo- late, 3 in a whorl; flowers terminal; corolla bell-shaped; anthers remote from the calyx; anthers awned, glabrous. G. Native of the Cape of Good Hope. E. incarnata, Thunb. diss. 84. Flowers small, reddish-purple. Corolla 4-5 lines long.

10 Deflansa (Bedl. hort. eric. wob. p. 8.) leaves 3 in a whorl, rough; flowers terminal, umbellate; corolla deflexed, open bell-shaped; anthers minute, remote from the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers white. Style exserted.

11 E. obtusa (Lodd. bot. cab. 1027.) glabrous; leaves 3 in a whorl; flowers terminal, by threes; corollas campanulate; anthers remote. G. Native of the Cape of Good Hope. Flowers white. Style exserted.

12 E. glomerata (Lodd. ex Bedl. eric. wob. p. 11.) leaves 3 in a whorl; flowers terminal, capitulate; corolla small, bell-shaped; anthers approximating the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style exserted.

13 E. vera (Lodd. bot. cab. 1608.) glabrous; leaves 3 in a whorl; flowers terminal; corollas campanulate; style exserted. G. Native of the Cape of Good Hope. Flowers purplish-red. Anthers unknown.

14 E. parviflora (Bedl. hort. eric. wob. p. 17.) leaves 3 in a whorl; flowers terminal, almost sessile; corolla campanulate; anthers remote from the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers small, reddish-purple. Style inclosed.

16 E. scholliana (Lodd. bot. cab. 538.) leaves alternate, scattered; flowers subterminal and axillary; corolla campanulate; anthers remote from the calyx; corolla bell-shaped; anthers awned; style inclosed. G. Native of the Cape of Good Hope. Flowers purple, drooping, and are as well as the calyxes coloured. Style inclosed.

17 E. actea (Bedl. hort. eric. wob. p. 1.) leaves 3 in a whorl, glabrous; flowers terminal; anthers remote from the calyx; corolla oblong-bell-shaped; anthers awned. G. Native of the Cape of Good Hope. Erica Léchmèa, Hort. but not of Andr. Corollas white. Style exserted.

791

ERICACEÆ.  I. ERICA.

* * Leaves 3 in a whorl.  Corollas urceolate.

28 E. adesophora (Spreng. syst. 2. p. 188.) leaves 3 in a whorl, glandularly hispid, spreading, remotes; flowers terminal, aggregate, glabrous; calyx viscid, coloured, adpressed.  ἑ.  G. Native of the Cape of Good Hope.  Anthers awned.  Corollas urceolate.  Gland-bearing Heath.  Fl.

34 E. Purilia (Bedr. l.c.) leaves 3 in a whorl; flowers terminal; corolla globose; anthers awned, a little exserted.  ἑ.  H.
Native of the Cape of Good Hope. Flowers reddish-purple, small. Style exerted.

33 E. regemíminans (Linn. syst. 364. Thum. 35. no. 54.) leaves linear, recurved, 3 in a whorl; flowers pedicellate, drooping, semi-lateral; bracteas remote; corollas ovate-globular; anthers awned. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1729. Erica uncifólia, Sal. in Lin. trans. 6. p. 369. Flowers small, pale red. Spurs of anthers very long.

30 E. rubeílla (Lodd. bot. cab. 658. Sims. bot. mag. 2165.) leaves 5 in a whorl; flowers terminal, capitulate; corolla ovate, ventricose, length of calyx; bracteas approximating the calyx. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

37 E. scabíscéllula (Link. enum. 1. p. 372. Lodd. bot. cab. t. 517.) leaves 3-4 in a whorl, oblong, beset with glandular hairs; flowers terminal; corolla ovate; bracteas approximate to the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers small, silky white or red, sessile. Style inclosed.

** * * * Leaves 4 in a whorl. Corollas campanulate.**

Var. γ, spicáta (Hort.) flowers spicate, white.

**Accomplished Heath.** Fl. April, May. Clt. 1774. Shrub 1 foot.

39 E. strígosa (Sol. in Ait. hort. kew. 2. p. 404.) leaves 4 in a whorl, linear, bluntish, downy, ciliated; branches villose; flowers axillary, aggregate; calycine segments villous, adpressed; corolla campanulate; spurs of anthers subulate, hairy. G. Native of the Cape of Good Hope. E. axílaria, Sal. in Lin. trans. 6. p. 325. E. arbórea, Thumb. diss. no. 65. Bracteas 2, minute. Corolla 1 1/2 lines long, smooth. There are white and purple flowered varieties of this species. Corolla campanulate. Style exserted.

**Strigose Heath.** Fl. March, April. Clt. 1775. Shrub 1 to 2 feet.

**Neglected Heath.** Fl. year. Clt. 1794. Shrub 1 foot.

41 E. lasophyílla (Spreng. syst. 2. p. 195.) leaves 4 in a whorl, linear, scabrous, glandularly ciliated, spreading, aristate at the apex; flowers racemose, drooping; corolla adpressed; corolla campanulate; anthers awned. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

42 E. floribu'nda (Lodd. bot. cab. 176.) glabrous; leaves 4 in a whorl; flowers terminal; corolla bell-shaped, open; anthers awned. G. Native of the Cape of Good Hope. Flowers small, axillary and terminal, pale red. Style exerted.

**Bundle-flowered Heath.** Fl. April, May. Shrub.

43 E. pellitíforis (Sal. in Lin. trans. 6. p. 576.) leaves 4 in a whorl; flowers terminal; pedicels hardly pubescent; corolla 1 1/2 line long, with a bowl-formed tube, and with the interstices of the limb oval at the base; spurs of anthers saccate. G. Native of the Cape of Good Hope. Erica persolúta, Thumb. diss. no. 62. Corp. bot. mag. no. 342. E. viridipúpura, Lin. diss. no. 9, with a flower. E. Mauritíánica, Lin. syst. nat. ed. 10. p. 1002. There are varieties of this with either white or purple flowers.

44 E. quadríflóra (Sal. in Lin. trans. 6. p. 375.) stem glabrous; leaves 4 in a whorl; flowers terminal, by fours; corolla 1 1/2 line long, with a cup-shaped tube, and an erect limb; spurs of anthers lanceolate-cuneate. G. Native of the Cape of Good Hope. E. quadrangularis, Sal. prod. p. 297.

45 E. leuca'ntia (Leaf) leaves 4 in a whorl; flowers terminal, umbellate; bracteas remote from the calyx; corolla bell-shaped; anthers awned. G. Native of the Cape of Good Hope. E. regemíminans, Andr. heath. vol. 4, but not of Lin. Flowers small, white. Style a little exerted.

** * * * Leaves 4 in a whorl. Corollas urceolate.**

Var. β, álba (Bedf. hort. eric. wob. p. 25.) flowers white. Ait. hort. kew. 2. p. 393.

**Besom Heath.** Fl. July, Sept. Britain. Shrub 1 1/2 to 1 foot.

47 E. Blanfordia'na (Ait. hort. kew. 2. p. 392.) leaves linear, 4 in a whorl, spreading; flowers terminal, almost solitary; corolla ovate-globose, or urceolate; anthers awned. G. Native of the Cape of Good Hope. Curt. bot. mag. 1793. Lodd. bot. cab. 115. E. Blanfordio, Andr. heath. 3. t. 8. Corollas yellow, small. In the botanic eric. wob. the anthers are said to be mutic; this must be wrong.

48 E. hirtíflóra (Sims. bot. mag. 481. Lodd. bot. cab. 1812.) leaves linear, hairy, 4 in a whorl; flowers terminal, umbellate, downy; corolla ovate-globose, with an erect limb; anthers awned; fruit glabrous. G. Native of the Cape of Good Hope. E. mitrefórmis, Salisb. in Lin. trans. 6. p. 375. E. pubéscens, Andr. leath. 1. t. 5. E. pubéscens, var. hispida, Thumb. eric. no. 61. Corollas purple, small.

49 E. tárdisflóra (Sal. in Lin. trans. 6. p. 375.) leaves 4 in

Late-flowered Heath. Fl. year. Clt. 1800. Shrub 1 to 2 feet.

51 E. fusilla (Salisb. in Lin. trans. 6. p. 374.) downy; leaves 4 in a whorl; calyces adpressed, broad, ovate-cuneated; corollas very small, downy, with a cup-shaped tube, and the limb the length of the tube; anthers awned; fruit glabrous. ½ G. Native of the Cape of Good Hope, in Baay Fals. Flowers terminal.

Least Heath. Shrub.

52 E. conica (Lodd. bot. cab. 1179.) leaves 4 in a whorl, linear, glabrous; flowers axillary, racemose; genitils inclosed. ½ G. Native of the Cape of Good Hope. Flowers purplish-red.

53 E. pubigerata (Sal. in Lin. trans. 6. p. 372.) downy; leaves 4 in a whorl; flowers terminal; calyces spreading, ovate-acuminate; corolla 1½ line long, downy, with a long recurved obtuse limb; anthers awned; fruit hairy. ½ G. Native of the Cape of Good Hope, on Mount Taffelberg.

Down-bearing Heath. Shrub.

54 E. catervsflora (Sal. l. c.) hairy; leaves 4 in a whorl; stem angular; flowers terminal; corolla 2 lines long, downy, with a narrow ovulate tube; anthers awned, dehiscing by long holes. ½ G. Native of the Cape of Good Hope, on the summit of Mount Taffelberg. E. pubescens villosa, Thumb. Thumbs. no. 61.

Company-flowered Heath. Shrub.

55 E. tuberosaflora (Sal. in Lin. trans. 6. p. 377.) stem glabrous; leaves 4 in a whorl; flowers terminal; corolla 1½ line long, smooth, with a tubinate 8-angled tube, and an incurved limb; spurs of anthers glabrous. ½ G. Native of the Cape of Good Hope. Flowers pale purple.

56 E. thlagnifera (Sal. in Lin. trans. 6. p. 374.) leaves 4 in a whorl; flowers terminal; calyx imbricate; corolla 2½ lines long, with an urceolar tube, and a recurved limb: anthers hairy, broadly foraminose; spurs hairy. ½ G. Native of the Cape of Good Hope.

57 E. plumosa (Andr. heath. 2. t. 6.) leaves 4 in a whorl, linear, hairy, erect, imbricated; flowers disposed in axillary whorls; corolla ovate-globose; calyxes hairy; anthers awned. ½ G. Native of the Cape of Good Hope. Erica amoena, Wendl. eric. 17. p. 73. Corollas purplish-red. Branches erect. Style exserted.

58 E. tendissima (Wendl. eric. fasc. 6. p. 9, with a figure) leaves 4 in a whorl, linear-filiform, glabrous, erect, somewhat imbricated; flowers terminal, aggregate; calyx short, naked; corolla urceolate, with an erect limb; anthers appendiculate. ½ G. Native of the Cape of Good Hope. Flowers red.

Cupped-beaked Heath. Shrub.

60 E. piluliformis (Lin. spec. ed. 2. p. 507.) leaves 4 in a whorl, linear, glabrous, ciliated; flowers terminal; corolla globose, 2½ lines long, having the tube length of the calyx; calyce segments ovate, acuminate, deeper coloured at the apex; spurs of anthers linear-attenuated; fruit glabrous. ½ G. Native of the Cape of Good Hope. E. nudiflora, Berg. pl. cap. p. 119. E. piluliformis, Sal. in Lin. trans. 6. p. 370. Flowers red. Style exserted.

61 E. imbrexella (Hort. Loud. Hort. brit. no. 9716. p. 150.) leaves 4 in a whorl; bracteas remote from the calyx; calyx minute; flowers terminal; corolla with an oval tube and a recurved limb; spurs of anthers linear-attenuated, hairy. ½ G. Native of the Cape of Good Hope. E. gracilis, Salisb. in Lin. trans. 6. p. 375. Flowers small, red or purple.

62 E. intervallaris (Sal. in Lin. trans. 6. p. 375.) stem slender; leaves 4 in a whorl, remote; flowers terminal; corolla 1½ to 2 lines long, with an ovate-cylindrical tube, and a broad mouth; anthers awned; pericarp hairy. ½ G. Native of the Cape of Good Hope. Erica elongata, Roxb. mss. Flowers small, red, drooping.—A very pretty species.

63 E. mucosa (Andr. heath. 1. t. 6.) leaves 4 in a whorl, glabrous; flowers terminal; corolla globose, viscid, having the interstices of the limb rather tumid; calyce segments ovate, obtuse, coloured, tipped with green; anthers awned. ½ G. Native of the Cape of Good Hope. Lodd. bot. cab. 35. Icon. pl. kew. t. 15. Flowers pale purplish-red. Corolla with the tube more or less obvate. Style inclosed.

64 E. mucosissima (Bedd. eric. wob. p. 15.) leaves short, 4 in a whorl; flowers terminal; corolla globose; calyce segments coloured, tipped with green; anthers awned. ½ G. Native of the Cape of Good Hope. Lodd. bot. cab. 1202. Flowers small, purplish red. Style inclosed.

65 E. lateralis (Willd. spec. 2. p. 380. but not of Andr.) leaves 4 in a whorl, linear-attenuated, glabrous; flowers terminal; bracteas remote from the calyx; calyce segments ciliated; corolla conical, having the segments anointed with drops of waxy matter at top; crests of anthers downy. ½ G. Native of the Cape of Good Hope. E. gullaeoflora, Sal. in Lin. trans. 6. p. 374. Corollas small, red. Style exserted.

Var. a; stem fastigate; corolla 1 or 1½ line long, with a hemispherical tube; stigma much exserted. ½ G. E. lateralis, Willd. l. c.

Var. b; stem low; corolla 2 lines long, with an ovate tube; stigma hardly exserted. ½ G. E. incarnata, Andr. heath. 1. t. 19. Lodd. bot. cab. 1655.

Var. g; stem dwarf; corolla 2½ lines long, with an ovate tube; stigma a little exserted. ½ G. E. rubens hümilis, Wendl. eric. fasc. 3. p. 13. with a figure.

66 E. festa (Sal. in Lin. trans. 6. p. 371.) leaves 4 in a
whorl; stem angular; flowers axillary at the tops of the branches; corolla viscid, 2½ lines long, with a narrow urceolate tube; filaments mutic; anthers appendiculate. 'G. Native of New Holland. Flowers fulvous.

67 E. canthareforrhis (Lodd. bot. cab. 1961.) leaves ovate, flowers terminal; pedicels about 3 together; calyx reflexed; corolla ovate, ventricose. 'G. Native of the Cape of Good Hope. Flowers white. Anthers unknown. Nearly allied to E. reflexa.

**Tanked-formated flowered Heath.** Fl. May, June. Clt.?

Shrub 1 to 2 feet.

68 E. bonplandia'na (Sims, bot. mag. t. 2126.) leaves 4 in a whorl, imbricate, acerose; flowers terminal, the small branches, solitary or by threes, sessile; anthers close to the calyx; corolla large, with an urceolate tube, and an acute spreading limb; genitils inclosed. 'G. Native of the Cape of Good Hope. Flowers white. Perhaps a species of *Callista*.

**Var. fuscus; flowers buff-coloured.**

**Var. gr. aurantia; corolla orange-coloured, with an ovate-globose tube; anthers a little exerted. 'G. Erica Bonplandia.**

69 E. cupressina (Hort. Bedf. hor. eric. wob. p. 6. pl. 3. f. 10.) leaves 4 in a whorl, slightly ciliated; flowers terminal; corolla ovate-globose; anthers remote from the calyx; calyx recurved; anthers awned. 'G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

**Variatia.**

**Modest Heath.** Fl. April, May. Shrub.

70 E. sullis (Bedf. eric. wob. p. 15.) downy; leaves 4 in a whorl, linear, linear-ovate, glabrous; flowers terminal; corolla ovate-globose; anthers remote from the calyx; corolla globose; anthers wided. 'G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

**Soft Heath.** Fl. May. Clt. 1790. Shrub 1 to 2 feet.

71 E. salicaria (And. heath. vol. 4.) leaves 4 in a whorl, sessile, crowded, linear, glabrous, flowers terminal, umbellate; corolla ovate-globose; anthers wided. 'G. Native of the Cape of Good Hope. Flowers red-purple. Style inclosed.

**Pipkin-flowered Heath.** Fl. Autumn. Clt. 1802. Shrub 2 feet.

72 E. subula'ta (Wendl. eric. ex Spreng. syst. 2. p. 190.) leaves 4 in a whorl, linear-subulate, a little incurved, elongated; branches rather hairy; flowers terminal, crowded; corolla urceolate; calyxes subulate, adpressed; anthers wided. 'G. Native of the Cape of Good Hope. Flowers purple. Style exerted.

73 E. rufoida (Thumb. diss. 64. t. 6.) leaves 4 in a whorl, linear, pilose; flowers terminal, umbellate, glabrous; calyxes villous, reflexed; corollas 2 lines long, urceolate; anthers lanceolate. 'G. Native of the Cape of Good Hope. Flowers red, with a globular tube, and the segments imbricate at the base. Anthers very minute. Style inclosed.

74 E. smithiana (Lodd. bot. cab. 1614. Bedf. eric. wob. p. 794) leaves 4 in a whorl; flowers subterminal, axillary, drooping; corolla globose, bell-shaped; anthers remote from the calyx; anthers awned. 'G. Native of the Cape of Good Hope. Flowers purplish-red.

**Smith's Heath.** Fl. April, May. Clt. 1791. Shrub 1 to 2 feet.

75 E. coriifolia (Bedf. hor. eric. wob. p. 29. but not of Ait. hor. kew.) leaves 4 in a whorl; flowers terminal; corolla ovate; anthers remote from the calyx; anthers inclosed. 'G. Native of the Cape of Good Hope. Flowers white. Style inclosed.

**Cory-laned Heath.** Fl. Autumn. Clt.? Shrub.

76 E. pectinifolia (Sal. in Lin. trans. 6. p. 367.) leaves 4 in a whorl, narrow, ovate-cuneated, pectinated; flowers terminal; calyx, incurved; corolla 5-7 lines long, woolly inside; anthers inclosed, appendiculate. 'G. Native of the Cape of Good Hope. Flowers white. Style inclosed.

§ 2. Anthers crestet.

* Leaves 3 in a whorl. **Corollas campanulate.**

78 E. nivea (Bedf. hor. eric. wob. p. 16.) leaves 3 in a whorl, glabrous; flowers terminal; corolla bell-shaped; anthers remote from and approximating the calyx, large, loose; calyx large; anthers crested. 'G. Native of the Cape of Good Hope. Flowers white. Style subexcised.

**Snowy-flowered Heath.** Fl. Summer. Clt. 1816. Shrub 1 to 2 feet.

79 E. lecanthes (Lin. suppl. p. 223. Andr. heath. 3 t. 15.) glabrous; leaves 3 in a whorl, erect; branches cymose; flowers terminal, drooping; peduncles glabrous; anthers remote from and approximating the calyx; corolla oblong bell-shaped, having the limb as long as the tube; anthers crested. 'G. Native of the Cape of Good Hope. Anthers crested. 'G. Native of the Cape of Good Hope. Flowers white, purple. Style inclosed.

**Var. fuscus; style very long.**

**Var. gr. squarrosa (Hort.) leaves squarrose.**

**Var. gr. miniata (Hortol.) plants small.**

81 E. polytrichifolia (Sal. in Lin. trans. 6. p. 329.) leaves 3-5 in a whorl; stem pendulous; flowers terminal; anthers remote from the calyx; calyxes gradually narrowed at the base; corolla 1-2 lines long; spurs of anthers cuneate. 'G. Native of Portugal, about Lisbon. Fruit pear-shaped. Perhaps only a variety of E. arborea.

**Polytrichum-leaved Heath.** Shrub.

82 E. leucotricha (And. heaths. 2. t. 16.) leaves 3 in a whorl, filiform; branches spreading; flowers terminal, by threes; co-
**Leaves 3 in a whorl.** Corollas urceolate.

83. E. *nītida* (Andr. heath. 3. t. 18.) leaves 3 in a whorl, scabrous, spreading; flowers terminal, drooping; pedicels downy; bracteas sessile, close to the calyx; corollas urceolately globose; anthers crested. **G.** Native of the Cape of Good Hope. Lodd. bot. bot. cab. 1131. E. *reflexa* rubra, Hort. Flowers white, tinged with red. Style exserted.

84. E. *pedunculāris* (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, linear, hispid; flowers terminal; corolla 3 lines long, with a globose tube; anthers woolly, dehiscing by long chinks, crested. **G.** Native of the Cape of Good Hope. E. rābens, Thunb. diss. no. 88. but not of Andr. Pedicels an inch long. Flowers purplish red.

*Peduncular-flowerd* Heath. Shrub.

85. E. *fauśta* (Sal. in Lin. trans. 6. p. 326.) leaves 3 in a whorl, bristle flowers terminal; corolla 3½ lines long, downy outside, with an urceolate tube; spars of anthers serrated, attenuated, crested. **G.** Native of the Cape of Good Hope. Very like *E. hirta*, Thunb. Flowers pale purple.

86. E. *incāna* (Wendl. eric. fasc. 18. p. 89. with a figure.) leaves 3 in a whorl, linear-oblong, obtuse, hairy, white beneath; bracteas remote from the calyx; flowers terminal, downy; corolla urceolate; anthers awned. **G.** Native of the Cape of Good Hope. Flowers white. There is also a red-flowered variety of this species. Style exserted.

87. E. *ovāta* (Lodd. bot. cab. 417.) downy; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corollas ovate; awns of anthers crested a little. **G.** Native of the Cape of Good Hope. Flowers purplish red. Style inclosed.

88. E. *reflexā* (Link, enum. 1 p. 371. Lodd. bot. cab. 1787.) leaves 3 in a whorl, glabrous, lanceolate, obtuse; flowers terminal, usually 3 in a fascicle; calyx, bracteas, and pedicels coloured; corolla ovate, venticose at the base, clammy, crests of anthers plumose. **G.** Native of the Cape of Good Hope. Calyx spreading. Corollas white, waxy, middle sized. Anthers black. Very nearly allied to *E. nītida*, and probably only a variety of it. The young leaves are said by Link to be glandularly ciliated. Style inclosed.

Var, *β*, _atropurpurea* (Lodd. bot. cab. 1400.) plant dwarf; flowers deeper purple.

Var, *γ*, _alba* (Bedd. l. c.) flowers white.

Var, *δ*, _pālīdā* (Lodd. bot. cab. 1507.) flowers pale purple.

90. E. *vernīcella* (Sal. in Lin. trans. 6. p. 335.) leaves 3 in a whorl, viscid; corolla 2½ lines long, with a recurved limb; flowers terminal; spars of anthers ear-formed and cuneated, hairy; fruit smooth. **G.** Native of the Cape of Good Hope. E. glūtīnōsa, Roxb. mas. The leaves are bluntly acuminate, densely clothed with glands in the reduplicate part; hence they appear shining and clammy.

**Leaves 4 in a whorl.** Corollas campanulate.

93. E. *declīnāta* (Bedd. hort. eric. wob. p. 7.) leaves 4 in a whorl; flowers axillar, subspicate; corolla bell-shaped; bracteas remote from the calyx; anthers crested. **G.** Native of the Cape of Good Hope. Lodd. bot. cab. 1662. Flowers white, tinged with red. Style a little exserted.

**Leaves 4 in a whorl.** Corollas urceolate.

95. E. *lachnaeōides*. This species is very distinct from *Erica lachnaeōa*, Andr.; but we have not means of giving any description of it. Anthers crested. **G.** Native of the Cape of Good Hope. E. lachnaeōa purpūreā, Andr. heaths. 3. t. 3. Flowers red.

*Lachnaeōa-like* Heath. Fl. May, July. Clt. 1793. Shrub 96. E. *racemīfera* (Andr. heaths. 3. t. 12.) leaves 4 in a whorl, and are as well as the calyces glabrous; flowers axillary, verticillate; corolla ovate-globose; anthers crested. **G.** Native of the Cape of Good Hope. Flowers small, red. Style inclosed.

97. E. *sōlānīdrī* (Andr. heath. 2. t. 17. Ait. hort. kew. 2. p. 399.) leaves 4 in a whorl, hispid; branches decumbent; flowers terminal, capitate, or umbellate; bracteas sessile, linear, ciliated, near the calyx; corolla globosely bell-shaped; anthers crested.

*512*
ERICACEÆ.  I. ERICA.

ERI.  G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

98 E. acvta (Andr. heath. 2. t. 19. Ait. hort. kew. 2. p. 399.) leaves 4 in a whorl, stiff, glabrous, spreading; flowers terminal, usually by threes, drooping; bracteas approximating the calyx; corolla ovate-globose; anthers crested. ER. G. Native of the Cape of Good Hope. Flowers small, deep purplish-red. Calyx ciliated. Style inclosed.

99 E. rubens (Andr. heath. 2. p. 21.) leaves 4 in a whorl, hispid, spreading; flowers terminal; bracteas remote from and approximating the calyx; anthers crested or awned; corolla ovate-globose. ER. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style incised.

101 E. barba'ta (Andr. heath. 2. t. 23.) leaves 4 in a whorl, ciliated; flowers terminal, umbellate, drooping; corolla short, urceolate; bracteas remote from the calyx; calycine segments spatulate, ciliated; anthers crested. ER. G. Native of the Cape of Good Hope. Lodd. bot. cab. 124. Erica barbata major, Andr. heath. 2. t. 23. Flowers pale yellow, with brown anthers. Style incised.

Var. β. minor (Andr. heath. 2. t. 24.) flowers white, with black anthers; but according to the hort. eric. wob. they are red, flowering Feb. Aug.

103 E. cernua (Lin. suppl. p. 222.) leaves 4 in a whorl, hoary, villous or ciliated, aristate: those of the branches ovate; flowers terminal, drooping, umbellate; bracteas decurrent; calyx much fringed; corolla ovate-globose; anthers crested. ER. G. Native of the Cape of Good Hope. Montin, in act. ups. 2. p. 291. t. 9. f. 3. Flowers purplish-red or pink. Corolla ½ lines long.

104 E. velece'nuda (Sal. in Lin. trans. 6. p. 379.) leaves 4 in a whorl, linear, incurvedly spreading, glabrous; branches hairy; spikes coarctate; flowers drooping; bracteas and calyces fringed; corolla 2½ lines long, with an amphoteri-formed tube, and crenulated limb; anthers hairy; spurs cuneated, hairy. ER. G. Native of the Cape of Good Hope. Erica cernua, Andr. heath. 1. t. 20. Lodd. bot. cab. 822. but not of Lin. Flowers flesh-coloured. Style inclosed.

105 E. pendula (Wendl. eric. 10. p. 13. with a figure) leaves 4 in a whorl, glabrous; flowers terminal, drooping; bracteas remote from the calyx; calycine segments lanceolate, adpressed; corolla ovate, angular; anthers crested. ER. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 400. E. arbuscula, Lodd. bot. cab. 843. Flowers purple: in hort. kew. there are said to be 3 bracteas on each pedicle; 2 near the calyx, and the third remote from it. Style inclosed.

106 E. nutans; leaves 4 in a whorl; flowers terminal, drooping; bracteas remote from the flower; calyx ribbed, green; corolla ovate-globose; anthers crested. ER. G. Native of the Cape of Good Hope. E. pendula, Hort. Bedd. eric. wob. p. 18. but not of Wendl. Flowers reddish-purple. Style a little exserted.

107 E. fibula (Link. enum. 1. p. 368.) leaves 4 in a whorl, finely ciliated; flowers terminal; bracteas remote from the calyx; corolla oblong-globose; anthers crested. ER. G. Native of the Cape of Good Hope. E. lactiflorum, Roll. cat. E. tricolor, Spreng. syst. 2. p. 193. Limb of corolla connivent and drawn out. Flowers white. Style inclosed.

108 E. lactiflora (Lodd. bot. cab. t. 901.) leaves 4 in a whorl, and are as well as the branches scabrous; flowers terminal, erectish; corolla ovate; bracteas remote from the calyx; anthers crested. ER. G. Native of the Cape of Good Hope. E. lactiflorum, Rol. cat. E. tricolor, Spreng. syst. 2. p. 193. Limb of corolla connivent and drawn out. Flowers white. Style inclosed.

109 E. unica (Spreng. syst. 2. p. 183.) leaves 4 in a whorl, crowded, ciliated, erect; flowers terminal, umbellate, drooping; bracteas remote from the calyx; calyx minute, coloured, ciliated; corolla urceolate or globosely bell-shaped; anthers crested. ER. G. Native of the Cape of Good Hope. E. pedunculata, Andr. heath. 4. icon. but not of Wendl. E. ciliata, Hort. Flowers purplish-red. Style inclosed.

* * * * * Leaves 5-6 or more in a whorl. Corollas campanulate.

111 E. empetrifolia (Lin. mant. p. 375.) leaves 6-7 in a whorl, oblong-linear, ciliated, erect; flowers disposed in globose racemose whorls; bracteas and calyces lanceolate; corolla 2 lines long, hairy, with an urceolar tube, and a recurvedly spreading limb; anthers awned or crested; stigma exserted. ER. G. Native of the Cape of Good Hope. Lin. diss. no. 15. with a figure. Thunb. diss. no. 70. Curt. bot. mag. 447. Lodd. bot. cab. 1875. Calyx 4-lobed. Style exserted Flowers purplish-red.
**ERICACEÆ. I. ERICA.**

_Bell-flowered_ Heath. Shrub.

**• • • • ** Leaves 5-6 in a whorl. Corollas urceolate.

113 E. empénotidès (Andr. heath. 2. t. 25. Ait. hort. kew. 2. p. 299.) leaves 6 in a whorl, glaucous, ciliated, spreading, soft; flowers terminal, subsicope, close; bracteas hairy, approximating the calyx; corollas ovate; calyx green, rough, large; auricles of anthers broad. ō G. Native of the Cape of Good Hope. Lodd. bot. cab. 1758. E. pyxidifólia, Sal. in Lin. trans. 6. p. 371. E. empetrifòlia glauca, Wendl. eric. 11. p. 11, with a figure. Flowers pale purplish-red. Calyx 4-cleft. Corolla smooth, 2 lines long, with an obovate tube, and an incurvally spreading limb. Pericarp globose, glabrous. Style exserted.

114 E. málleolâris (Sal. in Lin. trans. 6. p. 370.) leaves 6 in a whorl; flowers axillary at the tops of the branches; calyx quadrifid; corolla 1 1/2 line long, smooth, with an urceolar tube, and a recurvedly spreading limb; pericarp glabrous. ō G. Native of the Cape of Good Hope. Erica empetrifòlia, Schnev. pl. no. 17, with a figure. Houtt. pl. syst. 4. p. 517. t. 23. f. 2. Berg. pl. cap. p. 120.

115 E. glutinósa (Berg. fl. cap. p. 98. Thumb. diss. no. 48.) leaves alternate or opposite, beset with glandular hairs; spikes of flowers coarctate; flowers drooping; bracteas remote from the calyx; corollas viscid, with an ovate pyramidal tube and a spreading limb; anthers crusted. ō G. Native of the Cape of Good Hope. Icon. pl. kew. t. 17. E. drosseròides, Andr. heath. 1. t. 13. Lodd. bot. cab. 1685. Andrómeda drosseròides, Lin. mant. 239. Corollas deep red, form of those of a species of Callist. 3 to 5 lines long.

116 E. pálax (Sal. in Lin. trans. 6. p. 371.) leaves 6 in a whorl; flowers axillary at the tops of the branches; corolla 2 lines long, viscid, with the tube urceolar and a little ribbed; filaments length of tube, spurred; pericarp viscid. ō G. Native of the Cape of Good Hope. Anthers bipartite.

117 E. páillos (Sal. in Lin. trans. 6. p. 371.) leaves 6 in a whorl; flowers axillary at the tops of the branches; corolla 3 lines long, viscid, with an urceolar, rather ribbed tube; filaments hardly the length of the tube, minutely spurred. ō G. Native of the Cape of Good Hope.

118 E. carduifólia (Sal. in Lin. trans. 6. p. 330.) leaves 6 in a whorl, bristy; flowers terminal; pedicels long; corolla 2 1/2 lines long, smooth, with a glabrous tube; filaments very short; anthers awned. ō G. Native of the Cape of Good Hope. Stigma narrow. Corollas purple.

119 E. cinérascens (Willd. endem. suppl. p. 21.) branches and calyces tomentose, and beset with long hairs; leaves 5 in a whorl, ciliated with long hairs; bracteas foliaceous, close to the calyx; style subexserted; anthers awned. ō G. Native of the Cape of Good Hope. Flowers purple. Nearly allied to _E. cinerà._

120 E. phýsòsèdes (Lin. spec. ed. 2. 566. diss. no. 32, with a figure) leaves 4-6 in a whorl, spreading, viscid, slender; flowers terminal, 4-6 in a fascicle; bracteas remote from the calyx; calycine segments ovate, ciliated; corolla ovate-globose, clammy, having the interspaces of the limb ending in a tumid hook; anthers crested. ō G. Native of the Cape of Good Hope. Lodd. bot. cab. 223. E. sèquax, Sal. in Lin. trans. 6. p. 378. Corolla 3-4 lines long, white. Style inclosed.

§ 3. Anthers mutic, that is, without awns or crests.

* Leaves 3 in a whorl. Corollas campanulate.

121 E. canaliculâtà (Andr. heath. 3. t. 38.) leaves 3 in a whorl, subulate, glabrous, spreading; pedicels terminal, by threes, bracteate, downy; calyces coloured; corolla campanulate; stamens a little exserted. ō G. Native of the Cape of Good Hope. Lodd. bot. cab. 184. Corollas pale red, spreading.

123 E. fæâva (Andr. heath. 2. t. 38. Ait. hort. kew. 2. p. 292.) leaves 3 in a whorl, short, glabrous, erect; flowers terminal, crowded; pedicels bracteate; corolla campanulate. ō G. Native of the Cape of Good Hope. Lodd. bot. cab. 882. Flowers yellow. Style exserted.

124 E. coarçatâ (Wendl. eric. fass. 19. no. 1.) leaves 3 in a whorl, linear, a little ciliated, erectly spreading; flowers twin, axillary, erect, on pedicels, which are equal in length to the leaves; calyx small, foliaceous; stigma peltate; anthers mutic. ō G. Native of the Cape of Good Hope. Corolla campanulate, purple, dilated at top. Style much exserted. Bracteas remote from the calyx.

125 E. approximâtâ (Schlecht. ex Spreng. syst. 2. p. 196.) leaves 3 in a whorl, nearl tetricate, petiolate, short, glabrous, remote, spreading; branches twiggy, rather hairy; flowers subracemose, glabrous; calyx coloured, adpressed. ō G. Native of the Cape of Good Hope. Corolla campanulate. Anthers mutic.

126 E. spiculifólia (Sal. in Lin. trans. 6. p. 324. Smith, fl. græc. t. 333.) leaves 3 in a whorl, mucronulate, ciliated; flowers disposed in terminal racemes, drooping; pedicels bracteless, rather downy; style much exserted. ō H. Native on the top of Mount Olympus. E. Ólympica, Sibth. ms. Corollas 1 line long, smooth, red. Calyx coloured.

_Spike-flowered Heath._ Shrub decumbent.

127 E. scopâria (Linn. mant. 375. Diss. eric. no. 13, with a figure of the flower) leaves 3 in a whorl, linear, glabrous; flowers axillary, disposed in second racemes; corolla smooth, campa-
ERICACEÆ. I. ERICA.

*Leaves 3 in a whorl. Corollas urceolate.

133 E. eriocéphala (Andr. heath. 2. t. 37.) leaves 3 in a whorl, and are as well as the calyxes and corollas woolly; bracteas remote and approximating the calyx; anthers a little exserted; flowers terminal, umbellate; corolla urceolate; G. Native of the Cape of Good Hope. Lodd. bot. cab. 1270. E. canescens, Ait. hort. kew. 2. p. 407. E. graphiloides, Hort. Flowers with a purplish-red calyx, and a white corolla. Style exserted.

134 E. tuberculâris (Sal. in Lin. trans. 6. p. 330.) leaves 3 in a whorl; flowers terminal; corolla 1½ line long, rough from tubercles, with a globose tube; filaments mutic; pericarp on a long stipe. G. Native of the Cape of Good Hope. Erica inclyta, Sal. ms. Anthers minute, smooth. Flowers purple.

136 E. absinthoides (Lin. mant. p. 66.) leaves 3-4 in a whorl, linear, scabrous, more or less ovate, rather remote; flowers twice, terminal on axillary branches, drooping; calyx and corollas glabrous; bracteas remote from the calyx, leaf-like; corolla globose, viscid; stamens exserted. G. Native of the Cape of Good Hope. E. virgulâris a, Salib. in Lin. t. 3. p. 324. E. virgulâta, Wendl. E. exsêrta, Hort. Corollas white, with a red apex.

139 E. f. Colîle'ter (Spreng. syst. 2. p. 192.) branches straight, hairy; leaves linear-oblong, obtuse, revolute, rather hispíd, spreading; flowers axillary, drooping, clamy; corolla urceolate; style exserted; stigma peltate. G. Native of the Cape of Good Hope.

Collette Heath. Shrub.

** Leaves 4 in a whorl. Corollas campanulate.

140 E. odóra'ta (Andr. heath. 3. t. 64.) leaves 4 in a whorl, glandularly ciliated, spreading; flowers terminal, umbellately verticillate, drooping; pedicels coloured; bracteas remote from the calyx; corolla campanulate, viscid. G. Native of the Cape of Good Hope. Lodd. bot. cab. 633. Sims, bot. mag. 1399. Corolla white, very like those of some species of An'drómeda. Style inclosed.

141 E. prope'ndens (Andr. heath. 2. t. 45. Sims, bot. mag. 21408.) leaves 4 in a whorl, short, ciliated; branches flexuous; bracteas approximating the calyx; flowers terminal, solitary or by threes; corolla bell-shaped. G. Native of the Cape of Good Hope. Lodd. bot. cab. 63. Calycine segments jagged or serrated. Corolla purple, or deep red. Style inclosed.

142 E. pal'ûstris (Andr. heath. 2. t. 46.) leaves 4 in a whorl, linear, obtuse, downy; flowers terminal, umbellate; bracteas...
remote from the calyx; corollas cylindrically bell-shaped; anthers a little exserted. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Lodd. bot. cab. t. 4. Branches divaricate. Corollas reddish-purple.

143 E. visca'ria (Andr. heath. t. 1. t. 43.) leaves 4 in a whorl, linear, glabrous, spreading; flowers axillary, disposed in verticillate spikes or racemes, drooping; corolla campanulate, clothed with ciliate down; bracteas exserted from the calyx, sessile; calyxes perigynous; corolla glabrous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Lodd. bot. cab. 726. Icon. pl. kew. t. 1. E. viscida, Sal. in Lin. trans. 6. p. 372. Corolla pale purplish-red, 3 lines long, with a cup-shaped ribbed tube. Style inclosed.

Var. a, incâna; leaves hoary, 1½ to 3 lines long. \( \frac{1}{2} \). G. E. viscia'ria, Thunb. diss. no. 40. Lin. mant. 521. diss. no. 45. with a figure.

Var. b, glabra; leaves green, 3½–5½ lines long. \( \frac{1}{2} \). G. E. viscia'ria, Andr. heath. t. 43. Icon. pl. kew. t. 1.

144 E. pyrami'diformis (Wendl. ex Spreng. syst. 2. p. 198.) leaves linear, hispid, spreading, 4 in a whorl; flowers terminal, usually by threes, erect; calyxes adpressed, hispid; stigma quadrifid. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Flowers purplish-red, campanulate.

145 E. nida'cula'ria (Lodd. bot. cab. 764.) glabrous; leaves 4 in a whorl, short, obtuse; flowers terminal, imbricate; bracteas remote from the calyx; corolla cup-shaped; style exserted; anthers mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Flowers white.

146 E. be'lla (Lodd. bot. cab. 307. Spreng. syst. 2. p. 197.) leaves 4 in a whorl, linear, filiform, smoothish, spreading, incurved at the apex; pedicels terminal, racemose, hispid, erect; calyx reflexed: style filiform; corolla campanulate; anthers mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. E. pulchella, Hortul. Flowers red. Style exserted.

147 E. styli'aris (Spreng. syst. 2. p. 198.) leaves 4 in a whorl, linear, obtuse, much spreading, and are as well as the branches hispid; flowers terminal, glomerate, erectish; calyxes coloured, spreading, ciliolate; corolla campanulate; style much exserted; stigma capitate. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Anthers mucous.

148 E. jub'a'ta (Lodd. bot. cab. icon.) leaves 4 in a whorl, linear, filiform, rather ciliate, incurvedly spreading; pedicels terminal, corymbose, hispid; calyx tetragonal, coloured, sericulated; corolla campanulate rotate; anthers mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope.

149 E. consta'ntia (Bedf. eric. wob. p. 6.) leaves 4 in a whorl; flowers terminating the branches; bracteas remote from the calyx; corolla bell-shaped. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Style exserted.

150 E. con'geta (Wendl. eric. fasc. 17. p. 75.) leaves 4 in a whorl, linear, pilose, spreading; flowers axillary, capitate, drooping; calyx foliaceous, imbricate, toothed; corolla campanulate, open; bracteas sessile; anthers mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Flowers white. Style exserted.

151 E. flexi'caulis (Dry. in hort. kew. p. 2. p. 395.) leaves linear, 4 in a whorl, spreading, oblong, glandularly ciliate; flowers terminal, umbellate; calyxes coloured, glandularly ciliate. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. E. glandulosa, Andr. heath. 2. t. 58. but not of Thumb. Corolla purple, urceolate. Style inclosed.

152 E. perla'ta (Hort. ex Bedf. hort. eric. wob. p. 18.) leaves 4 in a whorl; flowers terminal, umbellate; bracteas free from the calyx; corolla globose; anthers a little exserted, mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Corolla reddish-purple; anthers reddish-orange. Style exserted.

153 E. cruci'formis (Andr. heath. vol. 4. icon.) leaves 4 in a whorl, linear, glabrous, spreading; flowers terminal, by fours, deccussate; corolla urceolate; anthers mucous. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Flowers purple. Style inclosed.

154 E. meli'fera (Hort. ex Link. enum. 1. p. 370.) leaves 4 in a whorl, linear, hairy, spreading, rather remote; flowers terminal, aggregate; calyxes foliaceous; corolla campanulate; anthers mucous; style capitata, exserted. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Branches hairy. Corollas purple. Anthers exserted, awned.

Honey-bearing Heath. Shrub.

155 E. Sicilia (Schönberg, in Linnaea. 2. p. 614.) leaves 4 in a whorl, petiolate, linear, nearly terete, ciliate; flowers terminal, on long pedicels, subumbellate, ciliate, erect; calyx small, scales ciliate; corolla campanulate; anthers mucous; style capitata, exserted. \( \frac{1}{2} \). H. Native of Sicily. Flowers red.

Sicilian Heath. Fl. April, June. Clt. 1819. Shrub 2 to 3 feet.

156 E. aggrega'ta (Wendl. eric. fasc. 18. p. 11.) leaves 4 in a whorl, linear, hairy, spreading; flowers terminating the small branches; bracteas remote from the calyx; corolla globose, downy, with an erectish limb. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Lodd. bot. cab. 1678. Flowers purplish-red, the whole forming bracted raceme. There is also a white-flowered variety of this. Style exserted.

157 E. dec'ora (Andr. heath. 3. t. 66. Ait. hort. kew. t. 392.) leaves 6 in a whorl, elongated, recurved; flowers axillary, terminal, disposed in spikes or racemes; bracteas remote from the calyx; corolla campanulate; anthers a little exserted. \( \frac{1}{2} \). G. Native of the Cape of Good Hope.

158 E. Beaumont'a'na (Roll. Lodd. bot. cab. 1686.) glabrous; leaves linear, 5½ in a whorl; flowers axillary and terminal, drooping; pedicels many-bracteata; corolla campanulate; style a little exserted. \( \frac{1}{2} \). G. Native of the Cape of Good Hope. Corollas white. Allied to E. propendens.

159 E. ceris'thoides (Lin. spec. ed. 2. p. 505. diss. no. 43.)
with a figure) leaves 5-6 in a whorl, linear-lanceolate, pilose and ciliated, bearded at the apex; flowers terminal, capitate, drooping; corolla oblong, with an inflated tube, clothed with viscid hairs outside; bracteas sessile, larger than the calyx; segments of calyx cuneate. *G.* Native of the Cape of Good Hope. 

§ 1. Anthers mutic at the base, that is, without any horns, anns, or spurs. 

*Leaves 4 in a whorl.* Corollas campanulate.

1 G. *va'gans* (Salisb. mss. ex Don, in edinb. phil. journ. 17. p. 153.) leaves 4-5 in a whorl, glabrous; flowers axillary, racemose; bracteas remote from the calyx; pedicels usually twin; corolla short, campanulate. *H.* Native of England, in Cornwall; and of the south of France and north of Africa.

II *GYPSOCALLIS* (from γύπος, gypsos, lime, and κάλλος, kallos, most beautiful; the plants are very elegant, and generally inhabit calcareous districts). Sal. mss. D. Don, in edinb. phil. journ. 17. p. 153.—Erica species of authors. 

LIN. SYST. Octádmia. Monogynia. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated mouth. Stamens exserted; filaments flattened or filiform; anthers bipartite; having the cells mutic at the base, distinct and subipitate, dehiscing by an oblique pore. Stigma simple. Capsule 4-celled, many-seeded.—Small shrubs, natives of Europe and Africa, with whorled acerose leaves, and lateral or terminal crowded flowers. This genus is easily distinguished from *Erica* in the exserted anthers, flattened filaments, and simple stigma.

§ 4. Anthers corniculate. Leaves 3 or 4 in a whorl.

160 *E.* M. (Andr. heath. vol. 4. icon.) leaves 3 in a whorl; flowers terminal by threes or fours; corollas ovate; bracteas remote from the calyx; anthers corniculate. *G.* Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

Delicate Heath. Fl. Year. CIt. 1791. Shrub ½ foot. 163 *E.* graced (Andr. heath. 1. t. 2.) stem and branches glabrous; leaves glabrous, 4 in a whorl, linear; flowers terminal; corolla ovate-globose, or urceolate; anthers corniculate. *G.* Native of the Cape of Good Hope. Lodd. bot. cab. 244. Flowers small, purplish-red. Style inclosed.

Early Heath. Fl. March. CIt. 1820. Shrub ½ foot. 165 *E.* fimbriata (Andr. heath. 3. t. 23.) leaves 3-4 in a whorl; flowers terminal, capitate; corolla globose; bracteas imbricated, ciliated; anthers corniculate, a little exserted. *G.* Native of the Cape of Good Hope. Lodd. bot. cab. 1047. Flowers red.

Fringed Heath. Fl. March, May. CIt. 1806. Shrub 1 foot. 166 *E.* setacea (Andr. heath. 1. t. 24.) leaves 3 in a whorl; flowers terminal; corolla globose, bell-shaped; bracteas remote from the calyx; anthers corniculate. *G.* Native of the Cape of Good Hope. Flowers small, purplish-red. Style exserted.

167 *E.* lavandulefolia (Sal. in Lin. trans. 6. p. 332.) stem hoary; leaves 3 in a whorl, hoary?; flowers terminal; bracteas close to the calyx; corollas 2 lines long, with a 4-angled tube, and an incurved limb; filaments very broad at the base; anthers inclosed, mutic. *G.* Native of the Cape of Good Hope.

Lavender-leaved Heath. Fl. May, Aug. CIt. 1795. Shrub. 168 *E.* cristiflora (Sal. in Lin. trans. 6. p. 332.) leaves 3 in a whorl; flowers terminal; calyx 4-toothed; corolla 2 lines long, having the limb 3 times longer than the tube, entire at the base; anthers mutic, inclosed; pericarp smooth. *G.* Native of the Cape of Good Hope. Erica melanthera, Thunb. dis. no. 12. but not of Lin. Perhaps a species of *Lopandra.* 

Crest-flowered Heath. Fl. May, June. CIt. 1803. Shrub. 169 *E.* umbilicata (Sal. in Lin. trans. 6. p. 336.) leaves 3 in a whorl; fascicles 7-12-flowered, terminal; calyx hoary; corolla 2 lines long, having the limb ciliated at both ends; anthers mutic, inclosed; pericarp hairy; stigma narrow. *G.* Native of the Cape of Good Hope. Erica aggregata, Roxb. mss. —Perhaps a species of *Lampros.&mdash;Horn-flowered Heath. Fl. May, Sept. CIt. 17? Shrub. 170 *E.* genistfolia (Sal. in Lin. trans. 6. p. 337.) flowers terminal, by threes; calyx viscid; corolla 2 lines long, having the limb ciliated at both ends; anthers mutic, inclosed; pericarp smooth; stigma broad. *G.* Native of the Cape of Good Hope. Erica tetraloba, Roxb. mss.—Perhaps a species of *Lampros.* 

Periploca-flowered Heath. Fl. May, Dec. CIt. 1812. Shb. Cult. Elegant shrubs when in blossom, like all the other genera of the order. Turfy peat, mixed with sand, is the best soil for the species; and young tops root readily, if planted in a pot of sand in spring, with a bell-glass over them, in a moderate heat. When the plants have grown a considerable size, the balls of earth should be raised a little above the surface, so as to prevent water from remaining at the top of the stem, and the pots in which they are grown should be well drained.
Floral structures:

- **Corolla**: white, oval, terminal, usually with three sepals, drooping, with calyce segments spathulate, serrated, corolla conical.
- **Calyx**: divided into five parts, campanulate, with toothed margins.
- **Pedicel**: elongated, with a rastellum.
- **Anther**: elongated, in a whorl, linear, spreading, with glabrous and hispidly covered tissues.
- **Flower structure**: includes leaves, flowers, petals, sepals, calyx, corolla, anther, filaments, and ovary.

**Additional notes**:

- **Flower clusters** are racemose, with a variety of lengths and colors.
- **Stem** and **branching pattern** vary depending on the species, from erect to procumbent.
- **Leaf characteristics** include glabrous, pubescent, and pilose surfaces.

**Scientific references**:

- **Smith**, *Flora of the British Isles*, vol. 11, 1834.
- **Lin.,** *The Genera of Plants*, 1834.

**European species**:

- **Erica carnea**, native to the South of Germany and Switzerland.
- **Erica neglecta**, native to the Moor-Heath.
- **Erica praestans**, native to the Moor-Heath.

**Mediterranean species**:

- **Erica m.**, native to the Moor-Heath.
- **Erica s.**, native to the Moor-Heath.

ERICACEÆ.

16 G. Actea; leaves 3 in a whorl, glabrous; flowers terminal on short pedicles; bracteas approximating the calyx; calyx one half shorter than the corolla, with ovate segments, furnished with a green line; anthers exerted, mutic; stigma peltate. H. G. Native of the Cape of Good Hope. Erica Actea, Link. enum. 1. p. 371. but not of Bedd. Corollas purplish.

17 G. nodicans; leaves 3 in a whorl, spreading, a little reflexed, linear, glabrous, awned at the apex; flowers terminal, usually by threes; pedicels bracteate, and are as well as the calyx coloured and viscid; corolla campanulate rotate, with a revolute limb. H. G. Native of the Cape of Good Hope. Erica nigrigia, Lodd. bot. cab. t. 54. Flowers white; anthers black.

18 G. pates; leaves 3 in a whorl, oval-oblong, ciliated, spreading; branches hairy; flowers terminal, usually by threes; calyx coloured, ciliated; corolla campanulate rotate; anthers connivent, scabrous. H. G. Native of the Cape of Good Hope. Erica pates, Andr. heath. 2. t. 35. Lodd. bot. cab. 1228. Flowers red.

19 G. concava; leaves 3-4 in a whorl, linear, glabrous, spreading; flowers axillary; corolla campanulate; anthers a little exerted. H. G. Native of the Cape of Good Hope. Erica concava, Ker. in bot. mag. 2149. Flowers pale red.

20 G. acutangula; leaves 3 in a whorl, ? linear; flowers terminal, usually by twos or threes; corolla campanulate, with a short tube, and a reflexed limb. H. G. Native of the Cape of Good Hope. Erica acutangula, Lodd. bot. cab. 1868. Flowers white; anthers black, exerted. Bracteas approximating the calyx, sessile.

21 G. melanthiaca; leaves 3 in a whorl, obtuse, smooth, spreading; flowers terminal, subumbellate, nutant; bracteas remote from the flower; corolla bell-shaped; bracteas and calyces coloured; stigma obtuse; fruit silky. H. G. Native of the Cape of Good Hope. Erica melanthiaca, Linn. mant. 232. Lodd. bot. cab. 867. Erica lysimachiaeflora, Sal. in Lin. trans. 6. p. 332. Corolla 2 lines long, having the limb twice the length of the tube. Flowers red, with black anthers. Calyx large, and is, as well as the pedicles, coloured.

22 G. thalictriflora; branches hairy, straight; leaves 3 in a whorl, linear, glabrous, erect; flowers terminal, 2-3 together, erect, almost sessile; bracteas approximating the calyx; corolla short, campanulate, with deep open segments. H. G. Native of the Cape of Good Hope. Erica thalictriflora, Lodd. bot. cab. t. 1294. Flowers yellow.

** Leaves 3 in a whorl. Corollas urceolate.

Umbrilale Moor Heath. Fl. April, July. Clt. 1782. Shrub 2 to 3 feet.

24 G. villosa; leaves 3 in a whorl, linear, spreading, villous; flowers axillary or terminal, on long pedicels, drooping, usually by threes; calyces segments ovate, villous; corollas urceolate, with the limb a little connivent. H. G. Native of the Cape of Good Hope. Erica villosa, Andr. heath. 3. t. 53. Corollas white, with black anthers.

25 G. dumosa; leaves 4 in a whorl, oval, with revolute edges, spreading, hairy; flowers terminal, corymbosse, drooping; calyces adpressed, follicaceous; bracteas close to the calyx; corollas urceolate. H. G. Native of the Cape of Good Hope. Erica dumosa, Andr. heath. 4. icon. Flowers pale red.

27 G. staminea; leaves 3 in a whorl, linear, glabrous, erect; flowers axillary, scattered; bracteas approximating the calyx; corolla subtrose, about equal in length to the calyx; stamens divaricate, much exerted. H. G. Native of the Cape of Good Hope. Erica staminea, Andr. heath. 3. t. 48. Flowers sulphur-coloured.

28 G. tiareflora; leaves 3 in a whorl, stiff, spreading, obtuse; flowers terminal, glomerate, drooping; calyx bracteate; corolla covered by the calyx, having the tube dilated at the base; filaments gradually dilated. H. G. Native of the Cape of Good Hope. Erica tiareflora, Andr. heath. 3. t. 52. Erica placentaflora, Sal. in Lin. trans. 6. p. 548. Plant with pale hoary aspect. Calyx coloured. Flowers red; anthers black.

29 G. imbricata; leaves 3 in a whorl, linear, erect, imbricated; branches rather hairy; calyx imbricated by bracteas; corollas urceolate, 1 line long, length of calyx; flowers terminal, aggregate, erectish; pericarp eggaroid. H. G. Native of the Cape of Good Hope. Erica imbricata, Linn. mant. 372. diss.
ERRICACEAE. II. GYPSOCALLIX.

803

no. 52. with a figure of the flower, spec. ed. 2. p. 503. Andr. heath. 1. t. 34. Lodd. bot. cab. 1347. Erica quinquangularris, Berg. pl. cap. p. 117. Erica pyramidalis, Sal. in Lin. trans. 6. p. 349. Flowers small, white or red, with brown anthers. * 

Shrub 1 foot.

30. G. squameflora; leaves 3 in a whorl, linear; flowers terminal; bracteas scattered above the middle of the pedicels; corolla ⅔ of a line long, shorter than the calyx; anthers acuminate; fruit broad, ovate. גו. Native of the Cape of Good Hope. Erica squameflora, Sal. in Lin. trans. 6. p. 349. Erica imbricata, Roxb. mss. but not of Lin.

Shrub 2 feet.

31. G. caesia; leaves 3 in a whorl, short, linear, glabrous; flowers terminal, twin, erect; calyx imbricate by bracteas; corolla campanulate, ⅔ of a line long, shorter than the calyx; anthers oblong, with a narrow dissepiement; fruit ovate; stigma broad. גו. Native of the Cape of Good Hope. Erica caesia, Sal. in Lin. trans. 6. p. 349. 

Grey Moor Heath. Shrub.

32. G. flexuosa; leaves 3 in a whorl, linear, glabrous, erect, short; flowers terminal, usually by threes, erect; bracteas scattered above the middle of the pedicels, imbricate, small; corolla bell-shaped, 1 line long, longer than the calyx, which is coloured; anthers oblong, with a narrow dissepiement; nectarium large; fruit imbricate. גו. Native of the Cape of Good Hope. Erica flexuosa, Andr. heath. 1. t. 23. Sal. in Lin. trans. 6. p. 349. Lodd. bot. cab. 1495. E. divaricata, Wendl. eric. t. p. 5. Flowers white, with red anthers.

Fleshy Moor Heath. Fl. April, July. Clt. 1792. Shrub 1 to 2 feet.

33. G. lasciva; leaves 3 in a whorl, linear; flowers terminal; calyx imbricate by bracteas; corolla ⅔ of a line long, a little shorter than the calyx; anthers foraminose from the base; stigma peltate. גו. Native of the Cape of Good Hope. Erica lasciva, Sal. in Lin. trans. 6. p. 349. Erica imbricata, Thumb. diss. no. 11.

34. G. dioteflora; leaves 3 in a whorl; flowers axillary at the top of the branches; calyce segments cuneated; corolla ⅓ line long, with an ureculose tube; anthers a little exserted; pericarp downy. גו. Native of the Cape of Good Hope. Erica dioteflora, Sal. in Lin. trans. 6. p. 342. Erica pistillaris, Sol. mss.

Shrub.

35. G. stylosa; leaves 3 in a whorl; flowers terminal; pedicels long, furnished with bracteas near the calyx; corolla 1 line long, a little longer than the calyx; anthers pointed; fruit ovate; style very long. גו. Native of the Cape of Good Hope. Erica stylosa, Sal. in Lin. trans. 6. p. 530. Erica bracteata, Roxb. mss. but not of Lin.

Shrub.

36. G. polhammii; leaves 3 in a whorl, obtuse, imbricate; flowers terminal; corolla with a globose tube, and a 4-parted limb; anthers a little exserted. גו. Native of the Cape of Good Hope. Erica Polhammii, Lodd. bot. cab. 1852. Flowers pale red, with deep red anthers.

37. G. longipedunculata; leaves oval, mucronate, 3 in a whorl, hispid; flowers terminal, umbellate, on long pedicels, pendulous; bracteas remote from the calyx, deciduous; calyces adpressed; corolla ovate; anthers mutic. גו. Native of the Cape of Good Hope. Erica longipedunculata, Lodd. bot. cab. 103. Flowers large, purple, pedicellate, and are, as well as the calyces, beset with glandular hairs.

Small-needled Moor Heath. Fl. April, June. Clt. 1810. Shrub 1 to 2 feet.

39. G. peltata; leaves 3 in a whorl; flowers terminal; bracteas remote from and approximating the calyx; corolla round, with deep, loose segments. גו. Native of the Cape of Good Hope. Erica peltata, Andr. heath. 4. icon. Erica excelsa, Bedf. eric. wob. p. 9. Flowers pale purplish-red.

* Leaves 3 in a whorl. Corollas campanulate.

40. G. articulatis; leaves 3 in a whorl, glabrous; flowers terminal, umbellate; bracteas remote from the calyx; anthers corniculate; corollas slender, campanulate. のでしょう. Native of the Cape of Good Hope. Erica articulata, Bedf. hort. eric. wob. p. 2. but not of Thumb. nor Curt. Flowers reddish-purple.

Jointed Moor-Heath. Shrub.

41. G. loddioeseni; leaves 3 in a whorl; downy; flowers terminal; bracteas approximating the calyx, sessile; corolla campanulate, with deep segments; anthers awned. のでしょう. Native of the Cape of Good Hope. Erica concavâ, Lodd. bot. cab. 134. but not of Ker. Flowers pale purplish-red, spreading. Probably a species of Erica.

42. G. intertexta; leaves 3 in a whorl, ciliated with long hairs; flowers sessile; bracteas approximating the calyx, which is ciliated; corolla round, campanulate; anthers awned. のでしょう. Native of the Cape of Good Hope. Erica intertexta, Lodd. bot. cab. 1034. Flowers yellow. Anthers black.

43. G. paniculata; leaves 3 in a whorl, linear, triquetrous, glabrous; branches tomentose; flowers terminal, by threes; corolla ⅔ of a line long, campanulate, having the segments imbricate at the base; spurs of anthers linear, smooth; style exserted. のでしょう. Native of the Cape of Good Hope. Erica paniculata, Lin. spec. ed. 2. p. 508. Lodd. bot. cab. 1194. Erica milleflora, Berg. pl. cap. p. 96. Sal. in Lin. trans. 6. p. 550. Flowers red. There is also a white-flowered variety of the species.

Shrub.

44. G. bedfordiana; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corolla bell-shaped; anthers awned, exserted, as well as the style. のでしょう. Native of the Cape of Good Hope. Erica mellifera, Bedf. eric. wob. p. 15. Duke of Bedford's Gypsocallis. Fl. Spring. Clt. 1812. Shrub.

** Leaves 3 in a whorl. Corollas urceolate.

45. G. fragrans; glabrous; leaves opposite, or 3 in a whorl, ⅞ × 2
ERICACEÆ. II. GYPSOCALLIS. III. BLERIA.

**LIN. Syst. Tetra-Pentándria Monogrâmia.** Calyx 4-parted. Corolla short-tubular, with a 4-cleft limb. Stamens 4-6, inserted in the receptacle; filaments linear, flattened, glabrous; anthers binate; cells of anthers attenuated at the base, mutic, dehiscing by an oblong hole. Stigma simple, obtuse. Capsule 4-celled, many-seeded.—Much branched shrubs, natives of the Cape of Good Hope. Leaves verticillate, with revolute margins. Flowers terminal, glomerate.

**Anthers mutic.**

**Depressed Bleria. Fl. June, July. Clt. 1816. Shrub depressed.**

**Scabrous Bleria. Fl. May, June. Clt. 1824. Shrub 1 foot.**

**Fascicled-flowered Bleria. Fl. June, July. Shrub 1 foot.**

5 B. antículata (Lin. mant. 198.) leaves 4 in a whorl, ovate or linear, glabrous, shining; bracteas solitary; calyx funnel-shaped, hairy; stamens 4-5, exerted. *Æ. G. Native of the Cape of Good Hope. Erica antícula, Thunb. prod. 71. Wendl. coll. 2. p. 19. t. 44. Erica paleácea, Sal. in Lin. trans. 6. p. 341. Erica ericóphala, Lam. encyc. no. 73. ill. 78. Flowers reddish. Heads drooping.

**Jointed-stemmed Bleria. Fl. May, June. Clt. 1795. Shrub 1 foot.**

**Purple-flowered Bleria. Fl. May, June. Clt. 1791. Shrub.**

7 B. mucósa (Willd. spec. 1. p. 630. Ait. hort. kew. 1. p. 150.) leaves 4 in a whorl; calyx pilose; corolla campanulate, pilose above; flowers axillary; stigma peltate. *Æ. G. Native of the Cape of Good Hope. Erica albáns. Thunb. prod. 70. ?

**Mossy Bleria. Fl. June, Aug. Clt. 1774. Shrub 1 foot.**

**Least Bleria. Shrub.**

**Hairy Bleria. Shrub.**

10 B. paucilíflóra (Wendl. coll. 2. p. 17. t. 43.) leaves 3 in a whorl, ovate, glabrous; corolla clavate, glabrous; calyx
hairy; anthers exserted. G. Native of the Cape of Good Hope. Flowers red.

11 B. Thunb. - leaves 4 in a whorl; bracteas and calyxes very pilose; corolla 2 lines long, hairy; stamens 4-5, very broad at top, inclosed. G. Native of the Cape of Good Hope. Erica hirsuta, Thunb. prod. p. 72. Sal. in Lin. trans. 6. p. 339.

**Thunberg’s Bleria.** Shrubs.
12 B. ciliciflora; leaves 3 in a whorl, minute; calyx very pilose; bracteas distinct; corolla 1½ line long, hairy; stamens 4, inclosed. G. Native of the Cape of Good Hope. Erica ciliciflora, Sal. in Lin. trans. 8. p. 389. Anthers didymous, bearded.

13 B. xeranthemifolia; leaves 3 in a whorl, recurved; calyx woolly, imbricate; corolla 1½ lines long, woolly; stamens exserted. G. Native of the Cape of Good Hope. Erica xeranthemifolia, Sal. in Lin. trans. 6. p. 339.

14 B. nodiflora; leaves 3 in a whorl, villous; calyx funnel-shaped, very villous; corolla 1½ line long, hairy; stamens 4, exserted. G. Native of the Cape of Good Hope. Erica nodiflora, Sal. in Lin. trans. 6. p. 340.

15 B. flosculosa; leaves 4 in a whorl; calyx fringed; corolla 2½ lines long, with a very narrow tube and dilated limb; stamens 4, exserted, with very narrow filaments. G. Native of the Cape of Good Hope. Erica flosculosa, Sal. in Lin. trans. 6. p. 340. The flowers resemble the florets in the disk of *Compositae*.

**Flosculose Bleria.** Shrubs.
16 B. barbi'gera; leaves 4 in a whorl; calyx deeply 4-cleft, imbricated by bracteas, bearded; corolla glabrous, 2 lines long; stamens 4-5, exserted; style very narrow. G. Native of the Cape of Good Hope. Erica barbigera, Sal. in Lin. trans. 6. p. 341.

**Beard-bearing Bleria.** Shrubs.
17 B. turmalis; leaves 6 in a whorl; pedunecles very short; calyx minute, adpressed; corolla 2 lines long; stamens 4-5, exserted; anthers broad. G. Native of the Cape of Good Hope. Erica turmalis, Sal. in Lin. trans. 6. p. 342.

**Trooper Bleria.** Shrubs.
18 B. equisetifolia; leaves 3 in a whorl; flowers 3-5 in a fascicle; pedunecles long, glabrous; corolla 1½ line long; stamens 4-5, exserted. G. Native of the Cape of Good Hope. Erica equisetifolia, Sal. in Lin. trans. 6. p. 342.

§ 2. Anthers anned.

20 B. ciliaris (Lin. suppl. 122.) leaves 4 in a whorl, glabrous, minute; calyx very hairy; corolla 1½ line long, hairy; stamens 4-5, inclosed; filaments spurred. G. Native of the Cape of Good Hope. Wendl. coll. 2. p. 35. t. 49.

**ERICACEAE. III. BleriA.**

**IV. SYMPIEZA. V. PACHYSI.**

805

21 B. dumosa (Wendl. coll. 2. p. 3. t. 38.) leaves 3-4 in a whorl, linear, oblong, erect, 1 line long; corolla 1½ line long, glabrous; anthers crested, exserted. G. Native of the Cape of Good Hope. Flowers rose-coloured, drooping.

22 B. brunneifolia; leaves 6 in a whorl, long; bracteas near the calyx, the outer one very long; corolla 1½ line long; stamens 6, exserted; filaments spurred. G. Native of the Cape of Good Hope. Erica brunneifolia, Sal. in Lin. trans. 6. p. 341. Erica hemerolista, Sal. ms. 

**Brunia-leaved Bleria.** Shrubs.

**Cult.** Pretty little shrubs, deserving a place in every collection of greenhouse plants. A mixture of turfy peat and sand is the best soil for them; and young tops root readily, planted in a pot of sand in spring, with a bell-glass over them.

**IV. SYMPIEZA (from συμπήζω, sympieza, to press; in reference to the stamens, which adhere to the tube of the corolla.)** Licht. ms. ex Rœm. et Schultes, syst. 3. p. 8. no. 447. and p. 171.

**Lin. syst. Tetrandria Monogynia.** Calyx turbinate, bilabiata, fringed. Corolla tubular, sub-bilabiata, longer than the calyx. Stamens 4-5, inserted in the tube of the corolla, exserted; anthers erect; style length of stamens; stigma simple. Capsule 4-celled, many-seeded.—A small branched shrub, native of the Cape of Good Hope. Leaves adpressed, erect, imbricated, 3 in a whorl, linear, trigonal, glabrous, engraved by a line above. Flowers drooping, disposed in terminal heads, purplish.

**Cult.** See Bléria above for culture and propagation.

**V. PACHYSA (from παχύς, pachys, thick; in reference to the thick substance of the corolla.)** D. Don, in edinb. phil. journ. 17. p. 153.—Erica species of authors.

**Lin. syst. Octandria Monogynia.** Calyx deeply 4-parted, (f. 155 a.) coriaceous. Corolla nearly globose, (f. 155 c.) coriaceous, with a contracted 4-lobed mouth, (f. 155 d.) Stamens inclosed; filaments much dilated; anthers biform; cells of anthers short, crested at the base, opening by an oblique foramen. Style dilated at the base; stigma simple, obtuse. Disk hypogynous, elevated. Capsule 4-celled, many-seeded.—Small erect shrubs, natives of the Cape of Good Hope. Leaves loosely imbricated, compressed, 3 in a whorl. Flowers large, terminal, subcorymbose, drooping; pedicels bracteolate.

**Ardent Pachysia.** Fl. April, June. Clt. 1800. Shrubs 1 to 2 feet.
ERICACEÆ. V. PACHYSA. VI. CERAMIA.

3 P. ariosta; leaves 3 in a whorl, linear, spreading, rough; corolla ovate-globose, clamy; bracteas approximating the calyx; cells of anthers awned. G. Native of the Cape of Good Hope. Erica vörnîx, var. coccinea, Bedf. eric. wob. p. 27. t. 3. f. 22. Corolla reddish-orange, tipped with green. This species differs from the rest in the anthers being awned, not crested.

4 P. lambertiana; leaves 3 in a whorl, linear, glabrous, spreading; corollas glabrous, ovate-globose; bracteas 3 near the calyx, and I remove from it. G. Native of the Cape of Good Hope. Erica lambertiana, Andr. heath. 2. t. 18. Erica lambertiana, Sol. in Ait. hort. kew. 2. p. 391. Lodl. bot. cab. 3. Calyx red. Corollas white.

6 P. formosâ; leaves 3 in a whorl, oblong, obtuse, spreading; calyxes spreading; corolla ovate-globose, clamy. G. Native of the Cape of Good Hope. Erica formosâ, Thumb. diss. no. 80. t. 3. f. 3. Corolla white.

Berry-flowered Pachysa. Fl. April, July. Cilt. 1774. Shrub 1 to 2 feet.

8 P. vesiculâris; leaves 3 in a whorl, besprinkled with black vesicles; corolla 1 line long, clothed with viscid pubescence; anthers inclosed; spurs of anthers parallel, cuneated; fruit silky. G. Native of the Cape of Good Hope. Erica vesiculâris, Sol. in Lin. trans. 6. p. 335. Erica conûceae, Hortul.

9 P. colmifôlora; leaves 3 in a whorl, narrow-cuneate; flowers terminal; calyx imbricating by bracteas; corolla 2½ lines long, viscid, with a spherical tube; spurs of anthers very violous. G. Native of the Cape of Good Hope. Erica glomifôlora, Sol. in Lin. trans. 6. p. 390. Erica viscidî, Sol. mss.

Tufted-flowered Pachysa. Shrub.

Cult. See Erica, p. 800. for culture and propagation.

VI. CERAMIA (from κεράς, keramion, a pitcher; shape of flowers). D. Don, in edinb. phil. journ. 17. p. 153.—Erica species of authors.

2 C. auriculâtis; leaves 3 in a whorl, linear-lanceolate; corolla 3 lines long, downy outside, with an ovate tube; spurs of anthers minute, ear-formed. G. Native of the Cape of Good Hope. Erica auriculâtis, Sol. in Lin. trans. 6. p. 327. Like the preceding, but differs in the spurs of the anthers.

Auricled-anthered Cerâmia. Fl. April, Nov. Cilt. 1500.

Cat-thyme-leaved Cerâmia. Fl. April, May. Cilt. 1792.

4 C. helianthemifôlîa; leaves opposite, obovate; corolla urceolate, 2 lines long, downy both inside and outside; spurs of anthers long. G. Native of the Cape of Good Hope. Erica helianthemifôlîa, Sol. in Lin. trans. 6. p. 328. Corollas white.

VI. CERAMIA

**Ericaceae**

Var. γ; corolla smooth; anthers exerted. **G.** Erica thymifolia, Wendl. obs. p. 48.

**Flat-leaved** Ceramia. Fl. June, Nov. Clt. 1795. Shrub 2 feet.

6 C. thymifolia; leaves 3 in a whorl, ovate, spreading, remititious, ciliate; flowers axillary, solitary; spurs of anthers short; corolla globose, urceolate, downy. **G.** Native of the Cape of Good Hope. Erica thymifolia, Andr. heath. 2. t. 29. Ait. hort. kew. 2. p. 402. Bracteas remote from the calyx. Corollas white, but in Andrew’s figure they are red or purple.

Shrub.

7 C. thymifolia; leaves 3 in a whorl, lanceolate, rather villous, spreading; flowers axillary, cymose. **G.** Native of the Cape of Good Hope. Erica thymifolia, Spreng. syst. 2. p. 109.

Shrub.

8 C. cordata; leaves 3 in a whorl, ovate, sub-cordate, villous above and woolly beneath; branches divaricate, hairy; corolla globose; anthers mutic. **G.** Native of the Cape of Good Hope. Erica cordata, Andr. heath. 3. t. 41. Corollas white, with black anthers.

**Cordate-leaved** Ceramia. Fl. April, June. Clt. 1799.

Shrub diffuse.

9 C. ? calathiflora; leaves 3 in a whorl, ovate, imbricated; flowers terminal; calyx tormentose; corolla campanulate, 1 line long, smooth; spurs of anthers cuneate, hairy: fruit tormentose; style exerted. **G.** Native of the Cape of Good Hope. Erica calathiflora, Sal. in Lin. trans. 6. p. 338. Erica bicolor, Thunb. diss. no. 57. Willd. spec. 2. p. 363.

Shrub.

10 C. latifolia; leaves 3 in a whorl, oblong-lanceolate, villous above and white beneath, as in the rest of the species; flowers axillary, aggregate; corolla conical; genitils exerted; anthers mutic. **G.** Native of the Cape of Good Hope. Erica latifolia, Andr. 2. t. 41. Flowers dark red or purple. Branches flexuous.

Shrub.

11 C. oblata; leaves obliquely verticillate, linear, truncate, with glandular margins; spikes of flowers terminal, corymbose; corolla urceolate, viscid, having the interstices of the limb ending in a tumid hook each; anthers awned. **G.** Native of the Cape of Good Hope. Erica oblata, Thunb. diss. no. 73. with a good figure. Baur. pl. kew. t. 3. Andr. heath, 1. t. 23. Wendl. eric. 17. p. 77. with a figure. Bracteas remote from the calyx; calyx segments linear-oblong. Corollas pale purple.

Shrub.

12 C. oxycoecifolia; stems decumbent, filiform; leaves 3 in a whorl, ovate; corolla 1½ line long, campanulate, hairy; filaments mutic. **G.** Native of the Cape of Good Hope. Erica oxycoecifolia, Sal. in Lin. trans. 6. p. 325.—A very pretty species, with the habit of Oxycoccus palustris. Flowers red.

**Cranberry-leaved** Ceramia. Fl. Feb. May. Clt. 1791.

Shrub decumbent.

13 C. bleennia; leaves 4-5 in a whorl, ovate, cuneated; corolla urceolate, 4-5 lines long, viscid, having the segments imbricated at the base; filaments very broad; anthers corniculate.

**VII. Desmia. VIII. Eurylepis.**

**VII. Desmia** (from desmia, desme, a fascicle; in reference to the glomerate flowers). D. Don, in edinb. phil. journ. July, 1834.—Erica species of authors.

**Lin. syst. Octandria, Monogynia.** Calyx 4-tooth. Corolla globose, with a contracted 4-toothed mouth. Stamens exerted; filaments flattened; cells of anthers short, dehiscing by an oblong foramen, with the base truly simple and confluent in the filament. Stigma capitate. Capsule 4-celled, many-seeded. Seeds suboblongate.—Small erect shrubs, natives of the Cape of Good Hope. Leaves scattered, spreading, subulate. Flowers terminal, glomerate.

Shrub 1 foot.

2 D. aquilegias (D. Don, l. c.) umbels pedunculate, aggregate; filaments dilated. **G.** Native of the Cape of Good Hope.

**Equal Desmia.** Shrub.

3 D. pociolor (D. Don, l. c.) leaves 3 in a whorl, aristate; flowers fascicled; corolla oblong, with a dilated throat; filaments dilated; stigma nearly simple. **G.** Native of the Cape of Good Hope.

**Polium-leaved** Desmia. Shrub.

**Cult.** See Erica, p. 800. for culture and propagation.

VIII. Eurylepis** (from eury, eury, broad, and lepis, lepis, a scale; in reference to the dilated scales of the calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erica species of authors.

**Lin. syst. Octandria, Monogynia.** Calyx 4-parted, coriaceous, bibracteate at the base. Corolla tubular, coriaceous, ventricose at the base, with a 4-cleft erect limb. Stamens inclosed; filaments dilated, canaliculate; anthers bipartite; cells of anthers coriaceous, dehiscing by an oblong foramen, auricled at the base. Stigma clavate, with a 4 tubercled disk and a crenulated ring. Capsule 4-celled, many-seeded. Segments of placentas 2-lobed. Seeds oval, ventricose.—Diffusely branched shrubs, natives of the Cape of Good Hope. Leaves scattered, with revolute margins. Flowers terminal, solitary, large, pendulous.
ERIACEÆ.

§ 1. Anthers mutic at the base. Normal species.

2 A. azaleefólia; leaves 3 in a whorl, lanceolate; flowers terminal; corolla 13 line long, hairy; anthers mutic, exserted, foraminose the whole length. h. G. Native of the Cape of Good Hope. Erica azaleefólia, Sal. in Lin. trans. 6. p. 334. Azalea-leaved Broad-scaled-Heath. Shrub.

6 E. bracteatá; leaves 3 in a whorl, lanceolate, glabrous, adpressed; flowers terminal, umbellate; bracteas large, obovate, and are, as well as the calyxes, coloured; corolla 2 lines long, having the segments crenulatá. h. G. Native of the Cape of Good Hope. Erica bracteatá, Thunb. diss. no. 3. Erica obvallária, Sal. in Lin. trans. 6. p. 397. Filaments spurred. Bracteate Broad-scaled-Heath. Fl. May. June. Clt. 1800. Shrub 1 foot.

7 E. mucronatá; leaves 3 in a whorl, linear-lanceolate, cuspidate, spreading, glabrous; flowers terminal, racemose; calyx bracteate, coloured, about equal in length to the corolla, which is campanulate. h. G. Native of the Cape of Good Hope. Erica mucronatá, Andr. heath. 3. t. 43. Flowers reddish-purple. Mucronate-leaved Broad-scaled-Heath. Fl. May. Aug. Clt. 1800. Shrub 1 foot.

9 E. ? oecordatá; leaves 3 in a whorl, lanceolate, keeled, broad-erect, with scabrous margins; floral leaves or bracteas dilated; flowers terminal; calyxes spreading, about equal in length to the corolla, which is urceolate; bracteas loose, ribbed. h. G. Native of the Cape of Good Hope. Erica oecordatá, Link. Bedf. eric. wob. p. 17. Calyx and corolla purplish-red.

§ 2. Anthers anned or corniculate at the base.

11 E. fra'grans; leaves 3 in a whorl, subulate, glaucous, erect; flowers drooping, terminal, usually by threes; bracteas large; calyx coloured, about equal in length to the corolla, which is campanulate and spreading; anthers bifid at the base, corniculate; stigma obtuse. h. G. Native of the Cape of Good Hope. Erica fra'grans, Andr. heath. 2. t. 27. Lodd. bot. cab. 288. Ait. hort. kew. 2. p. 407. Calyx and corolla purplish-red. Fragrant Broad-scaled-Heath. Fl. March, June. Clt. 1803. Shrub ¾ foot.

14 E. pyroleflóra (D. Don, l. c.) leaves 3 in a whorl, linear-cuneate, glabrous; flowers terminal, aggregate; calyx bracteate, equal in length to the corolla, which is urceolate; segments of the calyx ovate, cuneate; spurs of anthers broad, edformed. h. G. Native of the Cape of Good Hope. Erica pyroleflóra, Willd. spec. 2. p. 356. exclusive of the synonyms. Erica pyroleflóra, Sal. in Lin. trans. p. 2. Flowers white. Corolla 2 lines long, with a 4-angled spherical tube.

15. E. triflora; leaves 3 in a whorl, linear-cuneated, glabrous; spreading; flowers terminal; segments of calyx obturated; corolla 1½ times as long; a turbinate rather 4 angled tube; spurs of anthers narrow-cuneated. \( G \). Native of the Cape of Good Hope. Erica triflora, Linn. 1774. Shrub. 1. Foot.

16. E. palliiflora; stem angular; leaves lanceolate-cuneated, glabrous; flowers terminal; corolla 1½ times as long; a little longer than the calyx; spurs of anthers caréné-emblasted, glabrous. \( G \). Native of the Cape of Good Hope. Erica palliiflora, Linn. 1774. Trans. 6. p. 351. Corolla white, about the length of the calyx.

18. E. rigidiflora; leaves 3 in a whorl, linear, stiff, shining, erectly spreading; flowers terminal, aggregate, drooping; calyces colored, about equal in length to the corolla, which is campanulate; anthers appendiculate. \( G \). Native of the Cape of Good Hope. Erica rigidiflora, Wendl. Desmos.

20. E. Monsoniæ; leaves 3 in a whorl, linear, attenuated and ovate, erect, placed so as to appear in 4 ranks; flowers terminal, nuttant; corollas oblong, inflated, 7-9 lines long; bracteas imbricate, reflexed; calyx recurved; spurs of anthers awned; fruit globose, quadrangular. \( G \). Native of the Cape of Good Hope. Erica Monsoniæ, Linn. Suppl. 223. Thumb. Diss. no. 52. with a figure. Wendl. eric. fossa. 10. p. 9. with a figure. Erica varifolia, Linn. in Trans. 6. p. 353. Flowers white. Corolla twice longer than the calyx.

Lady Monson's Broad-scaled Heath. Fl. April, Sept. Cilt. 1787. Shrub 2 to 3 feet.

Cult. For culture and propagation see Erica, p. 800.

IX. EURYSTEGIA (from eurys, brodr, and stegy, stegy, a cover; in reference to the large calyx). D. Don, in edinb. phil. journ. 17. p. 154. —Erica species of authors.

Lin. syct. Octandria Monogynia. Calyx 4-parted, large, glumaceous. Corolla urceolate, with a contracted 4-toothed mouth. Stamens inclosed; filaments dilated, flat; anthers

bipartite, opening by an oblong foramen, biappendiculate at the base: appendages flattened, deciduous, orosely crenated. Stigma capitate. Capsule 4-celled, many-seeded. —Densely branched shrubs, natives of the Cape of Good Hope. Leaves loose, subulate, with revolute margins. Flowers almost solitary, drooping, white or rose-colored.

5. E. emarginata; leaves 3 in a whorl, oblong, channelled, recurved, ciliated; flowers terminal, by threes; bracteas near the calyx, and are, as well as the calyces, ciliated. \( G \). Native of the Cape of Good Hope. Erica emarginata, Andr. Heath. 3 t. 20. Flowers white, with black anthers. Very like Erica nigra, and Erica luchneefolius.

6. E. tripecs; leaves 3 in a whorl, somewhat trigonal, ciliated, erectly spreading; branches downy; flowers terminal, by threes; bracteas imbricate; calyx segments oblong, scarious, a little shorter than the corolla; anthers ciliated, mutic, and are, as well as the style, which is capitate, exserted; corolla ovate. \( G \). Native of the Cape of Good Hope. Erica tripecs, Link, enum. 1. p. 371. Bedf. eric. wob. p. 25. Lodd. Bot. cab. 902. Flowers white. Calyx white.

7. E. trigums; leaves 3 in a whorl, ciliated; flowers axillary; bracteas remote from the calyx; calyx large, inflated, angular; corolla ovate, inflated; anthers ciliated; style inclosed. \( G \). Native of the Cape of Good Hope. Erica trigums, Lodd. Bot. cab. 257. Bedf. eric. wob. 3 t. 19. Flowers large, white.

8. E. tegulifolia; leaves oval, downy; flowers terminal;
corolla 1½ line long, with a turbinate, rather 4-angled limb; spurs of anthers large, orbicular. 

Native of the Cape of Good Hope. Leaves broad, imbricated in the straight order.

**Tile-leaved Large-calyxed Heath. Clt. 1800.** Shrub.

9 E. corydalis; leaves 3 in a whorl, lanceolate-cuneate; flowers terminal; corolla 2 lines long, having the limb entire at the base; anthers inclosed, winged on the back. 

10 E. ? pannosa; leaves 3-5 in a whorl, a little reduplicate; flowers terminal; corolla 2 lines long, woolly; filaments broad, with short spurs; style exerted. 

—This plant is very like *Eriodictyum capitatum*, but differs in the leaves being 3-5 in a whorl, and greatly in the anthers.

11 E. ? lachnefolia; leaves 3 in a whorl, ovate, imbricated, downy; flowers terminal, subcapitate; bracteas imbricated, approximating the calyx; anthers crested; corolla ovate, rather longer than the calyx. 

Native of the Cape of Good Hope. Erica lachnefolia, Sal. in Lin. trans. 6. p. 335. 

Native of the Cape of Good Hope. Erica lachnefolia, Sal. in Lin. trans. 6. p. 335. 

—Erica species of authors.

**X. LOPHANDRA (from *lophos*, lophs, a crest, and *anthera* athera, a male; in reference to the cells of the anthers being crested).** 

—Erica species of authors.

ERICACEÆ.

6 L. ? Loddigesii; leaves 3 in a whorl, erectely spreading; flowers terminal, by twos or threes; bracteas imbricate, angular; genitals exerted, with black corinnicate anthers. G. Native of the Cape of Good Hope. Erica spumosa, Lodd. bot. cab. 366. but not of Lin. Flowers purplish-red.

7 L. Flaggelláris; leaves 3 in a whorl, linear-lanceolate, glabrous, finely ciliated, adpressed; branches twiggly, downy; flowers terminal, usually by threes, erect; calyx bracteate, exceeding the corolla; anthers created. G. Native of the Cape of Good Hope. Erica flagelláris, Link, enum. 1. p. 365. Flowers dirty-yellow. Calyce segments lanceolate, keeled, purple.

8 L. Flaggellifórma; leaves 3 in a whorl, imbricate, smooth; flowers terminal, umbellate, erect; bracteas remote from the calyx; calyx coloured, larger than the corolla, which is urceolate; anthers almost mutic. G. Native of the Cape of Good Hope. Erica flagellifórma, Andr. eric. 4. icon. Flowers reddish-purple.

9 L. Callínóco; leaves 3 in a whorl, linear, subulate, imbricate, glabrous; flowers terminal, glomerate or capitate; bracteas imbricate; calyx coloured, rather shorter than the corolla, which is urceolate; anthers almost mutic. G. Native of the Cape of Good Hope. Erica calínóco, Bedf. eric. wob. p. 4. Erica glomerata, Andr. heath. vol. 4. Erica calyca capitáta, Hortul. Flowers purplish-red.

10 L. Gonáfilhóde; leaves 3 in a whorl, ovate, glabrous; flowers in terminal fascicles; calyces spreading, with exquisitely ciliately glandular margins; corolla 1 line long, hardly longer than the calyx; fruit smooth; stigma large, 4-cleft; anthers crested. G. Native of the Cape of Good Hope. Erica gonalífilhóde, Lin. diss. no. 25. Berg. pl. cap. 119. Thunb. diss. 75. Erica gonalífilhóde, Sal. in Lin. trans. 6. p. 397. Flowers white.

11 L. Phyllíco; leaves 3 in a whorl, imbricating in 6 rows, glabrous; flowers axillary, drooping; calyx large, elongated; anthers awned. G. Native of the Cape of Good Hope. Erica phyllíco, Willd. spec. 2. p. 361. Corolla campanulate, purple, 1-2 lines long.—Perhaps a species of Eurylypis. 

12 L. Holóseráceae; leaves 3 in a whorl, sharply reduplicate; flowers terminal; corolla 3 lines long, silky, with an ovate tube; anthers crested, hairy. G. Native of the Cape of Good Hope. Erica holóseráceae, Sal. in Lin. trans. 6. p. 352. Flowers red.

Whole-silky Lamprósis. Shrub.

13 L. Lu'cida; leaves 3 in a whorl; flowers terminal; calyx minutely ciliated, shining; corolla 1 line long; crests of anthers ear-formed, deeply serrated; stigma narrow. G. Native of the Cape of Good Hope. Erica Lucida, Sal. in Lin. trans. 6. p. 397.

Shining-calyx Lamprósis. Shrub.

14 L. Ru'n'á; leaves 3 in a whorl, imbricate; bracteas and calyces quite entire; corolla 1 line long; crests of anthers ear-formed and ciliated; fruit hairy. G. Native of the Cape of Good Hope. Erica múnda, Sal. in Lin. trans. 6. p. 337.

15 L. Fabriliis; leaves 3 in a whorl, densely imbricated; flowers terminal; corolla 1 line long, hardly longer than the calyx; crests of anthers quite entire; anthers minute. G. Native of the Cape of Good Hope. Erica fabriliis, Sal. in Lin. trans. 6. p. 338. Flowers reddish-purple.

16 L. Chlamydióflora; leaves 3 in a whorl, linear, hairy, imbricate, flowers terminal; corolla 2 lines long, hardly longer than the calyx; crests of anthers ear-formed. G. Native of the Cape of Good Hope. Erica chlamydióflora, Sal. in Lin. trans. 6. p. 338. Flowers reddish-purple.

17 L. Selagífinóflora; stem tomontose; leaves linear, 3 in a whorl; flowers terminal; corolla smooth, 1½ line long, with a globose tube; crests of anthers very broad, orbicular. G. Native of the Cape of Good Hope. Erica selagífinóflora, Sal. in Lin. trans. 6. p. 338.

Selago-leaved Lamprósis. Shrub.

18 L. Brevifólia; leaves 3 in a whorl, ovate; flowers terminal; corolla 1½ line long, hardly longer than the calyx; spurs of anthers linear, attenuated. G. Native of the Cape of Good Hope. Erica brevifólia, Sal. in Lin. trans. 6. p. 387. Erica pígra, Sol. ex Salib. Flowers red.

20 L. Modésta; leaves 3 in a whorl, densely imbricated; corolla tomentose, 3½ lines long, with a broad ovate tube and a recurved limb; flowers terminal; spurs of anthers linear, attenuated. G. Native of the Cape of Good Hope. Erica modesta, Sal. in Lin. trans. 6. p. 352. Flowers very pale red.

Modest Lamprósis. Shrub.

21 L. Paniculata; leaves 3 in a whorl, adpressed; flowers terminal, drooping; bracteas close to the calyx; corolla ovate, ventricose, equal in length to the calyx; anthers cornute; style inclosed. G. Native of the Cape of Good Hope. Erica paniculata, Lodd. bot. cab. 419. but not of Thunb. Bedf. eric. wob. p. 17. Flowers pale purplish-red.

22 L. Bedfordiana; leaves 3 in a whorl, linear, glabrous; flowers terminal; bracteas remote from the calyx; corolla ovate-campanulate; anthers awned. G. Native of the Cape of Good Hope. Erica lutéa alba, Bedf. eric. wob. p. 14. Flowers pale yellow.

23 L. Taxióflora (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, trigonal, glabrous, spreading; flowers terminal, umbellate; corolla with a cone-shaped tube and a spreading limb; bracteas remote from and approaching the calyx; calyx coloured, almost equal in length to the corolla; anthers mutic. G. Native of the Cape of Good Hope. Erica taxióflora, Wendl. eric. fisc. 2. p. 19. with a figure. Bauer, pl. kew. t. 19. Andr. heath. t. 35. Erica turgida, Hortul. Flowers pale red. Leaves mucronate. Corolla 3 lines long, with ovate, cuneate, bifid segments.

24 L. Ru'n'ida; leaves 3 in a whorl, linear, glabrous; flowers 5 L 2
terminal, capitate; bracteae approximate, 3, 1 large and 2 small; calyx equal to the corolla in length, which is ovate-ventricose; anthers awned. \( \text{G.} \) Native of the Cape of Good Hope. Erica rubella, Bedd. eric. wob. p. 22. Flowers red.

* * * Leaves 4 in a whorl.

25 L. squamosa; leaves 4 in a whorl, imbricated, serrulately; flowers terminal, drooping; bracteas imbricate; calyx large, coloured, about equal in length to the corolla, which is urceolate; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Erica squamosa, Andr. heath. 3. t. 52. Flowers pale red.

**Scaly-cupped Lamprotis.** Fl. April, July. Clt. 1794. Shrub \( \frac{1}{2} \) foot.

* * * Leaves opposite.

**Fine-leaved Lamprotis.** Fl. April, May. Clt. 1794. Shrub \( \frac{1}{2} \) foot.

27 L. luteca; leaves opposite, linear, imbricate, glabrous; flowers nearly terminal; bracteas imbricate; branches flexuous; calycine segments narrow, ovate-cuneated; corolla \( \frac{3}{4} \) lines long, oval, ventricose; fruit obovate; anthers mutic or awned. \( \text{G.} \) Native of the Cape of Good Hope. Erica luteca, Lin. diss. no. 2. mant. p. 234. Berg. pl. cap. 115. Wendl. eric. 1. p. 13. with a figure. Andr. eric. 1. t. 31. Erica imbellis, Sal. in Lin. trans. 6. p. 385. Flowers yellow.—There appears to be two species confounded under this name; one with crested or awned anthers, and another with mutic anthers.

28 L. biflora; leaves opposite, canaliculate, adpressed, glabrous; flowers terminal, twin, on short pedicels; bracteas approximating the calyx; calycine segments ovate, acute, white; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Erica biflora, Link, emun. 1. p. 367. Lodd. bot. cab. 683. Corolla white.

**Two-flowered Lamprotis.** Fl. April, June. Clt. 1819. Shrub \( \frac{1}{2} \) foot.

29 L. borboniæfælia; leaves opposite; flowers axillary; calycine segments broad, ovate-acuminate, equal in length to the corolla, which is urceolate; fruit obovate; anthers crested or awned. \( \text{G.} \) Native of the Cape of Good Hope. Erica borboniæfælia, Sal. in Lin. trans. 6. p. 386. Flowers red, \( \frac{3}{4} \) lines long.

30 L. oppositæfælia; leaves opposite, filiform, imbricate; flowers terminal, crowded, erect; bracteas sessile; corolla urceolate, about equal in length to the calyx, which is spreading; anthers mutic. \( \text{G.} \) Native of the Cape of Good Hope. Erica oppositæfælia, Andr. heath. 3. p. 35. Lodd. bot. cab. 1343. Flowers white.

**Var. \( \beta \) rübra (Andr. heath. 3. t. 36. Lodd. bot. cab. 1060.)** flowers red.

**Opposite-leaved Lamprotis.** Fl. Spring and Autumn. Clt. 1804. Shrub \( \frac{1}{2} \) to \( \frac{3}{4} \) foot.

31 L. \( \text{ape'æra} \); leaves opposite, linear, cuspidate, erect, quite glabrous, with scarious margins; flowers terminal, aggre gate; bracteas and calyxes coloured; corolla rotate; genitals exerted; anthers mutic. \( \text{G.} \) Native of the Cape of Good Hope. Erica aperea, Spreng. syst. 2. p. 200.

32 L. rebecca; leaves opposite, or 3 in a whorl, linear, imbricate; flowers terminal, capitiate; corolla with a ventricose tube and a spreading limb; calyx about equal in length to the corolla, bracteate; anthers mutic. \( \text{G.} \) Native of the Cape of Good Hope. Erica rubella, Ker. bot. mag. 2165. Lodd. bot. cab. 658. Flowers red.

33 L. togata; leaves opposite, linear, imbricate; flowers terminal; bracteas remote from the calyx, broad; calyx coloured, large, cup-shaped; corollas urceolate, with a spreading limb; anthers mutic. \( \text{G.} \) Native of the Cape of Good Hope. Erica togata, Sims, bot. mag. 1626. Flowers fine red.

**Grown Lamprotis.** Fl. June, July. Clt.? Shrub \( \frac{1}{2} \) to \( \frac{3}{4} \) foot.

34 L. diandriæfælia; leaves opposite, long; flowers terminal; calycine segments ovate-cuneated; corolla \( \frac{3}{4} \) lines long; spurs of anthers serrated; pericarp glabrous. \( \text{G.} \) Native of the Cape of Good Hope. Erica diandriæfælia, Sal. in Lin. trans. 6. p. 338. Flowers pale purple.

**Pink-leaved Lamprotis.** Fl. April, May. Clt. 1796. Shb. 35 L. \( \text{a'phanes} \); branches hairy; leaves opposite, linear-trigonal, blunting, scabrous; flowers axillary and terminal. \( \text{G.} \) Native of the Cape of Good Hope. Erica a'phanes, Spreng. syst. 2. p. 196.

Cult. See Erica, p. 800, for culture and propagation.—Pretty little shrubs, easily distinguished from the other genera broke off from Erica by the large coloured calyx and small adpressed leaves.

XII. CALLISTA (from καλλίς, καλλίστος, very beautiful; flowers). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

**LIN. Syst. Octandria, Monogynia.** Calyx 4-parted, foliaceous. Corolla salver-shaped, with a dilated spreading 4-cleft limb, and a ventricose or cylindrical tube. Stamens inclosed; filaments capillary; cells of anthers short, dehiscent lengthwise, mutic at the base. Stigma capitellate. Capsule 4-celled, many-seeded.—Small, much branched shrubs, natives of the Cape of Good Hope. Leaves acerose, loosely imbricated. Flowers terminal, almost solitary, or in fascicles.

* Leaves 3 in a whorl.

**Var. \( \beta \) alba (Andr. heath. 3. t. 50.)** flowers white, sub-axillary, or terminating the small branches, sweet-scented.

**Fine-flowered Callista.** Fl. April, June; \( \beta \) July. Dec. Clt. 1800. Shrub 1 foot.

2 C. tetragona; leaves 3 in a whorl, linear, pointed, ciliated, erectly spreading; flowers terminating small branches; calyx bracteate, with ciliated cuspidate segments; corolla with

3 C. bacciniformis; leaves 4 in a whorl, linear, ciliated; bracteas sessile; flowers in terminal umbellate fascicles; corolla with a trumpet-shaped tube and a spreading border. \( G \). Native of the Cape of Good Hope. Erica bacciniformis, Sims, bot. mag. 2465. Lodd. bot. cab. 1127. Erica bucinniformis, Bedd. eric. wob. p. 4. Corolla red, with a white limb. Anthers cornute.

4 C. BANDONIA; leaves 3 in a whorl, linear-lanceolate, glabrous, spreading; flowers terminal, usually by threes, drooping; bracteas remote from the calyx; calyce segments broad; tube of corolla ovate, ventricose; style exerted. \( G \). Native of the Cape of Good Hope. Erica Bandonía, Andr. heath. vol. 4. Corolla red-purple.

5 C. magnifica; leaves 3 in a whorl, linear, obtuse, spreading; flowers terminal, usually by threes, drooping; bracteas remote from the calyx; calyx coloured; corolla with an ovate tube, and an erect limb; style inclosed. \( G \). Native of the Cape of Good Hope. Erica magnifica, Andr. heath. vol. 4. Corollas pale red. Anthers cornute.

6 C. Broadleyana; leaves 3 in a whorl, linear, fasciculated, spreading; flowers axillary, on long pedicels, drooping; calyce segments foliaceous, narrow; corolla ventricose, contracted at the mouth, with hardly any limb; style exerted. \( G \). Native of the Cape of Good Hope. Erica Broadleyana, Andr. heath. vol. 4. Flowers red.

8 C. celiana; glabrous; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corolla with a glabrous tube; style exerted. \( G \). Native of the Cape of Good Hope. Erica celiana, Lodd. bot. cab. 1777. Corollas with a pale red tube and a deep red border.

9 C. armata; leaves 3, sometimes 5, in a whorl, linear, erect, spinulose; flowers terminal, aggregate, clothed with yellow stripe; calyce segments foliaceous, spinose; style exerted. \( G \). Native of the Cape of Good Hope. Erica armata, Spreng. syst. 2. p. 184.

10 C. Humeana; leaves 3 in a whorl, linear, glabrous; flowers terminal, by threes; bracteas sessile, corolla with a short ventricose tube, and a large limb; style exerted. \( G \). Native of the Cape of Good Hope. Erica Humeana, Lodd. bot. cab. 589. E. Humea, Hortul. Corolla with a red tube, reddish-purple segments, and a dark eye.

11 C. carinula; leaves 3-4 in a whorl, linear, glabrous; flowers terminal, racemose; calyx bracteate; corolla with an inflated tube, and a short limb. \( G \). Native of the Cape of Good Hope. Erica carinula, Lodd. bot. cab. 926. Flowers pale red.

12 C. Sainsburyana; leaves 3 in a whorl, filiform, elongated, glabrous, erectly spreading; flowers terminal, umbellate; bracteas remote from the calyx; corolla oblong-ovate, with a short limb; anthers awned. \( G \). Native of the Cape of Good Hope. Erica Sainsburyana, Andr. heath. vol. 4. Flowers pale red. Style a little exerted.

13 C. Comptoniana; leaves 3 in a whorl, subulate, glabrous, spreading, recurved; flowers terminal, aggregate, pedicellate. \( G \). Native of the Cape of Good Hope. Erica Comptoniana, Andr. heath. vol. 4. Style inclosed.

14 C. infundibuliformis; leaves 4 in a whorl, filiform, obtuse, glabrous, erect; flowers terminal, aggregate; bracteas sessile; corolla with a slender tube, and large segments. \( G \). Native of the Cape of Good Hope. Erica infundibuliformis, Link. enum. 1. p. 364. Andr. heath. vol. 4. Lodd. bot. cab. 589. Flowers pale red, or pale purplish-red. Style inclosed.

15 C. variata; leaves 3 in a whorl; flowers terminal; bracteas approximating the corolla; corolla short, with revolute segments; style exerted. \( G \). Native of the Cape of Good Hope. Erica variata, Lodd. bot. cab. 1325. Erica Cassonii, Hortul. Flowers purplish-red.

16 C. undulata; glabrous; leaves 3-4 in a whorl; flowers terminal, by fours, sessile; corolla with an elongated, ventricose, twisted tube, and a spreading limb. \( G \). Native of the Cape of Good Hope. Erica undulata, Lodd. bot. cab. 1792. Flowers deep red.

** Leaves 4 in a whorl.

17 C. pregnans; leaves 4 in a whorl, linear, ciliated, spreadingly recurved; flowers terminal, crowded; bracteas remote from the calyx; calyce segments acute; corolla ventricose at the base. \( G \). Native of the Cape of Good Hope. Erica pregnans, Andr. heath. 3. t. 32. Lodd. bot. cab. 945. Corolla pale red, almost white. Very like C. ventricosa, and probably only a variety of it. Style inclosed.

18 C. metuleflora; leaves 4-5 in a whorl, subulate, spinulose-ciliated; flowers terminal, umbellate; bracteas remote from the calyx; corolla ventricose at the base. \( G \). Native of the Cape of Good Hope. Erica metuleflora, Sims, bot. mag. t. 612. Andr. heath. 3. t. 53. Lodd. bot. cab. 1763. Flowers red, with a paler border. Style a little exerted.

19 C. acuminata; leaves 4 in a whorl, trigonal, cuspidate, recurved; flowers terminal, nearly sessile, aggregate; calyce segments acuminate; corolla with an inflated acuminate tube, and a short revolute limb; bracteas close to the calyx. \( G \). Native of the Cape of Good Hope. Erica acuminata, Andr. heath. 3. t. 54. Lodd. bot. cab. t. 216. Flowers reddish-purple. Style inclosed.

20 C. ferruginea; leaves 4 in a whorl, linear, ciliated, with rusty hairs; flowers terminal, umbellately verticillate, horizontal; calyx bracteate, with the segments bearded at the
apex; filaments terminating in a flat glandular substance; corolla with an acuminated inflated tube. \( \eta \). G. Native of the Cape of Good Hope. Erica ferruginea, Andr. heath. 3. t. 57. Corolla with a red tube, and a greenish-yellow limb; but in the figure given by Andrews it is white, tipped with red. Style included.

21 C. hyacintoides; leaves 4 in a whorl, shining, spreading; flowers aggregate; calyx bracteate, having the segments serrated or ciliates; corolla with a ventricose tube. \( \eta \). G. Native of the Cape of Good Hope. Erica hyacintoides, Andr. heath. 3. t. 158. Ait. hort. kew. 2. p. 384. Flowers red. Style sub-exserted.

22 C. fastigiata; leaves 4 in a whorl, shining, erect, imbricated; flowers terminal, crowded, sessile; bracteates serrated; calyce segments serrated; corolla with a narrow tube. \( \eta \). G. Native of the Cape of Good Hope. Erica fastigiata, Lin. diss. no. 44. mant. 66. Thunb. diss. no. 37. Andr. heath. 2. t. 57. Lodl. bot. cab. t. 267. Erica falcifórmis, Sal. in Linn. trans. 6. p. 382. Corolla white, with the limb mealy inside, according to Sal. 1. c. In bot. mag. t. 2084. the corollas are painted pale red; it is therefore perhaps a distinct species.

23 C. Pellenicida; leaves 4 in a whorl, linear, attenuated; stem slender; flowers terminal; calyce segments spatulate, serrated; corolla 5–6 lines long, having the limb 3 times shorter than the tube. \( \eta \). G. Native of the Cape of Good Hope. C. pellenicida, Don, in edinb. phil. journ 17. p. 155. Erica Walkeria, Andr. heath. 1. t. 42. Lodl. bot. cab. 256. E. pulechra, Sal. in Linn. trans. 6. p. 384. Flowers pink or pale red. Style included.

**Pellenicid-flowered Callista.** Shrub.

24 C. Walkeriana; stem glabrous; leaves 4 in a whorl, linear, shining; flowers terminal, almost sessile; bracteates approximating the calyx, ciliates; calyce segments lanceolate, serrated; corolla 4–5 lines long, with an ovate ventricose tube, and a wide-spreading limb, which is doubly shorter than the tube. \( \eta \). G. Native of the Cape of Good Hope. C. pellenicida, D. Don, in edinb. phil. journ 17. p. 155. Erica Walkeria, Andr. heath. 1. t. 42. Lodl. bot. cab. 256. E. pulechra, Sal. in Linn. trans. 6. p. 384. Flowers pink or pale red. Style included.

25 C. denticulata (D. Don, in edinb. phil. journ 17. p. 155.) stem pubescent; leaves 4 in a whorl, linear, glabrous; flowers terminal, fastigiate; bracteates remote from the calyx; calyce segments obcurved, serrated; corolla 3 lines long, with a cylindrical tube: having the limb one-half shorter than the tube. \( \eta \). G. Native of the Cape of Good Hope. Erica denticulata, Lin. ment. p. 22. Erica dentata, Thumb. diss. no. 39. Erica denticularius, Sal. in Linn. trans. 6. p. 384. Erica primuloides, Wendl. Flowers purple.

**Denticulate-calyx Callista.** Fl. April, May. Clt. 1821. Shrub 1 foot.

26 C. Bedfordiana; leaves 4 in a whorl, linear; flowers terminal; bracteates sessile; calyce segments deeply serrated or toothed; corolla with an ovate ventricose tube. \( \eta \). G. Native of the Cape of Good Hope. Erica denticulata, Bedff. hort. wob. p. 8. Lodl. bot. cab. 1090. But not of Lin. nor others. Flowers yellow. Style a little exserted.

**Bedford’s Callista.** Fl. May, June. Clt.? Shrub.

27 C. Templeana; leaves 4 in a whorl, linear, ciliated; flowers terminal, almost sessile; bracteates approximating the calyx, ciliates, as well as the calyce segments; anthers curved; corolla with an oblong ventricose tube, and a small limb. \( \eta \). G. Native of the Cape of Good Hope. Erica Templea, Hort. Badf. eric. wob. p. 24. pl. 4. f. 17. Corolla about the size and shape of those of C. ventricosa, pale red, or reddish-purple. Style included.

28 C. comosa (D. Don, in edinb. phil. journ. 17. p. 155.) stem pubescent; leaves 4 in a whorl, linear, short, erectly spreading; flowers terminal, tufted; bracteates imbricate, and are ciliated as well as the calyce segments, coloured; corolla with an ovate ventricose tube. \( \eta \). G. Native of the Cape of Good Hope. Erica comosa, Andr. heath. 2. t. 54. Erica transpârens, Berg. pl. cap. p. 108. Erica galiforma, Sal. in Linn. trans. 2. p. 583. Flowers small, white, with dark anthers. Style included.

**Var. \( \beta \), rubra (Andr. heath. 2. t. 55.) corollas red. \( \eta \). G. Erica comosa, Lin. diss. no. 48. mant. p. 234. Thunb. diss. no. 38. Bauer, icon. hort. kew. t. 18.

**Tufted Callista.** Fl. April, Aug. Clt. 1787. Shrub 2 1/2 ft.

29 C. ventricosa (D. Don, in edinb. phil. journ. 17. p. 155.) leaves 4 in a whorl, short, acerose, semi-cylindrical, and are ciliated as well as the calyces and bracteates: flowers the broadest; flowers disposed in terminal umbellate fascicles; bracteates remote from the calyx; corolla with a ventricose tube. \( \eta \). G. Native of the Cape of Good Hope. Erica ventricosa, Thumb. diss. no. 36. with a figure. Andr. heath. 1. t. 28. Curt. bot. mag. t. 350. Wendl. eric. fasc. 3. p. 11. Bedff. eric. wob. pl. 4. f. 18. a. Lodl. bot. cab. 431. Erica venustula, Sal. in Linn. trans. 6. p. 385. Pedicsules bracteiatae below the middle. Corolla waxy, purplish-red. Style included.

**Var. \( \beta \), cocinea; flowers reddish-purple.**

**Var. \( \gamma \), stellifera; flowers purplish-red.**

**Var. \( \epsilon \), cárnea; flowers pale red.**

**Var. \( \varepsilon \), alba; flowers very pale red, almost white.**

**Var. \( \varepsilon \), supérba; flowers deep red.**

**Var. \( \eta \), crética; erect; flowers pale red.**

**Var. \( \zeta \), nína; dwarf; flowers pale red.**

**Ventricosa-flowered Callista, or Porcelain Heath.** Fl. April, Sept. Clt. 1787. Shrub 1 to 2 feet.

30 C. infestata; leaves 4 in a whorl, glabrous, linear; flowers in terminal umbellate fascicles; corolla with an elongated, ovate, ventricose tube, and a short limb; pedicels bracteate below the middle; calyce segments subulate. \( \eta \). G. Native of the Cape of Good Hope. Erica infestata, Thumb. diss. no. 67. with a figure. Erica amábilis, Sal. in Linn. trans. 6. p. 385. Erica glábula, Link. enun. 1. p. 362. Corolla large, with a reddish-purple base, and a green top. Anthers corniculate at the base.

31 C. muscari; leaves 4 in a whorl, linear-trigonal, glabrous, spreading; flowers terminal, sessile, usually by fours; bracteates approximating the calyx, leaf-like; calyce segments subulate; corolla ovate-ventricose, with a short obtuse revolute limb. \( \eta \). G. Native of the Cape of Good Hope. Erica muscari, Andr. heath. 1. t. 41. Ait. hort. kew. 2. p. 395. Wendl. eric. fasc. 18. p. 95. with a figure. Erica frángrans, Sal. in Linn. trans. 4. p. 383. Stem glabrous. Flowers small, pale yellow or yellowish-green. Corolla flat at the base. Fruit obpyramidal.

**Musk-scented Callista.** Fl. March. Clt. 1790. Shrub 1 foot.

32 C. lawsonii; leaves 4 in a whorl, filiform, spreading, ciliated; flowers terminal; bracteates sessile; corolla with a cylindrical tube, which is ventricose at the base; calyce segments narrow. \( \eta \). G. Native of the Cape of Good Hope. Erica Lawsonia, Andr. heath. vol. 4. icon. Sims, bot. mag. 1720. Lodl. bot. cab. 488. Erica Kennédia, Hort. Flowers red.
Lawson's Callista. Fl. Sept. Clt. 1802. Shrub 1 foot. 33 C. Daphniiflora; leaves 4 in a whorl, short, glabrous, acerose, erectly spreading; bracteas sessile; calycine segments lacerated a little; flowers terminal, usually by fours; corollas with an ovate ventricose tube, and a spreading obute limb. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica daphniiflora, Lodd. bot. cab. 543. Bedf. eric. wob. p. 7. Flowers small, white or red. Style exerted.

Daphne-flowered Callista. Fl. April, June. Clt. 1791. Shrub 1 foot. 35 C. Daphnoïdes; leaves 4 in a whorl, linear, glabrous; flowers terminal by fours; bracteas sessile; corolla with an ovate ventricose tube and a large limb. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica daphnoïdes, Lodd. bot. cab. 154. Erica mirabilis, Hortul. Flowers pale red. Style a little exerted.

Daphne-like-flowered Callista. Fl. May, June. Clt. 1800. Shrub 1 to 2 feet. 37 C. Coventryana; leaves 4 in a whorl, linear-trigonal, ciliated, as well as the calyces and bracteas; flowers terminal, aggregate, sessile; bracteas sessile; calycine segments foliaceous, narrow; corolla with a slender tube, and large segments. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica Coventrya, Andr. heath. 4. icon. Lodd. bot. cab. 423. Corolla with a greenish-yellow tube, and a red limb, with ovate segments. Style a little exerted.

Lord Coventry's Callista. Fl. July, Sept. Clt. 1800. Sh. 36 C. Verucunda; leaves 4 in a whorl, linear, obtuse; flowers lateral, verticillate; corolla with a ventricose tube, and a spreading limb. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica verucunda, Lodd. bot. cab. 1827. but not of Sal. Flowers red.

Reddish-flowered Callista. Fl. Spring, Autumn. Clt. 1820. Shrub 1 foot. 37 C. Stellifera; leaves 4 in a whorl, linear-lanceolate, subulate, pilose, spreading; flowers axillary and terminal, racemose, erect; bracteas remote from the calyx; limb of corolla 6-cleft. \( \ddot{g} \). G. A hybrid. Erica stellifera, Andr. heath. vol. 4. Lodd. bot. cab. 1622. Flowers reddish-purple.

Star-bearing Callista. Fl. April, July. Clt. 1800. Shrub. 38 C. Fræstans; leaves 4 in a whorl, linear, erect, glabrous; flowers terminal, aggregate; bracteas sessile, smooth; calycine segments ovate, cuspitate, with scariosly hardly serrated edges; corolla, with a ventricose tube, and a recurvedly reflexed limb. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica fræstans, Andr. heath. vol. 4. Lodd. bot. cab. 1595. Erica daphniiflora, Sal. in Lin. trans. 6. p. 384. Corollas white. Style exerted.

Exscissilis Callista. Fl. June, Nov. Clt. 1810. Shrub 1 foot. 39 C. Mündula; leaves 4 in a whorl, subulate, spreading, shining, glabrous; flowers terminal, usually by fours, sessile; bracteas sessile; calyx naked; corolla with a short narrow tube, and a wide limb; style inclosed. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica mündula, Andr. heath. vol. 4. Lodd. bot. cab. 114. Flowers reddish-purple.

Near Callista. Fl. Oct. Feb. Clt. 1810. Shrub. 40 C. Rigidula; glabrous; leaves 4 in a whorl, linear, spreading; flowers terminal, pedicellate; corolla ventricously tubular, with a blunt border; pedicels red; bracteas remote from the calyx. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica rigidula, Lodd. bot. cab. 256. Erica metuleflora bicolor, Bedf. eric. wob. p. 15. Corolla red. Limb short, white.

Stiff Callista. Fl. July, Aug. Clt. 1820. Shrub 1 foot. 41 C. Tröstula; leaves 4 in a whorl, linear, glabrous; flowers terminal; bracteas approximating the calyx; corolla with an ovate ventricose tube. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica tröstula, Lodd. bot. cab. 1742. Flowers white.

Var. \( \beta \), rubra; flowers red.

Spruce Callista. Fl. May, July. Clt. 1806. Shrub. 42 C. Struthioleflora.—This species has not yet been described or figured. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica struthioleflora, Lodd. bot. cab. p. 25.

Struthiola-flowered Callista. Shrub. 43 C. Cliffordiana; leaves 4 in a whorl, glabrous; flowers terminal; bracteas rather remote from the calyx; corolla with a slender ventricose tube; style inclosed. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica Cliffordiana, Lodd. bot. cab. 34. Flowers white.

Lady De Clifford's Callista. Fl. April, May. Clt. 1812. Shrub. 44 C. Pavetteflora; leaves 4 in a whorl, linear; flowers terminal; pedicels very short; corolla 9-10 lines long, having the limb mealy inside; filaments spurred near the top of the anthers. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica pavetteflora, Sal. in Lin. trans. 6. p. 382. Erica infundibuliformis, Roxb. mss.

Pavetta-flowered Callista. Fl. May, Aug. Clt. 1800. Shrub. 45 C. Spuriflora; stem pubescent; leaves 4 in a whorl, linear; flowers terminal; calycine segments cuneate, serrated; corolla 8 lines long, with the limb one-half shorter than the tube; spurs of anthers very minute, ear-formed. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica nidiflora, Sal. in Lin. trans. 6. p. 383. Erica denticulata, Roxb. mss.

Parmentier's Callista. Fl. April, June. Clt. 1810. Shrub 1 foot. 47 C. Moschata; glabrous; leaves 4 in a whorl?; flowers terminal; corolla short, with a ventricose tube, and a small spreading limb. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica moschata, Andr. heath. 4. icon. Lodd. bot. cab. 614. Corollas yellow.

Musky Callista. Fl. May, July. Clt. 1805. Shrub. 48 C. Calóstoma; glabrous; leaves linear, 4 in a whorl; flowers terminal, crowded; corolla with a ventricose elongated tube, a dark neck, and a white limb. \( \ddot{g} \). G. Hybrid. Erica calóstoma, Lodd. bot. cab. 1759.

Beautiful-mouthed Callista. Fl. May, June. Hybrid Shrub. 49 C. Russelliana; leaves 4 in a whorl, linear, glabrous; flowers terminal; bractea remote from the calyx; corolla ovate-globose, with large open segments. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica Russelliana, Lodd. bot. cab. 1013. Bedf. eric. wob. p. 22. Flowers reddish-purple.

Duke of Bedford's Callista. Fl. June, July. Clt. 1820. Shrub. 50 C. Venusta; leaves 4 in a whorl, ciliated; flowers terminal, sessile; bracteas sessile, premonere, membranous, ciliated, as well as the calyces; corolla ovate, ventricose, with broad segments. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica venusta, Hortul.

*** Leaves 5-6 in a whorl.

51 C. Blanda; leaves 6 in a whorl, spreadingly reflexed, imbricate; flowers terminal, umbellate, horizontal; calyx bracteate; genitals little exerted; corolla with an oblong tube, and small border. \( \ddot{g} \). G. Native of the Cape of Good Hope. Erica blanda, Andr. heath. 3. t. 34. Flowers reddish-purple or bluish.—Perhaps a species of Syringodea. Style exerted.

53 C. Swainsonii; leaves 5-6 in a whorl, linear, obtuse, crowded, erect; flowers terminal, umbrellate; bracteas sessile; calyce segments lanceolate; corolla with a cylindrical furrowed tube, and a spreading border; anthers somewhat exerted. L. G. Native of the Cape of Good Hope. Erica Swainsonii, Andr. hearth. 3. t. 65. Flowers reddish-purple or buff-red.

54 C. quadranguláris; leaves recurved, glabrous, scattered; flowers terminating small branches; bracteas sessile; corolla with a 4-angled tube, winged; style exerted. L. G. Native of the Cape of Good Hope. Erica quadranguláris, Andr. hearth. vol. 4. with a figure. Erica erosá, Lodd. bot. cab. 153. Bedf. eric. wob. pl. 2. t. 2. Corolla with a purplish-red tube, and a white crenulated limb.

Cult. For culture and propagation see *Erica,* p. 800.—Elegant shrubs when in bloom. The wood being harder than that of the species of *Erica,* cuttings are more difficult to root.

XIII. EURYLOMA (from *euroe, eury, wide, and *loma, *loma, a margin; in reference to the wide limb of the corolla). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

Lin. syst. Octandria Monogyinia. Calyx 4-parted, foliaceous. Corolla salver-shaped, with an elongated filiform or ventricose tube, and a 4-parted dilated limb. Stamens inclosed; filaments dilated, membranous, channelled; anthers bispurate; cells of anthers membranous, dehiscing longisectionally; and drawn out at the base into a short tumid spur. Stigma with an elevated 4-lobed disk. Capsule 4-celled, many-seeded.—Diffusely branched shrubs, natives of the Cape of Good Hope. Leaves adpressed, semi-cylindrical, minutely denticulated. Flowers terminal, solitary or by threes, large, showy, on short pedicels, clanny.

* Leaves 3 in a whorl.

1 E. Aitoni (D. Don, l. c.) leaves 3 in a whorl, linear, serrulat., erect; flowers terminal, usually by threes; bracteas remote from the calyx; corolla viscid, with a cylindrical tube, which is ventricose at top, and large ovate segments; style exerted. L. G. Native of the Cape of Good Hope. Erica Aitoni, Andr. 1. t. 25. Curt. bot. mag. 429. Erica Aitoniana, Ait. hort. kew. 2. p. 372. Lodd. bot. cab. 144. Erica Aitoni, Wildl. spec. 2. p. 398. Erica jamaijinóra, Sal. in Lin. trans. 6. p. 382. Corolla pale red, or nearly white, 16 to 19 lines long.

2 E. jamaijinóra (D. Don, l. c.) leaves 3 in a whorl, linear-oblong, serrulat, recurved, imbricated in 6 rows; flowers terminal, aggregate; bracteas ciliated, remote from the calyx; corolla viscid, with an ovate tube, which is ventricose at the apex, and ovate segments; style exerted. L. G. Native of the Cape of Good Hope. Erica jamaijinóra, Andr. hearth. 1. t. 26. Erica lageneacteó, Sal. in Lin. trans. 6. p. 382. Corolla 12-14 lines long, with a reddish tube, and a yellowish-green border.

* Var. β, álba; flowers pure white.

3 E. trícolor; leaves 3 in a whorl, linear, recurved, ciliated, as well as the bracteas and calyces; the terminating hairs the longest; pedicels bibracteate near the base; flowers terminal, usually about 3 together; corolla viscid, with a large ventricose tube, and ovate-cordate slightly crenulately segments; style exerted. L. G. Native of the Cape of Good Hope. Erica tricolor, Nois. Bedf. hort. eric. wob. p. 26. Corolla red at the base, white, at top, but greenish-yellow below the contraction of the limb.

* Var. β, major (Bedf. eric. wob. p. 26.) leaves adpressed, shortly ciliated; corolla oblong, inflated, with a red tube and segments, and yellowish-green below the contraction.

* Var. γ, dumíosa; leaves long-ciliated, recurved; corolla with an ovate-oblong inflated tube. L. G. Corolla with a red tube, a greenish-yellow contraction, and white segments. Bedf. eric. wob. p. 25. t. 4. f. 17.

* Var. δ, minor (Bedf. eric. wob. p. 26.) leaves 4 in a whorl; style inclosed; corolla inflated, ventricose. L. G. Corolla with a red tube, greenish-yellow, and red segments.

4 E. mirábilis; leaves 3 in a whorl, obtuse; flowers terminal, disposed in umbellate fascicles; corolla viscid; with a ventricose base, a contracted neck, and a wide-spreading border. L. G. Native of the Cape of Good Hope. Erica mirabilis, Lodd. bot. cab. 1804. Corollas white, tinged with red.

5 E. ampulláceá; leaves 3-4 in a whorl, lanceolate, ciliated, reflexed; flowers terminal, usually by fours; bracteas approximating the calyx; ciliated, as well as the calyce segments; corolla viscid, with a ventricose tube, ribbed neck, and ovate-cordate slightly crenulately obtuse segments; style exerted. L. G. Native of the Cape of Good Hope. Erica ampulláceá, Curt. bot. mag. 303. Andr. hearth. 1. t. 29. Lodd. bot. cab. 508. Erica ampulóspórrm, Sal. in Lin. trans. 6. p. 381. Leaves imbricate at the base, moderately spreading at top. Corolla 8-10 lines long, red. Anthers incurved at top.

6 E. Irby'íana; leaves 3 in a whorl, cuspidate, with scabrous margins, erect; bracteas remote from and approximating the calyx; flowers terminal, umbrellate; corolla viscid, with a cylindrical ventricose tube, and large segments; style exerted; anthers mutic. L. G. Native of the Cape of Good Hope. Erica Irby'íana, Andr. hearth. 3. t. 25. Lodd. bot. cab. 816. Flowers white.

* Var. β, rúbra; flowers reddish-purple.

7 E. nota'bilis; leaves linear-oblong, 3 in a whorl, serrulately ciliated, short, adpressed; branches slender, flexuose; flowers small, terminal, aggregate, viscid; corolla tubular, with a constricted neck, and small limb. L. G. Native of the Cape of Good Hope. Erica nota'bilis, Wendl. Licht. ex Sprng. syst. 2. p. 184. Style inclosed.

8 E. curvifólia; leaves 3 in a whorl, recurved, ciliated; spikes coarctate; corolla 4 lines long, viscid, with an ovate pyramidal tube; spurs of anthers linear-attenuated; pericarpy hairy. L. G. Native of the Cape of Good Hope. Erica curvifólia, Sal. in Lin. trans. 6. p. 380. Flowers lateral.

Cured-leafed Euryloma. Shrub.

9 E. Shannonína; leaves 3-4 in a whorl, stiff, spreading,
ERICACEÆ. XIII. Euryloma. XIV. Chona.

817

ending each in a hair; flowers terminal, umbellate, drooping; calyx coloured; bracteas remote from the calyx; corolla with a ventricose ribbed tube; style exerted. 迤 G. Native of the Cape of Good Hope. Erica Shannonii, Andr. heath. vol. 4. Erica Shannoniana, Lodd. bot. cab. 168. Spreng. syst. 2. p. 185. Flowers red.

* * Leaves 4 in a whorl.

10 E. Hartnelli; leaves 4 in a whorl, lanceolate, imbricated, finely ciliated; the terminating hairs the longest; corolla viscid nearly tubular, rather ventricose at the base, with ovate-triangular lobes. 迤 G. Native of the Cape of Good Hope. Erica Hartnelli, Roll. cat.

11 E. ampullacea; leaves 4 in a whorl, ciliated; flowers terminal; bracteas remote from the calyx; corolla with a ventricose curved tube. 迤 G. Native of the Cape of Good Hope. Erica ampullacea, Bedd. eric. wob. p. 2. Erica ampullacea, Hort. Corolla with a red tube, and a greenish-yellow neck.

12 E. prinsae; leaves 4 in a whorl, linear, ciliated, recurved; flowers terminal, umbellate; bracteas approximating the calyx, ciliated, as well as the calycine segments; corolla viscid, with a ventricose tube, and a hairy top; style inclosed. 迤 G. Native of the Cape of Good Hope. Erica prinsae, Andr. heath. 2. t. 44. Lodd. bot. cab. 647. Corollas reddish-purple.

Var. b., carnea; flowers pale red.

Var. b., alb; corolla white, Sal. I. c.

14 E. capax; leaves 4 in a whorl, ovate-cuneated; flowers terminal; corolla viscid, 8-10 lines long, with a flask-formed tube, and retuse segments. 迤 G. Native of the Cape of Good Hope. Erica capax, Sal. in Lin. trans. 6. p. 381. Erica praegnans, Sal. ms.

15 E. arista; leaves 4-5 in a whorl, oblong, subsecund, hispid, imbricated, awned at the apex; flowers terminal; bracteas approximating the calyx; corolla inflated upwards with revolute projecting segments: calycine segments obtuse. 迤 G. Native of the Cape of Good Hope. Erica arista, Andr. heath. 3. t. 28. Curt. bot. mag. t. 1449. Ait. hort. kew. 2. p. 384. Bedd. eric. wob. p. 2. pl. 2. t. 11. Lodd. bot. cab. 73. Corollas reddish-purple, with a paler limb.

16 E. aristella; leaves 4 in a whorl, hispid, awned, imbricated, subsecund; flowers terminal; bracteas approximating the calyx; corolla with an oblong acuminate tube; anthers mutic. 迤 G. Native of the Cape of Good Hope. Erica aristella, Bedd. eric. wob. p. 2. Erica aristata minor, Hort. Corolla reddish-purple.

Small-awned Euryloma. Fl. June, July. Clt. 1806. Shrub. 17 E. obbata; leaves 4 in a whorl, linear, ciliated, secund; flowers terminal; bracteas approximating the calyx, ciliated, as well as the calyxes; corolla viscid, with a globose-ventricose ribbed tube, and spreading obtuse segments. 迤 G. Native of the Cape of Good Hope. Erica obbata, Andr. heath. 2. t. 33. Corolla with a reddish-purple tube, a greenish-yellow neck, and a pale limb?

** Leaves 6 in a whorl.

19 E. squarrosa; leaves 6 in a whorl, squarrosely recurved; flowers terminal; corolla viscid, 5-6 lines long, with an ovate pyramidal tube, and an obtuse limb; anthers smooth; spurs marginal. 迤 G. Native of the Cape of Good Hope. Erica squarrosa, Sal. in Lin. trans. p. 380. Leaves very dense.

21 E. recurvata; leaves 6 in a whorl, linear, flexuous, recurved; flowers terminal, nearly sessile, drooping, capitate; bracteas sessile; corolla curved, ovate-oblong; style exerted; anthers mutic. 迤 G. Native of the Cape of Good Hope. Erica recurvata, Andr. heath. vol. 4. Flowers pale red.

Recurred-leaved Euryloma. Fl. April, June. Shrub.

22 E. crinita; leaves crowded, lanceolate, terminated each by a hair; flowers nearly terminal, drooping; pedicels red; corolla cylindrical, contracted at the neck. 迤 G. Native of the Cape of Good Hope. Erica crinita, Lodd. bot. cab. 1432. Corolla purplish-red, with a pale border.

Cult. For culture and propagation see Erica, p. 800. Most elegant shrubs when in blossom. The wood of the species being more hard than that of Erica, the cuttings do not strike so freely.

XIV. CHO'NA (from χόνα, chone, a funnel; from the figure of the corolla). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

ERICACEÆ. XV. SYRINGODEA.

Var. β, longiflora (Andr. heath. 3. t. 4.) flowers longer and more tubular, blood-red.

Bloodily-flowered Chona. Fl. year. Clt. 1799. Shrub 1 to 2 feet. Cult. For culture and propagation see Erica, p. 800.

XV. SYRINGODEA (from *syropt*, syrinz, a pipe; in reference to the long tubular corollas). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

Lin. syst. Ocständeria, Monogynia. Calyx 4-leaved, glamous. Corolla long, tubular, usually rather dilated at top, rarely a little contracted; limb short, 4-lobed. Stamens for the most part included; filaments capillary; anthers bipartite; cells of anthers short, obtuse, mucous or aristate at the base, distilling by an oblong foramen. Stigma simple or capitate, and in some species annulated, with an elevated disk. Capsule 4-celled, many-seeded. Seeds oval, compressed, smooth.—Erect shrubs, natives of the Cape of Good Hope. Leaves loose, acerose. Flowers large, showy, crowded at the tops of the branches on every side, disposed in something like spikes.

§ 1. Anthers mutic at the base. Normal species.

* Leaves 3 in a whorl.

1 S. costata; leaves bluish, downy, spreading; flowers terminal, by threes; bracteas close to the calyx; calycine segments serratulate; corolla glabrous, curved, ribbed; style a little exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica costata, Andr. heath. 1. t. 40. Corolla pale red, with a greenish border.

Var. β, supérba (Andr. heath. vol. 4.) corolla larger, reddish-purple, with a greenish-yellow mouth.

2 S. diaphanà; leaves spreading, glabrous; flowers terminal, by threes, pendulous, glabrous; bracteas foliaceous, close to the calyx; calyxes obtuse, foliaceous; corolla with a clavate inflated tube; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica diaphana, Spreng. syst. 2. p. 178. Corollas deep reddish-purple.

3 S. clavátà; leaves erect; flowers terminal, by threes, drooping; bracteas close to the calyx, adpressed; genitals exserted a little. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica clavata, Andr. heath. 3. t. 40. Corolla green, cylindrically clavate. Anthers black.

4 S. faléns; leaves linear, hoary, spreading; flowers disposed in terminal racemes, horizontal; bracteas close to the calyx. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica pallens, Andr. heath. 3. t. 45. Corolla sulphur-coloured.

5 S. dìcrhus; leaves 3-4 in a whorl, villous; flowers terminal, by threes; bracteas close to the calyx; calyxes coloured, ciliated; corolla cylindrical; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica dichrus, Spreng. syst. 2. p. 170. Erica biolor, Andr. heath. 2. t. 39. Lodgd. bot. cab. 1001, but not of Thumb. nor Willd. Erica dichromata, Lodgd. bot. cab. 1813. Corolla purplish-red, with a greenish-yellow mouth.

6 S. linkeana (D. Don, l. c.) leaves ciliated, spreading; flowers axillary, numerous, nearly sessile, horizontal; calyces clavate, downy or villous; bracteas close to the calyx, and are as well as the calycine segments serrate; style subexserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica Linneana, Lodgd. bot. cab. 102. Erica Linneana, Andr. heath. 2. t. 34. Erica perspicua, Bölt. Hort. kew. 2. p. 371. Corolla white, with a red base. Anthers bearded on the back at top. In this and S. abietina the ovarium is 6-8-celled.

Var. β, supérba (Lodd. bot. cab. 1778.) flowers large, white tinged with red, erect. \( \text{h. G.} \) Erica Bedfordiana, G. Don, in Loud. Hort. brit. p. 147.

7 S. versicolor; leaves glabrous, spreading; flowers terminal, by threes; calyces coloured; bracteas close to the calyx, cylindrical, as well as the calycine segments; corolla nearly cylindrical; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica versicolor, Andr. heath. 1. t. 39. Lodgd. bot. cab. 208. Corolla purplish-red, with a greenish-yellow mouth.

Var. β, major (Lodd. bot. cab. 1816.) flowers larger.

8 S. triphylla; leaves glabrous, spreading; flowers terminal, 2-3 together, on short pedicels; bracteas approximating the calyx; calyx foliaceous, spreading; anthers inclosed; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica triphylla, Link. enum. 1. p. 360. Corolla clammy, red, yellow at top.

Three-leaved Syringodea. Fl. July, Nov. Clt. 1822. Shb. 9 S. Broadleyana; leaves linear, spreading; flowers axillary, on long pedicels, drooping; calycine segments narrow, foliaceous; bracteas remote from the calyx; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica Broadleyana, Andr. heath. 3. t. 44. Corolla deep red, with a yellow mouth. Anthers mutic.

10 S. insúlsa; leaves 3 in a whorl; flowers terminal; bracteas close to the calyx, foliaceous; corolla with a cylindrical incurved tube, and ciliated segments; style a little exserted; \( \text{h. G.} \) Native of the Cape of Good Hope. Erica insulsæ, Hort. Bedd. eric. wob. p. 12. Loddg. cab. p. 25. Flowers yellowish-green.

* * Leaves 4 in a whorl.

11 S. repulgens; leaves glabrous, spreading; flowers terminal, drooping, by fours; calyxes coloured, subulate, adpressed; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica repulgens, Andr. heath. vol. 4. with a figure. Corollas scarlet or deep purplish-red.

12 S. transhærens; leaves ovate-cuneated, shortly pectinated; calycine segments cuneated; corolla 6-7 lines long, bristly towards the apex outside; filaments spurred. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica transhærens, Thunb. prod. p. 71. Erica cerinoides γ, Thunb. disp. no. 33. Erica strigilifolia, Sal. in Lin. trans. 6. p. 367. Corollas white.\)

13 S. fellúcida; leaves linear, horizontal, ciliated; flowers terminal, pedicellate, drooping; bracteas close to the calyx; corolla with an oblong inflated tube, subpellucid; style exserted. \( \text{h. G.} \) Native of the Cape of Good Hope. Erica fellúcida, Andr. heath. 3. t. 60. Lodgd. bot. cab. 276. Corolla white. Calycine segments linear-subulate. Var. β, rābra (Bedd. eric. wob. p. 18. but not of Andr.) co-
rolla reddish-purple, with an inflated ribbed tube. Calycine segments linear-subulate.

14 S. **Bedfordiana**; leaves linear, ciliated; flowers terminal, pedicellate, drooping; bracteas remote from and approximating the calyx; corolla cylindrical, curved; style subexcrescent. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica pellicida* rubra, Andr. heath. vol. 4. with a figure. *Erica pellicoides*, Bedf. eric. wob. p. 18. Corollas reddish-purple.

16 S. **sulphurea**; leaves linear, obtuse, villous; flowers fasciculate, axillary and terminal, nearly sessile, horizontal; bracteas close to the calyx; corolla cylindrical, trumpet-shaped, villous; style exserted. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica sulphurea*, Andr. heath. vol. 4. with a figure. *Sims*, bot. mag. 1884. Lodd. bot. cab. 1762. *Corollas pale yellow or sulphur-coloured.*

17 S. \*flava*; leaves 3 in a whorl, filiform, glabrous, short, erect; flowers horizontal, axillary, crowded; calyx bracteate; corolla urceolate, tubular; short, style exserted. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica flavâ*, Lodd. bot. cab. 882. Andr. heath. vol. 2. t. 38. Flowers yellow.

**Yellow-flowered Syringodea.** Fl. April, Sept. Clt. 1795. Shrub.

18 S. **rubescens**; leaves linear-lanceolate, with revolute ciliated margins; floriferous branches pendulous; bracteas awned, close to the calyx, and are as well as the calycine segments dentately fringed; corolla cylindrical, inflated, beest with glandular hairs both inside and outside, with a revolute limb; style exserted. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica rubescens*, Andr. heath. 3. t. 56. Lodd. bot. cab. 1826. *Erica elongâta*, Hortul. *Corolla from pale purplish-red to white. Calycine segments ovate, roundish.*

20 S. \*linkii*; leaves spreading, beset with a few hairs; flowers terminal, umbellate; bracteas remote from the calyx; calycine segments ovate, white; anthers mutic; subexcrescent. \( \text{H.} \) S. T. G. Native of the Cape of Good Hope. *Erica prostrâdens*, Link, enulm. 1. p. 572. *Corolla 2-3 lines long, white.—Probably a species of *Cyanea.*

**Link's Syringodea.** Fl. April, May. Clt. 1805. Shrub.

22 S. **flamma**; leaves filiform, erectish, glabrous; flowers subsolitary, terminating the small branches, spike-like, horizontal; bracteas close to the calyx; calycine segments subulate, imbricated, unequal; corolla 8 lines long, downy, with a clavate tube, and the segments of the limb imbricated at the base; genitals a little exserted. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica flamma*, Andr. heath. 2. t. 56. *Erica bibax*, Sal. in Lin. trans. 6 p. 386. *Erica curviflora*, Thunb. diss. no. 30. *Corollas pale yellow.*

23 S. **linneoides**; leaves linear-lanceolate, pilose, spreading; flowers almost sessile, terminating small branches; bracteas close to the calyx; calycine segments lanceolate; corolla villous, cylindrical, swollen at top; style subexcrescent. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica linneoides*, Andr. heath. 2. t. 42. *Erica Linneana*, Ait. hort. kew. 2. p. 375. Lodd. bot. cab. 102. *Corollas with a purplish-red base, and a white top.*

24 S. **radiaeta**; leaves filiform, spreading; flowers terminal, umbellately verticillate; bracteas remote from the calyx; calyx adpressed; corolla 9-10 lines long, glabrous, with a cylindrical tube, and recurved limb; style exserted; fruit glabrous. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica radiaeta*, Andr. heath. 1. t. 46. *Erica calaminiflora*, Sal. in Lin. trans. 6 p. 380. Flowers reddish-purple.

25 S. **spuria**; leaves linear, subciliated, erectly spreading; flowers aggregate, terminating the small branches; bracteas remote from the calyx; calycine segments ovate, acuminate; corolla 7-8 lines long, downy, with a cylindrical tube, and a spreading border; genitals inclosed; pericarp obpyramidal. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica spuria*, Andr. heath. 1. t. 54. *Erica cicutaeflora*, Sal. in Lin. trans. 6 p. 357. *Corolla red.*

**Var. \( \beta \), translocens;** corolla purplish-red, rather ventricose at the base.—*Erica translocens*, Andr. heath. vol. 4. with a figure.

**Spurious Syringodea.** Fl. April, May. Clt. 1796. Shrub.

26 S. **exuergens**; leaves filiform, spreading recurved; flowers axillary, verticillate, horizontal, crowded; bracteas remote from and approximate to the calyx; corolla cylindrically clavate, 13-15 lines long, viscid, with ovate cuneated segments; filaments excised; pericarp 4-furrowed. \( \text{H.} \) G. Native of the Cape of Good Hope. *Erica exuergens*, Andr. heath. 1. t. 57. Lodd. bot. cab. 835. *Erica grandiflora breviflora*, Wendl. eric. 7. p. 7. with a figure. *Erica pharetraeflora*, Sal. in Lin. trans. 6 p. 361. *Corollas orange-red.* This species differs from all others in the corolline segments being attenuated at the apex, and bifid. There are several varieties of the species in the garden, besides those mentioned below, differing in the colour of the flowers.

**Var. \( \beta \), grandiflora** (Bedf. eric. wob. p. 7.) leaves 6-7 in a whorl; anthers a little exserted; style exserted; corolla long, cylindrical, trumpet-shaped, with an orange-red tube, and orange-yellow segments.

**Var. \( \gamma \), rutila** (Sal. in Lin. trans. 6 p. 361.) corolla golden-yellow. \( \text{H.} \) G. *Erica abietina*, Roxb. mss. ex Sal.

27 S. **curviflora**; leaves linear, spreading, glabrous; flowers usually solitary, terminating small branches; bracteas close to the...
the calyx; corolla glabrous, 10-11 lines long, with a curved cylindrical tube, and an erect or spreadingly reflexed limb; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica curtivilia, \( \text{Lin. dis. no. 41. a. Andr. heath. t. 52. Lodd. bot. cab. 1668.} \) Wendl. eric. fasc. 3. no. 3. p. 3. with a figure. Erica fastuosa, \( \text{Sal. in Lin. trans. 6. p. 359.} \) Flowers orange-yellow. Fruit broadly turbinate.

**Curved-flowered Syringodea.** Fl. July, Nov. C1t. 1774. Shrub tall.

28 S. simpliciflora; leaves trigonal, erectly spreading, flowers terminating the small branches, solitary, erect; bracteas remote from the calyx; calycine segments lanceolate, adpressed; corolla tubular, constricted in the middle, with a spreading limb; genitils exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica simpliciflora, \( \text{Willd. spec. 2. p. 402.} \) Wendl. eric. 17. p. 69. with a figure. Erica curtivilia, \( \text{Lin. syst. ed. 13. p. 305. but not of his dis. Sal. in Lin. trans. 6. p. 358.} \) Flowers rufous or reddish-orange. Pedicels downy. Corolla 9 lines long, downy; interstices of the limb lanceolate. Calycine segments ovate, acuminate. **Simple-flowered Syringodea.** Fl. March, July. C1t. 1774. Shrub.

29 S. tubiflora; leaves linear, obtuse, downy, erect; flowers usually solitary, terminating the small branches; bracteas almost close to the calyx; corolla downy, cylindrical, 9-10 lines long, a little curved, with a revolute limb; calycine segments oblong; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica tubiflora, \( \text{Lin. dis. no. 40. spec. ed. 2. p. 505.} \) Andr. heath. t. 55. Wendl. eric. 4. p. 7. with a figure. Ionon. hort. kew. 38. \( \text{Sal. in Lin. trans. 6. p. 357.} \) Flowers purplish-red. Pedicels glabrous. **Var. \( \beta \), coccinea** (\( \text{Sal. in Lin. trans. 6. p. 357.} \) ) flowers deeper red. \( \text{G}. \text{ Erica coccinea, Lin. dis. no. 42. with a figure of the flower.} \)

**Tube-flowered Syringodea.** Fl. April, Aug. C1t. 1775. Shrub.

30 S. ignescens; leaves linear, glabrous, spreading; flowers solitary, terminating the small branches, drooping; calycine segments ovate, acuminate, a little ciliated; bracteas ovate, ribbed, close to the calyx, or rather remote; corolla cylindrical, rather pilose at top, with a revolute limb; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica ignescens, \( \text{Andr. heath. 2. t. 47.} \) Corollas reddish-orange. Calycine segments ovate, acuminate. **Fiery Syringodea.** Fl. March, June. C1t. 1792. Shrub.

31 S. sooida; branches scattered, hairy; leaves linear, obtuse, woolly, spreading; flowers usually solitary, terminating the small branches, drooping; bracteas remote from the calyx; calyxes adpressed, convex outside at the base; corolla 12 lines long, cylindrical, curved, villous, with a revolute limb; genitils inclosed. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica sooida, \( \text{Andr. heath. 1. t. 55. Lodd. bot. cab. 1793.} \) Erica laniflora, \( \text{Wendl. eric. fasc. 19. no. 4. with a figure.} \) Erica floccosa, \( \text{Sal. in Lin. trans. 6. p. 360.} \) Flowers dirty orange-red. Style exserted. **Dirty-flowered Syringodea.** Fl. Aug. Dec. C1t. 1790. Shrub.

32 S. brachiatis; leaves linear, hairy; flowers terminal; corolla 6-8 lines long, hairy both inside and outside, with a curved pyramidal tube; anthers mutic, very long. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica brachiatis, \( \text{Sal. in Lin. trans. 6. p. 367.} \) **Branched Syringodea.** Fl. March, July. C1t. 1792. Shrub.

33 S. serratifolia; leaves linear, acute, spreading, with plumeose margins; flowers aggregate, terminal; bracteas close to the calyx; calyxes foliaceous, glandularly ciliated, a little recurved; corolla 9 lines long, glabrous, cylindrical, with a spreading limb; anthers a little exserted; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica serratifolia, \( \text{Andr. heath. 1. t. 48. Lodd. bot. cab. 1793.} \) Erica cylindriciflora, \( \text{Sal. in Lin. trans. 6. p. 356.} \) Erica plumosa, \( \text{Wendl. eric. no. 12. p. 5.} \) Corolla greenish-yellow at top, and orange-red at base. Leaves 4-6 in a whorl.

34 S. Massonii; leaves 4-5 in a whorl, linear, serrulate, hairy, imbricately spreading; flowers axillary, crowded, drooping, disposed in a verticillate crown; bracteas imbricate; corolla 10-12 lines long, viscid, swollen at top; style exserted; pericarp clavate, stipitate. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica Massonii, \( \text{Lin. suppl. 219. Curr. bot. mag. t. 356.} \) Pl. kew. t. 20. Lodd. bot. cab. 1069. Erica Massonia, \( \text{Andr. heath. 1. t. 51.} \) Erica lycopodiifolia, \( \text{Sal. in Lin. trans. 6. p. 361.} \) Corolla with a scarlet or reddish-purple tube, and a greenish-yellow constricted mouth. **Var. \( \alpha \), minor** (\( \text{Bedd. eric. wob. p. 14.} \) ) corolla smaller, with an inflated clavate tube. \( \text{G}. \text{ Masson's Syringodea.} \) Fl. July, Oct. C1t. 1787. Shrub.

35 S. procera; leaves linear, erect, downy; flowers solitary, terminating the small branches, ereticith; corolla constricted in the middle, with a spreading limb; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica procera, \( \text{Wendl. eric. with a figure.} \) Corollas white?

**Lofty Syringodea.** Fl. April, June. C1t. 1791. Shrub.

36 S. conspicuus; leaves linear, oblong, glabrous, spreading; flowers terminal, rather aggregate, drooping; bracteas near the calyx, spatulate; calycine segments ovate, obtuse, concave at the base outside; pedicels pubescent; corolla 15 lines long, with a clavate tube, and a retuse limb; genitils exserted a little. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica conspicua, \( \text{Sol. in hort. kew. 2. p. 373.} \) Willd. spec. 2. p. 404. Pl. kew. t. 12. Andr. heath. 1. t. 30. Wendl. eric. 4. p. 9. with a figure. Corollas orange-yellow.

**Conspicuous Syringodea.** Fl. May, Aug. C1t. 1774. Shrub.

37 S. glandulososa; leaves linear, acute, beset with glandular hairs, spreading; flowers nearly terminal, crowded, disposed in a verticillate crown; bracteas close to the calyx, and are as well as it ciliated with glandular hairs; corolla glabrous, with a clavate tube; style exserted. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica glandulososa, \( \text{Thumb. prod. p. 71. disso. no. 32.} \) Corollas orange-red?

**Glandular Syringodea.** Fl. May, June. C1t. 1801. Shrub.

38 S. gemmifera; leaves oblong, adpressed, ciliated, aristate, 4-5 in a whorl; branches thickened at top; bracteas remote from and approximating the calyx; flowers drooping, crowded, disposed in a verticillate crown; corolla villous, cylindrical, inflated, genitils inclosed. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica gommifera, \( \text{Simms, bot. mag. t. 2986. Lodd. bot. cab. 457.} \) Erica Massonii minor, \( \text{Hortul.} \) Corollas reddish-purple or scarlet, with a green apex.

39 S. lituiflora; leaves linear, nearly smooth; flowers solitary or by threes, terminating the branches; bracteas close to the calyx; corolla 6-8 lines long, downy or villous, with the tube clavate; filaments bearded on the back at the apex. \( \text{G}. \text{ Native of the Cape of Good Hope.} \) Erica lituiflora, \( \text{Sal. in Lin. trans. 6. p. 356.} \) Erica perspicua, \( \text{Wendl. eric. fasc. 1. p. 7. with a figure.} \) Corolla white, tinged with red.
ERIACEE. XV. SYRINGODEA.

40 S. perspicua; leaves linear, nearly smooth; flowers terminating in the small branches, spike-formed; bracteae remote from the calyx; pedicels hairy; corolla cylindrical, erect; genitals inclosed. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica perspicua. Hort. Bedd. eric. wob. p. 18. Corolla reddish-purple.

41 S. Bedfordiana; leaves linear, ciliated, hairy; flowers terminal, subcapitate; pedicels slightly hairy; bracteae remote from the calyx; corolla downy, with a cylindrical subventricose tube; genitals inclosed. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica perspicuicollis, Bedd. eric. wob. 18. Flowers reddish-purple.

42 S. cyrilleflora; stem slender; leaves linear, glabrous; corolla 2-3 lines long, downy, with a narrow campanulate tube, and a short limb. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica cyrilleflora, Sal. in Lin. trans. 6. p. 357. Flowers pale scarlet.

43 S. obpyramidalis; leaves pubescent, spreading; flowers terminal, usually by threes; bracteae remote from the calyx, broad at the base; corolla funnel-shaped, with a spreading border, having the interstices of the limb tumid on the outside; fruit spherical. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. E. pyramidalis, Andr. heath. 1. t. 45. Sims, bot. mag. 366. kew. Lodd. bot. cab. 319. Ait. hort. kew. 3. p. 401. Icon. pl. t. 27. Wendl. eric. 5. p. 3. with a figure. Erica obpyramidalis, Sal. in Lin. trans. 6. p. 356. Corollas purplish-red, \( \frac{3}{2} \) to 4 lines long. Style exerted.

Obopyramidal-flowered Syringodea. Fl. Year. Clt. 1787. Shrubs \( \frac{1}{4} \) foot.

44 S. verticillata; leaves linear, glabrous; flowers crowded, nearly terminal, verticillate, drooping; bracteae remote from the calyx; corolla with a cylindrical inflated tube, glabrous, contracted at top; genitals inclosed. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica verticillata, Andr. heath. 1. t. 7. Lodd. bot. cab. 145. Erica mammosa, \( \beta \), verticillata, Ait. hort. kew. 2. p. 369. Flowers scarlet.

45 S. coloans; leaves linear, spreading, ciliated; flowers crowded, terminating the small branches; bracteae close to the calyx; corolla cylindrical, clavate, glabrous; style almost inclosed; calyxes coloured, subulate. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica coloans, Andr. heath. vol. 4. with a figure. Lodd. bot. cab. 224. Ker. bot. reg. 601. Bedf. eric. wob. pl. 4. f. 11. Corollas varying from white to red.

** ** Leaves 6 or more in a whorl.

46 S. sylvandens; leaves linear, obtuse, spreading; flowers densely crowded, drooping; calyculate segments ovate; corolla downy, with a subrevolute limb; genitals exerted. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica sylvandens, Wendl. eric. fasc. 8. p. 5. with a figure, but not of Andr. Corolla deep red.

47 S. longifolia; leaves long, linear, incurvate spreading, with scabrous edges; flowers crowded in whorls, drooping; bracteae close to the calyx; corolla pubescent, clammy; calyx segments linear; genitals inclosed. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica longifolia, Pl. hort. kew. t. 4. Willd. spec. 2. p. 398. Erica longifolia, \( \ddot{\gamma} \), Sal. in Lin. trans. 6. p. 363. 48 S. vestita; leaves linear, erect, with scabrous edges; flowers crowded, verticillate, nearly sessile, spreading; bracteae close to the calyx; corolla cylindrical, more or less claveate, 9-11 lines long, downy, with a revolute limb: style exerted; pericarp silky at top. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica vestita, Thumb. dis. no. 25. Erica longifolia, var. a, Sal. in Lin. trans. 6. p. 363. Erica vestita alba, Andr. heath. 1. t. 62. Wendl. eric. no. 12. p. 3. with a figure. Calyce segments ciliated with glandular hairs. Corolla white, cylindrical, curved.

Var. \( \beta \), lutea (Andr. heath. 3. t. 72.) leaves 6-8 in a whorl; corolla cylindrical, pale yellow.

Var. \( \gamma \), incarnata (Andr. heath. 2. t. 66. Lodd. bot. cab. 1698.) leaves 7 in a whorl; genitals a little exerted; corolla cylindrical, almost straight, pale reddish-purple. Erica longifolia, Curt. bot. mag. 706.

Var. \( \alpha \), rosea (Andr. heath. 2. t. 67.) leaves 7-8 in a whorl; anthers a little exerted; corolla cylindrical, subclavate, reddish-purple.

Var. \( \epsilon \), fulgida (Andr. heath. 2. t. 68.) anthers a little exerted; flowers nearly terminal; corolla with a cylindrical tube, and straight segments, reddish-purple or deep red. Erica fulgida, Bedd. eric. wob. p. 11. Lodd. bot. cab. 1633.

Var. \( \zeta \), purpurea (Andr. heath. 1. t. 63.) anthers a little exerted; corolla cylindrical, subclavate, purplish-red. Lodd. bot. cab. 217. Wendl. eric. 10. p. 7. with a figure.

Var. \( \eta \), cocinea (Andr. heath. 1. t. 6. bot. mag. 402. Wendl. eric. 11. p. 5. with a figure.) anthers a little exerted; corolla erect, cylindrical, curved, deep red, not exactly scarlet.

49 S. finea; leaves linear, obtuse, spreading; flowers crowded, verticillate, almost sessile, spreading; bracteae close to the calyx; calyce segments dilated at the base, and linear-subulate at the apex, imbricate; corolla 6-7 lines long, glabrous, with a cylindrical clavate tube, and a serrated spreading limb; pericarp glabrous; style exerted. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica finea, Thumb. dis. no. 26. Andr. heath. 1. t. 61. Erica pinifolia, Sal. in Lin. trans. 6. p. 362. but not of Andr. Flowers deep red and blue.

Var. \( \beta \), purpurea (Lodd. bot. cab. 1259.) corolla purple.

There are several other varieties in the gardens.

50 S. pinifolia; leaves filiform, elongated, glabrous, spreading, 6-8 in a whorl; flowers nearly terminal, crowded, horizontal, verticillate; bracteae close to the calyx; calyx villous, with linear segments; corolla tomentose, cylindrically club-shaped, inflated, ribbed; style exerted. \( \ddot{\gamma} \). G. Native of the Cape of Good Hope. Erica pinifolia, Andr. heath. 3. t. 69. Erica pittyophylla, Spreng. syst. 2. p. 181. Corolla white, with dark anthers.

Var. \( \beta \), diacolor (Andr. heath. 3. t. 70.) corolla with a cylindrical ribbed tube, reddish-purple or pale red.

Var. \( \gamma \), spiralis (Hort. Bedd. eric. wob. 19.) corolla with a clavate inflated tube, white and purplish-red.

Var. \( \delta \), cocinea (Andr. heath. 2. t. 65.) flowers scarlet.

ERICACEÆ. XV. SYRINGODEA.

51 S. aurea; leaves linear, recurvedly spreading; flowers horizontal, crowded, verticillate, nearly terminal; bracteas close to the calyx, aristate; corolla cylindrical, with reflexed segments; style exerted; calyce segments ovate, acuminated. h. G. Native of the Cape of Good Hope. Erica aurea, Andr. heath. 2. t. 61. Corollas orange-yellow.

Var. β, flore pallido (Andr. heath. 3. t. 71.) flowers pale red, with dark anthers.

52 S. virens; leaves linear, spreading, subrecurved; flowers crowded, verticillate, horizontal; bracteas one-half shorter than the calyx; corolla cylindrical, ribbed, dilated in the middle, with a revolute limb; style exerted. h. G. Native of the Cape of Good Hope. Erica virens, Andr. heath. 2. t. 59. Ait. hort. kew. 2. p. 376. Flowers greenish-yellow.

53 S. Hibbertiana; leaves 4-6 in a whorl, linear, glabrous, spreading; flowers horizontal, crowded, disposed in a whorled crown; bracteas 3, two of which are close to the calyx, and the third remote; corolla glabrous, clamy, cylindrical, curved, clavate, with an erect limb; anthers a little exerted. h. G. Native of the Cape of Good Hope. Erica Hibbertiana, Andr. heath. 3. t. 68. Erica Hibbertiana, Ait. hort. kew. 2. p. 378. Sims. bot. mag. 1758. Corollas red or purplish-red, with a yellow mouth.

54 S. onosmaeflora; leaves linear, spreading, glabrous; flowers crowded, axillary, subverticillate; corolla viscid, with a cylindrical tube and spreading limb; bracteas one-half shorter than the calyx. h. G. Native of the Cape of Good Hope. Erica glutinosa, Andr. heath. 1. t. 60. Erica viscósa, Wendl. eric. with a figure. Erica onosmaeflora, Sal. in Lin. trans. 6. p. 363. Corolla sulphur-coloured; tube clavate, 5-10 lines long. Calyce segments ovate-oblong.

55 S. echiflora; leaves 5-7 in a whorl, linear, downy, with rough margins, spreading; flowers axillary, horizontal, spicate; bracteas close to the calyx; corolla with a short inflated ribbed tube, clamy; style exerted. h. G. Native of the Cape of Good Hope. Erica echiflora, Andr. heath. 3. t. 62. Lodd. bot. cab. 364. Erica echiflora, var. supraéba, Bedf. eric. wob. p. 8. Corollas deep red or reddish-purple.

Var. β, purpurea (Bedf. eric. wob. p. 8.) corolla purple, with a short equal tube, that is not inflated.

Var. γ, coccinea (Lodd. cat. p. 25.) corollas deep red or scarlet.

56 S. argentiflora; leaves linear, glabrous, spreadingly incurved; flowers axillary, horizontal, spicate, rather pellucid; bracteas close to the calyx; style exerted. h. G. Native of the Cape of Good Hope. Erica argentiflora, Andr. heath. vol. 4. with a figure. Corolla tubular, short, white.

57 S. Archerioida; leaves 6-7 in a whorl, serrulately ciliate, spreading; flowers axillary and terminal, crowded, verticillate; pedicels trubacteats, 2 of the bracteas near the calyx, and the third remote; corolla downy, viscid, with a cylindrical inflated tube; calyce segments serrulately hispid, as well as the bracteas; style exerted. h. G. Native of the Cape of Good Hope. Erica Archerioida, Ait. hort. kew. 2. p. 378. Lodd. bot. cab. 1466. Corolla deep reddish-purple or scarlet. Ovarium cylindrical.

58 S. rosea; leaves filiform, erect, 5-6 in a whorl; flowers sessile, terminating small branches; bracteas close to the calyx; corolla glabrous, with a cylindrical tube and erect segments; calyce segments subulate; genitils inclosed. h. G. Native of the Cape of Good Hope. Erica rosea, Andr. heath. 2. t. 13. Lodd. bot. cab. 782. Flowers red.

59 S. Salisburiana; leaves linear, erect, with revolute margins, white beneath; flowers axillary, racemosely spicate, tufted, crowded, drooping; corollas cylindrically clavate; style exerted. h. G. Native of the Cape of Good Hope. Erica Salisburiana, Andr. heath. vol. 4. with a figure. Erica rosea, Hort. Bedf. eric. wob. p. 132. Flowers purplish-red.

60 S. grandiflora; leaves linear, bluntish, glabrous, reclinate; flowers axillary near the tops of the branches and stem, verticillate; bracteas small, close to the calyx; calyce segments ovate-lanceolate; corolla long, curved, trumpet-shaped, viscid, with a revolute limb; genitils exerted. h. G. Native of the Cape of Good Hope. Erica grandiflora, Thunb. diss. no. 28. Lin. suppl. 223. Curt. bot. mag. 189. Pl. hort. kew. t. 8. Andr. heath. 1. t. 50. Erica grandiflora longifolia, Wendl. eric. 6. p. 5. with a figure. Lodd. bot. cab. 498. Corolla orange-yellow outside, yellow inside. Leaves from 4 to 6 in a whorl, but usually the latter number.

Var. β, formosa; leaves 8 in a whorl; pedicels bracteate, 2 of the bracteas close to the calyx, and the third remote from it; corollas reddish-orange. Erica formosa, Bedf. eric. wob. p. 10.

Var. γ, humilis; leaves 4 in a whorl. Shrub dwarf.

Var. δ, Andrémsii; flowers scarlet. h. G. Erica formosa, Andr. heath. 2. t. 64.

61 S. Leea; leaves linear, filiform, stiff, obtuse, spreading; flowers axillary, verticillate; bracteas close to the calyx, and length of it; corolla 5-6 lines long, viscid, with a clavate 4-ribbed tube, and a spreading limb; calyx adpressed; style exerted. h. G. Native of the Cape of Good Hope. Erica Léea, Andr. heath. 1. t. 59. Erica Leéea, Ait. hort. kew. 2. t. 376. Pl. kew. 24. Lodd. bot. cab. 298. Erica costaféora, Sal. in Lin. Trans. 6. p. 363. Corollas orange-red.

62 S. cephalotes; leaves linear; flowers disposed in capitate whorls; calyx downy; corolla tubularly clavate; anthers inclosed; style exerted. h. G. Native of the Cape of Good Hope. Erica cephalotes, Thunb. diss. no. 23. prod. 70. Willd. spec. 2. p. 398. Corolla purple.

63 S. coccinea; stem angular; leaves linear, cuspidate, ciliate, spreading; flowers axillary, crowded; bracteas close to the calyx; calyx spreading, woolly or villous; corolla viscid, 5-10 lines long, having the tube hardly clavate, and the limb erect; style exerted; ovariurn turbinate. h. G. Native of the Cape of Good Hope. Erica coccinea, Berg. pl. cap. p. 98. Wendl. eric. fase. 3. p. 9, with a figure. Andr. heath. 1. t. 49. Lodd. bot. cab. 1374. Erica abietina, Lin. spec. ed. 1. p. 355. Erica frondosa, Sal. in Lin. trans. 6. p. 364. Flowers scarlet or deep red.

Var. β, Bedfordiana; bracteas coloured; calyx woolly; genitils exerted; flowers nearly terminal, verticillate; corolla with
ERICACEÆ. XV. SYRINGODEA.

823

Scarlet-flowered Syringodea. Fl. Year. Clt. 1793. Shrub. 64 S. purpurea; stem terete; leaves short, linear, ciliated, spreading, 6-7 in a whorl, rather remote; flowers crowded, horizontal, verticillate; bractees close to the calyx; calyx incurved erect; corolla cylindrical, trumpet-shaped, 8-9 lines long, viscid, with a hardly elevate tube, and a spreading limb; genitalia exserted; ovary turbinate. ¾ G. Native of the Cape of Good Hope. Erica purpurea, Andr. heath. t. 1. t. 56. Loddbot. cab. 703. Erica phyllichola, Sal. in Lin. trans. 6. p. 364. Corollas purple.

Thready Syringodea. Fl. Year. Clt. 1800. Shrub. 67 S. lanata; leaves 5-6 in a whorl, woolly, as well as the branches, which are also verticillate; flowers terminal; calyx incurvedly spreading, concave at the base outside; corolla 9-11 lines long, rather woolly. ¾ G. Native of the Cape of Good Hope. Erica lanata, Wendl. eric. p. 45. with a figure. Erica verticillaris, Sal. in Lin. trans. 6. p. 360. Flowers of a rufous fulvous colour. Anthers mucous.

Woolly Syringodea. Fl. Feb. May. Clt. 1775. Shrub. 68 S. pura; leaves linear, glabrous; flowers axillary, verticillate, near the tops of the branches; bractees close to the calyx; style exserted; corolla with a cylindrical subcalvate tube. ¾ G. Native of the Cape of Good Hope. Erica pura, Andr. heath. vol. 4. with a figure. but not of Lodd. Flowers pure white.

Pretty Syringodea. Fl. Autumn. Clt. 1792. Shrub. 70 S. pulviniformis; leaves linear, attenuated, serulate ciliated; flowers longish, on the rudiments of the branches; corolla 7-9 lines long, viscid, with a cylindrically urceolate tube. ¾ G. Native of the Cape of Good Hope. Erica pulviniformis, Sal. in Lin. trans. 6. p. 364. Corollas red.—Habit of Erica cerinthisoides.

§ 2. Anthers awned or crested. Aberrant species.

71 S. discolor; leaves linear, spreading, ciliated; flowers terminal, by threes; bractees close to the calyx; calycine segments serrated; corolla 9-10 lines long, anointed with glutinous, urceolate, having the tube finely striated; awns of anthers short, glabrous. ¾ G. Native of the Cape of Good Hope. Erica discolor, Andr. heath. t. 1. t. 3. Wendl. eric. 5. p. 9. with a figure. Lodd. bot. cab. 1453. Erica cupressiformis, Sal. in Lin. trans. 6. p. 354. Corollas pale red.

Two-coloured-flowered Syringodea. Fl. Nov. March. Clt. 1788. Shrub. 72 S. ruysda; leaves crowded, linear, spreadingly reflexed, 3-5 in a whorl; flowers axillary, verticillate, near the tops of the branches; bractees broad at the base, remote from the calyx; calyx foliaceous; corolla with a wrinkled tube; genita exserted; anthers awned. ¾ G. Native of the Cape of Good Hope. Erica ruysda, Andr. heath. vol. 4. with a figure. Flowers reddish-purple.

Dense-leaved Syringodea. Fl. March, May. Clt. 1811. Shrub. 74 S. Ewerana; leaves linear, scabrous, spreading; flowers subspicate; bractees remote from the calyx; calyx flat, with thick margins; corolla cylindrical, 8-10 lines long, clothed with viscid down, curved and clavate; style exserted; awns of anthers long, downy. ¾ G. Native of the Cape of Good Hope. Erica Ewerana, Dry. in Ait. hort. kew. 2. p. 368. Lodd. bot. cab. 303. Erica Ewrena, Hort. Erica Uliria, Andr. heath. 2. t. 3. Wendl. eric. 18. p. 91. Erica decora, Sal. in Lin. trans. 6. p. 554, with a figure. Corolla dark red, or reddish-purple, with a greenish-yellow mouth.

Var. β, pilosa (Andr. heath. 2. t. 4.) leaves pilose; bractees close to the calyx; flowers terminating small branches; corolla slightly curved and clavate, purplish-red, with a greenish-yellow mouth.

Ewer’s Syringodea. Fl. July, Nov. Clt. 1790. Shrub. 75 S. hirta; leaves linear, ciliated; flowers terminal; bractees sessile, close to the calyx, ciliated; corolla cylindrically; style exserted; anthers awned. ¾ G. Native of the Cape of Good Hope. Erica hirta, Andr. heath. 3. t. 5. Lodd. bot. cab. 1116. but not of Thurb. nor Wildl. Corolla reddish-purple, with a greenish-yellow mouth.

Hairy Syringodea. Fl. Feb. May. Clt. 1800. Shrub. 76 S. cruenta; leaves linear, subulate, glabrous, spreading; flowers terminal, by threes; bractees remote from the calyx; calyx serrated; corolla 9-12 lines long, shining, smooth, with a clavate, more or less compressed, curved tube; style exserted; pericarp ovate. ¾ G. Native of the Cape of Good Hope. Erica cruenta, Pl. kew. t. 13. Lodd. bot. cab. 1656. Erica melliflua, Sal. in Lin. trans. 6. p. 354. Corolla reddish-purple or blood-coloured.

Var. β; calyx slightly serrated; corolla deep red or scarlet. ¾ G. Erica cruenta, Andr. heath. 1. t. 9. Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 16. Wendl. eric. 4. p. 11. with a figure.
Bloody-flowered Syringodea. Fl. Year. Ct. 1774. Shrub. 77 S. viridiflora; leaves 3 in a whorl, or alternate, ciliated; flowers terminal, drooping; bracteas imbricate; corolla with a cylindrical calyx tube; style exerted; anthers a little exerted, subulate. [G. Native of the Cape of Good Hope. Erica hirta, var. viridiflora, Andr. heath. 3. t. 7. Lodd. bot. cab. 917. Flowers deep green.

Green-flowered Syringodea. Fl. July, May. Ct. 1810. Shrub. 78 S. speciosa; leaves linear, downy, spreading; flowers terminal, by threes; bracteas close to the calyx; calyx cleft segments broad, short, imbricate, with woolly edges; corolla with a cylindrical, inflexed, curved tube, and an erect limb; style exerted, incurved at top; anthers awned, about the length of the corolla. [G. Native of the Cape of Good Hope. Erica speciosa, Andr. heath. 2. t. 2. Lodd. bot. cab. 375. Ait. hort. kew. 2. p. 369. Corollas dark red or reddish-purple, with a greenish-yellow mouth.

Var. βthala; flowers white.
Var. γthala; flowers red.

* * Leaves 4 in a whorl.

80 S. mutabilis; leaves linear, ciliated, spreading, 3-4 in a whorl, the 3 terminal hairs the longest; flowers terminal, umbellate; pedicels downy; bracteas 3, 2 near the calyx, and the third remote from it; calyx cleft segments ciliated, with glan-dular hairs; corolla cylindrical, inflated, filaments awned; anthers a little exerted; style exerted. [G. Native of the Cape of Good Hope. Erica mutabilis, Andr. heath. 3. t. 31. Siims, bot. mag. 2948. Lodd. bot. cab. 46. Corolla purplish-red, deeper towards the top. The hairs or down on the plant are tipped with black glands in the young state.

Changeable-flowered Syringodea. Fl. Year. Ct. 1798. Shrub 1 to 2 feet. 81 S. cuspidoidea; leaves linear, pedicels glabrous; calyx cleft segments ovate, cupulidade; flowers terminal; corolla 11-12 lines long, downy, having the interspaces of the limb lanceolate at the base; anthers hairy, awned; filaments rather villous. [G. Native of the Cape of Good Hope. Erica cuspidoidea, Sal. in Lin. trans. 6. p. 338.

Point-bearing Syringodea. Fl. Feb. May. Ct. 1796. Shrub. 82 S. densa; leaves 4-5 in a whorl, linear, somewhat imbricated, spreading; flowers axillary, crowded, nearly sessile; bracteas close to the calyx; calyx adpressed; corolla with an oblong-cylindrical tube, and a short spreading limb; anthers awned; style a little exerted. [G. Native of the Cape of Good Hope. Erica densa, Andr. heath. 3. t. 30. Corolla pale red, with a deep spreading border, like a Callista, of which it may probably be a species.

Dense-flowered Syringodea. Fl. May, Oct. Ct. 1810. Shrub. 83 S. naana; stem trailing; leaves linear, spreading, obtuse; flowers terminal; bracteas close to the calyx, imbricated, ciliated; corolla 9-11 lines long, downy outside, with a clavate compressed tube; style exerted; awns of anthers long. [G. Native of the Cape of Good Hope. Erica nana, Sal. in Lin. trans. 335. Erica depressa, Andr. heath. 2. t. 12. but not of Thumb, nor Willd. Corollas yellow-green.

Purple-flowered Syringodea. Fl. June, Nov. Ct. 1820. Shrub. 85 S. hybrida; leaves linear, glabrous, flowers terminal; bracteas close to the calyx; corolla glabrous, with a cylindrical, slightly curved tube; style exerted; anthers arista. [G. Native of the Cape of Good Hope. Erica hybrida, Hort. Flowers purplish-red. Nearly allied to S. cylindrica.

Hybrid Syringodea. Fl. May, June. Ct.? Shrub. 86 S. nitens; leaves hairy, flowers terminal; pedicels tri-bracteate, 2 of the bracteas near the calyx, and the third remote; calyx coloured, hairy; corolla with a curved subcalyx tube; genitils arista, a little exerted. [G. Native of the Cape of Good Hope. Erica nitens, Hortul. Bedd. eric. wob. p. 16. Corolla purplish-red, with a green top.

Skining Syringodea. Fl. June, Sept. Ct.? Shrub. 87 S. sanguinea; leaves linear, glabrous; flowers nearly terminal, crowded, verticillate; calyces broad; bracteas remote from the calyx; corolla cylindrical, anthers a little exerted, subulate; style exerted. [G. Native of the Cape of Good Hope. Erica sanguinea, Lodd. bot. cab. 86. Flowers deep red.

Greenish-flowered Syringodea. Fl. May. Ct. 1804. Shrub. 89 S. ambigua; leaves linear, rather hairy, spreading; flowers terminal, usually solitary; bracteas close to the calyx; calyx segments subulate, adpressed; corolla striated, glabrous, with a cylindrical tube and short reflexed limb; style a little exerted; anthers awned. [G. Native of the Cape of Good Hope. Erica ambigua, Wendl. eric. fasc. 16. p. 61. with a figure. Erica cylindrica, Andr. heath. 2. t. 30. Lodd. bot. cab. 1434. Corolla reddish-purple.

Club-flowered Syringodea. Fl. Aug. Oct. Ct. 1799. Shrub. 92 S. epiotoma; leaves glabrous; flowers terminal; bracteas remote and close to the calyx; calyx green, large, inflated; corolla with an oblong inflated tube; genitils inclosed, arista. [G. Native of the Cape of Good Hope. Erica epistoima,
ERICACEÆ. XV. SYRINGODEA.

93 S. saxicifóra; leaves linear, flowers terminal; calyx segments broad, ovate, acuminate; corolla 6-8 lines long, glabrous, with a cylindrical tube; anthers long; epithets close, papillate. ₇. G. Native of the Cape of Good Hope. Erica saxicifóra, Sal. in Lin. trans. 6. p. 555.

₉₄ S. Patersòni; leaves dense, linear, straight, spreading, glabrous; flowers crowded, axillary; bracteas close to the calyx; calyces segments ciliated at the base, and cussipitate at the apex; corolla 6-8 lines long, glabrous, with a cylindrical tube and a short reflexed limb; style exerted; anthers of long. ₇. G. Native of the Cape of Good Hope. Erica Patersòni, Andr. heath. 1. t. 10. Wendl. eric. fasc. 1. p. 16. with a figure. Erica Patersòni, Ait. hort. kew. 2. p. 379. Loddd. bot. cab. 1729. Erica abietina, Lin. spec. ed. 2. p. 506. diss. no. 20. Erica spissifolia, Sal. in Lin. trans. 6. p. 555. Flowers yellow.

Var. β, monòstrós (Bedf. eric. wob. p. 17.) corolla larger.

Var. γ, Major (Andr. heath. 3. t. 16.) calyx slightly toothed.

95 S. velitárias; leaves linear; flowers terminal; corolla $\frac{3}{4}$ to 3 lines long, downy, with an obovate tube and a recurved spreading limb; of anthers long, cuneate, and a little serrated. ₇. G. Native of the Cape of Good Hope. Erica velitárias, Sal. in Lin. trans. 6. p. 557.

₉₆ S. olívæ; leaves linear, triquetrous, stiff, glabrous; spreading; flowers axillary, verticillate, pendulous, crowded; pedicels glabrous; bracteas lanceolate, close to the calyx, ribbed; calyces segments lanceolate; corolla downy, 7-9 lines long, with a cylindrical inflated tube, 4-angled at the base; genits inclosed, and anthers awned. ₇. G. Native of the Cape of Good Hope. Erica olívæ, Wendl. eric. with a figure. Erica gélida, Andr. heath. 2. t. 11. Ait. hort. kew. 2. p. 379. Loddd. bot. cab. 698. Erica alveífíora, Sal. in Lin. trans. 6. p. 366. Flowers green. Leaves 4-6 in a whorl.

Var. β, albínæ (Bedf. eric. wob. p. 11.) corolla with a white base and a green top.

Var. γ, gítea (Wendl. eric. fasc. 12. p. 13. with a figure); bracteas remote from the calyx; flowers disposed in a verticillate crown, greenish-yellow. Leaves 4-5 in a whorl.

₉₇ S. mammósæ; leaves linear, subulate, glabrous, erect, spreading; flowers drooping, axillary, crowded, verticillate, near the tops of the branches; bracteas linear, remote from the calyx; calyces coloured; pedicels downy; corolla downy, 8-10 lines long; with a cylindrical inflated tube, having 4 pits near the base; genits inclosed; anthers awned. ₇. G. Native of the Cape of Good Hope. Erica mammósæ, Lin. mant. 234. diss. 21. Andr. heath. 1. t. 8. Loddd. bot. cab. 125. Erica mammósæ, β, Sal. in Lin. trans. 6. p. 366. Erica abietina, Thunb. diss. no. 68. Schw. pl. no. 22. with a figure. Berg. pl. cap. 105.—Buxb. cent. 4. p. 25. t. 41-42. Corollas pale purplish-red, or dark pink.

Var. β, minor (Andr. heath. 3. t. 9.) corolla more slender, purplish-red.

Var. γ, pallídæ (Lodd. bot. cab. 951.) flowers paler.

₉₈ S. túmida; leaves linear, obtuse, hairy, reflexed; flowers terminal, usually by fours; pedicels tricraciate, 2 of the bracteas close to the calyx, and the third remote; corolla downy, with an oblong-cylindrical tube; calyx spreading; style somewhat exerted; anthers awned. ₇. G. Native of the Cape of Good Hope. Erica tûmida, Ker. bot. reg. t. 65. Erica splêndens, Andr. heath. vol. 4. with a figure. Erica splêndida, Hort. Loud. hort. brit. p. 146. Flowers red.

₉₉ S. Bowiea’na; leaves linear, glaucous, glabrous; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, pendulous; corolla cylindrical, with an inflated tube, and contracted mouth; genits inclosed; anthers awned. ₇. G. Native of the Cape of Good Hope. Erica Bowiea’na, Loddd. bot. cab. 842. Erica Boiviá, Bedf. eric. wob. p. 4. Erica Bãiæa, Andr. heath. vol. 4. with a figure. Flowers white.—Habit of S. mammósæ, and S. verticillata, &c.

*** Leaves 5-6 to 8 in a whorl.

100 S. cervicifóra; leaves 5-6 in a whorl, linear; flowers axillary, crowded; corolla 5-6 lines long, downy, with a very narrow urceolate tube and a spreading limb; filaments minutely spurred. ₇. G. Native of the Cape of Good Hope. Erica cervicifóra, Sal. in Lin. trans. 6. p. 362. Erica inapértta, Hort. Pedicels tricraciate.

₁₀₁ S. patersòniaéa; leaves linear, glabrous, 5-6 in a whorl; flowers axillary, verticillate; bracteas close to the calyx, toothed; corolla with a cylindrical, clavate, curved tube; style exerted; anthers aristate. ₇. G. Native of the Cape of Good Hope. Erica patersòniaéa, Bedf. eric. wob. p. 18. Erica Patersònia cocinea, Andr. heath. 3. t. 11. Corolla deep reddish-orange or scarlet.

₁₀₂ S. carináta; leaves 5 in a whorl, reflexed, woolly; flowers terminal; bracteas remote from the calyx; corolla with a cylindrical, inflated, ribbed tube; crests of anthers plumose; style a little exerted. ₇. G. Native of the Cape of Good Hope. Erica carináta, Loddd. bot. cab. 1071. Corollas reddish-purple.

₁₀₃ S. foliósæ. We know nothing further about this species. ₇. G. Native of the Cape of Good Hope. Erica foliósæ, or foliàceæ, Andr. heath. vol. 4. with a figure. Flowers of a orange-yellow colour.

₁₀₄ S. spíca’ta; leaves linear, subulate, hispid, spreadingly reflexed, 5-6 in a whorl; pedicels very short; bracteas sessile; flowers axillary, crowded, verticillately spicate, drooping; calyces segments callous, spatulate, entire; corolla dewy, 7-9 lines long, cylindrical; genits inclosed; anthers awned. ₇. G. Native of the Cape of Good Hope. Erica spíca’ta, Thunb. diss. no. 71. with a figure. Wendl. eric. fasc. 2. p. 27. with a figure. Erica sessilifóra, Lin. suppl. 222. Ericafavósæ, Sal. in Lin. trans. 6. p. 365. Corolla yellowish-green.

Var. β; corolla 5-7 lines long, having the segments contiguous at the base. ₇. G. Erica spíca’ta, Andr. heath. 1. t. 11. Loddd. bot. cab. 1208. Flowers greenish-yellow.

₁₀₅ S. fæsculáris; leaves 8 in a whorl, narrow-linear, obtuse, glandularly ciliate, spreading, a little recurved; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, horizontal; corolla 13 lines
long, viscid, with a cylindrical clavate tube and an erect limb; pedicels and bracteas glandular; style a little exerted; awns of anthers subulate. \( \gamma \). G. Native of the Cape of Good Hope. Erica fasciculáris, Lin. suppl. 219. Pl. kew. t. 6. Erica coro-
náta, Andr. t. 12. Bedd. eric. wob. pl. 11. f. 17. Erica oct-

106 S. \( \gamma \) scepfriformis; leaves 8 in a whorl; stem straight; pedicels very short, axillary, crowded; calyx ciliolate, with broad, spatulate, deeply serrated segments; corolla 7-10 lines long, downy. \( \gamma \). G. Native of the Cape of Good Hope. Erica scepfriformis, Sal. in Lin. trans. 6. p. 365. Erica enneaphylla, Roxb. ms.

107 S. \( \gamma \) rolfiformis; leaves hairy, linear, 6 in a whorl; bracteas close to the calyx; flowers terminal; corolla 4-5 lines long, viscid, with an urceolar tube; awns of anthers short, cuneated. \( \gamma \). G. Native of the Cape of Good Hope. Erica rolfformis, Sal. in Lin. trans. 6. p. 366. Erica mammósa, Thunb. diss. no. 69. with a figure.

† **Species hardly known.**

108 S. \( \gamma \) hisro'ta; leaves 4 in a whorl, hairy, hoary, linear; flowers axillary, crowded, verticillate; anthers awned. \( \gamma \). G. Native of the Cape of Good Hope. Erica hirsuta, Lodd. bot. cab. 754. Corolla with a red base and white apex.

109 S. \( \gamma \) sponda; leaves linear, 4 in a whorl, glabrous; flowers terminal and axillary; bracteas distant from the calyx; corolla tubular, drooping; anthers?. \( \gamma \). G. Native of the Cape of Good Hope. Erica rúbida, Lodd. bot. cab. 1166. Pedicels and calyxes red. Corollas white.

110 S. \( \gamma \) espósa; leaves 4 in a whorl, hairy, calyx, bracteas, and pedicels, clothed with glandular hairs; flowers terminal, by three or four; corolla cylindrical. \( \gamma \). G. Native of the Cape of Good Hope. Erica espósa, Lodd. bot. cab. 1521. Flowers red.

111 S. \( \gamma \) elongáta; leaves hoary, linear, 4 in a whorl; flowers terminal; corolla hairy at top. \( \gamma \). G. Native of the Cape of Good Hope. Erica elongáta, Lodd. bot. cab. 738. Flowers white.

112 S. \( \gamma \) rollinósi; leaves 4 in a whorl?; flowers nearly terminal, verticillate; corolla with a straight cylindrical tube. \( \gamma \). G. Native of the Cape of Good Hope. Erica Rollinósi, Hort. Bedd. eric. wob. p. 21. Flowers purplish-red.

**XVI. DASYANTHES (from dasan, dasan, hairy, and \( \sigma \) theo, \( \sigma \)theo, anther, a flower; in reference to the corolla, which is hairy).** D. Don, in edinb. phil. journ. 17, p. 156.—Erica species of Lin.

**LIN. SYST. Octándria, Monogyinia.** Calyx 4-parted, bifracteate at the base. Corolla tubular, hispid, with an erect 4-lobed limb. Stamens inclosed; filaments capillary; anthers biparti-
tite; cells of anthers mastic at the base, dehiscing longitudinally. Stigma large, peltate. Capsule 4-celled, many-seeded.—An erect shrub, native of the Cape of Good Hope. Leaves loosely imbricate, hispid from bristles, with revolute margins. Flowers terminal, fascicled, yellow.

**XVII. ECTASIS** (from extráe, ectasis, extension; from the stamens being much exerted). D. Don, in edinb. phil. journ. 17. p. 156. Erica species of authors.

**LIN. SYST. Octándria, Monogyinia.** Calyx 4-leaved, glumaceous. Corolla tubular, rather verticose at the base, with a 4-
toothed limb. Stamens much exerted; filaments dilated; an-
thers bifartite; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, continuous, with the base of the filaments mucous. Stigma clavate, truncate. Capsule 4-celled, many-
seeded. Seeds ovate, compressed, smooth, shining.—Muel-
branches shrubs, natives of the Cape of Good Hope. Leaves loosely imbricate, with revolute edges, flat above, 3 or 4 in a whorl, but mostly the latter number. Flowers terminal, solitary or numerous.

§ 1. **Flowers lateral. Calyx bractless.** Normal species.

1 E. \( \gamma \) Petívérí (D. Don, l. c.) leaves spreadingly recurved, ciliolate; flowers solitary; corolla cylindrical; fruit ovate. \( \gamma \). G. Native of the Cape of Good Hope. Erica Petívérí, Linn. mant. 292. diss. no. 50. Lodd. bot. cab. 1426. Erica Petí-

**Var. β;** corollas of a dirty rusby colour. \( \gamma \). G. Erica Petívérí, Thunb. diss. 21.

**Var. γ, hirsuta (Andr. heath. 2. t. 72.) leaves hairy; corollas deep red.**

2 E. \( \gamma \) Pluknetí (D. Don, l. c.) bracteas cuneated, remote from the calyx; corolla ovate, pyramidal or conical, smooth.

**Var. β;** calyx 4½ to 3 lines long; corolla purple, with orange-
cooured anthers, 6-7 lines long. \( \gamma \). G. Erica Pluknetí, Linn. spec. ed. 2. p. 506. exclusive of the synonyms. Erica Pluknetí nána, Andr. heath. 1.

**Var. γ;** calyx 1 line long; corolla white, 3 to 3½ lines long. \( \gamma \). G. Erica Petívérí β, Thunb. diss. no. 21.

**Var. ε;** calyx 2½ lines long; corolla white, 3 to 3½ lines long. Sal. in Lin. trans. 6. p. 346.

**Var. ζ;** calyx 5 lines long; corolla white, 5-8 lines long.

**Var. τ, penicillát(a) (Alt. hort. kew. 2. p. 361,) corolla red-
dish purple, with orange-red anthers. \( \gamma \). G. Erica penicillá-

lát(a), Andr. heath. 2. t. 69. Lodd. bot. cab. 1918. Erica Pluknetí interíptá, Wendl. eric. 2. p. 21, with a figure.

3 E. **bruníades;** leaves 3 in a whorl, linear-oblong, erect, short, villously tomentose; flowers terminal, subumbellate, drooping; bracteas remote from the calyx, 4-leaved; corolla campanulate, much longer than the calyx, which is very villous and silky; nectarium astagaliform, silky. \( \gamma \). G. Native of the Cape of Good Hope. Erica bruníades, Linn. mant. p. 378. diss. no. 52. with a figure of the flower. Wendl. eric. 16. p. 53, with a figure. Lodd. bot. cab. 1365. Erica carbasína, Sal. in
Lin. trans. 6. p. 333. Corolla 1½ line long, white or pale red, also yellow.

**Brassia-like Ectasis.** Fl. April, July. Clt. 1790. Shrub 1½ ft.

4 E. valleræflora ; leaves 3 in a whorl, linear, downy or hairy, spreading, rather remote; flowers terminal, by threes; bracteas remote, quadridif; corollas globose, urceolar, a little longer than the calyx, which is large, and densely clothed with silky hairs; nectarium cotyliform, glabrous. G. Native of the Cape of Good Hope. Erica valleræflora, Sal. in Lin. trans. 6. p. 333. Ait. hort. kew. 3. p. 365. Erica brunnidæ, Andr. heath. 1. t. 37. Erica villosa, Pluk. mant. 69. t. 347. f. 9. Wendl. eric. fasc. 16. p. 65. with a figure. Erica capitâta, Thumb. eric. no. 15. Calyx and corolla pale red. Anthers black. Corolla 1½ line long.

§ 2. Flowers terminal. Calyx imbricated by numerous scales at the base. Aberrant species.

Var. β, alba; flowers white.

6 E. vestiflora; leaves incurvally spreading, pilose while young; flowers solitary, terminal; corolla with a cylindrical tube, 7–9 lines long. G. Erica vestiflora, Sal. in Lin. trans. 6. p. 346. Erica Petiviriâna, Roxb. ms. Corolla rufous.

**Flowering Ectasis.** Fl. March, June. Clt. 1795. Sh.

Var. γ, râbra; flowers reddish-orange at top, and reddish-purple at the base; anthers orange-yellow.

**Pump-flowered Ectasis.** Fl. April, May. Clt. 1799. Sh.

9 E. furfurâs; leaves incurvatively spreading, downy; flowers by threes; corolla viscid, cylindrical; filaments very broad; nectarium cotyliform. G. Native of the Cape of Good Hope. Erica furfurâs, Sal. in Lin. trans. 6. p. 348. Erica monadelphà, Andr. heath. 1. t. 65. Sims, bot. mag. 1370. Corolla white, with a red border, and orange-yellow anthers.

10 E. monadelphà; corolla with a cylindrical tube, and reflexed segments; filaments very broad. G. Native of the Cape of Good Hope. Erica monadelphà, Beddf. eric. wob. p. 15. pl. 2. f. 12. Erica Banksaâna purpureà, Andr. heath. 3. t. 57. Corolla greenish-white or yellow, with a purple border, and yellow anthers.—Perhaps the same as the preceding.

14 E. penicilliflora; leaves ciliated, erect; flowers by threes; corolla 2 lines long, covered by the calyx, with a spherical tube; anthers concurring into a pencil-form. G. Native of the Cape of Good Hope. Erica penicilliâs, Sal. in Lin. trans. 6. p. 348. Erica Petiviriâs vîra, Hortul. Erica calyculâta, Wendl. eric. 4. p. 5. with a figure. Bracteas and calyces white. An elegant species.

15 E. flâcenteflora; leaves very obtuse; corolla covered by the calyx, with a turnip-formed tube; filaments gradually dilated; stigma narrow. G. Native of the Cape of Good Hope. Erica placentaeflora, Sal. in Lin. trans. 6. p. 348. Herb pale, hoary.

**Placenta-flowered Ectasis.** Shrub.

16 E. pudibusâna; leaves 3–4 in a whorl, rather viscid; flowers terminal, by threes; calyces ciliated; corolla conical, viscid. G. Native of the Cape of Good Hope. Erica pudibusâna, Sal. in Lin. trans. 6. p. 345. Erica nâtans, Wendl. eric. fasc. 3. p. 5. with a figure. Corolla 2 lines long; anthers broad, hairy. Fruit turbinate, hairy. Flowers pale red?

17 E. râfâliflorus; leaves 3 in a whorl, remote, narrow, recurved, clothed with viscid pubescence; calyx bracteate; corolla 1 line long, glabrous, with a recurved tube; filaments broad at the top; stigma narrow; fruit smooth. G. Native of the Cape of Good Hope. Erica filiformis, Sal. in Lin. trans. 6. p. 345. Filiaformis Ectasis. Shrub.

**Starry Ectasis.** Fl. April, June. Clt. 1810. Shrub.

20 E. ? tûrgida; leaves 3 in a whorl; flowers terminal; pediclea very short; corolla hairy, ½ line long, with a bulged tube; spurs of anthers cuneated; anthers very short. G. Native of the Cape of Good Hope. Erica tûrgida, Sal. in Lin. trans. 6. p. 345. Erica flûscûrubens, Roxb. ms. Flowers brownish-red.

**Turgid-flowered Ectasis.** Shrub.

**Colt.** For culture and propagation see Erica, p. 800.
XVIII. ERIODÈSMA (from ἐρως, erion, wool, and ἐσμυς, desme, a fascicle; the flowers resemble a fascicle of wool). D. Don, in edinb. phil. journ. 17. p. 156. Erica capitisata, Lin. &c.

Lin. syst. Octándria Monogynia. Calyx large, 4-parted, bisected at the base. Corolla campanulate; limb 4-lobed, revolute. Stamens exserted; filaments dilated, flat; anthers bidentate, obtuse, scabrous from papillae; cells of anthers differing by an oblong pore, having the base continuous with the filaments. Stigma capitate. Capsule 4-celled, many-seeded. Seeds angular, shining.—An erect branched shrub. Leaves 3 in a whorl, obtuse, very hairy. Flowers terminal, solitary or by threes, forming a very hairy head.

Cult. For culture and propagation see Erica, p. 800.

XIX. OCTOPERA (from ὠκτα, octo, eight, and πέρα, pera, a sack; in reference to the 8-celled capsule). D. Don, in edinb. phil. journ. 17. p. 156.—Erica Bergiana, Lin.

Lin. syst. Octándria Monogynia. Calyx 4-parted, reflexed, naked at the base. Corolla globose, with a contracted bluntly 4-lobed mouth. Stamens inclosed; filaments flat; cells of anthers very short, dehiscing by a large foramen, furnished with a lanceolate acuminate crested appendage at the base. Stigma peltate. Capsule 8-celled, many-seeded.—A procumbent downy shrub, native of the Cape of Good Hope. Leaves broad, 4 in a whorl. Flowers terminal, umbellate; pedicels scaly.

Cult. For culture and propagation see Erica, p. 800.

XX. EREMÍA (from ερεμος, eremos, solitary; from the seeds being solitary in the cells). D. Don, in edinb. phil. journ. 17. p. 156.—Erica Totta, Thunb.

Lin. syst. Octándria Monogynia. Calyx 4-parted, imbricated by bracteas at the base; segments broadly orbicular, ciliate, coriaceous. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed; filaments capillary; anthers bipartite; cells of anthers short, mucile at the base, opening by an oblong hole. Stigma capitate. Capsule 4-celled; cells 1-seeded. Seeds large, elliptic, ventricose.—A diffusely branched shrub, native of the Cape of Good Hope. Leaves spreading, hispid from bristles. Flowers glomerate.

Cult. For culture and propagation see Erica, p. 800.

XXI. SALAXIS (from salax, unchaste; but the application is not evident). Sal. MSS. spec. 2.

Leaves from 3 to 6 in a whorl, with revolute margins. Flowers somewhat racemose at the tops of the branches.

1 S. ARBORESCENS (Willd. ex Spreng, syst. 2. p. 20.) leaves 3 in a whorl, nearly terecet, adpressed; pedicels downy. ñ. G. Native of the Mauritius.

Arborescent Salaxis. Shrub.

2 S. MONTÁNA (Willd. l. c.) leaves 3 in a whorl, adpressed, tetragonal; pedicels glabrous. ñ. G. Native of the Mauritius.

Mountain Salaxis. Shrub.

3 S. AXILLÁRIS (Salisb.) leaves 3 in a whorl, glabrous; flowers racemose; corolla globose; branches tomentose. ñ. G. Native of the Cape of Good Hope. Erica axillaris, Th. diss. no. 10.

Axillary flowery Salaxis. Shrub.

4 S. ABÉRINA (Willd. l. c.) leaves generally 3 in a whorl, linear, spreading. ñ. G. Native of the Mauritius.

Fir-like Salaxis. Shrub.

Cult. Turfy peat mixed with rough sand is the best soil for the species of Salaxis; and young cuttings of these strike root readily in sand, under a bell-glass, in a little heat.

Lin. syst. Octándria Monogynia. Calyx 4-parted, membranous, coloured, furnished with 4 bracteas at the base. Corolla campanulate, 4-lobed, shorter than the calyx. Stamens inclosed; filaments dilated; anthers bipartite, biappendiculate at the base; cells of anthers mucronulate, dehiscing lengthwise. Stigma capitate. Capsule with a septical dehiscence. Seeds ovoid, smooth.—A small spreading shrub, native of Europe. Leaves trigonal, obtuse, very short, imbricating in 4 rows, having the margins revolute, and the base sagittate. Flowers disposed in long terminal spicate racemes.

1 C. Vul'

2 3. Native

3 4. European

Var. a, purpurea; flowers purplish-red.

Var. β, spária; flowers purplish-red; spikes short; branches tufted.

Var. γ, decumbens; flowers purplish-red; spikes short; branches decumbent.

Var. δ, tomentosa; flowers purplish-red; leaves and branches woolly.

Var. ε, filiculba; flowers white, less crowded; corolla shorter.

Var. ι, flore pleno; flowers double, pale purplish-red.

Var. κ, folius variegátis; leaves variegated; flowers purplish.

Var. θ, purpurina; leaves variegated with yellow.

Var. ω, cocicina; flowers deep red.

Var. χ, spicíata; spikes long; flowers red, or white.

Cult. The varieties of Calluna vulgaris are very ornamental when planted in a border or clump, along with the dwarf hardy species of Erica and their varieties, as Erica ciliáris, E. tétrálax, E. cínera, and Gypsócalis multífíora, G. vágans, &c. The border in which they are grown requires to be composed of peat soil. All are increased by layers, or young cuttings under a bell-glass.

Subtribe II.

ANDROMEÖDEEE, (this Subtribe contains plants agreeing with Andromeda in the Corolla being dead.) D. Don, in Edinb. phil. journ. 17. p. 157. Corolla deciduous.

XXIII. ANDROMÉDA (named from the daughter of Cepheus, rescued from the sea-monster by Perseus). D. Don, in
Andromeda, species of Authors. Polifolia, Buxbaum, cent. 5. p. 5. t. 55. f. 1.

**LIN. SYST. DECANDRIA, MONOGYNIA.** Calyx 5-leaved; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments bearded; cells of anthers short, timid, furnished with one awn each, (f. 136 g.) Style dilated at the base, (f. 136, d.); stigma obtuse. Capsule with a loculicidal dehiscence; valves bifid at the apex. Placenta 5-lobed: lobes simple. Seeds oblong, compressed, shining.—Small heath-like shrubs, natives of Asia and North America. Leaves small, imbricated. Flowers solitary, penduculate, rose-coloured, lateral or terminal.

* Leaves flat.

**FIG. 136.**

1 C. Hynoïdes (Don. l. c.) leaves oblong, acerosus. H. Native of Lapland, Denmark, and Siberia, on the mountains, where it covers tracts of land; and on the north-west coast of America. Andromeda hynoïdes, Lin. spec. 563. fl. lapp. 165. t. 1. f. 3. Oed. fl. dan. t. 10. Pall. fl. ross. p. 55. t. 73. f. 2. Hook. bot. mag. t. 2936.—A small creeping shrub, resembling a moss. Flowers small, with a red calyx, and white corolla.

2 C. Lycopodioides (Don. l. c.) leaves ovate, adpresso, imbricata in 4 rows. H. Native of Siberia and the Island of St. Lawrence. Andromeda lycopodioides, Pall. fl. ross. p. 55. t. 73. f. 1. Flowers red. A small moss-like creeping shrub.

**Club-moss-like Cassiope.** Shrub creeping.

* * Leaves imbricated in 4 rows, adpresso, with revolute margins, timid, somewhat bilocular.

3 C. Tetradoxa (Don. l. c.) leaves obtuse, mutic, minutely ciliat; peduncules glabrous. H. Native of Lapland and Siberia; of North America, in Canada, Labrador, and the north-west coast; Island of St. Lawrence, Kotzebue Sound. Andromeda tetradoxa, Lin. spec. 563. fl. lapp. 166. t. 1. f. 4. Pall. fl. ross. p. 50. t. 73. f. 4. Hook. bot. mag. t. 3181. Flowers white.

5 C. Ericoides (Don. l. c.) leaves awned, setosely ciliat; peduncules glabrous. H. Native of Dahuria and Kamtschatka. Andromeda ericoides, Pall. fl. ross. p. 56. t. 73. f. 3. Flower?

**Heath-like Cassiope.** Shrub ½ foot.

6 C. Fastigia (Don. l. c.) leaves elongated at top, with scarios membranous margins; peduncules woolly. H. Native of Nepal and Mongol. Andromeda fastigia, Wall. pl. rar. asiat. 3. t. 254. Andromeda cupressiformis, Wall. mss. ex D. Don, in mem. wern. soc. 3. p. 411. prod. fl. nep. p. 130. Flowers pale red.

**Fastigiate Cassiope.** Shrub procumbent.

7 C. Redowski; leaves scale-formed, shining, smooth, fringed, imbricating in 4 rows, making the branches appear exactly tetragonal; pedicels axillary, glabrous. H. Native of the east of Siberia. Andromeda Redowskii, Cham. et
ERICACEÆ. XXV. CASSANDRA.

Schlecht. in Linnaea. 1. p. 517. Shrub procumbent, much branched. Flowers drooping. Calyx deeply 4-parted. Corolla campanulate, quadrifid, with very blunt segments. Stamens 8, very short; anthers 2-celled, biaristate, the cells opening by a pore at the apex. Capsule 4-valved; valves septiferous at the middle.

Redovski's Cassiope. Shrub procumbent.

Cult. All the species are delicate little shrubs; they grow well in a peat border, or in pots well drained with sherd's in the same kind of soil; and may be increased by layers.

XXV. CASSANDRA (a mythological name of the daughter of Priamus and Hecuba). D. Don, in edinb. phil. journ, July, 1834. Andromeda species, Lin. and others.

Lin. syst. Decândria, Monogynia. Calyx 5-leaved, bifractente at the base; leaflets imbricated at the base. Corolla oblong, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments glabrous, simple at the base; cells of anthers elongated, and tubular at the apex, mutic. Stigma annular, with a 5-tubercled disk. Capsule with a loculicidal dehiscence. Placenta 5-lobed: lobes simple. — An evergreen shrub, common in North America, north of Europe, and the north of Asia. Branchlets recurved, pubescent. Leaves on short petioles, elliptic-oblong, denticulated, coriaceous, veinless, lepidotted on both surfaces by peltate scales, when young silvery beneath. Flowers axillary, on short pedicels, drooping, snow white, disposed in the manner of racemes at the tops of the branches.

1 C. calyculata (D. Don, l. c.) leaves elliptic-oblong, blunting, obsolescently serrulated, rusty beneath; racemes recurved, leafy; bracteas of calyx broad, ovate, acuminate; corollas oblong-cylindrical. ♀. H. Native of North America, from Canada to Virginia, in bogs and swamps, on the mountains. It grows also in Sweden, Prussia, Siberia, &c. Andromeda calyculata, Lin. spec. 565. Pall. fl. ross. 2. p. 53. t. 71. f. 1. Lodd. bot. cab. 1464.

Var. a, ventricosa (Sims, bot. mag. 1286.).

Var. b, latifolia (Lodd. bot. cab. 530.).

Var. γ, nanus (Sims, bot. mag. 862. Lodd. bot. cab. 826.).

Calyculata - flowered Cassandra. Fl. April, May. Fl. 1748. Shrub 1 to 3 feet.

2 C. angustifolia; leaves linear-lanceolate, acute, with subundulated revolute edges, rusty beneath; racemes recurved, leafy; bracteas of calyx minute; corollas oblong-ovate. ♀. H. Native of Carolina and Georgia, in open swamps. Andromeda calyculata, β, angustifolia, Æit. hort. kew. 2. p. 70. Andromeda angustifolia, Pursh. fl. amer. sept. 1. p. 291. Andromeda crispa, Desf. and Link.

Narrow-leaved Cassandra. Fl. April, May. Fl. 1748. Shrub 1 to 2 feet.

Cult. For culture and propagation, see Lyonia, p. 813.

XXVI. ZENOBIA (a queen of Palmyrensis). D. Don, in edinb. phil. journ, july, 1834. Andromeda species, Michx.

1 Z. spectosa (D. Don, l. c.) leaves oval, obtuse, mucronate, crenated, or serrate, veiny; floriferous branches naked, racemose. ♀. H. Native of North Carolina, in swamps. A very ornamental little shrub. Flowers large, white, drooping. Andromeda speciosa, Michx. fl. bor. amer. 256. Lodd. bot. cab. 551.

Var. a, nütida (Pursh. fl. amer. sept. 1. p. 294. under Andromeda); leaves oblong—ovate, serrated, green on both surfaces. ♀. H. Andromeda cassinifolia, Vent. malm. 79. Flowers white.

Cult. See Lyonia, p. 831. for culture and propagation.

XXXVII. LYONIA (in memory of John Lyon, an indefatigable collector of North American plants, who fell a victim to a dangerous epidemic amidst those savage and romantic mountains, which had so often been the theatre of his labours). Nutt. gen. amer. 1. p. 268. D. Don, in edinb. phil. journ. 17. p. 158.

Lin. syst. Decândria, Monogynia. Calyx 5-parted. Corolla ovate or tubular, with a 5-toothed contracted mouth. Stamens inclosed; filaments flattened, dilated, very short, downy; cells of anthers membranous, dehiscing lengthwise, altogether mutic. Style robust, pentagonal, fusiform, thickened at bottom; stigma simple, truncate. Capsule pentagonal, 5-celled, with a loculicidal dehiscence; margins of valves closed by 5 other external narrow valves. Seeds accicular, imbricated. — Shrubs, natives of North America. Leaves usually membranous and downy. Flowers for the most part terminal, disposed in racemose panicles.

* Leaves evergreen.

1 L. ferruginea (Nutt. gen. amer. p. 266.) shrubby; leaves on long petioles, coriaceous, obovate, usually obtuse, quite entire, with hardly revolute edges, covered with brown umbilicate furfuraceous scales, as well as every other part of the plant; pedicles axillary, collected into threes or fives; corollas small, ovate-globose. ♀. H. Native of Georgia, Florida, and Mexico, in pine woods. Andromeda ferruginea, Wats. fl. car. 158. Vent. malm. t. 80. Andromeda, ferruginea, β, fruticosa, Michx. fl. amer. bor. 1. p. 252. Corollas white inside, and rusty outside.

2 L. rüdda (Nutt. gen. amer. 1. p. 266.) arboreascents; leaves coriaceous, stiff, crowded, on short petioles, cuneate-lanceolate, acute, quite entire, convex, with revolute edges, clothed with brown, umbilicate furfuraceous scales, as well as every other part of the plant; pedicles aggregate, axillary; corollas globose. ♀. H. Native of Carolina and Florida, in barren sandy woods. Andromeda ferruginea, Wildl. spec. p. 2. 609. Ait. hort. kew. 2. p. 67. Andromeda ferruginea, a, arborascens, Michx. 1. p. 252. Andromeda rüdda, Pursh. fl. amer. sept. 1. p. 292. Lodd. bot. cab. 430. Corollas white inside. This species is very nearly allied to the preceding; but their habits, and particularly their flowering time, differ so materially, that they are actually distinct.

3 L. marnina (D. Don, in edinb. phil. journ. 17, p. 159.) quite glabrous; branchlets somewhat 3-sided; leaves coriaceous, oval, acuminate, quite entire, smooth, having the midrib running through the deflexed margin; pedicles axillary, aggregate; corollas cylindrical; calyce segments elongated, linear, coloured. ♀. H. Native of Carolina and Florida, in sandy forests.

Var. r. rubra (Lodd. bot. cab. 672.) flowers deep red.

* * * Leaves deciduous.

4. L. Mariana (D. Don, in edinb. phil. joum. 17, p. 159.) leaves oval, acutish at both ends, quite entire, glabrous, rather coriaceous, paler beneath; floriferous branches almost leafless; pedicels aggregate; corolla ovate-cylindrical; calyx foliaceous; capsule conoid. H. Native from New England to Florida, in woods and dry swamps, particularly in sandy soil. Andromeda Mariana, Lin. spec. 564. Sims, bot. mag. 1579. Pluk. mant. 448. A dwarf shrub. Flowers large, white, sometimes tinged with red. This plant has a number of very striking varieties.

5. L. racemosa (Don. 1. c.) leaves oval-lanceolate, acute, serrated, membranous, glabrous; spikes terminal, secedum, elongated, simple, or branched; bracteae linear, acute; corollas cylindrical; calyces acutish, biciliate at the base. H. Native from Canada to Carolina, in bogs and swamps. Andromeda racemosa, Lin. spec. 564. Lher. stirp. 2. t. 13. Andr. paniculata, Walt. carol. 138—Gron. virg. 67. Flowers white. A middle-sized shrub, which may be reckoned one of the finest in North America, not only for the graceful appearance of its flowers, but also for the fine odour they have. The cells of the anthers are said to be biserial at the apex; it is, therefore, probably, a species of Zenobia. There are several varieties of the plant.

6. L. arboresc (D. Don, l. c.) branches terete; leaves oblong, acuminate, mucronately serrated, glabrous; panicles terminal, or many spikes; corollas ovoid-cylindrical, downy. H. Native from Pennsylvania to Florida, in the valleys of the Alleghany Mountains. Andromeda arboresc, Lin. spec. 565. Sims, bot. mag. 905. Catesb. car. 1. t. 71. A beautiful tree, from 40 to 60 feet high. Flowers white. The leaves have a very pleasant acid taste, from which it has been called sorrel-tree. They are frequently made use of by hunters in those mountains, to alleviate thirst.

7. L. paniculata (Nutt. gen. amer. 1. p. 266.) downy; leaves obovate-lanceolate, subacuminate at both ends, and almost entire; floriferous branches terminal, panicled, nearly naked; clusters of flowers pedunculate; corollas nearly globose, downy. H. Native from Canada to Carolina; common in all swamps and woods. Andromeda paniculata, Lin. spec. 564. Lher. stirp. nov. 2. t. 12. Wats. dendr. brit. 37. Flowers small, white. There are a number of varieties of this species, differing in size, pubescence, shape of leaves, &c. Upper surfaces of the older leaves nearly smooth.

8. L. frondosa (Nutt. gen. amer. 1. p. 267.) every part of the plant is densely clothed with powdery villi; leaves oblong, or oblong-obovate, blunt, or acutish, clothed with furfuraceous villi, often rusty, prominently veined: with revolute, entire, scabrous margins; panicle terminal, panicose or leafy; corollas globose, hispid or downy. H. Native of the lower counties of Virginia and Carolina. Andromeda frondosa, Pursh. fl. amer. sept. 1. p. 295. Flowers white. Pursh says the anthers are awned; but Nuttall thinks this must be a mistake, or that his plant must be different from that of Pursh.

9. L. multiflora (Wats. dendr. brit. 128.) leaves narrow-lanceolate, serrated, sprinkled with hair-like atoms; panicle terminal, composed of numerous fascicled racemes. H. Native of North America. Flowers numerous, small, white. Perhaps only a variety of L. paniculata.

10. L. Jamaicaeensis (D. Don, in edinb. phil. joum. 17, p. 159.) branches smooth; leaves broad—lanceolate, quite entire, cinereous beneath from dot-like scales, but shining above; pedicels aggregate, on long leafless branches, scaly as well as the calyces; corollas ovate. H. S. Native of Jamaica, on the tops of the mountains. Andromeda Jamaicensis, Swartz. fl. in. occ. 2. p. 888. Flowers white.

Jamaicca Lyonia. Shrub 6 feet.

11. L. fasciculata; leaves ovate-lanceolate, blunting, a little crenated, coriaceous; racemes shorter than the pedioles; pedicels aggregate, reflexed. H. S. Native of the south of Jamaica, on the mountains. Andromeda fasciculata, Swartz. fl. ind. occ. 2. p. 836. Flowers white.

Fascicled-flowered Lyonia. Tree.

12. L. capreifolia (Wats. dendr. brit. 127.) leaves coriaceous, elliptic, short-acuminate, serrated, sprinkled with short fleshy hairs; corollas rather silky, globrular, coarctate; racemes and coryrams mixed, lateral, leafy. H. Native of North America. Flowers white. Perhaps only a variety of L. paniculata.

Rusty Lyonia. Shrub.

14. L. rhomboidalis; shrubby; floriferous branches tricquetrous; leaves somewhat rhomboid-oblung, cartilaginous, glabrous, rusty beneath, quite entire, callous at the apex; peduncles axillary, aggregate, elongated, filiform. H. Native of Florida and Carolina. Andromeda rhomboidalis, Duham. ed. nov. abr. 192.

Rhomboid-leaved Lyonia. Shrub.

Cult. The species thrive best in peat soil, or a sandy loam. Being very ornamental, they are desirable shrubs in every garden. They may either be increased by layers or by seeds. The seeds should be sown in pots or pans in sandy peat soil; they should be covered slightly with earth, as they are extremely small.

XXVIII. LEUCOTHOE (a mythological name). D. Don, in edinb. phil. joum. 17, p. 159. Andromeda species of authors.

Lin. syst. Decandria, Monogynia. Calyx 5-leaved; leaves imbricated at the base. Corolla tubular, 5-toothed. Stamens inclosed; filaments dilated, flattened, downy; cells of anthers short, truncate, mutic. Stigma ample, capitata. Capsule with a loculcular dehiscence.—Evergreen shrubs, natives of North
ERICACE.  XXVIII. LEUCOTHEE.

America. Leaves coriaceous, dentately spinulose. Flowers white, racemose, axillary, or terminal.

1 L. axillaris (D. Don, l. c.) leaves oblong or oval, acuminate, upper part carallaginously and mucronately serrated, covered by scattered glandular hairs on the under surface; young branches clothed with powdery down; racemes axillary, spicate, sessile, beset with acutish bracteas; corollas ovate-cylindrical; filaments ciliated, very short. \( \gamma \). H. Native from Virginia to Georgia, on the mountains. Andromeda axillaris, Solander in Hort. kew. 2. p. 89. Pursh. fl. amer. sept. 1. p. 292. Leaves glabrous. Flowers in short spikes, white. Capsule depressed, globose. Var. \( \beta \), longifolia (Pursh. fl. amer. sept. 1. p. 293.) leaves linear-lanceolate, very long. \( \gamma \). H. Sims, bot. mag. 2357. Andromeda Waltheri, Wats.

2 L. spinulosa; leaves petiolate, ovate-oblong, rounded at the base, gradually narrowed to the apex, acuminate, somewhat spinulose serrated, glabrous, coriaceous; racemes sub-spicate, axillary, sessile, second, rather loose, with sessile bracteas; corollas short, ovate-cylindrical. \( \gamma \). H. Native of Lower Carolina. Andromeda spinulosa, Pursh. fl. amer. sept. 1. p. 293. Andr. Catesbaei, Walt. fl. Carol. p. 137. Willd. spec. 2. p. 613. Sims, bot. mag. t. 1955. Loddd. bot. cab. 1820. Flowers white. Resembles the preceding in several respects. The figure in Cat. car. is very bad, that there can be no reference made to it.

3 L. acuminata; quite glabrous; leaves ovate-lanceolate, gradually narrowed to the top, acuminate, quite entire or unequally serrated, glabrous, shining, reticulate venied, coriaceous; racemes axillary, very short, coriaceous, nearly naked; flowers pedicellate, drooping; corollas cylindrically ovate. \( \gamma \). H. Native of Georgia and Florida, in sandy swamps. Andromeda acuminata, Ait. hort. kew. 2. p. 70. Pursh. fl. amer. sept. 1. p. 293. Smith, exot. bot. 39. And. lucida, Jacq. icon. rar. 1. t. 79. And. populifolia, Lam. encycl. 1. p. 195. A. reticulata, Walt. fl. carb. 157. Andr. formosissima, Bartr. cat. Andr. laurina, Michx. fl. amer. bot. 1. p. 253. Flowers white, in great abundance, which gives the shrub a fine appearance. The stems are hollow, and are used by the natives for making their pipe stems, from whence the name Pipe-stemmwood.

5 L. spicata; glabrous; leaves elliptic-lanceolate, acute, ovate or attenuated at the base, serrated; racemes long, lateral and terminal, secund; branchlets beset with short white hairs. \( \gamma \). H. Native from Canada to Florida. Andromeda spicata, Wats. dendr. brit. 36. Flowers white.

Cult. For culture and propagation see Lyonia, p. 831. Elegant shrubs, worth cultivating in every shrubbery for the sake of the beauty of their blossoms.

XXIX. PIE'IRIS. XXX. PHYLLODOCE.

XXIX. PIE'IRIS (one of the Muses) D. Don, in edinb. phil. journ. 17, p. 159. Andromeda species, Wall.

1 P. formosa (D. Don, l. c.) leaves lanceolate, acuminate, crenulated, glabrous, acute at the base; racemes erectly spreading, disposed in a terminal thryse; pedicels recurved, drooping, and are, as well as the calyces, pruinose; calyces segments ovate-oblong, margined, shining; corollas ovate. \( \gamma \). F. Native of Nipaul, where it is called Sheabogee and Chemata.—An evergreen tree, with the habit of Arbutus or Clithra. Pedicels unilateral. Flowers rose-coloured, each furnished with a small bractea at the base. Andromeda formosana, Wall. in asiat. res. 13. p. 295. D. Don, prod. fl. nep. 149.

Beautiful Pieris. Tree.

2 P. lanceolata (D. Don, l. c.) leaves elliptic, bluntly acuminate, quite entire, acute at the base; racemes terminal, glabrous, straight; pedicels corymbose, sessile, calyces segments roundish, ciliated; corollas ovate, downy; style inclosed. \( \gamma \). F. Native of Nipaul. Andromeda lanceolata, Wall. in asiat. res. 13. p. 300. with a figure. Andr. squamulosa, D. Don, prod. fl. nep. p. 149. A small much-branched tree. Leaves 3-4 inches long. Corollas purplish. Scales of pedicels ciliated.

Lanceolate-leaved Pieris. Tree small.

3 O. ovatifolia (D. Don, l. c.) leaves ovate, acuminate, quite entire, rounded at the base; racemes lateral, leafy, many-flowered; pedicels secund, downy; calyces segments roundish, ciliated; corollas oblong, downy. \( \gamma \). F. Native of Nipaul, at Suemba, and in Sirinagur. Andromeda ovatifolia, Wall. in asiat. res. 13. p. 391. with a table. Andr. capricida, Hamilt. msg. Branches downy. Leaves downy when young, 2-4 inches long, and 1-2 broad. Racemes numerous, elongated. Pedicels unilateral. Corolla pale flesh-coloured. The tree is poisonous to goats.

4 P. japonica (D. Don, moss.) glabrous; leaves lanceolate, crenulated, attenuated at the base, entire; racemes terminal, panicked. \( \gamma \). F. Native of Japan. Andromeda Japonica, Thunb. fl. jap. p. 181, t. 22. Leaves \( \frac{1}{2} \) to 2 inches long. Flowers red.

Japan Pieris. Shrub.

Cult. Sandy peat and a little loam is the best soil for the species of Pieris; and they may be increased by cuttings not too young, planted in sand, with a bell-glass over them.

XXXII. DABOECIA (Called St. Dabeoc's Heath, in Ireland).

D. Don, in edinb. phil. journ. 17. p. 160.—Andromeda species, Lin.—Menziesia species, Juss.—Erica species, Lin.

Lin. syst. Octandria, Monogynia. Calyx 4-parted. Corolla oval, ventricose; limb 4-toothed. Stamens 8, inclosed; filaments dilated, glabrous; anthers linear, sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma simple, truncate. Capsule 4-celled, with a septical dehiscence.—A dwarf, bushy, evergreen shrub, native of Ireland and the Pyrenees. Leaves elliptic, flat, clothed with white tomentum beneath. Flowers terminal, racemose, purple.

Cult. This shrub is well fitted for decorating the front of shrubberies, or to be grown on rock-work or banks. It has much the habit of a species of Heath, and is very pretty when in blossom. As the shrub grows in large dense tufts, it may be increased by division; it is also easily increased by layers or cuttings.

XXXIII. ENKIANTHUS (from ενκιάνθος, enkías, pregnant, and ἀνθός, anthos, a flower). Meladora, Sal. in hort. trans. 2. p. 156.

Lin. syst. Decandria, Monogynia. Calyx 5 cleft, furnished with coloured bracts. Corolla campanulate; with a 5-cleft limb, and with 5 pits at the base of the tube. Stamens 10, inserted in the base of the corolla; filaments toothed, pilose at base; cells of anthers avowed, opening by a pore at the apex. Style filiform. Berry 5-celled, many-seeded.—Elegant shrubs. Leaves broad, opposite, oblong-elliptic-acuminate, glabrous, green and shining on the upper surface, pale beneath, and frequently red. Bud scales red. Flowers large, terminal, drooping, shewy. The species are held in high veneration by the Chinese.

2 E. biflorus (Lour. coch. p. 276.) stem shrubby; flowers twin, terminal. $\updelta$. G. Native of the south of China. Flowers red.

**Two-flowered** Enkianthus. Shrub.

*Cult.* Elegant green-house plants while in blossom, but rather difficult of culture. The best soil for them is said to be an equal mixture of sandy loam and peat, but care must be taken not to over-water them when not growing freely. Cuttings taken from ripened wood are found to strike root freely, if planted in sand, with a hand-glass placed over them. When they grow to a considerable size, they are the greatest ornaments for a green-house or conservatory.

**Lin. syst. Decandria, Monogynia.** Calyx 5-parted. Corolla globose, or ovately campanulate: limb 5-cleft, reflexed. Stamens 10, inclosed; anthers compressed on the sides, dehiscing by 2 pores at the apex, fixed by the back beneath the apex, where they are furnished with 2 reflexed awns. Ovary seated on a hypogynous disk, or half immersed in it, 5-celled; cells many-seeded. Style 1; stigma obtuse. Berry nearly globose, granular.—Trees and shrubs, with alternate laurel-like leaves. Racemes terminal, panicled. Flowers pedicellate, bracteate. Corollas white or flesh-coloured.

1 A. unedo (Lin. spec. 366.) arboreous; branches clothed with glandular hairs; leaves oblong-lanceolate, glabrous, serrulate; petioles smooth, nodding. $\updelta$. H. Native of the south of Europe, as of Spain, Italy, Greece; Palestine, and many other parts of Asia. It is also found in the west of Ireland, in the County of Kerry, near the Lake of Killarney, on barren limestone rocks, where the country people eat the fruit. Mill. fig. t. 48. Cam. epit. 1681. Barrel. icon. t. 674. Smith, engl. bot. 2377. The common A'rbutus, or Strawberry-tree, rises to the height of 20 or 30 feet, but rarely with an upright stem. It is one of the greatest ornaments in the month of October and November, that being the season when it is in flower: and the fruit of the former year is ripe. When there is plenty both of fruit and flowers upon the trees, they make a handsome appearance at a season when most others are past their beauty. The fruit is said to have constituted part of the food of mankind in early ages. That it was not in any esteem among the ancients, we may suppose from the name U'nedo, if Pliny's reason for that name be the true one, —"cui nomen ex argumento fit unum tantum edendi." Virgil recommends the twigs as good for goats in winter:—"Jubeo frondentia capris Arbuto sufficiere;" and for baskets,—"Arbutue cratet mystica vannus Iacci." Horace celebrates the shade of it:—"Nunc viridi membra sub Arbuto stratus." The tree is named, in Greek, Καμάρης, and the fruit Μ. μμωκλων; in Latin, A'rbutus, and the fruit U'nedo; in Italian, Arbuto, Albato, Albastro, Corbezzolo; in French, L'A'rboussier commun. The Greek name is almost preserved at Constantinople, in Komaria.

2 A. Canariensis (Lam. dict. vol. 1.) leaves oblong-lanceolate, serrated, glaucous beneath; panicles erect, clothed with hispid hairs. $\updelta$. G. Native of the Canary Islands. Sims, bot. mag. 1577. Flowers greenish white.

**Canary-Island Strawberry-tree.** Fl. May, June. Clt. 1796. Shrub 8 to 10 feet.

3 A. hry'dria (Ker. bot. reg. 619.) leaves oblong, acute, serrated, glabrous; panicles pilose; panicle terminal, pendulous, downy; calyx glabrous. $\updelta$. H. Native country unknown. A. andrachnoides, Link. enum. 1. p. 395. Flowers white.

**Hybrid Strawberry-tree.** Fl. Feb. May. Clt.? Shrub 8 to 12 feet.

4 A. serratifolia (Nois. ex Lodd. bot. cab. t. 580.) leaves serrated, narrower than those of A. Andrachne; flowers disposed in terminal clusters. $\updelta$. H. Native country unknown. Flowers yellowish. Perhaps only a variety of the following.

**Serrated-leaved Strawberry-tree.** Fl. Feb. March. Shrub 6 to 10 feet.

5 A. Andrachne (Lin. spec. 566.) leaves oblong, bluntish, quite entire, and a little serrated, glabrous; panicles terminal, erect, clothed with viscid down. $\updelta$. H. Native of Greece, Asia Minor, Tauria. Belon says it is common in Crete, and between Aleppo and Antioch. Wheeler observed it near Athens, and saw the fruit in the market of Smyrna. About Magnesia it is so plentiful, that it is used as the principal fuel by the inhabitants. Ehret. act. angl. vol. 57. p. 414. t. 6. Ker. bot. reg. 113. Sims, bot. mag. t. 2024. A. integrifolia, Lam. Andrachne Theophrasti, Clus. hist. 1. p. 48. Andrachne, Park. theat. 1490. f. 2. Flowers greenish-white. Fruit like that of the common sort. This is the A'ρεσκόα of Theophrastus, and is called 'Αρέσκαλα in modern Greek. It is a fine ornamental tree; the largest of the kind in Britain is growing in the botanic garden at Edinburgh. Tournefort enumerates three varieties of it which he observed in the Levant; one with serrated leaves; a second with a large oblong fruit; and a third with large compressed fruit.

6 A. laurifolia (Lin. syst. 407. suppl. 238.) leaves oblong, acuminate at both ends, acutely serrated, glabrous; racemes axillary, second, sessile, solitary. $\updelta$. H. Native of North America, but what part is unknown, as nothing can be found respecting it in the Linnaean herbarium.

**Laurel-leaved** Strawberry-tree. Tree.

7 A. Menzie'sii (Pursh. fl. amer. sept. 1. p. 282.) arboreous; leaves broad-oval, quite entire, glabrous, on long petioles; racemes axillary and terminal, panicled, dense-flowered. $\updelta$. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. et Arn. in Beech. voy. pt. bot. p. 143.
Menzies’s Strawberry-tree. Tree.
8 A. tomentosa (Pursh. fl. amer. sept. 1. p. 282.) shrubby; branches hispid; leaves oblong, acute, subcordate at the base, clothed with white tomentum beneath, on short petioles; peduncles axillary, shorter than the leaves, somewhat capitate racemose; flowers campanulately urceolate, bracteate.  h.  .  H.  Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. bot. mag. t. 3290. Hook. fl. amer. text. bot. 1529. f. 1. Flowers pure white. The whole herb, except the flowers, is downy, while young. Petioles and mid-rib of leaves hispid. Var. b. sudá (Hook. et Arn. in Beech voy. pt. bot. 144. Hook. fl. amer. bot. 129 fl.) shrub quite destitute of long stiff hairs.

9 A. xalapensis (H. B. et Kunth, nov. gen. amer. 3. p. 279.) leaves oblong, acute, quite entire, glabrous above, but clothed with fuscous pubescence above, and canescent tomentum beneath; panicle terminal, composed of many racemes.  h.  .  G.  Native of Mexico, in mountain woods near Xalapa, and at Malpays de Joya. Epidermis separating, brownish purple. Young branches glabrous, but best with ramenta. Leaves obverse at the base, 2 inches long, petiolate. Corollas ovate, white. Filaments villous, dilated at the base.

Xalapa Strawberry-tree. Tree.
10 A. mollis (H. B. et Kunth, nov. gen. amer. 3. p. 280.) leaves oblong, acute, sharply toothed, coriaceous, clothed with soft pubescence above, and canescent tomentum beneath; panicle terminal, crowded, composed of racemes.  h.  .  F.  Native of Mexico, near Guanaxauto. Branchlets purplish brown, angular, downy. Leaves petiolate. Flowers drooping? like those of the preceding.

Soft Strawberry-tree. Tree.
11 A. densiflora (H. B. et Kunth, nov. gen. amer. 3. p. 280. t. 260.) leaves on long petioles, oblong, acute, sharply toothed, coriaceous, glabrous above and shining, but clothed with fuscous pubescence beneath, and the middle nerve with rusty villi; panicle terminal, composed of approximate racemes; flowers crowded.  h.  .  F.  Native of Mexico, on the eastern declivities of the mountains between La Pileta and Xalapa. Branches angular, pilose. Petioles pilose. Leaves 4-5 inches long. Pedicels furnished with 3 bracteae at the base. Corollas oval, white. Filaments dilated and pilose at the base.

Dense-flowered Strawberry-tree. Cht. 1826. Tree 20 feet.?  12 A. petiolaris (H. B. et Kunth, l. c. p. 281.) arborescent; leaves on long petioles, oblong, acute, mucronate, with dentilicate margins, membranous, glabrous above, but clothed with canescent tomentose pubescence beneath; racemes short, crowded, forming a terminal panicle.  h.  .  F.  Native of Mexico, on the western declivities of mountains between Cuernavaca and Guichila. Epidermis separating. Leaves rounded at the base, 3 or 3½ inches long. Petioles hairy, red. Ramenta numerous at the base of the branches. Pedicels villous, canescent. Corollas ovate-globose, white. Filaments villous, dilated at the base.

Petriculate-leaved Strawberry-tree. Tree tall.

Rusty Strawberry-tree. Tree.
15 A. phlygryea (Hook. et Arn. in Beech voy. pt. bot. p. 33.) stem nearly simple, downy; leaves ovate, on short pedioles, dentilculated, coriaceous, with revolute edges, shining above, and glandular on both surfaces, the glands terminating in hairs; racemes short, axillary; rachis and pedicels downy and scaly; calyx glabrous; corolla glabrous outside, and hairy inside.  h.  .  H.  Native of Chili, about Conception. Qued-Que, Feuille, 3. p. 56. t. 43. A low-growing shrub. The fruit is described by Feuille to be a reddish brown berry, which is dangerous when eaten, causing delirium; whence the Indian name, which signifies madness.

Raging Strawberry-tree. Shrub.
16 A. punctata (Hook. et Arn. in Beech voy. pt. bot. p. 33.) much branched; branchlets downy; leaves nearly sessile, ovate-lanceolate, dentilculated, coriaceous, with revolute margins, be sprinkled with piliferous glands; racemes axillary, downy, scaly; calyx glabrous; corolla glabrous outside, but pilose inside.  h.  .  F.  Native of Chili, about Conception. Apparently a large shrub, and probably the A. phyllyreaefolia, Pers.

Dotted-leaved Strawberry-tree. Shrub.

Cult. The hardy species of this genus being all ornamental trees or shrubs, are proper for picturesque places in shruberies, or to stand singly on lawns. A. Andrachne must be protected by a mat in severe weather in winter. They are to be increased by seeds, or by budding or inarching on the commoner kinds. The green-house kinds require the treatment of common green-house plants.

Lin. syst. Decandria, Monogynia. Calyx 5-parted (f. 139. a.) Corolla globose (f. 139. b.) or ovate-campanulate; limb 5-cleft, reflexed. Stamens 10, inclosed; filaments dilated at the base, and pilose; anthers compressed at the sides, dehiscing by 2 pores at the apex (f. 139. b.), fixed by the back beneath the middle, where they are furnished with 2 reflexed awns. Ovarium seated on the hypogynous disk, or half immersed in it, usually 5-celled (f. 139. g.), rarely 6-9-celled; cells 1-seeded. Style 1; stigma obtuse. Drupe nearly globose.—Shrubs or subshrubs. Leaves alternate. Racemes terminal. Flowers pedicellate, bracteate. Corollas white or flesh-coloured. Drupes red or black.

1 A. uva-úrsi (Spreng. syst. 2. p. 287.) stems procumbent; leaves permanent, ovate, quite entire, coriaceous, shining; flowers fasciculate; drupe 5-celled.  h.  .  H.  Native of North America, in the pine barrens of New Jersey, and in mountainous and rocky situations of Canada and New England; and the Island of Unalaska. It is abundant on the continent of Europe, as in Sweden, Denmark, and most parts of the north; also in Switzerland, Germany, Carniola, Dauphiny, Savoy, Siberia, &c. With us it is common upon dry, heathy, mountainous and rocky places throughout the Highlands and Western Isles of Scotland; also in the north of England and Wales. Arbutus uva-úrsi, Lin. spec. 566. fl. lapp. no. 162. t. 6. f. 3. Woodv. med. bot. 1914. t. 70. Fl. dan. t. 33. Blackw. t. 592. Smith, engl. bot. 714. Arbutus buxifolia, Stokes, bot. 509. Uva-úrsi buxifolia Sal in Gray arr. 2. p. 400.—Schmidt. arb. t. 138. Plench. icon. 340. It is called in English Bear berries and Bear-herbelle berries, from the German, Baren-traube or Barenbeere; in Dutch, Beerdruif; in French, La Bussiere; in Italian, Uva d’orzo; in Spanish, Uba de oso; in
Portuguese, *Uva de urso*; and by most old botanists, *Uva-ursi*. Leaves like those of box. Flowers pale red, or white with a red mouth, growing in small clusters at the extremities of the branches. The leaves have been much celebrated in calculous and nephritic complaints, and other disorders of the urinary passages; the dose is half a drachm of the powder of the leaves every morning, or 2 or 3 times a day. The trials, however, made in this country by no means answered expectation. Perhaps, upon the whole, it will be found no better than other vegetable astringents; some of which have long been used by the country people in gravelly complaints, and with very great advantage. On the plains of the Mississippi, the Indians smoke the leaves under the name of *Sacaeomnis*. and consider them of great medicinal virtue. But whatever may be its medicinal qualities, the whole plant is certainly very serviceable in drying an ash-colour, but particularly in tanning leather. In this view, it may deserve attention in those countries where whole mountains are covered with it. The berries are red when ripe, filled with an austerely mealy pulp; they serve as food for grouse and other game.

**Bear-berrys.** Fl. May, June. Britain. Shrub trailing.

2 A. *alpina* (Spreng. syst. 2. p. 287.) stems procumbent; leaves ovate, acute, wrinkled, serrated, deciduous; racemes terminal. H. H. Native of Denmark, Switzerland, Dauphiny, Savoy, Siberia, &c. In many places of the Highlands of Scotland, in very sandy places. It is also found in Canada, and the more northern parts of America, Aleutian Islands, &c. *A. rubescens, Lin. spec. 566. Oed. fl. dan. 73. Smith, engl. bot. 2090. Lightf. fl. scot. 215. t. 11. f. a. b. Pedicels rather hairy. The flowers grow in reflexed racemes, and are pure white. The berries are black when ripe, and of the size of a sloe, with a taste somewhat resembling that of black currants, but more mawkish, insomuch that *Linnaeus* says the Laplanders will scarcely eat them. Haller, on the contrary, thinks the flavour not unpleasant. Mr. Miller describes them as of a pleasant taste, so as frequently to be eaten by the inhabitants of those countries where the plant grows wild.

**Polium-leaved Bear-berry.** Shrub 4 to 6 feet.

**FIG. 139.**

**Pungent-leaved Bear-berry.** Shrub 1 foot.

6 A. *Hooker*; branches prostrate, rather downy; leaves petiolate, permanent, oral or ovoborate, coriaceous, shining, minutely reticulated, mucronately pungent, smoothish, finely margined, almost quite entire; racemes terminal, short; flowers bracteate. F. F. Native of Chile. Arbutus ptinus, Hook. et Arn. in Beech. voy. pt. bot. 144. Habit of *A. ursi*, and with the leaves of the same size. Flowers small, ureculate; young leaves white from down beneath, more or less serrated.

**Hooker's Bear-berry.** Shrub prostrate.

**Cult.** The hardy species of this genus grow well in a mixture of sand, loam, and peat, or in a peat border. They are increased by layers, put down in the spring. The greenhouse kinds require the treatment of other hardy green-house shrubs.

XXXVI. PERNETTYA (named after M. Pernetty, author of a history of his voyage to the Falkland Islands). Gaud. in Freyc. voy. p. 454. t. 67.

**Lin. syst. Deciduia, Monogynia.** Calyx inferior, 5-parted. Corolla glbose: limb 5-parted, revolute. Stamens 10, almost hypogynous, inclosed; filaments thickened at the base; cells of anthers bifid, and dehiscing at the apex. Ovarium free, depressed, globose, 5-celled; cells many-seeded. Hypogynous scales or glands 10, 3-lobed, forming a ring round the ovarium, and alternating with the stamens. Style terminal, short. Stigma convex, absolutely 5-lobed. Berry propped by the rather fleshy calyx. Seeds minute, oblong-ovate.—Small, much branched shrubs, with small alternate approximate leaves; axillary, solitary, pedunculate, drooping white flowers, and bracteate peduncles. This genus agrees with Epacriceae in the presence of hypogynous scales.

**Crow-berry-leaved Pernettya.** Shrub 2 to 3 feet.

2 P. *mucronata* (Gaud. in ann. sc. 5. p. 102.) leaves ovate, cuspidate, dentiellately serrulate, stiff, shining on both surfaces; pedicels axillary, bracteate, about equal in length to the leaves. F. F. Native of Terra del Fuego, Cape Horn, and Straits of Magellan. Lindl. bot. reg. 1675. *Arbutus mucronata, Lin. fil. suppl. p. 239. Forst. in comm. geot. 9. p. 31. Graham in bot. mag. t. 3093. Lam. ill. t. 566. f. a. Lodd. bot. cab. 1848. Flowers white, drooping.

**Mucronate-leaved Pernettya.** Fl. May. Clt. 828. Shrub 2 to 3 feet.

**Small-leaved Pernettya.** Shrub 2 to 3 feet.

4 P. *myrsinifolia*; leaves ovate-lanceolate, serrated, scat-
ered; pedicels solitary, axillary, very short.  h. H. Native of
the Straits of Magellan, in woods on the mountains. Andróme-
meda myrsinitis, Lam. ill. gen. t. 365. f. 2. Leaves small.

Myrtle-like Pernettya. Shrub 2 to 3 feet. 5 P. Cavanillesiana; leaves ovate, acute, glabrous, ob-
tusely serrated; pedicels axillary, solitary, furnished with two
scales at the base; stems trailing.  h. F. Native of South
America. Andrómeda prostrata, Cav. icon. 6. p. 43. t. 562.
f. 2. Leaves green above, and rusty and veiny beneath, on
very short pedioles.

Cavanilles's Pernettya. Shrub prostrate.

6 P. pilosa; stem pilose, procumbent; leaves ovate-elliptic,
ciliately-serrulate, coriaceous, mute at the apex and callous;
pedicels axillary, 1-flowered, elongated, nutant; corolla ovate,
with blunt revolute teeth.  h. F. Native of Mexico. A. whilst
pilosa, Graham, in bot. mag. 3177. Corolla white.
Pilose Pernettya. Fl. May, Fr. May, June. Shrub pro-
strate.

7 P. purpurea (D. Don, mss. in herb. Lamb.) branchlets setose;
leaves lanceolate, acute, denticulated, glabrous, veiny
beneath; pedicels scabrous, glandular; corollas ovate.  h. F.
Native of Peru. Flowers purple.

Purple-flowered Pernettya. Shrub.

8 P. ciliaris (D. Don, l. c.) branchlets setose; leaves ovate-
lanceolate, acute, having the margins denticulated, and cili-
ated with bristles; peduncles glandular.  h. F. Native of
Mexico.

Ciliated Pernettya. Shrub.

Cult. For culture and propagation see Phyllodoce, p. 833.

XXXVII. AGARISTA (a mythological name, the beautiful
daughter of Clithenes; in reference to the beauty of
the flowers). D. Don, mss.—Andrómeda species of Comm.
and other authors.

Lin. Syst. Decandra Monogynia. Calyx fleshy, 5-lobed;
lobes imbricate at the base. Corolla ovate, with a contracted,
5-toothed, conical mouth. Stamina 10, inclosed; filaments
flattened, dilated at the base, and villous; anthers bipartite;
with short membranous cells, which are mucilaginous at the base
and diverging at the apex, opening by a terminal hole. Style robust,
terete; stigma capitulate. Capsule globose, pentagonal, 6-celled,
with a loculicidal dehiscence. Placenta thick, oblong. Seeds
angular, curved.—Evergreen shrubs. Natives of the Mauri-
tius and South America. Leaves coriaceous, reticulately veined,
quite entire. Flowers racemose, terminal, very beautiful. In-
termediate between Gaultheria and Andrómeda.

1 A. buxifolia; leaves cordate ovate, mucronulate, rusty
beneath; panicle terminal, downy, composed of racemes; flowers
secund.  h. G. Native of the Island of Bourbon. Andrómeda

Box-leaved Agarista. Fl. June, July. Cilt. 1822. Shrub 3
to 6 feet.

2 A. salicifolia; leaves lanceolate, attenuated at both ends,
white beneath; racemes simple, secund, glabrous.  h. S.
Native of the Mauritius. Andrómeda salicifolia, Comm. mss.
fl. 3. t. 199. bot. mag. 3286. Leaves 2-4 inches long. Ra-
cemes simple. Corolla oblong, ovate, beautiful purple.

Willow-leaved Agarista. Shrub 2 to 3 feet.

3 A. subrotunda; leaves roundish-elliptic, cordate at the
base, mucronate at the apex, glabrous above, but clothed with
ferruginous tomentum beneath; racemes terminal, solitary, or
fascicled, second, downy.  h. G. Native of Brazil, in the prov-
ince of Minas Geraes, on rocks about Villa St. Joao d'el Rey.

Andrómeda subrotunda, Pohl. pl. bras. 2. p. 32. t. 121.
Branches tomentose. Leaves on very short pedioles, approxi-
mate, setosely denticulated on the nerves and margins, and ter-
minating in a spinose mucrone. Corolla ovate, ventricose, pure
red or scarlet, with almost erect segments. Ovaries villous.

Roundish-leaved Agarista. Shrub 3 feet.

4 A. multiflora; leaves lanceolate, rounded at the base,
andromedas; racemes axillary, suprafloraceous; ovary glabrous.

h. G. Native of Brazil, in the province of Minas Geraes, in
mountainous places; in Serra Matuquiera. Andrómeda mul-
tiflora, Pohl. pl. bras. 2. p. 33. t. 152. Shrub much branched.
Leaves petiolead, remote, 2½ inches long and 3 lines broad.
Racemes many-flowered, secund. Bracteas oblong, acute,
ciliated. Corolla elliptic, ventricose, white, with erect seg-
ments.

Many-flowered Agarista. Shrub 6 to 10 feet.

5 A. Pohlil; leaves ovate, acute at the apex, emarginate
at the base, glabrous, painted beneath on the sides of the nerve
with dots; racemes axillary.  h. G. Native of Brazil, in the
province of Minas Geraes, in dry mountainous places of Itambe.
Andrómeda crassifolia, Pohl. pl. bras. 2. p. 34. Leaves on
short pedioles, deciduous, ½ inch long and 3 lines broad.
Racemes many-flowered, secund; bracteas oblong, glabrous.

Corollas unknown.

Pohl's Agarista. Tree.

6 A. Bracamoros; leaves ovate-oblong, obtuse, obso-
letely mucronate, with revolute margins, coriaceous, glabrous,
shining above; racemes axillary and terminal, approximate at
the tops of the branches.  h. G. Native of New Granada, in
the province of Bracamoros, near St. Felipe, and Paramo de Yama-
oca. Andrómeda Bracamoros, H. B. et Kunth, nov. gen. amer. 3.
p. 288. t. 263. Andrómeda myrtifolia, Willk. herb. Branch-
lets angular. Leaves 6-7 lines long. Bractees minute at the base
of the pedicels. Corollas scarlet, with ovate, obtuse,
revolute teeth. Stigma ciliated, hardly thicker than the style.

Bracamoros Agarista. Tree 10 to 15 feet.

7 A. Sprengeli; leaves ovate-oblong, obtuse, mucronate,
coriaceous, with revolute margins, glabrous on both surfaces;
racemes axillary, drooping.  h. S. Native of Brazil, within
the tropic. Andrómeda revoluta, Spreng. neu. end. 2. p. 131.
syst. 2. p. 291. Young leaves and young branches rather
downy.

Sprengel's Agarista. Shrub.

8 A. eucalyptoides; glabrous; leaves on long pedioles,
oblong, acuminate, obliquely rounded at the base, with
revolute margins; racemes lateral, approximate towards the tops
of the branches.  h. G. Native of Brazil, in the Rio Grande do
Sul. Andrómeda eucalyptoides, Cham. et Schlecht, in Linæa.
Leaves ½ inch long. Corolla urceolate, 3 lines long, with ob-
tuse spreading teeth, scarlet? Ovarium pubescent.

Eucalyptus-like Agarista. Shrub or small tree.

9 A. fulchra; glabrous; leaves petiole, ovate, mucronate,
coriaceous, with revolute margins; racemes secund, axillary
and terminal, glabrous, approximate at the tops of the branches;
ovary glabrous.  h. G. Native of Brazil, within the tropic.
Andrómeda fulchra, Cham. et Schlecht. in Linæa. 1. p. 541.
Branches angular. Leaves more than an inch long, larger
than those of A. nummulària. Style length of corolla. Corolla
urceolate, with short obtuse spreading teeth, scarlet.

Fair Agarista. Shrub 1 to 2 feet.

10 A. nummalaria; leaves on short pedioles, cordate, broad-
ovoate, rather retuse, mucronate, coriaceous; racemes axillary
and terminal, and are, as well as the young branches, hispid;

ovary downy.  h. G. Native of the south of Brazil, in the
province of Rio Grande do Sul. Andrómeda nummulària,
Cham. et Schlecht., in Linnaea, 1. p. 520. Leaves shining above, ciliated with long stiff hairs on the nerves beneath, and margins while young. Larger leaves 8 lines long. Racemes approximate at the tops of the branches. Calyx hairy. Style exerted. Corolla urceolate, with short, obtuse, reflexed teeth, scarlet.

**Money-wort-leaved Agarista.** Shrub 1 to 2 feet.

11. *A. neriifolia*; quite glabrous; leaves petiolate, oblanceolate, acute, ovate at the base, coriaceous; panicle terminal, composed of numerous racemes; ovary glabrous. \textsuperscript{*} S. Native of Brazil, within the tropic. *Andrómeda neriifolia*, Cham. et Schlecht., in Linnaea, 1. p. 522. Leaves 3 inches long, shining above and paler beneath. Racemes second; flowers drooping. Corollis urceolate, with short, obtuse, hardly spreading teeth, scarlet. \textsuperscript{*} Calycine segments finely ciliated.

**Nerium-leaved Agarista.** Shrub 2 feet.

12. *A. oleifolia*; leaves on short petioles, oblong, subacuminate, mucronate, acutish at the base, or rounded, with reflexed margins, flat, glabrous, coriaceous; racemes axillary, length of leaves; calycine segments ovate, acuminated, acute; corollas oblong; ovarium glabrous. \textsuperscript{*} S. Native of equinoctial Brazil. *Andrómeda oleifolia*, Cham. in Linnaea, 8. p. 504. — Flowers scarlet, with white filaments and yellow anthers. There are varieties of it having the inflorescence either hairy or glabrous.

**Olive-leaved Agarista.** Shrub 6 to 10 feet.

13. *A. serrulata*; leaves subimbricated, almost sessile, spreading, stiff, ovate, cordate, acute, reticulately veined, with reflexed margins, and serrulate-ciliate near the margin above, very scabrous, hairy on the nerve beneath as well as the branches, inflorescence, and calyces; racemes terminal, and from the axis of the upper leaves, and much exceeding them; calycine segments ovate, acuminated, acute or lanceolate, one-half the length of the corolla; ovary glabrous. \textsuperscript{*} S. Native of Brazil, within the tropic. *Andrómeda serrulata*, Cham. et Schlecht. in Linnaea, 8. p. 506. Corollas scarlet, with obtuse spreading stamens.

**Serrulat-leaved Agarista.** Shrub 2 to 3 feet.

14. *A. pistrix*; branchlets bluntly angular; leaves on short petioles, ovate-cordate, acute in the young state, and obtuse in the adult state, always mucronate, coriaceous, marginated, clothed with fine white tomentum beneath, as well as the branchlets, inflorescence, and calyces; racemes terminal and axillary, exceeding the leaves; calycine segments broad, ovate, acuminated, acute, spreading; corollas downy; ovary glabrous with white tomentum. \textsuperscript{*} S. Native of Brazil. *Andrómeda Pistrix*, Cham. in Linnaea, 8. p. 508. Leaves 15 lines long. Corollas ovoid, coriaceous, scarlet, much larger than those of *A. pulchra*. Style woolly at the base.

**Whale Agarista.** Shrub.

15. *A. chlorantha*; leaves on short petioles, ovate-cordate, obtuse, mucronate, coriaceous, glabrous, with revolute margins; branches, inflorescence, and calyces downy; racemes terminal and axillary, a little longer than the leaves; calycine segments narrow-ovate, acuminated, or lanceolate, acute, longer than the third part of the corolla, which is ovoid-cylindrical; ovary downy or villous. \textsuperscript{*} S. Native of Brazil. *Andrómeda chlorantha*, Cham. in Linnaea, 8. p. 508. A box-like shrub, with the habit of *A. Trachomerovia* and *A. revoluta*. Corollas white, green at the apex, glabrous.

**Green-flowered Agarista.** Shrub 6 to 10 feet?

16. *A. fulchella*; leaves on short petioles, cordate, ovate-oblong, mucronate, marginated, rather coriaceous, flat, pubescent on the midrib beneath while young, as well as the petioles, branchlets, and inflorescence; racemes terminal and axillary, 3-8-flowered, a little longer than the leaves; flowers on long pedicels; calycine segments broad-ovate, acuminated, acute. \textsuperscript{*} S. Native of Brazil. *Andrómeda fulchella*, Cham. in Linnaea, 8. p. 509. Like *A. neriifolia* and *A. pulchra*, but differs much in the inflorescence. Leaves \(\frac{1}{2}\) inch long. Young branches angular. Racemes crowded at the tops of the branches.

**Neat Agarista.** Shrub.

17. *A. pyrifolia*; leaves ovate, acuminated, quite entire, and as, as well as the panicle, glabrous. \textsuperscript{*} S. Native of the Mauritis. *Andrómeda pyrifolia*, Pers. ench. 1. p. 481. — Tree 20 feet high, with sulcately striated bark. Flowers obscure, purple.

**Pear-leaved Agarista.** Tree 20 feet.

18. *A. ilicifolia*; leaves cordate, broad, coriaceous, slightly toothed; racemes axillary and terminal, crowded at the tops of the branches. \textsuperscript{*} S. Native of Peru. *Andrómeda ilicifolia*, Pers. ench. 1. p. 481. Leaves on short petioles, ovate and quite entire when young, but when larger and older furnished with a few distant teeth at the base.

**Holly-leaved Agarista.** Shrub.

19. *A. eriophylla*; leaves roundish-ovate, omentose on both surfaces, and terminated by a gland, quite entire; racemes terminal, second, bracteate; corollas ovate. \textsuperscript{*} G. Native of Brazil, on the mountains. *Andrómeda eriophylla*, Vand. fl. bras. spec. Pers. ench. 1. p. 482.

**Woody-leaved Agarista.** Shrub.

**Anastomosing Agarista.** Shrub.

**Cult. Agarista** is a genus of most showy and elegant shrubs, well worth the cultivator's care. Peat and sand is the best soil for them; and cuttings not too young will strike root in sand under a hand-glass, in a moderate heat. Although the species are said to require the stove, they would probably be better if treated as greenhouse plants.

**XXXVIII. DIPLECOSIA** (from \textit{diplo} double, and \textit{cos} covering; in reference to the double covering, the calyx and calyculus.) Blum. bijdr. 857.

**Lin. Syst.** Decándria, Monogynía. Calyx 5-cleft, girded by a calyculus at the base, which is composed of 2 combined bracteas. Corolla campanulate, with a 5-cleft reflexed limb. Stamens 10, inclosed, inserted in the calycine disk; anthers bifid at the apex. the lobes undivided. Style erect; stigma truncate. Capsule subglobose, depressed, inclosed in the calyx, which is baccate, 5-celled, and dehiscing irregularly. Seeds numerous, cuneate, compressed, fixed to fleshy prominent receptacles.—Parasitical shrubs. Leaves scattered, coriaceous. Flowers solitary or in fascicles, axillary. Corollas pale-greenish. This genus is intermediate between *Andrómeda* and *Gaillthéra*. It differs from the latter in the structure of the corolla and anthers; and from the first in the baccate calyx and dehiscence of the fruit.

1. *D. pilosa* (Blum. bijdr. 858.) leaves ovate-lanceolate, acuminated, strigose above and pilose beneath, as well as the branchlets; pedicels solitary or twin. \textsuperscript{*} S. Native of Java, on Mount Salak, in woods, where it is called by the natives Kila Ge Daichjula.

**Pilose Diplecosia.** Shrub.

2. *D. latifolia* (Blum. l. c.) leaves oval, acutish at both ends, with recurved margins, glabrous; pedicels fascicled. \textsuperscript{*} S. Native of Java, upon trees on the mountains.

**Broad-leaved Diplecosia.** Fl. Year. Shrub par.
ERIACE.E. XXXIX. GAULTHERIA.

3 D. heterophylla (Blum. l. c. p. 558.) leaves oblong or lanceolate, acuminate at both ends, nearly veinless, glabrous, dotted beneath; pedicels fascicled. \( \gamma \). S. Native of Java, on the higher mountains, on the west side of the island.

\( \vartheta \). \( \beta \). leaves cuneate-oblong, acutish or obtuse.

Variable-leaved Diploecia. Fl. Year. Shrub par.

Cult. For culture and propagation, see Agarista, p. 838.

Lin. syst. Decandra, Monogyna. Calyx 5-cleft. Corolla ovate, with a short 5-cleft limb (f. 140. h.). Stamens 10, inclosed; anthers bifid at the apex; lobes biaristate (f. 146. e.). Style 1; stigma obtuse. Hypogynous scales 10, obsolete or connate at the base. Capsule depressedly globose, 5-celled, 5-furrowed, covered by the calyx, which is sometimes baccate; valves septiforous in the middle. Placenta adnate to the base of the column. Seeds numerous, covered by a reticulated testa.

Small trees or shrubs. Leaves alternate. Flowers axillary and terminal, racemose, rarely solitary; pedicels bracteolate. Corolla white, rose-coloured, or scarlet. Filaments usually hairy.

* Flowers axillary, solitary. Peduncles or pedicels beset with some imbricated bracteas at the base.

1 G. procumbens (Lin. spec. 565.) stem procumbent; branches erect, naked at bottom, but with crowded leaves at top; leaves ovate, acute at the base, finely and ciliately toothed; flowers few, terminal, nutant. \( \gamma \). H. Native of North America, in dry woods, on mountains, and in sandy plains from Canada to Virginia. Andr. bot. rep. 116. Kalm. amoen. 3. p. 14. t. 1. f. 6. Duham. arb. 1. p. 286. t. 138. Loddi. bot. cab. t. 82. Sims. bot. mag. 1986.—A little shrubby plant, resembling seedling plants of Kalmia latifolia. Flowers white. Berries red, eatable, and known by the name of partridge berries. The leaves, if properly cured, make a most excellent tea, for which reason it is likewise known by the name of Mountain Tea.

2 G. reftens (Blum. biijdr. p. 587.) stem creeping, rather pilose; leaves minute, rather pilose beneath, ovate, acute, coriaceous; peduncles axillary, 1-flowered. \( \gamma \). G. Native of Java, on the top of Mount Gede.

Creeping Gaultheria. Fl. Year. Shrub.

3 G. nummularioides (D. Don. prod. fl. nep. p. 150.) branches filiform, procumbent, very bristly; leaves cordate, mucronulate, nearly sessile, naked above, but hirsut from hairs beneath and on the margins; pedicels axillary, very short, solitary. \( \gamma \). H. Native of Nippal, on the Alps. Shrub much branched. Flowers drooping. Pedicels and calyces glabrous. Calyce segments broad-ovate, mucronulate, with prominent margins. Corolla ovate, longer than the calyx.

Money-wort-like Gaultheria. Shrub procumbent.

4 G. euskofilla (Willd. in nov. act. berol. vol. 4.) stem erect; branches hairy; leaves roundish-ovate, obtuse, toothed, coriaceous, sebaceous; flowers from dots beneath; pedicels filiform. \( \gamma \). S. Native of Caraccas. Branches hairy, erect.

Box-leaved Gaultheria. Shrub.

Anastomosing Gaultheria. Shrub.

6 G. purpurascens (H. B. et Kunth, nov. gen. amer. 3. p. 282.) procumbent? branchlets and leaves clothed with bristly hairs; leaves elliptic-oblung, acute at both ends, serrulat, 1-nerved, purplish beneath; flowers axillary, solitary. \( \gamma \). G. Native of New Granada. Hairs or bristles dark purple. Leaves green above. Peduncles or pedicels bracteate at the base. Fruit drooping.

Purples-leaved Gaultheria. Shrub procumbent.

7 G. myrtioides (H. B. et Kunth, l. c. p. 283.) branches and leaves glabrous; leaves oblong, acute, obtuse at the base, crenated at top, shining above; flowers axillary, solitary. \( \gamma \). G. Native of New Granada, near the town of Almaguer. Branchlets angular. Peduncles downy, furnished with imbricated bracteas at the base. Corollas ovate-globose, glabrous, white.

Myrside-like Gaultheria. Shrub.

8 G. myrtioides (Cham. et Schlecht, in Linnea. vol. 1. p. 533.) branches beset with bristles, as well as the under sides of the leaves and calyces; leaves broad- lanceolate, with the margins ciliately serrulat and somewhat reflexed; flowers axillary, solitary, on short pedicels near the tops of the branches. \( \gamma \). G. Native of Brazil, within the tropic. Scales at base of pedicels ciliat. Corolla urceolate, pilose inside, glabrous outside, with reflexed teeth. Filaments dilated at base.

Myrtle-like Gaultheria. Shrub \( \frac{1}{2} \) to 1 foot.

9 G. cilla (Cham. et Schlecht, in Linnea. 5. p. 120.) shrubby, glabrous; flowers axillary, solitary; peduncles downy, bracteolate at the base; leaves coriaceous, nearly sessile, lanceolate, acute, sharply serrulat; teeth setigerous in the young state. \( \gamma \). G. Native of Mexico, on Mount Oritzaba, along with Solanum tuberosum; and at Chiconquica and Malpays de Joya. Leaves \( \frac{1}{4} \) inch long. Flowers white. Berries black. Ciliated-leaved Gaultheria. Shrub.

* * * Racemes axillary and terminal at the tops of the branches. Pedicels bracteate.

10 G. shallon (Parsh. fl. amer. sept. 1. p. 283. with a figure) procumbent, hairy; leaves ovate, subcordate, serrated, glabrous on both surfaces; racemes secund, bracteate, clothed with rusty down. \( \gamma \). H. Native of North America, on the falls of the Columbia, and near the Western Ocean. Hook. bot. mag. t. 2843. Lindl. bot. reg. 1411. Loddi. bot. cab. 1372. Brancheswarted, clothed with rusty down while young. Leaves broad, abruptly acuminate. Pedicels scaly. Corolla white, tinged with red, downy, urceolate, with a closed limb. Berries globose, acutish, fleshy, purple. — This plant grows in the shade of close pine forests, where hardly any thing else will grow, which makes it a very desirable shrub for plantations. The berries of the Shallon are much esteemed by the natives, on account of their agreeable flavour.

FIG. 140.
ERICACEÆ. XXXIX. GAULTHERIA.

12 G. punctata (Blum. bibd. p. 826). leaves lanceolate, terminated by a gland, serrated, dotted beneath, glabrous as well as the branches; racemes panicled, terminal; calyces ciliated. ὶ. G. Native of Java, very common on the top of Mount Gede, where it is called by the natives Tjatonge-wangie.

Dotted-leaved Gaultheria. Shrub.

13 G. leucocarpa (Blum. bibd. p. 856) branches and leaves glabrous; leaves ovate-oblong, long-acuminate, bluntly serrated; racemes axillary and terminal, drooping; calyces a little ciliate. ὶ. G. Native of Java, in woods on the higher mountains, where it is called Zanigid badas by the natives.

14 G. Sprengelii; leaves oblong, rounded at both ends, callous at the apex, quite entire, with revolute edges, hispid on both surfaces; branches hairy; racemes terminal, straight, rounded, clothed with ciliate hairs. ὶ. S. Native of Brazil, where it was collected by Sello. G. hispida, Sprengel, syst. 2. p. 288. but not of R. Br.

Sprengel's Gaultheria. Shrub.

15 G.? Bracteata; branches beset with rusty hairs; leaves ovate-acute, obscurely dentilicate, shining above and rusty beneath; racemes terminal, simple; corollas and calyces hairy. ὶ. G. Native of Quito, near the Crater of Tungragua, and on Mount Chimbora. Andromeda bracteata, Cav. icon. 6. p. 42. t. 502. f. 1. Hairs on the under side of the leaves, bulbous at the base. Leaves 1½ inch long, and 1 inch broad. Bractæ at the base of the pedicels concave, ovate-acute, and the pedicels are bibracteate. Stamina 10, villous; anthers biaristate at the base. Corollæ tubular, pale red, with erect ovate-acute teeth.

Bracteeate Gaultheria. Shrub. ½ foot.

16 G. elliptica (Cham. in Linneæ. 8. p. 502) racemes, corollæ, and capsules, downy; bractæ and calyces ciliated, the rest of the plant glabrous; leaves elliptic, acute at both ends, mucronate, margined, rather coriaceous, finely and equally serrulleted, smooth and shining above, and beset with black dots beneath, reticulately veined; racemes terminal and axillary, forming a panicle; bractæ ovate- orbicular, obtuse, concave, at first imbricated, and therefore the racemes appear strobile-formed. ὶ. S. Native of the south of Brazil, where it was collected by Sello. Very like G. acuminata, Cham. in Linneæ. 5. p. 126. and G. vernalis, Popp. pl. chil. excis. 3. no. 119. Prostrate and rooting. Corollæ ovate-ureceolate, inflatæ, downy outside and villous inside.

Elliptic-leaved Gaultheria. Shrub creeping.

17 G. acuminata (Schlecht. et Cham. 6. p. 126. and 7. p. 534) shrubby; glabrous; flowers racemose, axillary; leaves on short petioles, ovate, acuminate, acute, finely serrulleted, coriaceous, reticulately veined, discouloured, full of black dots beneath, but scabrous on both surfaces from elevated dots; serra- tures mucronate. ὶ. G. Native of Mexico, on Serra Colorado; and at St. Salvador and Malpays de Joya. Flowers white. Fruit black. Leaves ¾ inches long.

Acuminated-leaved Gaultheria. Shrub.

18 G. reticulata (H. B. et Kunth, nov. gen. 3. p. 284) branches and leaves glabrous; leaves oblong, acutish at both ends, serreolated, crenulleted, shining above; racemes crowded at the tops of the branches, axillary and terminal; corollæ glabrous. ὶ. G. Native of the Andes of Quito, between Ona and Lonza, in Paramo de Saraguru. Andromeda reticulata, Humb. proo. p. 39. Leaves terminated by a sessile gland, shining above. Racemes involucrated by some bractæ at the base, downy. Corolla ovate, tubular, white, glabrous. Fruit capsular.

Reticulated-leaved Gaultheria. Shrub.

19 G. cocinea (H. B. et Kunth, l. c. p. 284) branches rather pilose; leaves roundish-ovate, acutish, rounded at the base, denticulately, glabrous, shining above and dotted beneath; racemes terminal and axillary at the tops of the branches; corollæ clothed with glandular hairs. ὶ. S. Native of Caracas, on Mount Avila. Andromeda cocinea, Humb. proo. p. 39. Leaves with black dot-like glands beneath. Racemes involucrated by imbricate bractæ at the base. Flowers secund, on long pedicels; pedicels clothed with glandular hairs. Brac- teæ at the base of the pedicels concave, coloured, glandularly ciliated. Corollæ ovate, scarlet, clothed with glandular hairs. Fruit capsular.

Scarlet-flowered Gaultheria. Shrub.

20 G. odorata (Humb. trav. 1. p. 397. and 599. nov. gen. 3. p. 285. Pers. excl. 1. p. 482) branches beset with glandular viscid hairs; leaves ovate-oblong, acuminate, ciliate, corollæ at the base, sharply denticulately, glabrous and shining above, and scabrous from dots beneath; racemes axillary and terminal at the tops of the branches; corollæ pilose. ὶ. S. Native of New Andalusia, on Mount Tumiriquirí; and on the southern declivity of Mount Silla de Caracas, where it is called Pejo by the natives; and of Mexico, at Cuesta Grande de Chiconquía. G. scabra, Wildl. herb. Shrub much branched. Leaves aromatic, 2 inches long, glandularly ciliated while young. Racemes involucrated by some bractæ at the base. Flowers secund, nutant. Pedicels beset with glandular hairs as well as the rachis. Bractæ red, lanceolate, length of pedicels. Corollæ ovate, pale red. Fruit capsular.

Sweet-scented Gaultheria. Shrub 4 to 5 feet.

21 G. cordifolia (H. B. et Kunth, nov. gen. amer. 3. p. 285. t. 261) branches clamy, hispid; leaves ovate, acute, corotate, denticulately, rugose, glabrous and shining above, but hairy beneath; racemes axillary and terminal at the tops of the branches; corollæ clothed with clammy hairs. ὶ. G. Native of New Granada, on the Andes near Almaguer and Pansitara, in rather frigid places. Branches twining, ex Bonpl. Leaves ½ inches long. Pedicels and flowers beset with glandular hairs and clammy. Bractæ oblong, acute, concave, ciliated with glandular hairs, and clothed with adpressed hairs outside, longer than the pedicels. Calyx clammy, clothed with glandular hairs. Corollæ ovate, scarlet or purple.

Heart-leaved Gaultheria. Shrub.

22 G. rigida (H. B. et Kunth, l. c. p. 286) branches puberulous; leaves ovate-oblong, acute, corolate at the base, sharply denticulately, glabrous, but a little ciliated; racemes axillary and terminal at the tops of the branches; corollæ glabrous. ὶ. S. Native of the province of Cuman, on Mount Cocollar. Andromeda rigida, Humb. trav. p. 397. Leaves terminated by a sessile gland. Racemes involucrated by many imbricate bractæ. Bractæ oblong, concave, ciliated, glabrous, coloured, longer than the pedicels. Pedicels and rachis downy. Corollæ ovate, scarlet.

Stiff Gaultheria. Tree small.

23 G. tomentosa (H. B. et Kunth, l. c. p. 287. t. 262)
branches and under sides of leaves clothed with rusty tomentum; leaves glabrous and shining above, lanceolate-oblong, acute, obtuse at the base, with quite entire revolute margins; racemes axillary and terminal at the tops of the branches; corolla tomentose. H. S. Native of the Andes, about Quito, in Paramo de Saraguru. Leaves tomentose on both surfaces while young. Pedicels and calyces clothed with rusty down. Bracteae tomentose, ovate-oblong, much shorter than the pedicels. Corolla ovate.

**Tomentose Gaultheria.** Tree 10 to 15 feet.

24 G. ferruginea (Cham. et Schlecht, in Linnaea, 1. p. 524.) leaves ovate-cordate, acute, shining above, with serrulately scabrous margins, clothed with rusty tomentum beneath, as well as the racemes and flowers. H. G. Native of Brazil, within the tropic. Leaves often cordate at the base. Racemes bracteate, erect, rising from the axils at the tops of the branches, the whole forming a panicule. Corolla 3 lines long, with erect teeth.

**Rusty Gaultheria.** Shrub.

25 G. Escara (Willd. in nov. act. soc. berol. 4.) leaves ovate-cordate, acute, toothed, scabrous, reticulately veined beneath; racemes axillary, simple; calyx and bracteae clothed with glandular hairy. H. S. Native of Caraccas. Calyx baccate, black.

**Scabrous Gaultheria.** Shrub.

26 G. erecta (Vent. hort. cels, p. 5. t. 5.) leaves ovate, mucronate, clothed with rusty hairs; branches and racemes clothed with glandular clammy hairs. H. G. Native of Peru. Leaves with revolute denticulated margins.

**Erect Gaultheria.** Shrub.

27 G. hispida (R. Br. prod. p. 559.) leaves long-lanceolate, serrulately pilose beneath as well as on the petioles; branchlets hispid; racemes axillary and terminal, shorter than the leaves; rachis and pedicels downy; calyxes baccate; fruit and ovaries glabrous; stem erect. H. F. Native of Van Diemen's Land. Corollas white.

**Hispid Gaultheria.** Shrub erect.

28 G. Rupestris; racemes simple, bracteate; corollas campanulate; leaves oblong, serrulately. H. F. Native of New Zealand. Andromeda rupestris, Forst. prod. no. 195. Nearly allied to the preceding.

**Rock Gaultheria.** Shrub erect.

29 G. Antipoda (Forst. prod. no. 186.) leaves roundish-ovate, serrate-toothed, glabrous, reticulately veined; branches downy; stem diffuse; racemes panicled, rather hairy; corollas glabrous. H. F. Native of New Zealand. Flowers white. H. Antipodal Gaultheria. Shrub.

**Cult.** The species are ornamental: they thrive best in a heat soil, and are readily increased by dividing or by layers. The greenhouse species should be treated as other hardy greenhouse shrubs.

**Lin. Syst. Decândria Monogyânia.** Calyx large, 5-parted, furnished with 3 bractees at the base. Corolla salver-shaped, with a 5-parted spreading limb; tube villous inside. Stamens 10.

1 E. refens (Lin. spec. 565.) branches, petioles, and nerves of leaves very hairy; leaves cordate-ovate, quite entire; corollas cylindrical. H. H. Native from Canada to Carolina, on shady rocks and in stony woods, sides of hills and roots of pines. Andr. bot. rep. 102. Lam. ill. t. 367. f. 1. Lodde. bot. cab. 160.—Pluk. alm. t. 107. f. 1. Flowers white, tinged with red, very fragrant.

**Creeping Epigaea.** Fl. May, July. C1t. 1736. Shrub creeping.

2 E. cordifolia (Swartz, prod. 73. fl. ind. occ. 2. p. 842.) stem erectish, strigose; leaves cordate, roundish, hispid, serrated, convex; corollas ovate. H. S. Native of Guadaloupe and Cayenne. Lam. ill. t. 367. f. 1. Flowers white.

**Heart-leaved Epigaea.** Shrub erectish.

**Cult.** E. repens is a beautiful procumbent shrub: it will thrive only in peat soil and shady situations, and, being rather tender, should have a hand-glass or frame placed over it in frosty weather; indeed, it grows best under a hand-glass or frame the whole year: it is increased by layers or separating the rooted shoots; or by cuttings, which root readily in sand with a hand-glass over them. For the culture of E. cordifolia see Agarista, p. 838.

1 P. serpyllifolia; H. H. Native from Canada to Pennsylvania. Mr. Nuttall has observed this plant north-westward of Lake Michigan; and, as Mr. Pursh very justly remarks, abounding where evergreens are predominant, keeping pretty constant pace with the northern forests of pines, larches, and fir, growing always amidst sphagnum. Vaccinium hispidulum, Lin. spec. 500. Michx. fl. 6. bor. Amer. 1. p. 228. t. 25. Gaulthîria serpyllifolia, Pursh. fl. Amer. sept. 1. p. 283. t. 13. A´rbutos filiformis, Lam. dict. 1. p. 228. Berries white, produced in inconsiderable quantities. They are aromatic, not very acid, and rather hispid than agreeable. The shrub has the same aromatic taste and smell as Gaulthîria procumbens.

**Wild Thyme-leaved Snowberry.** Fl. April, May. Cit. 1815. Shrub creeping.

**Cult.** See Oxyccoccus, p. 858, for culture and propagation.

**Lin. Syst. Decândria, Monogyânia.** Calyx 5-parted. Corolla so deeply 5-parted as to appear pentapetalous. Stamens 10, inclosed, or nearly so; anthers behind, at length inflexed pendulous and obverse, corolla, mucronate at the apex, mutic. Ovarium free. Style straight. Stigma trifid. Capsule girded by the calyx, 3-celled, with a loculicidal dehiscence; cells many-seeded. Shrub or trees. Leaves alternate. Racemes terminal, solitary or panicled. Flowers bracteate, white.

**Alder-leaved Clethra.** Fl. July, Sept. Cit. 1791. Shrub 1 to 4 feet.
2 C. tomentosa (Lam. dict. 2. p. 46.) leaves cuneate-obo-vate, acute, finely serrated at top, clothed with white tomentum beneath; racemes spicate, simple, bracteate, villously tomentose. H. Native of Virginia and Carolina, in swamps. Wats. dend. brit. t. 39. C. alnifolia, b, pubescens, Ait. hort. kew. 2. p. 73. C. Incana, Pers. ench. 1. p. 482. This is a very distinct species, although it has been considered by some as a mere variety of the preceding.

Tomentose Clethra. Fl. July, Oct. Clt. 1731. Shrub 3 to 4 feet. 3 C. scabra (Pers. ench. 1. p. 482.) leaves broad, cuneate-obo-vate, acute, scabrous on both surfaces, coarsely serrated; racemes hooked; racemes spicate, subpanicled, bracteate, finely tomentose. H. Native of the western parts of Georgia, where it was collected by Mr. Lyon.

4 C. Paniculata (Ait. hort. kew. 2. p. 73.) leaves narrow, cuneate-lanceolate, acute, acuminate serrated, glabrous on both surfaces; panicle terminal, elongated, composed of racemes, and clothed with white tomentum. H. Native of Carolina.

Acuminated-leaved Clethra. Fl. July, Oct. Clt. 1806. Tree 10 to 15 feet. 6 C. Brasiliensis (Cham. in Linnae. 8. p. 510.) leaves oblong, obtuse, rather retuse, acutish at the base, cuneate, glabrous above and tomentose beneath, almost quite entire, or serrately-toothed at the apex; teeth and apex mucronate; racemes forming panicles at the tops of the branches, tomentose; segments of corolla fringed; genials inclosed. S. Native of tropical Brazil. The leaves vary much in form and size. Tomentum of a rusty-colour.

Brazilian Clethra. Shrub, or tree.

7 C. Pagifolia (H. B. et Kunth, nov. gener. amer. 3. p. 289.) arboreous; leaves obvate, sharply and remotely toothed, coriaceous, glabrous; racemes clustered at the tops of the branches. S. Native of South America, in woods near Bonavista, between Caracas and La Victoria. Young branches angular, and densely clothed with rusty down. Leaves 3-4 inches long, paler beneath. Racemes clothed with rusty tomentum. Corollas white, about the size of those of the lily of the valley.

Beach-leaved Clethra. Tree.

8 C. Sicolor (H. B. et Kunth, l. c. p. 289.) arboreous? leaves oblong, coarsely and undulate crenated, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches. S. Native of South America, near Santa Fe de Bogota. Cuellaria floribunda, Willd. herb. Branchelets angular, clothed with rusty down, intermixed with stiff hairs, as well as the racemes. Leaves 3-4 inches long, having the teeth intermixed with gland-formed dentilications, while young having a few dot-formed stipitate hairs above. Corollas white.

Two-coloured-leaved Clethra. Tree.

9 C. Emmanuel (H. B. et Kunth, l. c. p. 290. t. 264.) arboreous; leaves elliptic-oblong, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches; staminens hardly inclosed.

9 S. Native along with the preceding. Cuellaria rugosa, Wildl. herb. Branches glabrous, brown. Flowers sub-sectund, nutant, about the size of those of C. alnifolia. Pedicels, calyces, and rachis clothed with rusty tomentum. Corolla white, having the segments emarginately 2-lobed, and lacinately fringed at the apex.

Fringed-flowered Clethra. Tree.

11 C. obovata (Ruiz et Pav. fl. per. 4. t. 381.) leaves oblong, wrinkled, denticulate. G. Native of Peru, in forests about Cuchero. Cuellaria obovata, Ruiz et Pav. syta. t. 103. Racemes long, fascicled at the tops of the branches. Branches and leaves downy. Flowers small.—A tall tree. The wood is very hard, and is made into utensils by the natives.

Obovate-leaved Clethra. Tree tall.

12 C. Revoluta (Ruiz et Pav. fl. per. 4. t. 380. f. a.) leaves oblong, denticulated, revolute and excavated at the base. G. Native of Peru, in forests towards Pilleo. Cuellaria revoluta, Ruiz et Pav. syta. t. 103. Branches, leaves, and racemes downy. Racemes simple, fascicled at the tops of the branches.

Revolute-leaved Clethra. Tree 30 feet.

14 C. Tinifolia (Swartz, fl. indica. occ. 2. p. 845.) arboreous; leaves oblong-lanceolate, quite entire, hoary beneath; racemes spike-formed, paniced at the tops of the branches, tomentose. G. Native of the south of Jamaica; also of Mexico, near Chiconiquaco. Tinus occidentalis, Lin. spec. 530. Volkmehria. P. Browne, jam. 214. t. 21. f. 1. Sloan, jam. 2. p. 86. t. 198. f. 2. Flowers white. Snoke calls this tree Bastard Locust tree.

Laurestine-leaved Clethra. Clt. 1825. Tree 12 to 14 feet.

15 C. Arboridea (Ait. hort. kew. 2. p. 73.) leaves oblong, attenuated, lanceolate, glabrous on both surfaces, serrated; racemes spike-formed, paniced at the tops of the branches; calyce segments obtuse. G. Native of Madeira. Simas, bot. mag. 1057. Flowers white. There are several varieties of this species; a smaller variety, and a variegated-leaved one.

Cult. All the species of this genus are very ornamental. The hardy kinds thrive best in peat earth, or a very light sandy loam: they are dwarf shrubs, and are therefore well fitted for the front of shrubberies, where the soil will suit. By layers is the usual mode of increasing them, but they also strike root readily from cuttings in sand under a hand-glass. The greenhouse kinds are well adapted for large conservatories, and they thrive in the same kind of soil recommended for the hardy species. Cuttings taken from wood not too ripe will strike root readily in sand under a hand-glass. All may be raised from seeds, which in most of the species ripen in plenty.

Tribe II.

RHODODENDRONE (so called because the genera contained in it agree with Rhodora, or Rhododendron, in particular characters).

**XLIII. RHODODENDRON** (from βοδος, rhodon, a rose, and δένδρον, dendra, a tree; in reference to the terminal bunches of flowers, which are usually red). Lin. gen. no. 543. Schreb. gen. no. 746. Gardn. fruct. 1. p. 304. t. 63. Juss. gen. 158. D. Don, in edinb. phil. journ. prod. fl. nep. p. 152.—Azâleas species of authors.—Rhôdora, Lin.—Châmerophodondrons, Tournef. inst. t. 373.

Lin. syst. Pentâ-Deçâdria, Monogyniâ. Calyx 5-parted. Corolla somewhat funnel-shaped, or campanulate; rarely rotate or 5-parted; limb 5-cleft, somewhat bilabiate; upper lip the broadest, and usually spotted. Stamens 5-10, usually exserted, declinate; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, rarely 10-celled and 10-valved, as in *R. arboreum*, with a sepaticial dehiscence at the apex. Placentas simple, angular. Seeds compressed, scrobiform, winged.—Shrubs or trees, usually evergreen. Leaves alternate, quite entire, terminated by a spatulate apex, or yellow gland. Flowers terminal, corymbose, showy.

1 R. Po'nticum (Lin. spec. 562.) leaves oblong-lanceolate, glabrous on both surfaces, attenuated towards the thick petioles, with a streak on the upper surface, of a wide lanceolate form; racemes short, corymbose. ʒ. ʒ. Native of Asia Minor, at Pontus; and of Gibraltar, Iberia, and Caucasus, in wet places in beech and elder coppices. Pall. fl. Ross. 1. p. 43. t. 29. Jacq. icon.ตาร. t. 75. Lam. ill. 364. Curt. cot. mag. 650. Leaves sometimes becoming fervicent incridescent. Corolla purple, large, with ovate, acute, or lanceolate segments. Calyx minute, 5-toothed, somewhat carilaginous. This is a very common plant, of which there are a great many varieties. The most remarkable are those with white, red, or bluish flowers, and striped leaves. Tournefort has related that the flowers of this species were reputed to impart a noxious quality to honey; this Gildendi-stadt contradicts, and imputes it to *Azâleas Pontica*.

Var. β, obtusum (Wats. dand. brit. t. 162.) leaves subcorulate, coriaceous, obtuse; calyx very short, unequally and undulate crenate. ʒ. ʒ. Native of Pontus. Shrub 3-4 feet high.

Flowers purple.

Var. γ, myrtifolium (Lodd. bot. cab. 908.) leaves small; flowers purplish. ʒ. ʒ. Native of Gibraltar.

Var. δ, Smithii (Sweet fl. gard. n. s. t. 50.) leaves lanceolate, clothed with white tomentum beneath; corymbs many-flowered; ovary tomentum, 10-celled; flowers of a rosy purple, approaching to crimson, elegantly spotted with black. ʒ. ʒ. A hybrid, raised by Mr. Smith, of Coombe Wood, from the seed of *R. Ponticum*, impregnated by the pollen of *R. arboreum*.

2 R. Maxim (Lin. spec. p. 563.) arborecent; leaves elliptic-oblong, acute, convex, bluntish at the base, whitish or rusty beneath, glabrous; calyces segments oval-obtuse: segments of corolla roundish. ʒ. ʒ. Native from Canada to Carolina, on the mountains near rivulets and lakes. Sims, bot. mag. 951. Lam. ill. 364.—Schmidt, aubr. t. 121.—Mill. fig. 229.—Catseb. car. 3. t. 17. f. 2. Flowers pale red, in umbelate corymbs, studded with green, yellow, or purple protuberances. Largest Rhododendron or American Rose-bay. Fl. June, Aug. ʒ. Clt. 1736. Shrub 10 to 15 feet.

3 R. purp’reum; arboreous; leaves large, oblong-elliptic, flattish, acute, bluish at the base, green and glabrous on both surfaces; segments of corolla oblong, obtuse. ʒ. ʒ. Native of Virginia and Carolina, on the highest mountains, near lakes. R. maximum γ, purpurânum, Pursh, fl. Amer. sept. 1. p. 297. Flowers large, purple. Calycine segments obtuse. This shrub approaches near to *R. Ponticum*, but it differs in its foliacous calyx, and otherwise. It grows to an immense size; its stem is often found 16 inches and more in diameter, and its foliage triple the size of any other species. Purple-flowered Rhododendron. Fl. May, June. Clt. 20 feet.

4 R. Pur’shii; arborescent; leaves cuneate-lanceolate, flat, glabrous, tapering gradually to the base, paler beneath; calyces segments oval, obtuse; segments of corolla roundish-oblong. ʒ. ʒ. Native of New Jersey and Delaware, in shady cedar swamps. R. maximum β, album, Pursh, fl. Amer. sept. 1. p. 297. Flowers white, smaller than those of *R. maximum*.

5 R. Macroph’yllum (D. Don, mss. in herb. Lam.) leaves lanceolate, acute, glabrous on both surfaces, as well as the peduncles, rounded at the base; ovary bristly. ʒ. ʒ. Native of the north-west coast of America, where it was collected by Menzies. Petioles an inch long. Leaves 7-8 inches long. Flowers copious, smaller than those of *R. maximum*, white. Calycine lobes short, rounded. Filaments glabrous.

Long-leaved Rhododendron. Shrub.

6 R. Catawbiense (Michx. fl. bor. Amer. 1. p. 258.) leaves short-oval, rounded, and obtuse at both ends, glabrous, of a different colour beneath; calyces segments elongated, oblong. ʒ. ʒ. Native on the high mountains of Virginia and Carolina, particularly on the head waters of the Catawba River. Sims, bot. mag. 1671. Lodd. bot. cab. 1176. Flowers purple, disposed in umbellate corymbs.

Var. β, Russellianum (Sweet fl. gard. n. s. t. 91.) leaves oblong, finely tomentose beneath; corymbs many-flowered; flowers of a bright rosy red, approaching to crimson. ʒ. ʒ. A hybrid, raised from the seed of *R. Catawbiense*, impregnated by the pollen of *R. arboreum*, by Mr. Russell, of Battersea.

7 R. Brachye’rum (D. Don, mss. in herb. Lam.) leaves elliptic-oblong, obtuse, clothed with rusty tomentum beneath, rounded at the base; ovaries 5-celled, and are as well as the peduncles hairy. ʒ. ʒ. Native of Japan. Petioles half an inch long. Leaves 5 inches long. Calycine lobes very short, roundish, revolute, callous. Style elongated. Stigma clavate.

Short-fruit Rhododendron. Shrub.

8 R. Chrys’anthum (Lin. syst. 465. suppl. 237.) leaves acutish, attenuated at the base, oblong, glabrous, reticulately veined, and of a rusty colour beneath; flowers and buds clothed with rusty tomentum; pedicles hairy; calyx hardly any; segments of the corolla rounded; ovary tomentose. ʒ. ʒ. Native of Siberia, on the highest mountains, and of Caucasus. Pall. itin. append. p. 729. no. 87. t. n. f. 1-2. fl. Ross. 1. p. 44. t. 30. Wood. med. bot. 453. t. 149. Fl. Plen.$$ p 2 $$

**FIG. 141.**
par. lond. t. 80.—Gmel. sib. 4. t. 54. R. officinale, Salisb. p. 121. t. 54. Branches decumbent, beset with rusty stipuliformed scales. Flowers handsome, large, drooping, revolute, rather irregular, yellow. Stigma 5-lobed. The plant and its effects were first described by Gmelin and Steller, who mention it as used in Siberia for the cure of rheumatism: with us it is used in decoction as a substitute for *Cocculus.* (F. 141.)

10 R. FERRUGINEUM (Lin. spec. 562.) leaves oblong, attenuated at both ends, glabrous, shining and green above, but thickly beset with rusty dots beneath; calyce segments dentately ciliated. F. H. Native of the Alps of Europe, as of Switzerland, Austria, Savoy, Dauphiny, and Piedmont, where this and *R. hisitum* terminate ligneous vegetation, and furnish the shepherds with their only fuel. Jaqc. obs. 1. p. 26. t. 16. fl. austr. 3. t. 255. Lodg. bot. cab. 65. —Lob. icon. 366. Leaves like those of the box-tree, when young ciliated with a few hairs at bottom. Flowers of a beautiful rose-colour or scarlet, disposed in umbellate corymbs, marked with ash-coloured or yellow dots. Corollas funnel-shaped. Filaments hairy at bottom.

*Var. flori-albo;* flowers white.

11 R. HIRSUTUM (Lin. spec. 562.) leaves ovate-lanceolate or elliptic, acutish, ciliated with rusty hairs on the margins, glabrous above, dotted and hairy beneath; calyce segments fringed, bearded. F. H. Native of the Alps of Europe, as of Switzerland, Austria, Savoy, Dauphiny, &c. Jaqc. austr. 1. t. 98. Sims, bot. 1835. Lodg. bot. cab. 479. —Lob. icon. 408. Very like *R. ferrugineum.* Flowers pale red or scarlet, disposed in umbellate corymbs. Corollas funnel-shaped.

*Var. variegatum;* leaves edged with yellow.

*Bristy Rhododendron. Fl.? Clt. 1825. Shrub ½ to 1 ft.*

Sect. II. BoBAM (the name of the first species in Nipaul). Limb of calyx 5-lobed. Corolla campanulate. Staminas 10. Ovarium 8 or 10-celled. Leaves coriaceous, evergreen.—Species all natives of India.

14 R. ARBOREUM (Smith, exot. bot. t. 6.) leaves lanceolate, acute, silvery beneath, tapering to the base; pedicels and calyces woolly; segments of corolla 2-lobed, with crenately curved margins; capsule 10-celled, tomentose. F. F. Native of Nipaul, on the mountains at Narainthetty, where it is called *Booram* by the natives. Hook. exot. fl. 168. Lindl. bot. reg. t. 896. Sweet, fl. gard. 3. t. 250. R. purpureum, Hamilt. mss. Tree very showy when in blossom. Leaves 4-6 inches long. Flowers large, scarlet, dotted with black on the upper lip inside, disposed in dense heads. Stigma capitate, crenulated.

15 R. ALBANUM (Hamilt. mss. Sweet, fl. gard. t. 148.) leaves lanceolate, wrinkled and dark green above, but of a rusty cinnamon colour beneath; alternate filaments toothed. F. F. Native of Nipaul. R. arboreum γ, floribus niveis, D. Don, prod. fl. nep. p. 154. Wall. pl. asiat. var. 2. t. 123. Flowers white, spotted with purple on the upper lip. Dr. Wallich considers this and *R. arboreum,* to be only varieties of each other.

16 R. CINNAMONUM (Wall. cat. no. 760.) leaves lanceolate, acute, obfuse at the base, clothed with intense rusty tomentum beneath; limb of calyx short, callous, 5-lobed; ovarium tomentose, 10-celled. F. F. Native of Nipaul. Very nearly allied to *R. arboreum,* and hardly distinct from that species. Leaves 3-4 inches long. Corolla with wavy crenulate segments, apparently white. Capsule an inch long. Perhaps the same as *R. album.*

17 R. BARBATUM (Wall. cat. no. 757.) leaves oblong-lanceolate, acute, obfuse at the base, yellowish beneath; calyce segments dilated, membranous; ovarium 10-celled, glandular, hispid; petioles and mid-rib of leaves bristly; filaments glabrous, toothless. F. F. Native of Nipaul. Habit of *R. arboreum.* Leaves a span long. Corolla dark red, with broad rounded segments. Ovarium thickly beset with glanduliferous bristles.

Beaded Rhododendron. Tree.

18 R. ? LINEARIFOLIUM (Poir. suppl. ex Spreng. syst. 2. p. 293.) leaves linear, coriaceous, obtuse, with revolute edges, clothed with rusty down beneath; flowers corymbose; calyx minute, obtuse, velvety. F. F. Native of the East Indies.

Linear-leaved Rhododendron. Shrub.

19 R. CAMPAULATUM (D. Don, in wern. mem. 3. p. 409. prod. fl. nep. 153.) leaves elliptic-oblong, mucronate, rusty beneath, rather coriaceous at the base; segments of corolla flat, marginate; ovarium 6-celled, glabrous. F. F. Native of Nipaul, on Gosasingthun, a high mountain to the north of the valley. Lodg. bot. cab. 1844. Sweet, fl. gard. n. s. t. 241. Under surfaces of leaves clothed with fine scaly pubescence, at first of a purplish hue, afterwards changing to nearly white, and finally to a deep ferruginous brown. Flowers corymbose, disposed in corymbose clusters. Pedicels glabrous. Bracteas fringed. Corollas large, pale pink, changing to white, having the upper lip marked with irregular purple spots. Filaments bearded at the base. This species surpasses all others in the size of its flowers, except one found in Java by Dr. Horsemield.

20. **R. formosum** (Wall. pl. rar. asiat. 3. p. 3. t. 207.) leaves lanceolate, acute, attenuated at the base, beset with rusty dots beneath; segments of corolla entire, flat; filaments bearded; ovary 10-celled. _FLOWERS_ Native of Nipal. Leaves an inch and a half long. Flowers about the size of those of _R. Ponticum_, white, suffused with red. Limb of calyx short.

Shoqy Rhododendron. Shrub.

**Sect. III. Pogonanthum** (from πωγόν, pagon, a beard; and ἀνθος, anthos, a flower; throat of corolla woolly inside). Limb of calyx short, 5-lobed. Corolla salver-shaped, with a cylindrical tube, and a spreading limb. Stamens 8, inclosed. Ovary 5-celled.—Leaves evergreen, coriaceous.

**Sect. IV. Leiphtherum** (from λιφτε, lepis, a scale; and φερω, phero, to bear; leaves covered with small scales.) Limb of calyx dilated, 5-lobed. Corolla campanulate or rotate. Stamens 10. Ovary 5-celled.—Leaves membranous, sometimes deciduous.

22. **R. lepidotum** (Wall. cat. 758.) every part of the plant is beset with ferruginous scale-like dots; leaves spatulate or lanceolate, attenuated at the base, beset with round scale-like dots, as well as the branchlets, ferruginous beneath; calycine segments rounded; corollas short, campanulate, lepidoptered, with roundish entire lobes; capsules also lepidoptered; filaments woolly at the base. _FLOWERS_ Native of Nipal. A widely-branched shrub, with the habit of _R. Dauricum._ Leaves of a thinner texture, about an inch long. Flowers as well as the capsule covered with round rust-coloured scales. Flowers deep pink, solitary or 2-5 together, terminal, on short filiform pedicels.

_Scaly-dotted Rhododendron._ Shrub 2 to 3 feet.

23. **R. Lapponicum** (Wahl. fl. succ. p. 249.) shrub branched, procumbent; branches divaricate; corollas rotately funnel-shaped; leaves oblong, obtuse, stiff, beset with foveolate dots, yellowish and lepidoptered beneath. _FLOWERS_ Native of the Arctic regions of Europe, Asia, and North America. Azalea Lapponica, Lin. fl. succ. p. 64. spec. 214. fl. lapp. ed. Smith. p. 59. t. 6. f. 1. Hook. bot. mag. 3106. Young branches obscurely pubescent, warted. Leaves deep green above, pale green and at length yellowish beneath, thickly beset with hollow dots on both surfaces, which are covered by umbilicate permanent scales. Flowers crimson, disposed in umbellate corymbs, 5-6 together, surrounded by large dotted scales or bracteas. Calyx covered with yellow scales, ciliated. Segments of corolla unequal, undulated. Stamens 5-8, equal in length to the corolla. Stigma capitate, 5-lobed. Filaments hairy at the base.

24. **R. Dauricum** (Lin. spec. 562.) deciduous; leaves oblong, attenuated at both ends, glabrous, lepidoptered from rusty scales, particularly beneath; limb of calyx 5-toothed; corollas rotatory. _FLOWERS_ Native of Siberia, peculiar to the alpine tracts of Eastern Asia; it appears first at the mouth of the river Yenesei, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but about the Baikal it is most abundant, and extends through the deserts of the Mongols to China and Thibet; at the Lena it becomes more rare, and beyond that it is much dwarfer, with more slender flowers and narrower leaves. Pall. fl. ross. 1. p. 47. t. 32. Andr. bot. rep. t. 4. Curt. bot. mag. t. 636. Lodd. bot. cab. 605.—Amm. ruth. 181. t. 21. Roots knobbed, bound by fibres. Stems twisted and knobbed in the wild state. Petioles downy. Leaves dotted on both surfaces, but ferruginous beneath; before the fall in autumn they become of a dusky red colour. The flowers rise before the leaves from the tops of the branches, from buds which are composed of concave downy scales. Corollas purple.

_Var. β, atraiirens** (Ker. bot. reg. t. 194.) evergreen; leaves deep and shining above. _FLOWERS_ Native of Siberia. Sims, bot. mag. 1888.

**Sect. V. Chamecistus** (from χάμης, chamai, on the ground; and _cistus_, the rock-rose: plants with the habit of species of Helianthemum). Limb of calyx foliaceous, 5-cleft. Corolla rotate. Stamens 10. Ovary 5-celled.—Leaves small, membranous, evergreen.

26. **R. Chamecistus** (Lin. spec. 562.) leaves oblong-lanceolate, attenuated at both ends, stiffish, glandularly ciliated; peduncles usually twin, and are as well as the calyxes beset with glandular hairs. _FLOWERS_ Native of the Alps of Europe; as of Austria, Carniola, Mount Baldo, and near Salzburg; and in Eastern Siberia. Jacq. fl. austr. 3. t. 217. Curt. bot. mag. t. 488. Lodd. bot. cab. 1491.—Mich. gen. 225. t. 106.—Plank. phyt. t. 25. f. 4. Corollas rotate, pale purple. A dwarf tufted shrub, with small leaves, about the size of those of a species of _Helianthemum._

**Sect. VI. Tsutsutsi** (the Chinese name of the first species). Limb of calyx foliaceous, 5-cleft. Corolla campanulate. Stamens 5-10. Ovary 5-celled.—Leaves membranous, evergreen, hispid from pili.

27. **R. Indericum** (Fl. gard. n. s. 128.) branches strigose; leaves cuneate-lanceolate, finely crenulately, strigose, attenuated at both ends; calycine teeth long-lanceolate, obtuse, ciliated, spreading; flowers terminal, solitary or twin, deciduous. _FLOWERS_ Native of China. Much cultivated in Japan for the sake of its elegant flowers. Azalea Indica, Lin. spec. 214. Thurb. jsp. 84. Sims, bot. mag. 1480. Lodd. bot. cab. 275.—Herm. lugdub. 152. t. 153. Tsut-sutsi, Kœmpf. amoen. 814. t. 146. Flowers showy, scarlet or red.

_Var. β, pulechrum** (Fl. gard. n. s. 117.) calyx very hairy, with subulate segments; leaves elliptic, acute; flowers deciduous, terminal, 2-3 together. _FLOWERS_ A hybrid between _R. Indericum_, impregnated by the pollen of _R. Indicum_. R. Indicum, var. γ, Smithii, Sweet, Hort. brit. 2. p. 348. Corollas large, of a deep rosy purple, spotted with deep red inside.

_Var. γ, ignéscens** (Sweet, fl. gard. n. s. 128.) The four lower segments of the corolla flame-coloured, and the superior one liliac, and obscurely dotted. _FLOWERS_ Native of China.
Var. \(\varepsilon\), aurantiacum; flowers of orange-red colour. \(\varepsilon\). G. Native of China.

Var. \(\gamma\), latum (Sweet, l. c.) flowers double, yellow.

Var. \(\delta\), variegatum (Blum. bijdr. 851.) leaves obvate, covered with white strigose bristles; flowers rose-coloured, variegated with white, \(\varepsilon\). G. Native of China.

Var. \(\eta\), spatulatum (Blum. bijdr. 852.) leaves spatulate, mucronate, beset with rusty stigae; flowers rose-coloured. \(\varepsilon\). G. Native of China and Japan.

28 R. \(\zeta\), scabra; leaves ovate, mucronulate, acute at the base, ribbed beneath, beset with adpressed bristles, as well as the branchlets and peduncles; flowers deciduous; filaments papillate; anthers coriaceous at the base; stigma dilated. G. Native of Japan, in woods on mountains. R. maximum. Thumb. fl. jap. p. 181. Flowers deep rose-coloured, campanulate, usually twin. Lobes of corolla oblong, obtuse, twice longer than the tube. Stamens exerted. Calyx segments oval, obuse, ciliolate. Leaves \(1\frac{1}{2}\) to 3 inches long, coriaceous. Corolla 5 inches in diameter.

Sect. FOURTH. Rhododendron. Shrub.

29 R. \(\kappa\), macranthum; leaves opposite or 3 in a whorl, obvate or lanceolate, mucronulate, shining, clothed with adpressed bristles; flowers pentandrous; calyces segments lanceolate, acute, deeply toothed, bristly; filaments glabrous. G. Native of Japan. Azalea macranthum, Bunge, in mem. acad. petersb. 2. p. 115. R. niten, D. Don, MSS. Stems several, rising from the rootstock, 2-4 feet long, procumbent, naked. Branches fascicled, leafy at the tips, beset with adpressed silvery bristles, which change to brown, as well as the calyces. Flowers solitary or in pairs, nearly sessile, involucrated by bracteas. Corollas large, of a brilliant salmon-colour, glabrous outside; the limb spreading with oblong blunt lobes; the upper lobes marked with deeper coloured spots. There is a variety of this species, having the flowers pale pink and striped.

Large-flowered Rhododendron. Fl. May, June. CIt. 1833. Shrub procumbent, 2 to 3 feet.

30 R. \(\lambda\), reticulatum (D. Don, MSS.) leaves broadly ovate, acute, rather coriaceous, sparingly hairy, glaucous and reticulated veined beneath. G. Native of Japan, on the mountains, and has been lately introduced by Mr. Knight, of King's Road, Chelsea. Stems erect, a foot or 3 feet high, stiff. Leaves stiff, \(1\frac{1}{2}\) inch long, rounded at the base, bright green and shining above, beset with a few adpressed bristles as well as the young shoots. Flowers not seen.

31 R. \(\mu\), farkei (Tate, in Sweet. fl. gard. n. s. t. 95.) branches stiff, villous while young, but glabrous in the adult state; leaves stiff, coriaceous, ovate, obtuse, ending in a short cartilaginous mucrone, attenuated at the base, nerved and reticulately veined, hairy on both surfaces, with somewhat recurved ciliated edges; petioles ciliated at the base; flowers terminal, solitary. G. Native of China, from whence it was brought by Capt. Farrer. Calyx pilose, 5-lobed. Corolla spreading, with undulated segments, lilac or pale purple-red. A dwarf deciduous shrub. Flowers deciduous.

32 R. \(\nu\), phoeniceum; hairy; leaves oblong-ovate, tapering into the petioles at the base; flowers collected at the tops of the branches, large, deciduous; stamens short; calyx erect, glan-

Var. \(\psi\), flore pleno (Hook. bot. mag. 2509.) flowers double, purple. Lodd. bot. cab. 1461.

Purple Rhododendron. Fl. May. Cit. 1824. Shrub 3 to 10 feet.

33 R. \(\chi\), lepidophyllum; the whole shrub is hairy; leaves-elliptico-
lanceolate, opaque; flowers by threes at the extremity of the branches, deciduous; calyx erect, glanular and viscid; stamens unequal. G. Native of China, about Pekin. Azalea lepidophyllum, Hook. bot. mag. 2901. Azalea Indica, var. alba, Lindl. bot. reg. t. 811. Lodd. bot. cab. 1253. Rhod. leucan-

thum, Bunge, in mem. acad. petersb. 2. p. 115. Flowers showy, pure white.

34 R. macranthum; much branched; branches pilose; leaves cuneate-oblong, mucronate, clothed with clamyh hairs; flowers in fascicles; calyces segments long-acuminate, pilose; flowers octandrous and deciduous. G. Native of China. Flowers white. Azalea macrantha, Blum. bijdr. p. 853.—Perhaps the same as R. lepidophyllum.

Macronate-leaved Rhododendron. Shrub.

35 R. \(\upsilon\), serrulatum; leaves linear-lanceolate, long-acuminate, with recurved margins, clothed with silky villi on both surfaces. G. Native of Japan. Azalea rosmanifolia, Blum. ex Blum. bijdr. p. 853, but not of Roth. Flowers petandrous.

Burmann's Rhododendron. Shrub.

36 R. \(\upsilon\), mollis; branches pilose; leaves oblong-lanceolate, acute, narrowed at the base, ciliolate, very soft beneath; flowers in fascicles; calyx very short; tube clothed with silky tomen-

Soft Rhododendron. Shrub.

37 R. \(\upsilon\), lourieri; leaves lanceolate, quite entire, rugose about the edges smooth; corolla white, dotted with red, as also the calyx, anthers, and germs. G. Native of Cochinchina. Azalea punctata, Lour. coch. p. 113. Flowers disposed in terminal heads.

Loureiro's Rhododendron. Shrub.

38 R. \(\upsilon\), decumens (D. Don, MSS.) stems decumbent; leaves ovate, acute; flowers petandrous; segments of the calyx ovate, acute, ciliate. G. Native of China, from whence it has been lately introduced by Knight and Tate. Flowers crimson.

39 R. \(\upsilon\), sinense (Sweet, fl. gard. 290.) leaves slowly deciduous, elliptic, acutish, pilosely pubescent, feather-nerved, with ciliated margins, canescent beneath; corollas downy; stamens equal in length to the limb of the corolla. G. Native of China. Azalea Sinensis, Lodd. bot. cab. 855. Flowers flame-coloured, pentandrous.

Var. \(\beta\), flavescens (Sweet, fl. gard. 290.) flowers yellow.

Sect. VII. Pentanthera (from \(\varphi\), pente, five; and \(\alpha\), anthera, an anther; flowers pentandrous). Limb of calyx short, 5-lobed. Corolla funnel-shaped. Stamens 5. Ovarium 5-celled. Leaves deciduous.
40. R. flavum; flowers leafy, clanny; leaves ovate, oblong, pilose, ciliated; corolla funnel-shaped; stamens very long. H. Native of the Levant, at Pontus; Caucasus, Turkey, &c. Azalea Pónica, Lin. spec. 1669. Curt. bot. mag. t. 453. Azalea arborescens, Lin. spec. ed. 1. p. 150.—Buxb. cent. 5. p. 36. t. 69. Flowers fine yellow. Leaves shining. There are a great number of varieties of this species in the gardens, differing principally in the colour of the flowers, and the hue of the leaves. The flowers are of all shades, from yellow to copper or orange-colour. They are sometimes white, (see Sims, bot. mag. 2983.), and are sometimes striped with yellow and red.

**Yellow-flowered Rhododendron.** Fl. May, June. Clt. 1793.

Shrub 4 to 6 feet.

41. R. nudiflorum (Torr. fl. un. st. 1. p. 140.) leaves lanceolate-oblong, nearly smooth and green on both surfaces, ciliated on the margins, having the mid-rib bristly beneath, and woolly above; flowers rather naked, not clanny; tube of corolla longer than the divisions; teeth of calyx short, rather rounded; stamens much exerted. H. Native from Canada to Georgia, on the sides of hills. Azalea nudiflora, Lin. spec. 214. Azalea periclymenoides, Michx. fl. bor. amer. 1. p. 151. This beautiful shrub has a great many varieties, besides those mentioned below, for which see Loud. hort. brit. p. 66 and supplement, among which is one with double flowers. Flowers scarlet, pink, white, striped, variegated, red, purple, &c., disposed in terminal clustered racemes, appearing before the leaves. The variety *prostrata* clearly shows that *Azalea* and *Rhododendron* are not genetically distinct.

**Var. prostrata** (Ait. c.) flowers white; calyx middle-sized. H. Ait. l. c.

**Var. papilionaceum** (Pursh, l. c.) flowers reddish, with the lower segment white; calyx foliaceous. H. Ait. l. c.

**Var. prostrata** (Pursh, l. c.) flowers pale red, 5-parted even to the base. H. Ait. l. c.

**Var. prostrata hort.** (Ait. c.) branches tomentose downy; leaves evergreen or deciduous, oblong, acute, downy while young, but glabrous in the adult state, and recurved at the apex; tube of corolla a little shorter than the segments. H. A hybrid, raised from the seed of *R. nudiflorum*, impregnated by the pollen of a hybrid raised between *R. Ponticum* and *R. Canadense*. Flowers delicate light purple, disposed in terminal racemose corymbs. R. Govenium, Sweet, fl. gard. 3. t. 263.

**Var. rubrum** (Lodd. bot. cab. t. 51.) flowers red. H. Native near Philadelphia.

**Naked-flowered Rhododendron.** Fl. April, June. Clt. 1734.

Shrub 3 to 4 feet.

42. R. viscosum (Torr. l. c.) leaves oblong-obovate, acute, smooth and green on both surfaces, ciliated on the margins, having the mid-rib bristly; flowers clanny, leafy, hairy; tube of corolla as long as the segments; teeth of calyx short, rounded; stamens hardly longer than the corolla. H. Native from Canada to Georgia, in swamps and shady woods. Azalea vicosá, Lin. spec. 214.—Plit. alm. 106. t. 161. f. 4. Catesb. car. 1. t. 57. Flowers white, sweet-scented, in terminal clusters, downy. There are a great number of varieties of this species, see Loud. hort. brit. p. 66., varying in the colour of the flowers, and otherwise. The flowers are white and red, and variegated with these colours. There is a downy variety with red flowers figured in Lodd. bot. cab. t. 441.

Var. ornatum (Sweet, fl. gard. n. s. 137.). A hybrid raised from the seed of *R. viscosum* rubescens, fertilized by the pollen of *R. Ponticum*.

Shrub 2 to 4 feet.

43. R. calendulaeaceum (Torr. l. c.) leaves oblong, pubescent on both surfaces, at length hairy; flowers large, not clanny, rather naked; teeth of calyx oblong; tube of corolla hairy, shorter than the segments. H. Native from Pennsylvania to Carolina. Azalea calendulaeae, Michx. fl. bor. amer. 1. p. 156. Lodd. bot. cab. 1394. A nudiflora, var. coerulea, Ait. hort. kew. 310. Flowers yellow, red, orange-coloured, and copper-coloured. Sims, bot. mag. 172. Lodd. bot. cab. 1394. or flame-coloured. Ker. bot. reg. 145. Said to be the handsomest shrub in North America. There are a great many varieties of it, varying in the colour of the flowers. See Loud. hort. brit. p. 66.

**Var. spectabile.** (Sweet, fl. gard. n. s. t. 10.) A hybrid between *R. calendulaeaceum* and one of the red varieties of *R. nudiflorum*. There are also two kinds of this; one with a flesh-coloured corolla, having the upper segment orange-coloured, edged with flesh-colour, called *R. Morterii carnea*; and another called *R. Morterii*, var. praeclara, with pale copper-coloured flowers, tinged with blush.

**Marygold Rhododendron.** Fl. May, June. Clt. 1806.

Shrub 2 to 6 feet.

44. R. arboreum (Torr. l. c.) leaves obovate, rather obtuse, smooth on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib almost smooth; flowers not clanny, leafy; tube of corolla longer than the segments; calyx leafy, with the segments oblong and acute; filaments exerted. H. Native of Pennsylvania, on the sides of rivulets near the Blue Mountains. Azalea arboreum, Pursh, fl. amer. sept. 1. p. 153. Flowers large, reddish; leaves of flower-buds large, yellowish brown, surrounded with a fringed white border.

**Arborescent Rhododendron.** Fl. May, July. Clt. 1818.

Shrub 10 to 20 feet.

45. R. nittidum (Torr. l. c.) branches smoothish; leaves oblongate, rather mucronate, coriaceous, smooth on both surfaces, shining above, having the nerve bristly beneath, with revolute ciliated margins; flowers clanny, leafy; tube of corolla a little longer than the segments; calyx very short; filaments exerted. H. Native from New York to Virginia, in deep mossy swamps on the mountains. Azalea nittida, Pursh, fl. amer. sept. 1. p. 153. Ker. bot. reg. 414. Flowers white, tinged with red. Leaves dark green, shining, smaller than any other species of the present section.

**Shining-leaved Rhododendron.** Fl. June, July. Clt. 1812.

Shrub 2 to 4 feet.

46. R. hispidum (Torr. l. c.) branches straight, very hispid; leaves long-lanceolate, hispid above, and smooth beneath, glaucous on both surfaces, ciliated on the margins, having the nerve bristly beneath; flowers very clanny, leafy; tube of corolla wide, scarcely longer than the segments; teeth of calyx oblong, rounded; filaments exerted. H. Native of New York and Pennsylvania, on the borders of lakes on the highest part of the Blue Mountains. Azalea hispida, Pursh, fl. amer. sept. 1. p. 154. Wats. dendr. brit. 6. Azalea viscosa, var. glauca, Ait. hort. kew. 1. p. 310. Flowers white, with a red border, and a tinge of red on the tube, which makes them appear to be of a rose-colour before expansion. Stamens sometimes 10. This species may be distinguished from the rest of the present section by its bluish appearance.

Shrub 10 to 15 feet.

47. R. vicicola; leaves oblong, clothed on both surfaces with fine hoary pubescence, not bristly on the nerve; flowers small,
not clammy, naked; tube of corolla hardly longer than the segments; calyxes very short: having one of the segments linear, and 4 times longer than the rest; filaments exerted; branches hispid. \( \varphi \). H. Native of Carolina and Georgia, on barren sandy hills. Azalea bicolor, Pursh, fl. amer. sept. 1. p. 153. Azalea nudiflora, var. bicolor, Ait. Hort. kew. 1. p. 319.—Trew. chret. t. 48. Flowers slender and smaller than the rest, of a pale rose-colour, or nearly white, with a deep red-coloured tube.

48 R. glauc'æum; branches hispid; leaves oblongate, acute, glabrous on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib bristly; flowers very clammy, leafy: tube of corolla twice longer than the segments; calyx very short; filaments about equal in length to the segments of the corolla. \( \varphi \). H. Native from New England to Virginia, in swamps of a clayey soil. Azalea glauca, Pursh, fl. amer. sept. 1. p. 154. Lam. ill. p. 493. Wats. dendr. brit. 5. Azalea virid'cosa, var. floribunda, Ait. Hort. kew. 1. p. 319. Flowers white, very fragrant. The shrub is dwarfer than other species of the present section, and flowers in great abundance. Nutall considers this as only a variety of \( A. \) virid'cosa, differing in nothing but in the under sides of the leaves being glaucous.

49 R. can'escens; leaves ovate-oblong, downy above, and tomentose beneath, not bristly on the middle nerve; flowers not clammy, nearly naked; tube of corolla hardly shorter than the segments; teeth of calyx very short, rounded, obtuse; stamens hardly exerted. \( \varphi \). H. Native of Lower Carolina, on the banks of rivers; and of Virginia, on the mountains of the Cacapoop Springs, near Winchester. Azalea canescens, Michx. fl. bor. amer. 1. p. 150. Wats. dendr. brit. 116. Flowers rose-coloured.

50 R. spec'içùm; branches hairy; leaves lanceolate, ciliatet, acute at both ends; calyx pubescent; corolla silky, with obtuse, ciliatet, lanceolate, undulate segments; stamens exerted. \( \varphi \). H. Native of North America. Azalea speciosa, Willd. enum. p. 10. Lodg. bot. cab. 624. Wats. dendr. brit. 116. A coc'china, Lodg. Flowers scarlet and orange-coloured. There are several varieties of this species, varying in the shape of the leaves and the colour of the flowers; see Loud. hort. brit. p. 66. Lodg. bot. cab. 1255.

Showy Rhododendron. Fl. May, June. Ct.? Shrub 3 to 4 feet.

Sect. VIII. Rhodôra (from \( \text{'pòvov, rhôdon, a rose; colour of flowers.} \) Limb of calyx 5-toothed. Corolla bilabiata; upper lip broadest, and 2-3-foet; lower one bidentate. Stamens 10. Capsule 5-celled, 5-valved.—Leaves deciduous. Habit of last section.

Cult. Of all the genera in existence, Rhodôdendron comprises the most handsome, elegant, and showy shrubs, well fitted for adorning shrubberies, or to be grown singly on lawns. All the species grow best in peat soil, or very sandy loam, or vegetable mould; they are either increased by layers or by seeds. When raised in the latter way, the seeds must be sown early in the spring, in flat pans or pots, filled with peat earth, and covered very slightly; the pots or pans should then be set in a close frame, or at the front of a hot-house, till the plants come up, watering them very slightly when dry; and as soon as the seedlings have grown high enough to be laid hold of, they should be planted out into other pans or pots, filled with the same kind of mould; after which they may stand in a close frame for a few days, until they have struck fresh roots, and afterwards hardened to the air by degrees. The smaller kinds of Rhodôdendron may be propagated freely by cuttings, taken off from young wood, and planted in sand, placing a bell-glass over them. There are now in the gardens a great many hybrid kinds of Rhodôdendron, and are still increasing in number; some of which outvie the species in splendour. The species natives of Nipaul, China, and Japan, in mild winters, would probably succeed in the open air, but they will not survive a severe winter without protection; they are therefore best kept in pots, and placed among other greenhouse or frame plants. \( R. \) arbôreum and \( R. \) album are among the most showy of the species, and are well adapted for conservatories, or to be placed in large tubs in the greenhouse. Young cuttings of the tender kinds, if torn off close to the stem, and planted in a pot of sand, will strike root readily; the pot should be plunged in heat under a hard-glass.

XLIV. VIREYA (named by Blume after M. Virey, a French physician). Blum. bijdr. p. 854.

Lin. syst. Decândria, Monogynía. Calyx small, obsolesc 5-toothed. Corolla subcampanulate, or funnel-shaped, regular, 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calycine disk; alternate filaments the shortest; anthers oblong, bursting inwardly, naked, dehiscing by two pores at the apex. Style filiform; stigma capitata, 5-furrowed. Capsule silique-formed, 5-angled, 5-celled. Placenta 5-lobet. Seeds numerous, expanded into a bristle-formedawn at both ends.—This genus differs from Rhodôdendron in the calyx being small, and in the stamens not being attached to the corolla in any way.—Mostly parasitical shrubs. Leaves scattered and verticillately, quite entire, coriaceous, covered with scaly dots beneath. Flowers disposed in terminal fascicles.

* Corollas subcampanulate.

1 V. Java'xîca (Blum. bijdr. 854.) leaves oblong-lanceolate, clothed with fine rusty dots beneath; flowers showy, deep orange. \( \varphi \). G. Native of Java, at the foot of Mount Salak, where it is called by the natives Gaga Mirha. Fl. \( \beta \); flowers citron-coloured, smaller. Java Vireya. Fl. Year. Shrub.

2 V. \( \alpha' \)îla (Blum. bijdr. 855.) leaves lanceolate, densely clothed with rusty scales beneath: flowers white, middle-sized. \( \varphi \). G. Native of Java, on Mount Salak, parasitical upon trees. Rhodôdendron album, Blum. cat. hort. buitenz. p. 72. White-flowered Vireya. Fl. Year. Shrub.

* * Corollas funnel-shaped.

3 V. tubifîôra (Blum. bijdr. p. 855.) leaves lanceolate, densely clothed with rusty dot-like scales beneath; flowers scarlet. \( \varphi \). G. Native of Java, on the higher mountains. Tube-flowered Vireya. Fl. Year. Shrub.

4 V. Celeb'esca (Blum. l. c.) leaves broad, lanceolate, clothed with rusty dot-like scales beneath; flowers scarlet. \( \varphi \). G. Native of the Celebes, in mountain woods. Celebes Vireya. Fl. Year. Shrub.

5 V. ret'u'ra (Blum. bijdr. p. 856.) leaves spathulate, retuse, with recurved margins, beset with rusty dots beneath; branches
ERICACEÆ. XLV. BEJARIA. XLVI. HYMENANTHES.

849

rough; flowers scarlet.  G. Native of the west of Java, on high mountains.

"Retuse-leaved" Vireya. Fl. Year. Shrub.

Cult. For culture and propagation, see Agarista, p. 838.

Lin. syst. Dodecándria, Monogynía. Calyx deeply 7-cleft. Corolla so deeply 7-cleft as to appear of 7 petals, spreading. Stamens 14, hypogynous; anthers obverse or pendulous, awnless. Ovarium free, 7-furrowed. Style elongated; stigma depressedly capitate, 7-furrowed. Capsule depressedly globose, girded by the permanent calyx, and terminated by the style, 7-celled, 7-valved, with a septical dehiscence; cells many-seeded.

—Elegant alpine shrubs; with scattered, crowded, quite entire, coriaceous leaves; racemos or corymbos, bracteate flowers. Corollas usually purple.

1 B. Resinosó (Mutis, amer. 1. t. 8. Lin. syst. 443. suppl. 246.) branches downy; leaves ovate, smooth; corymb terminal, simple; pedicles downy; corollas resinous and viscid; filaments downy near the base.  G. Native of New Granada. Branches proliferous. Leaves an inch long. Corollas purple.

Resinosó-flowered Bejaria. Shrub 3 to 5 feet.

3 B. Glauca (Humb. et Bonpl. pl. aequin. 2. p. 118. t. 177.) glabrous; leaves oblong, obtuse, glaucous beneath; racemes terminal and axillary; pedicles somewhat fastigiate.  G. Native of South America, in the alpine region of the province of Venezuela, near the top of Silla de Caracas. Shrub much branched; branches angular. Corolla flesh-coloured, glabrous; filaments glabrous.

4 B. Coarctáta (Humb. et Bonpl. pl. aequin. 2. p. 125. t. 121.) branches clothed with pubescent tomentum; leaves oblong, glabrous, glaucous beneath; corymb terminal, simple; peduncles, pedicels, rachi, and calyces clothed with rusty tomentum.  G. Native of Peru, in cold places near the city of Caxamarcá. Shrub much branched. Flowers purple. Filaments glabrous, but dilated and pubescent at the base.

Coarctató-corymbos Bejaria. Shrub 4 to 5 feet.

5 B. Grandifóra (Humb. et Bonpl. pl. aequin. 2. p. 122. t. 119.) leaves ovate, glabrous above, but clothed with rusty tomentum beneath, as well as the pedicels, pedicels, rachi, calyces, and branchlets; corymb terminal, branched a little, many-flowered.  G. Native of the province of Quito, in cold places between Luxá and Oná, in Paramo de Saraguri; and near Alto de Pulía, and Víncuca. Shrub much branched; branches subverticillate. Corollas purple, about the size of those of Dictamnus albus. Filaments glabrous, but dilated and ciliated at the base.

Great-flowered Bejaria. Shrub 3 to 4 feet.

6 B. Estuans (Mutis, in Lin. fl. suppl. 247. mant. 242. Humb. et Bonpl. pl. aequin. 2. p. 120. t. 118.) leaves elliptic, rather glabrous above, but downy and glaucous beneath, while young clothed with rusty tomentum, and ciliated with glands; coryps terminal, simple; peduncles, pedicels, rachi, calyces, and branchlets clothed with clammy glandular hairs.  G. Native of New Granada, near Gonzanama. Much branched; branchlets subverticillate. Flowers smaller than those of the preceding, purple. Filaments villous at the base.

Heating Bejaria. Shrub 10 to 15 feet.

7 B. Lepidófora (Humb. et Bonpl. pl. aequin. 2. p. 124. t. 120.) leaves oblong, somewhat mucronate, with revolute edges, glaucous beneath, beset with glandular hairs on both surfaces along the middle nerve; racemes terminal; peduncles, pedicels, rachi, branchlets, and calyces clothed with clammy glandular hairs.  G. Native of South America, on the top of Silla de Caracas. Shrub much branched; branchlets purplish. Flowers about the size of those of B. glauca, purple.

Lem-leafed Bejaria. Shrub 3 to 4 feet.

8 B. Caxamarcaénsis (H. B. et Kunth, nov. gen. amer. 3. p. 294.) branchlets pilose; leaves oblong, glabrous above, pubescently hairy and glaucous beneath; corymb terminal, simple; peduncles, pedicels, and rachi, clothed with rusty pilose tomentum; calyces hairy.  G. Native of Peru, on the Andes, about Caxamarcá. A much-branched shrub. Flowers size of those of the preceding, purple; petals narrow.

Caxamarcá Bejaria. Shrub 3 to 4 feet.

9 B. Lanceolóta (Ruiz et Pav. fl. per. 4. t. 1513. f. b.) branches and racemes hairy; leaves ovate-lanceolate; corymbs simple, racemose; pedicels short.  G. Native of Peru, on the high hills of Rodos Pillao and Huassa-Huassi, where it is called Rosa-Rosa, or Rosa Huaygutta. Acúnna lanceoláta, Ruiz et Pav. syst. p. 124. Flowers purple or rose-coloured.

10 B. Oblónga (Ruiz et Pav. fl. per. 4. t. 1513. f. a.) leaves oblong, with revolute margins; flowers corymbose; pedicels long.  G. Native of Peru, in the province of Tarma, at Churupalána, and of Panatallahu, at Acomaya and Macora, where it is called Rosa-Rosa, from the copious rose-coloured flowers. Acúnna oblíonga, Ruiz et Pav. syst. p. 123. Flowers purple or rose-coloured. Branches, petioles, and corymb downy. Coryps compound.

Oblóng-leaveded Bejaria. Shrub 4 to 5 feet.

Cult. For culture and propagation see Agarista, p. 838. Extremely elegant plants, with the habit of some species of Rhododendron, and are therefore well worth the cultivator’s care.

XLVI. HYMENANTHES (from ἱμήν, hymen, a membrane; and ἀνθός, anthos, a flower; in reference to the thin corollas). Blum. bijdr. 862.

Lin. syst. Dodecándria, Monogynía. Calyx small, obliquely denticulate. Corolla campanulate, with a short compressed tube, and a 7-parted limb; segments of the limb imbricated. Stamens 14, hypogynous: alternate ones shortest. Anthers fixed by the back, mutic, opening by 2 pores at the apex. Ovarium free, girded by a nectariferous tumid margin at the base. Style long; stigma obtuse, 7-crenated. Capsule oblong, 7-celled, 7-valved, many-seeded.—Nearly allied to Bejaria, but differs from it in the small calyx and monopetalous corolla.

1 H. Japónica (Blum. l. c.) shrub a little branched; leaves subverticillate, 3 to 4 in a whorl, petiolate, oblong, acutish, narrow at the base, quite entire, coriaceous, glabrous, reticulated above, veinless and yellowish beneath; flowers disposed in dense, terminal, bracteate spikes.  G. Native of Japan, from whence it was received by Blume under the name of Rhodódenron máxima.

Japan Hymenanthes. Shrub.

Cult. For culture and propagation see Agarista, p. 838.

Linn. syst. Decândria, Monogynia. Calyx 5-parted. Corolla salver-shaped; under side of limb producing 10 cornute proteruberances, and as many cavities on the upper side, in which the anthers lie, or are concealed. Capsule 5-celled, many-seeded; dissections marginal.—Evergreen shrubs, with alternate or ternately verticillate leaves. Flowers disposed in terminal, racemose, compound corymb; but in one species the flowers are solitary and axillary. Pedicels long, 1-flowered, trichotomous at the base; external bracteate originating from the rachis. Buds naked. Anthers opening by two oblique truncate pores.—This genus is considered poisonous, and is often fatal to cattle.

1 K. latifolia (Lin. spec. 560.) leaves on long petiolo, scattered, or 3 in a whorl, oval, coriaceous, smooth and green on both surfaces; corollas terminal, downy, and viscid. \( ^{3} \). H. Native from Canada to Carolina, on the sides of stormy hills. Curt. bot. mag. 175. Bigel. med. bot. p. 193. Wangh. amer. t. 25. f. 50.—Catesb. car. 2. t. 98.—Trew. fl. t. 38. f. 1.—Pluk. mant. t. 379. f. 6. A very elegant shrub when in flower; in America it is called Laurel, and on the mountains Calico-bush. Flowers red. It is not improbable that the deleterious honey in Philadelphia might have been collected by the bees from the flowers of the Calico-bush, which in some places pervades, in rocky woods and depressed summits of mountains, almost in a similar manner with Calliuna vulgaris of Europe.

2 K. angustifolia (Lin. spec. 561.) leaves petioloate, scattered, or 3 in a whorl, oblong, obtuse, rather rusty beneath; corollas lateral; bracteas linear; peduncles and calyces clothed with glandular pubescence. \( ^{3} \). H. Native from Canada to Carolina, in bogs, swamps, and sometimes in dry mountain lands. Curt. bot. mag. 321. Lodd. bot. cab. 502.—Catesb. car. 2. t. 17. f. 1.—Trew. ehrh. t. 38. f. 2. Flowers dark red. The plant is known by the name of Sheep Laurel in North America, being considered very poisonous when fed upon by sheep. There are several varieties of this species besides the one mentioned, differing in the size of parts, and in the deeper and lighter shade of the corolla. See Loud. hort. brit. p. 171.

Var. \( ^{3} \). ovata (Pursh, fl. amer. sept. 1. p. 296.) leaves broader; stem taller. \( ^{3} \). H. Native of New Jersey, on the mountains.

3 K. glauca (Ait. hort. kew. ed. 2. p. 64.) branchlets 2-edged or triquetrous; leaves opposite, on short petiolo, oblong, smooth, glaucous beneath, with revolute edges; corollas terminal, compound, bracteate; pedicels and calyces glabrous. \( ^{3} \). H. Native of Kogs in Canada; and on the borders of mountain lakes of New York and Pennsylvania; and of the Island of Sichua. Curt. bot. mag. 177. Lam. ill. t. 363. Lher. strip. nov. 2. t. 9. Lodd. bot. cab. 1508. K. polifolia, Wangh. act. soc. heral. 8. p. 129. t. 5. A very handsome upright small shrub, with pale red flowers. According to Nuttall, the flowers are disposed in terminal compound corollas, each corollas composed of 3 raceme corollacymbules; and the pedicels and calyces are said by him to be clothed with powdery viscid pubescence.

Var. \( ^{3} \). rosmarinifolia (Pursh, fl. amer. sept. 1. p. 296.) leaves linear, more revolute on the margins, and having under the surface green. \( ^{3} \). H. Mr. Pursh discovered this species in a bog near Albany, and is inclined to think it a distinct species.

4 K. cuneata (Michx. fl. bor. amer. 1. p. 257.) leaves scattered, sessile, cuneate-oblong, glandularly pubescent beneath, minutely awned at the apex; corollas terminal, corymbosus; peduncles axillary, solitary, 1-flowered, longer than the leaves. \( ^{3} \). H. Native of Carolina, on the mountains. Branches twiggy. Leaves deciduous. Flowers white, red at the bottom, disposed in sessile, lateral, fastigate clusters.

5 K. thuruta (Walt. fl. carol. 138. Michx. fl. bor. amer. 1. p. 257. Curt. bot. mag. 138.) branches, leaves, and calyxes very hairy; leaves opposite and alternate, almost sessile, elliptic; peduncles axillary, solitary, 1-flowered, longer than the leaves. \( ^{3} \). H. Native of South Carolina and Georgia, in barren pine-woods. K. ciliata, Bartr. f. 18. 19. A beautiful little shrub, but difficult to cultivate. Leaves small, like thyme. Flowers large, red.

Cult. Handsome shrubs when in blossom. They grow best in peat soil, and are increased either by layers or by seeds. When raised by seeds, they are reared and otherwise treated in the manner recommended for Rhododendron, which see, p. 848.

1 M. flabriovia (Smith, icon. inn. 1. p. 56. t. 55.) corolla urceolate, with rounded lobes; leaves and branches hairy. \( ^{3} \). H. Native of the north-west coast of America, particularly on the Columbia River; and of the Island of Stichua. Lam. ill. t. 255. M. urceolæ, Salisb. par. lond. no. 44. Leaves ovato-lanceolate. Flowers of a rust-colour.

Three-flowered Menzie'sia. Shrub tall.

Cult. For culture and propagation see Azalea, p. 851.

XLIX. AZALEA (from azaiaes, azaleos, dry, arid; habita-

Lin. syst. Pentändria, Monogény. Calyx 5-parted. Corolla short, campanulate, 5-cleft. Stamens 5, equal, shorter than the corolla; cells of anthers opening by a terminal pore. Style straight, inclosed. Capsule 5-celled: with 5 cloven-pointed valves, whose inflexed edges form the double partitions.—A small, evergreen, glabrous, procumbent shrub, with the habit of *Thyme*. Leaves opposite, small, elliptic, glabrous, with revolute margins. Flowers pedicellate, rising in fascicles from the axils of the upper leaves, small, red.

Cult. This small shrub grows well in a peat border, or in pots in sandy peat earth; it is easily increased by layers or by seeds.

Cult. For culture and propagation see Lédum below.

L. LÉDUM (λέδος, ledon, was a name applied by the ancients to a plant producing the substance called Ludanum, and now known by the name of Cistus Lédum; in foliage, the Lédum of modern botanists agrees with the plant of the ancients). Lin. gen. 546. Gært. fruct. 2. p. 145 t. 112. Juss. gen. 159. Nutt. gen. amer. 1. p. 275.

—Dwarf evergreen shrubs. Leaves coriaceous, with revolute margins, and tomentose on the under surface. Flowers white, disposed in terminal corymes; pedicels bracteate at the base. Shrubs exhaling a peculiar scent when bruised.

1 L. *palus* (Lin. spec. 561.), leaves linear, with revolute margins, clothed with rusty tomentum beneath; stamens 10, longer than the corolla. H. Native of Canada, in swamps, and round the mountain lakes of New York; in Kotzebue's Sound, &c.; also of the north of Europe, as of Denmark, Silesia, &c. Oed. fl. dan. 1031. Duh. arb. 1. t. 67. Schmidt, arb. 163. Lodd. bot. cab. 560. Lédum Silesiacum, Clus. pan. 68. Rosmarinum sylvestre, Cam. epît. 546. Flowers white. Leaves resembling those of *Rosmary*.

2 L. LATBFÖLJUM (Ait. hort. kew. 2. p. 65.) leaves linear-oblong, with replicate margins, clothed with rusty tomentum beneath; stamens 5, about the length of the corolla. H. Native of Canada, in sphagnum swamps; Greenland, Labrador, Newfoundland, Hudson's Bay. This or the preceding species has lately been found in Ireland. Jacq. icon. 5. t. 1464. Schmidt, arb. t. 164. Lam. ill. t. 363. f. 1. Lodd. bot. cab. 534. L. Greenländicum, Retz, obs. 4. p. 26. Fl. dan. t. 567. L. palustre, Michx. fl. bor. amer. 1. p. 259. Flowers white. A larger and broader leaved shrub than the last; commonly called *Labrador Tea*; and the leaves are said to be a good substitute for it. Bees are very fond of the flowers.

3 L. *canadense* (Lodd. bot. cab. 1049.) leaves ovate petiolate, white beneath; flowers disposed in terminal umbellate corymes, large. H. Native of Canada, in swamps. Flowers white.

Cult. A peat soil, or very sandy loam answers best for the species of this genus; and they are readily increased by layers and seeds. The seeds should be sown, and the seedlings afterwards managed in the manner recommended for *Rhododendron*, p. 848.

Tribe III.

Lin. syst. Octo-Decandria, Monogyny. Calyx 4-5-toothed (f. 142. a.) Corolla urceolate or campanulate (f. 142. b.), or more or less deeply 4-5-cleft; limb reflexed. Stamens 8-10, hypogynous. Anthers 2-horned (f. 142. d.), dehiscent at the summits, and sometimes furnished at the back with 2 spreading spurs or bristles. Style longer than the stamens; stigma obtuse. Berry globose (f. 142. c.), depressed at top, 4-5-celled (f. 142. f.), many-seeded.

—The species of *Vaccinium* are mostly confined to Europe and North America, but are peculiarly abundant in the latter country. They are suffrutescent, shrubby, gemmaceous plants. Bud-scales generally permanent, on the base of the small branches. Leaves alternate, membranous, often beset with resinous dots, either permanent or deciduous. Flowers pedicellate, either solitary, simply racemose, or tufted, drooping, inodorous, generally very elegant, tinted with various shades of red or pink, never blue, scarcely yellowish.

5 q 2
Berries black, purple, bluish, or red, generally eatable, though not always pleasant, nor wholesome in a crude state. The species of this genus were all understood by Linnaeus, who therefore has led all following authors astray. In reviewing the whole, we find something to add, though we have many specimens that are dubious. We are obliged to follow the distribution of Linnaeus, into the evergreen and deciduous species, though some uncertainty must always attend that character respecting species known from dried specimens only.

§ 1. Leaves deciduous.

* Pedicels 1-flowered, usually solitary, rarely twin or fasciculated.

1 V. Myrtillus (Lin. spec. 498.) pedicels solitary, 1-flowered; leaves serrated, ovate, smooth; stem acutely angular, smooth; calyx hardly divided. H. Native on heaths, stony moors, and mountain woods throughout most parts of Europe, especially the more northern; plentiful in Britain. Dr. Sibthorp gathered it on the Bithynian Olympus. It is common on the hills in the Island of Unalaschka. Smith, engl. bot. 456. Fl. dan. 974.—Ger. emac. 1415. Math. valgr. 1. p. 210. Cam. epit. 135. Corolla globose, generally 5-cleft, of a very delicate waxy pink hue. Berries the size of currants, bluish black, covered by a mealy bloom, eaten in tarts or with cream, or made into jellies, in the north and west of England and Scotland. In Devonshire the berries are eaten with clotted cream; in Poland they are ripe in July, and being mixed with wood strawberries, and eaten with new milk, are considered a great delicacy. They may be successfully cultivated in a shady border, in bog earth. The fruit is sometimes sent into Norfolk from Devonshire. The juice of them has been employed to stain paper or linen purple. In autumn the wood game chiefly live upon the product of this shrub. Mr. Menzies brought from the west coast of North America what can scarcely be considered more than a gigantic variety, 7 or 8 feet high, larger in every part, with less distinctly serrated leaves.

Myrtle-like or Common Bilberry, or Bleaberry. Fl. May. Britain. Shrub ½ to 2 feet.

Chamiso's Whortle-berry. Shrub 1 foot.

3 V. ovalifolium (Smith, in Rees' cyclo. no. 2.) pedicels solitary, 1-flowered; leaves elliptic, obtuse, pointless, entire, smooth, strongly veined beneath; stem angular; calyx hardly divided. H. Native of the north-west coast of America, where it was collected by Mr. Menzies; and in the Island of Sitka by Bongard. Branches smooth, less acutely angular than in the foregoing species. Leaves ½ inch long. The flowers seem to agree with those of V. myrtillus in colour and structure, except that the corolla is more ovate. Berries black, crowned, cup-shaped, with a slightly 4-lobed calyx.

Oval-leaved Bilberry. Shrub 10 to 12 feet.

4 V. Parvifolium (Smith, in Rees' cyclo. no. 3.) pedicels solitary, 1-flowered, clavate while bearing the fruit; leaves elliptic, obtuse pointed, entire, smooth, glaucous and slightly veined beneath; stem acutely angular; calyx hardly divided. H. Native of the north-west coast of America, where it was collected by Mr. Menzies; and in the Island of Sitka by Bongard. Branches smooth, as acutely angled as in V. myrtillus. The leaves agree most in shape with V. ovalifolium, but are not a quarter the size, even when full grown. The berries are red, and make excellent tarts. They appear to be smaller than the last, and crowned with a similar calyx.

Small-leaved Bilberry. Shrub 8 to 10 feet.

5 V. Geminiflorum (H. B. et Kunth, nov. gen. amer. 3. p. 267.) flowers axillary, twin, drooping, deciduous; leaves oblong, bluish, crenulated, reticulately veined, rather membranous, glabrous; anthers furnished with 2 awns on the back. F. Native of Mexico, between Omitlan and Moran. Habit and stature of V. myrtillus. Branches angular, downy. Leaves 8-10 lines long, paler beneath. Corolla campanulate, ventricose at the base, with short orovate blunt segments. Filaments membranous, glabrous.

Twin-flowered Whortle-berry. Shrub 1 foot.

6 V. Nitium (Thunb. jap. 155.) pedicels solitary, 1-flowered; leaves ovate, serrated, hairy all over, as well as the young branches. H. Native of Japan, on the hills between Miao and Jedo. Branches terete. Flowers on very short stalks.

Hairy Bilberry. Fl. April. Shrub 2 to 3 feet.

7 V. Ulmo'no'sum (Lin. spec. 499.) pedicels somewhat aggregate, 1-flowered; leaves ovate, entire, smooth; branches terete. H. Native of Sweden, Germany, Siberia, Switzerland, Savoy, Scotland, and the north of England; as well as in the more northern parts of America, and on its west coast; and in the Island of Sitka, on marshy mountain heaths and alpine bogs. Smith, engl. bot. t. 581. Fl. dan. 231. Myrtillus grandis. Baul. hist. 1. p. 518. Taller than the Common Bilberry, and of a more glaucous hue. Leaves glaucous beneath. Flowers flesh-coloured, with 8 long-horned stamens. Berries large, juicy, black, covered with a mealy bloom; they are eatable, but not either very grateful or wholesome. A variety with slightly pointed leaves was published by an apothecary at Berne, in 1787, as V. mucronatum, an imaginary species.

8 V. Calycinum (Smith, in Rees' cyclo. no. 7.) pedicels solitary, 1-flowered; leaves obovate, serrated, smooth, with downy ribs; branches angular; calyceine segments deep, ovate. H. Native of the Sandwich Islands, in woods upon lofty mountains. Leaves ½ inch long, and near an inch wide. Corolla oblong, with 5 angles.

Large-calycized Bilberry. Shrub 2 to 3 feet.

9 V. Angustifolium (Ait. hort. kew. ed. 2. vol. 2. p. 326.) pedicels scattered, mostly solitary, 1-flowered, naked; leaves lanceolate, nearly entire, downy at the ribs and margins. H. Native of Canada, about Hudson's Bay and Labrador. Berries large, bluish black, known by the name of Bluets. V. myrtilloides, Michx. fl. bor. amer. 1. p. 234. Michaux says this species has the habit of V. myrtillus; its leaves being membranous, of a narrow lanceolate form.

Willowy Whortle-berry. Shrub creeping.

11 V. Essef'torum (Michx. fl. bor. amer. 1. p. 234.) flowers
Native corolla. 

**Flowers in sessile tufts.**

12. *V. gale'zans* (Michx. fl. bor. amer. 1. p. 232.) flowers on very short stalks, in sessile tufts; leaves sessile, lanceolate, wedge-shaped, slightly serrated, downy; calyx pointed; corollas ovate, much contracted at the mouth; style prominent. H. Native of Virginia and Carolina, in shady woods and swamps. V. galif'ormis, Smith, in Rees' cyclo. no. 16. Flowers small, yellowish-white. Berries small, globular, black. Michaux describes this shrub as having the aspect of *Myrica Gale*, with slightly downy branches. Leaves varying. The pedicels shorter than the flowers, burst from a bud, composed of numerous crowded scales.

13. V. *tenu*llum (Ait. hort. kew. ed. 2. vol. 2. p. 328.) flowers in dense sessile tufts; leaves nearly sessile, ovate-lanceolate, acuminate, finely serrated, smooth, except the rib and margins; branches angular, with a downy line on each side; calyx of 5, deep, acute segments. H. Native from New England to Virginia, on dry hills, on a gravelly soil. Wats. dendr. brit. 35. V. Pennsylvanicum, Lam. dict. 1. p. 74. Michx. fl. bor. amer. 1. p. 232. A low, very branching shrub. Corollas pale red, or white. Berries large, bluish, extremely sweet, and agreeable to eat. The mountains of Pennsylvania produce an immense variety of this species, in size and shape of the fruit, leaves, and flowers. Leaves sometimes an inch long.

14. V. *ligustrinum* (Michx. fl. bor. amer. 1. p. 283.) flowers nearly sessile, in tufts; leaves nearly sessile, erect, lanceolate, mucronate, finely serrated, veiny, downy; corolla longish, ovate; branches angular. H. Native from Pennsylvania to Virginia, in dry woods; common on the mountains. Pursh, fl. amer. sept. 1. p. 238. exclusive of the syn. of Wild. A straight shrub. Leaves membranous, furnished with conspicuous, often purplish veins. Scales of the flower-buds often purplish. Corollas purplish-red. Berries black. The leaves vary extremely in shape and size. The *V. ligustrinum* of Linnaeus is a nomenity, or rather no *Vaccinium*, according to Smith, being the very same plant with *Lyonia paniculata*.

***Flowers disposed in racemes.***

15. V. *pa'llidum* (Ait. hort. kew. ed. 2. vol. 2. p. 355.) racemes bracteate; corolla cylindrically bell-shaped; leaves ovate, acute, finely serrated. H. Native of North America, from whence it was said to have been sent, in 1772, to Kew Gardens, by Dr. Samuel Martin; but Mr. Pursh never met with it.

16. V. *arbo'reum* (Marsh. in Michx. fl. bor. amer. 1. p. 230.) pedicels axillary and solitary, or terminal and racemose, naked; leaves ovate, acute, with slight glandular serratures, polished above, and rather downy beneath; corollas bell-shaped, acute; stamens the length of the tube. H. Native from North Carolina to Florida, in dry woods on the rocky banks of rivers. V. diffusum, Ait. hort. kew. ed. 2. vol. 2. p. 356. A large shrub, sometimes 20 feet high, very elegant. Corollas white, tinged with red. Berries globular, black, almost dry. Branches terete, downy while young. This species joins the solitary flowered species with the racemose flowered species; the axillary flowers being solitary and pedicellate, and the terminal ones racemose.

17. V. *stamineum* (Lin. spec. 498.) racemes downy, with oval bracteas as long as the flowers; anthers biaristate on the back, twice as long as the spreading bell-shaped corolla; leaves elliptic, acute, entire, glaucous and rather downy beneath. H. Native from New England to Florida. Andr. bot. rep. 263. V. album, Pursh, fl. amer. sept. 1. p. 235. V. elevatum, Banks, herb. Lod. cat.—Pluck. mant. 22. phyto. t. 329. f. 3. Trunk 2 feet high, with numerous green branches, which are downy while young. Leaves 1½ or 2 inches long, on very short downy stalks. Flowers decandrous, copious, white, having linear or nearly linear anthers, which are spurred near the base. Berries greenish or white, called *Deer-berries*. The bracteas resemble the leaves, but are much smaller. The *V. album*, Lin. is *Xylosteum citatum*, Pursh, fl. amer. sept. 1. p. 161.; and therefore there is no wonder that subsequent investigators could never ascertain the *V. album* of Linnaeus. We must notice another error of Linnaeus, to prevent mistake. He cites, under *V. stamineum*, the proper figure of Plukenet, but with a wrong synonyme or definition. Here also it falls to our lot to correct him respecting another of Kalm's plants, *V. mucronatum*, which has ever remained as unintelligible as *V. album*. His described specimen is certainly a pomaceous plant.

*Var. β*; (H. B. et Kunth. nov. gen. amer. 3. p. 267.) leaves larger, ciliated on the nerves beneath and margins. H. Native of Mexico, in woods between Pachuca and Real del Monte. Shrub ½ foot. Corolla campanulate, white.

*Var. β, hámile* (Wats. dendr. brit. t. 32.) flowers white; anthers red; pedicels solitary, axillary; shrub ½ foot high.

ERICACEÆ.

LI. Vaccinium.

Vaccinium Crassifolium (Thunb. fl. jap. 156.) racemes axillary, longer than the glabrous, acute, serrated leaves; bracteas lanceolate, serrate; pedicels furnished with 2 awl-shaped bracteoles. \(\text{H.} \) Native of Japan, in the Island of Nippon. Branches smooth, angular while young. Racemes 2-3 inches long; pedicels secund, drooping. Corollas cylindrical, white. The leaves may be evergreen.

Branclate-flowered Whortle-berry. Shrub.

26 V. ciliatum (Thunb. fl. jap. 156.) racemes axillary, longer than the ovate, bristly, nearly entire leaves; bracteas lanceolate, smooth. \(\text{H.} \) F. Native of Japan, &c. where it is called Sasa-jebus. The stem is smooth, and the branches villous. Leaves 1-2 inches long, unequal. Flowers red, unilateral.

Ciliate-flowered Whortle-berry. Shrub.

27 V. frondosum (Lin. spec. 499.) racemes loose; bracteas ovate, not half so long as the slender pedicels, which bear 2 small linear bracteoles in the middle; leaves obovate-oblong, obtuse, entire, smooth. \(\text{H.} \) Native from New Jersey to Carolina, in open woods. Andrz. bot. rep. 140. V. glaicum, Michx. fl. bor. amer. 1. p. 231. Flowers small, almost globular, white. Berries large, blue, globular, edible, called by the country people Blue Tangles. Branchlets tereate, smooth, and slender. Leaves 2-3 inches long, glaucous beneath, and sprinkled with minute resinous dots. Racemes lateral from the former year’s wood. Flowers drooping, greenish-white, shaped like those of the Lily of the valley, but smaller; anthers included.

Var. \(\beta\), vernístum (Ait. hort. kew. ed. 2. vol. 2. p. 357.) leaves lanceolate, acute at both ends. \(\text{H.} \) H. frondosum, \(\text{H.} \) \(\text{β.} \) lanceolatvum, Pursh. fl. bor. amer. 1. p. 786.

28 V. resinosum (Ait. hort. kew. ed. 2. vol. 2. p. 357.) racemes leafless, viscid, downy, with lanceolate bracteoles on the pedicels; leaves obovate-lanceolate, bluish, entire, covered with resinous dots; calyx in 5 deep ovate segments, longer than the ovary. \(\text{H.} \) Native from Carolina to Virginia, in woods, and on mountains frequent. Curt. bot. mag. t. 1288. Andromeda haccata, Wangh. amer. t. 90. f. 69. Branches tereete, downy when young. Leaves usually 1½ inch long, bright green on both sides, rather viscid. Racemes lateral from last year’s wood, drooping. Flowers greenish-yellow. Berries black, eatable.

Var. \(\beta\), rubescens (Pursh. fl. amer. sept. 1. p. 286.) corollas redish. \(\text{H.} \) Curt. bot. mag. 1288.

Var. \(\gamma\), lutescens (Pursh. l. c.) leaves lanceolate; flowers redish-yellow. \(\text{H.} \) V. parvicefórum, Andr. bot. rep. 125.

29 V. arctostaphylos (Lin. spec. 500.) racemes lateral; bracteas all at the base of the pedicels; leaves elliptic, acute, minutely serrated, hairy beneath; stamens as long as the corolla, which is bell-shaped, with very hairy filaments; calyx slightly 5-lobed. \(\text{H.} \) H. Native on the coast of the Black Sea, where it was gathered by Tournefort, who describes it as a shrub about the height of a man, with a trunk as thick as a man’s arm. Young branches downy on two opposite sides. Leaves 2½ inches long. Racemes from the wood of the preceding year, below the fresh leafy shoots, drooping, rather hairy, each composed of 8-10 pendulous flowers, of a dirty white color, tinged with purple. Anthers spurred at the base. Corollas bell-shaped, hairy. Tournefort judges this to be, with great probability, the \(\alpha r k o t o s t æ f o l e, \) or Bear’s Grape, of Galen. What the var. \(\beta\) of Linnaeus may be, we know not, as nothing answerable to it is to be found in Tournefort’s Corollarium.

30 V. pyaphiliuM (Smith, in Rees’ cyclo. no. 22.) racemes lateral; bracteas all at the base of the pedicels; leaves ovate-
lanceolate, acute, serrulate, smooth on both surfaces, except the mid-rib; stamens nearly as long as the bell-shaped corolla, with smooth slightly fringed filaments; calyx 5-lobe. \( \frac{1}{2} \) F. Native of Madeira, on the loftiest part of the island, where it forms impenetrable thickets. V. arctostaphylos, Andr. bot. rep. t. 30. Curt. bot. mag. 974. V. Madèrens, Link. enum. I. p. 375. Corollas larger than those of the preceding, pale green, with a purple tinge; sometimes it appears to be all over purple externally. The Caucasian plant, discovered by Pallas, is said not to differ from that of Madeira. Pallas says the berries are black, juicy, eatable, and gratefully acid; and he sometimes found the flowers 4-cleft.

31 V. cylindraceum (Smith, in Rees' cycl. no. 23.) racemes lateral; bracteas serrated, all at the base of the pedicels; leaves elliptic-lanceolate, acute, serrulate, quite smooth, except the base of the mid-rib; stamens half the length of the cylindrical corolla, with hairy filaments; calyx slightly 5-toothed. \( \frac{1}{2} \). Native of the Azores, on the mountains, where it is called *Uva de Serra,* or Mountain-berry. Apparently arborescent. Branches downy on the opposite sides. Racemes numerous, rising from the wood of the preceding year. Flowers drooping, nearly an inch long, apparently red or purple.

*Cyldrical* flowered Bear's Grape. Shrub or tree.

32 V. lepidophorum (Polil, pl. bras. 2. p. 36. t. 123.) racemes axillary and terminal, loose, downy; flowers unilateral; leaves sessile, linear, attenuated at the base, ciliated, glabrous above, but yellowish-brown beneath, with the nerves downy. \( \frac{1}{2} \). G. Native of Brazil, in the province of Minas Geraes, on the higher mountains, in dry places. Stem dark, hoary. Leaves deciduous. Bracteas of two forms, acute, ciliated. Corolla white, glabrous, having the teeth reflexed.

*Ledum-leaved* Whortle-berry. Shrub 1 foot.

§ 2. Leaves evergreen.

* Flowers racemose.

33 V. meridionale (Swartz. f. ind. occ. p. 676.) racemes erect, downy; bracteas coloured, solitary, ovate, at the base of the pedicels; leaves ovate, crenated, smooth; stem arborescent. \( \frac{1}{2} \). G. Native of Jamaica, on the Blue Mountains. Tree with a very straight trunk and hard wood. Branches downy when young. Leaves 1 inch long. Flowers drooping, reddish-white. Corollas ovate, quadrangular before expansion, contracted at the mouth, with 4 acute, recurved segments. Stamens 8, as long as the corolla: their filaments hairy in the middle. Berries roundish, juicy, pleasantly flavoured, pale red, resembling those of *V. vitis-idaea.* The flowers are rarely 5-cleft, and decandrous. Racemes rising from the top of the wood of the preceding year.

34 V. confertum (H. B. et Kunth, nov. gen. amer. 3. p. 265. t. 250.) racemes axillary, solitary, short, sessile, drooping, about equal in length to the leaves; leaves ovate elliptic, bluntish, crenulated, coriaceous, glabrous; flowers decandrous; anthers mucous. \( \frac{1}{2} \). H. Native of Mexico, on high mountains near Moran and Cerro de Oyamel. Branchlets angular, glabrous. Leaves 3-6 lines long, beset with scattered, brown, minute dots beneath. Pedicels bibracteate at the base. Corolla campanulate, white, with ovate, acute, recurved segments.

*Crowed-leaved* Whortle-berry. Shrub 1 foot.

35 V. floribundum (H. B. et Kunth, nov. gen. amer. 3. p. 266. t. 221.) racemes terminal and axillary, drooping, much longer than the leaves; leaves oblong, acute, coriaceous, glabrous, crenulated; flowers obovate, angular and decandrous; anthers mucous. \( \frac{1}{2} \). G. Native of Peru, on the mountains near Caixa marca. Branchlets angular, downy. Leaves 6-7 lines long, besprinkled with a few black dots beneath. Corolla campanulate, white, having a quadrifid or quinquifid limb, with oval bluntish segments. Flowers about the size of those of *V. vitis-idaea.* Filaments membranous, ciliated. Racemes approximately at the tops of the branches (f. 142.)

*Bundle-flowered* Whortle-berry. Shrub.

36 V. luzcastrum (Cham. in Linnœa. 7. p. 524.) arborescent; branches angular, sometimes downy; leaves coriaceous, on short petioles, oval-lanceolate, acute, glabrously serrated, having the petioles and mid-rib downy above, the rest glabrous; racemes secund, rising from the branches of the preceding year, leafless; flowers drooping; corollas unciately campanulate; anthers bizarinate. \( \frac{1}{2} \). F. Native of Mexico, below St. Salvador. Flowers white. Fruit black and edible. Nearly allied to *V. meridionale.*

37 V. caraccasianum (H. B. et Kunth, nov. gen. amer. 3. p. 266.) racemes axillary, twice longer than the leaves; flowers secund, obovate or decandrous; leaves elliptic, acute, crenated, coriaceous, glabrous, shining above; anthers bizarinate on the back. \( \frac{1}{2} \). H. Native on the southern declivity of Mount Silla de Caraccasa. Branchlets angular, glabrous. Leaves shining above, 9-10 lines long. Racemes crowded at the tops of the branches. Corolla campanulate, glabrous, reddish-white, with a 4-5-parted limb; segments ovate, acuminate. Filaments membranous, ciliate.

38 V. vitis-idaea (Linn. spec. 500.) racemes terminal, drooping, with ovate concave bracteas, which are longer than the pedicels; leaves ovate, revolute, minutely toothed, dotted beneath; corolla bell-shaped. \( \frac{1}{2} \). H. Native of dry, barren, stony woods and heaths in the north of Europe; plentiful in Scotland, Westmorland, Derbyshire, and Wales. Mr. Pursh says it occurs on rocks near the sea-coast, from Canada to New England; but the American plant is more robust than the European, with considerably larger leaves. Lodd. bot. cab. 616. It has also been found in the islands of Kamschatka, Unalaska, and St. Lawrence. Smith, engl. bot. 598. Fl. dan. t. 40. Lodd. bot. cab. 1025. — *Vitis-idaea* rubra, Cam. epit. 136. Root creeping, woody. Stems ascending a span high; young branches terete, downy. Leaves like those of box, but darker. Flowers pale pink, 4-cleft, obovate. Anthers without spurs. Berries blood-red, acid, astringent, and bitter, less palatable in tarts than either the Cranberry or Bilberry, but excellent in a robb or jelly, for colds and sore throats, as well as to eat with roast meat; to which latter purpose this jelly is universally applied by the Swedes, and forms a sauce to venison which is thought superior to currant jelly. In Wales it is used with roast mutton. It may be cultivated in a moist shady border of bog-earth, like the Bleaberry.
**Excerpt from a natural history text on Ericaceae, specifically mentioning Vaccinium.**

**Cow-berry or Red Whortle-berry.** Fl. June. Britain. Shrub ½ foot.

39 V. MYRTIFOLIUM (Michx. fl. bor. amer. 1. p. 229.) creeping, quite smooth; leaves petiolate, oval, shining, revolute, sparingly and minutely toothed; racemes axillary, nearly sessile, of few flowers; corolla bell-shaped, somewhat inflated, minutely 5-toothed; anthers without dorsal horns. h. H. Native of Carolina. Michaux describes the berries as small, globose, crowned by the calyx, black, on short stalks.

40 V. calyculatum (Andr. bot. rep. t. 105.) racemes lateral and terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic, crenated, smooth, paler and veiny beneath; corolla bell-shaped; stem diffuse. h. H. Native of Carolina. Curt. bot. mag. 1152. A hairy shrub, requiring some shelter from our variable winters and springs. Leaves not an inch long, with a little minute pubescence on the mid-rib and petioles. Flowers 5-cleft, decandrous, prettily variegated with pink and white, drooping, on red corymbose stalks. Stamens hairy.

41 V. villosum (Smith, in Rees’ cyc1. no. 29.) racemes longer than the leaves; pedicels, calyx, corolla, and lanceolate bracteas densely hairy; leaves elliptic, entire, revolute, coriaceous, with a blunt point, hairy on the upper side. h. F. Native of Mexico, from whence specimens were sent by Mutis to Linneæus. Branches densely hairy when young. Leaves crowded, an inch long, on thick downy petioles, scarcely hairy beneath, except on the mid-rib. Racemes towards the ends of the younger branches, axillary, drooping, very hairy. Pedicels bracteolate. Corolla purplish, with 5 hairy angles, and as many recurved teeth. Perhaps a species of Gaylussacia.

Villos Whortle-berry. Shrub.

42 V. stitifolium (Andr. bot. rep. t. 480.) racemes terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic-obovate, acute, crenated, smooth and shining; corollas cylindrical. h. H. Native of Carolina. Curt. bot. mag. 1550. Stems either erect or diffuse. Leaves ½ to 1 inch long, paler and veiny beneath. Pedicels, bracteas, and calyx very smooth, of a shining red or purple colour. Calyx of 5 broad, or rather shallow segments. Corollas ovate, oblong, white or pink, with 5 slight spreading teeth, decandrous. The branches are downy on two opposite sides.

43 V. schlechtendalii; racemes elongated, erect, and are as well as the pedicels, peduncles, and ribs of leaves on the under surface, downy; leaves rather coriaceous, permanent, with the nerves and veins prominent on both surfaces, lanceolate or ovato-lanceolate, acute, adpressedly serrated, callymously mucronate at the apex as well as the serratures, and running into the short petioles, at the base; fructiferous branches nearly leafless. h. F. Native of Mexico, near Jalacingos, in woods. Vaccinium, nov. spec. Cham. et Schlecht. in Linnaea. 6. p. 395. An erect, much-branched, evergreen, smoothish shrub. Leaves 2 inches long, and 9 lines broad. Bracteas linear, acute, caducous; calyx bifracteate at the base. Berries drooping, umbonate, crowned by the minute calycine teeth.

Schlechtendal’s Whortle-berry. Shrub.

44 V. buxifolium (Salisb. par. t. 4.) racemes axillary, of few flowers; leaves petiolate, obovate, toothed or crenated, smooth on both surfaces; stems tufted; corollas roundish-ovate; filaments glandular; stigma capitulate. h. H. Native of the western parts of Virginia, near Winchester and the Sweet Springs. Curt. bot. mag. 928. Loddi. bot. cab. 648. V. brachytherum, Michx. fl. bor. amer. 1. p. 234. A handsome little shrub, in stature and general aspect, resembling V. vitis-idaea. The leaves are, however, smooth, even, and not dotted on the under side. Corollas globular, contracted at the mouth, not bell-shaped. Stamens 10. Anthers spursless at the base, discharging their pollen by lateral, not terminal apertures. Flowers white, delicately striped with red.

45 V. ovatum (Pursh, fl. amer. sept. 1. p. 290.) racemes axillary and terminal, bracteate, short; leaves on short petioles, oblong, ovate, acute, revolute, serrated, smooth, coriaceous; corolla cylindrical, campanulate; calyxes acute. h. H. Found by Governor Lewis on the banks of the Columbia River, and by Mr. Menzies on the north-west coast of America. Hook. et Arn. in Beech. voy. pt. bot. p. 144. Shrub much branched; branches hairy, as well as the petioles. The foliage is like that of Pernettya mucronata.

46 V. canadense (Richards. in Franklin. 1st journ. append.) leaves lanceolate, quite entire, downy; racemes terminal; flowers fasciculate; style inclosed. h. H. Native of Arctic America.

Canadian Whortle-berry. Shrub.

47 V. scabrum (Pohl. pl. bras. 2. p. 37. t. 124.) racemes terminal and axillary, longer than the leaves, beset with glandular hairs; leaves on short petioles, oblong, mucronate, with revolute ciliated edges, sebaceous, having the nerves hispid beneath. h. G. Native of Brazil, in turfy bogs at Registo Velho and Villa de Babacena. Stems many from the same root, leafy at the tops. Leaves scabrous above, and glabrous beneath, permanent. Pedicels pilose, bracteate at the base. Bracteas of two forms, deciduous. Corolla glabrous, campanulate, white.

Scabrous Whortle-berry. Shrub 1 foot.

48 V. montanum (Pohl. pl. bras. 2. p. 38. t. 125.) racemes axillary, bracteate, pilose; leaves on short petioles, oblong-elliptic, mucronate, hardly narrowed at the base, glabrous, but having the nerves on the under side rather pilose. h. G. Native of Brazil, in the province of Minas Geraes, in dry places on Serra de Pinheiro. Leaves permanent, dark green above, and yellowish-green beneath, 8 lines long and 4' broad. Flowers unilateral. Corolla campanulate, glabrous, white.

Mountain Whortle-berry. Shrub diffuse.

**Flowers disposed in scaly tufts, nearly sessile.**

Var. β, lanceolatum (Pursh, fl. bor. amer. 1. p. 290.) leaves lanceolate, acute at both ends.

Var. γ, obtusum (Pursh, l. c.) leaves roundish-ovate.

**Flowers solitary, pedicellate.**

50 V. cereum (Forst. prod. 28.) pedicels axillary, solitary, 1-
flowered, furnished with 2 lanceolate bracteas about the middle; leaves roundish-ovate, serrated; calyx of 5 broad ovate pointed segments.  G. Native of Otaheite and Oahu. Andrómeda céréa, Lin. fl. suppl. 238. Branches terete, slightly downy when young. Leaves mucronate, about an inch long. Corolla ovate-oblong, with 5 angles, and 5 erect small segments. Stamen 10. Anthers with 2 dorsal horns, according to Linnaeus. Perhaps a species of *Pernétya*.

*Waxy Whortle-berry.* Shrub small, ½ foot. 51 V. reticulatum (Smith, in Rees' cyclo. no. 30.) pedicels axillary, solitary, 1-flowered, downy; leaves obovate, more or less serrated, coriaceous, with a blunt point, strongly reticulated on both sides, and nearly smooth.  G. Native of the Sandwich Islands, on the high mountains, in woods, where it was collected by Mr. Menzies. Branches when young angular and downy. Leaves an inch long, with revolute margins. Pedicels bracteless, swelling upwards. Calyx in 4 or 5 deep-ribbed clefted segments, as length involute. Corolla cylindrical, twice as long as the calyx, purple, slightly hairy, with 4 or 5 erect blunt teeth. Style hairy. Berries globular, depressed, nearly smooth.

*Trailing Whortle-berry.* Fl. May, June. Ch. 1827. Shrub creeping.

53 V. penduliflorum (Gand. in Freyc. voy. pt. bot. p. 454.) pedicels axillary, solitary, 1-flowered, elongated, pendulous in the fruit-bearing state; flowers deciduous; calyces clefted lanceolate, one-half shorter than the corolla, which is campanulate and 5-angled; anders awned; branches angular, leafy; leaves oblong, sharply serrated, rather coriaceous.  G. Native of the Sandwich Islands, at the altitude of 500 hexapods. An erect glabrous shrub.

*Pendulous-flowered Whortle-berry.* Shrub. 54 V. meiosphyllum (Herb. Reinw. ex Blum. bijdr. p. 861.) stem shrubby; branchlets puberulous; leaves oval, obtuse, quite entire, with recurved margins, veiny, coriaceous, glabrous; pedicels almost solitary, axillary, 1-flowered; corollas urceolate; anthers mutic; calyx bracteate.  G. Native of the Sandwich Islands, on the lofty mountains, where it was found by Mr. Menzies. The branches are angular, and always smooth, like every other part. Leaves rather longer than the *V. reticulatum*, with less prominent veins. Calyx segments keeled. *Tooth-leaved Vaccinium.* Shrub. 55 V. obtusum (Pursh, fl. amer. sept. 1. p. 290.) pedicels axillary, solitary, 1-flowered, smooth; leaves obovate, with sharp tooth-like serratures, coriaceous, veiny, very smooth; calyx longer than the smooth ovary.  G. Native of the Sandwich Islands, on the lofty mountains, where it was found by Mr. Menzies. The branches are angular, and always smooth, like every other part. Leaves rather longer than the *V. reticulatum*, with less prominent veins. Calyx segments keeled.

*Blunt-leaved Whortle-berry.* Shrub. 56 V. empetrifolium (H. B. et Kunth, nov. gen. amer. 3. p. 263. t. 268.) creeping, quite glabrous leaves approximate, subimbricated, obtuse, quite entire, coriaceous, glabrous; pedicels solitary, axillary, 1-flowered; flowers octandrous; corollas tubularly campanulate; anthers mutic; calyx bracteate at the base.  G. Native of the western declivity of the burning Mount Antisana, between Pintac and Pinautara. Leaves 2½ lines long. Corolla scarlet, glabrous: with ovate, acute, spreading segments. Anthers dehiscing lengthwise. Filaments ciliated.

*Empetrum-leaved Whortle-berry.* Shrub creeping. 58 V. penéoides (H. B. et Kunth, nov. gen. amer. 3. p. 264.) creeping, glabrous; leaves approximate, subimbricated, oblong, acute, obsoletely and remotely crenulat, stiff, glabrous, a little ciliated; pedicels short, axillary, solitary, 1-flowered; flowers octandrous; calyx bracteate; anthers mutic.  G. Native of the province of Quito, at Mount Tunguragua, near Cuchilla de Guandasiva. Leaves 3 lines long. Branches downy. Flowers solitary, on the tops of the branches. Corolla tubularly campanulate, scabrous, with ovate acutis segments. Filaments pilose.

*Penea-like Whortle-berry.* Shrub creeping. 59 V. acumínatum (H. B. et Kunth, nov. gen. amer. 3. p. 264.) arborescent; leaves roundish, elliptic, acute, quite entire, obsoletely 3-nerved, coriaceous, glabrous; flowers axillary, solitary, twin or tern, almost sessile, octandrous; calyx bracteate; anthers mutic.  G. Native of New Granada, in Paramo de Almaguer, and near Pansitara. Branches clothed with rusty hairs, densely leafy. Leaves on short petioles, 3 lines long. Corollas nearly globose, white, with a quadridif refractil limb. Filaments pilose.

*Acuminate-leaved Whortle-berry.* Shrub 10 to 15 feet. 60 V. alaternoides (H. B. et Kunth, nov. gen. amer. 3. p. 265.) arborescent leaves roundish, elliptic, acute, quite entire, obsoletely 3-nerved, coriaceous, glabrous; flowers axillary, solitary, twin or tern, sessile, octandrous; calyx bracteate; anthers mutic, half exserted.  G. Native of the Andes of Peru, near Ayavaca. Branches downy. Leaves 8-9 lines long. Corolla tubularly campanulate, white, with a quadridif revolute limb. Filaments villous.

*Alaternus-like Whortle-berry.* Shrub or small tree.

**LIII.** OXYCOCCUS (from οξυς, oyxys, sharp, and κόκκος, kokkos, a berry; in reference to the sharp acid taste of the berries). Pers. syn. 1. p. 419. Pursh, fl. amer. sept. 1. p. 263. 5 R
Nutt. gen. amer. 1. p. 250.—Vaccinium species of Lin. and others.

1. *O. pallustris* (Petr. ench. 1. p. 419.) stems filiform, creeping; leaves small, ovate, entire, acute, smooth, with revolute margins; pedicels terminal, 1-flowered; segments of corolla oval. B. H. Native of turfy mossy bogs in the mountainous parts of Europe; common in Switzerland, Russia, Scotland, Ireland, and the north of England, as well as in Lincolnshire and the neighbouring part of Norfolk. Mr. Pursh speaks of it as common on the boggy mountains of Northern America, from Canada to Pennsylvania, Island of Unalaska. O. vulgaris, Pursh, fl. amer. sept. 1. p. 263. O. Europeus, Nutt. gen. amer. 1. p. 251. Vaccinium oxyccocus, Linn. spec. 500. Smith, engl. bot. t. 319. Oed. fl. dan. t. 80. Vaccinium oxyccocus, var. a, ovalifolius, Michx. fl. bor. amer. 1. p. 228. Vaccinia palustris, Ger. macr. 1410. Lob. icon. 2. t. 109. Oxyccoccus, Cord. hist. 140. 2 f. 1. Leaves convex, and dark shining green above, and glaucous beneath. Stems reddish. Pedicels few together, about the tops of the branches, red, slightly hairy. Corolla pink, with reflexed oblong segments. Stamens with purple downy filaments and yellow anthers. Berries pear-shaped, globular, often spotted, crimson, with a peculiar flavour, with a strong acidity, grateful to most people in the form of tarts, for which purpose they are largely imported from Russia. Not long since, cranberries from Lincolnshire and the north-west corner of Norfolk were sold in the streets of Norwich by cart-loads; but the extensive inclosures have in many parts destroyed and drained their native bogs. Lightfoot records, that at Longtown, on the borders of Cumberland, not less than 20l. or 30l. worth were sold each market day, for 5 or six weeks together, and dispersed over different parts of the kingdom. In Sweden, these berries serve only to boil silver plate to its due degree of whiteness, their sharp acid corroding the superficial particles of the copper alloy.

2. *O. macrocarpus* (Pursh. fl. amer. sept. 1. p. 263.) stems prostrate, filiform, creeping; leaves elliptic-oblong, nearly flat and obtuse, distantly subserreolated on the margins, glaucous beneath, downy at the points when young: segments of the corolla linear-lanceolate; flower-bearing branches erect, proliferous; pedicels lateral. B. H. Native from Canada to Virginia, in bogs, principally on a sandy soil, and on high mountains. Wats. dendr. brit. t. 122. Vaccinium macrocarpum, Ait. Hort. kew. ed. 1. vol. 2. t. 7. Hook. bot. mag. 2506. Lam. ill. t. 286. f. 4. Vaccinium hispidulum, Wangh. amer. t. 30. f. 67. Vaccinium oxyccocus, var. b, oblongifolius, Michx. fl. bor. amer. 1. p. 228. Points of young leaves, peduncles, and the margins of the calyx and bracteas downy. Berries spherical, red, often remaining throughout the winter. This is a larger and more robust plant than the preceding. Several flowers come forth at the ends of the last year's branches, surmounted by the shoots of the present year. The bracteas are situated in the upper part of the pedicels in this, while in the preceding they are situated at the lower part. The berries are larger, and of a brighter red than the last, and are collected in great abundance for making tarts in America, and exported from thence to Europe; but they always prove here far inferior in quality to the Russian cranberries, however excellent in America. The best way of having American cranberries in Europe is by cultivation in an artificial bog, with great plenty of water, and a first contrived by Sir Joseph Banks. A very few square yards of ground thus employed will yield as many cranberries as any family can use. If allowed to hang until they are full ripe, as late as October, they are even better than the common cranberry, and may be kept dry in bottles throughout the year. Our wild cranberries have generally been gathered too early; as may also be the case with those brought from America. "Wherever there is a pond," Mr. Neill observes, "the margin may, at a trifling expense, be fitted up for the culture of this plant, and it will continue productive for many years. All that is necessary is to drive in a few stakes 2 or 3 feet within the margin of the pond, and to place some old boards within these, so as to prevent the soil of the cranberry-bed from falling into the water; and lay a parcel of small stones or rubbish in the bottom, and over it peat or bog earth, to the depth of about 3 inches above and 7 inches below the surface of the water. In such a situation the plants grow readily; and if a few be put in they entirely cover the bed in the course of a year or two, by means of their long runners, which take root at different points. From a very small space a large quantity of cranberries may be gathered; and they prove a remarkable regular crop, scarcely affected by the state of the weather, and not subject to the attack of insects.

Large-fruited or American Cranberry. Fl. May, July. Ct. 1760. Shrub creeping.

Erect Cranberry. Fl. May, June. Ct. 1806. Shrub 2 feet. Cult. When any of the species are grown for the sake of their berries, they should be planted in an artificial bog, as mentioned under *O. macrocarpus*. But when grown only for having a specimen of the plants, they will grow well in pots filled with peat and sand, having sphagnum set round their roots: the pots should be well drained with sherds, and set in deep pans of water.

Linn. syst. Pentandria, Monogynia. Limb of calyx 5-cleft. Corolla tubular, ventricose at the base; limb 5-toothed. Stamina 10, inserted in the limb of the calyx, included; anthers mucous, drawn out from the top into 2 little tubes. Style erect; stigma depressedly capitately. Drupes nearly globose, clothed by the calyx, 10-celled; cells 1-seeded. Seeds lenticular, smooth. —Evergreen or deciduous shrubs. Leaves scattered, coriaceous, each terminated by a mucroned or gland. Racemes axillary, approximate. Flowers scarlet, bracteate. Very nearly allied to Thibadella, but very distinct.

* Corollas urceolate, or cylindrical.

t. 257.) young branchlets hispid; leaves elliptic or elliptic-oblong, rounded at both ends, terminated by a depressed brown gland, pilosely pubescent on both surfaces with minute scattered glands beneath, toothed at the apex; racemes axillary and approximate at the tops of the branches; flowers and fruit downy. ḡ. S. Native near Caracas, on Mount Avila, and near Santa Fe de Bogota. Corollas scarlet. Calycine segments ovate, acute.

**Box-leaved Gaylussacia.** Shrub.

2 G. *p. inermis* (Pohl. pl. bras. 2. p. 40. t. 126.) leaves imbricated, oval-elliptic, terminate at the apex, terminated by a callous mucrone; calyx and corolla glabrous; bracteas of 2 forms, linear-lanceolate and oblong acute. ḡ. G. Native of Brazil, in the province of Rio Janeiro, at Rio Tijuco, on the mountains. G. buxifolia, Cham. et Schlecht. in Linnaea. vol. 1. p. 528. but not of H. B. et Kunth. Leaves permanent, clothed with yellow down on the nerves beneath. Racemes many-flowered, 2 inches long, downy. Flowers scarlet or crimson.

**Implicated-leaved Gaylussacia.** Shrub 2 feet.

3 G. *p. inermis* (Pohl. pl. bras. 2. p. 41. t. 127.) leaves oblong-elliptic, quite entire, with revolute edges, each terminated by a short callous mucrone, glabrous above, but pilose on the nerves and veins beneath, as well as the calyxes; corollas glabrous; bracteas of 2 forms, linear and oblong, acute. ḡ. G. Native of Brazil, in the province of Minas Geraes, by waysides about Arrayal St. Joao Baptista. Stem branched, hoary. Branches leafy, glabrous, florescente at the tops. Leaves deciduous, remote, green above and yellowish-green beneath, 1 ½ inches long and 8 lines broad. Racemes loose.

**Fair Gaylussacia.** Shrub 2 feet.

4 G. *p. inermis*; branchlets angular, downy; leaves ovate, mucronate, cinereous; flowers axillary, aggregate; teeth of calyx ovate, acute. ḡ. G. Native of Peru. Vaccinium dependens, Ruiz et Pav. in herb. Lamb. Leaves an inch long.

**Dependent Gaylussacia.** Shrub.

5 G. *p. inermis*; branchlets pilose, terete; leaves ovate, acuminate, striated beneath; flowers solitary, nearly sessile; calyx teeth ovate, acute. ḡ. G. Native of Peru. Leaves hardly more than a line and a half long. Flowers scarlet. (v. s. in herb. Lamb.):

**Small-leaved Gaylussacia.** Shrub.

6 G. *p. inermis*; branchlets terete; leaves ovate, acute, pilose; flowers aggregate; calyces teeth ovate, acute. ḡ. G. Native of Peru. Leaves half an inch long. Flowers scarlet.

**Crenated-leaved Gaylussacia.** Shrub.

7 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 1. p. 534.) branches hispid; leaves oblong, retuse, rugose, with revolute margins, scabrous above and hairy beneath, furnished with 2-3 short teeth on each side; racemes decumbent, drooping, 8-10-flowered, beset with glandular hairs; corollas tubularly ureculate, hairy on the angles and at the tops of the segments; young leaves beset with pili, which are tipped with black glands. ḡ. G. Native of Brazil, without the tropic. Filaments ciliated. Calyces teeth narrow, acuminate.

**Rugose Gaylussacia.** Shrub 1 to 2 feet.

8 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 1. p. 533.) branches hispid; leaves nearly glabrous, elliptic, narrowly oval at the base; petioles pruinose, obtusely serrated towards the apex; racemes lateral, secund, drooping; corollas cylindrical. ḡ. G. Native of Brazil, within the tropic. Racemes terminal, or nearly so, and axillary. Flowers dense, secund. Pedicels hispid. Calyces segments short, elliptic, obtuse, ciliate. Corollas pilose or smoothish.

**Rhododendron Gaylussacia.** Shrub.

9 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 1. p. 530.) glabrous or downy; leaves elliptic-lanceolate; racemes terminal, aggregate; corollas cyllindrical; ovarium glabrous. ḡ. G. Native of Brazil, within the tropic, in open sandy places; near Caravellos Freireis. Vaccinium Brasilienis, Spreng. nov. prov. p. 42. syst. 2. p. 212. Leaves obliquely serrated towards the tops, with a few ciliate at the base of the younger leaves. Racemes axillary, erect, secund, bracteate, of a fine crimson colour, as well as the corollas, which are cylindrically urceolate; calyces teeth roundish, acuminate. There are glabrous and downy varieties of this species.

**False-vaccinium Gaylussacia.** Shrub 1 to 2 feet.

10 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 8. p. 494.) leaves obovate-lanceolate, acute, terminated by an obtuse callous point, with serrulated reflexed margins, an inch long; racemes crimson, usually solitary, nearly terminal, erect, exceeding in leaves; calyces segments short, ovate, acuminate. ḡ. G. Native of Brazil, within the tropic. Corolla tubular, ventricose. Young branchlets pilose. Young leaves ciliate. Leaves yellowish beneath, pilose on the petiole and midrib.

**Myrtle-leaved Gaylussacia.** Shrub.

11 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 1. p. 532.) quite glabrous and pruinose; leaves oblong-lanceolate, acuminate, coriaceous, glabrous, reticulately veined, and triple-nerved beneath; racemes axillary, simple, and are, as well as the calyxes, tomentose; pedicels tribrate at the base. ḡ. G. Native of Java, on trees on the mountains. Anthers biastisate on the back, beneath the apex. Stigma truncate, simple. Capsule 10-celled; cells 1-seeded.

**Lanceolate-leaved Gaylussacia.** Shrub.

12 G. *p. inermis* (Blum. bijdr. s. p. 861.) stem parasitical; leaves oblong-lanceolate, acuminate, coriaceous, glabrous, reticulately veined, and triple-nerved beneath; racemes axillary, simple, and are, as well as the calyxes, tomentose; pedicels tribracteate at the base. ḡ. G. Native of Java, on trees on the mountains. Anthers biastisate on the back, beneath the apex. Stigma truncate, simple. Capsule 10-celled; cells 1-seeded.

**Var. β;** branchlets, rachi, and petioles, downy from shorter hairs; bracteas and calyces ciliate; nerves and veins of leaves prominent beneath. ḡ. G.

**Var. γ;** leaves coriaceous, having the nerves and veins hardly conspicuous beneath, quite glabrous in the adult state.

**Dense-flowered Gaylussacia.** Shrub.

14 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 8. p. 498.) leaves sharply serrated in front, ending in a straight mucrone; calyces segments lanceolate, length of the corolla; filaments ciliated, length of anthers. ḡ. G. Native of Brazil, within the tropic. Branchlets, petioles, rachi, pedicels, and ovaries, beset with long spreading white hairs. Inflorescence crimson, glandulariferous. Leaves having the margins and nerves beneath pilose in the young state. Bracteas and calyces pectinately ciliate. Corollas glabrous.

**Myrtle-like Gaylussacia.** Shrub.

15 G. *p. inermis* (Cham. et Schlecht. in Linnaea. 8. p. 499.) branches marked by cicatrices occasioned by the falling of the leaves; leaves nearly sessile, quite entire, usually acute, terminating
each in an inflexed white mucron; flowers pale, clothed with glandular down; bracteas foliaceous, green, length of flowers; bracteoles somewhat foliaceous, lanceolate, situated under the calyxes; calyce segments lanceolate, about a third the length of the corolla; filaments villos, about a fourth the length of the anthers. ½ S. Native of Brazil, within the tropic.

Pale-flowered Gaylussacia. Shrub.

16 G. angustifolia (Cham. in Linnaea. 8 p. 490.) branches, petals, inflorescence, and calyces downy; leaves coriaceous, linear-lanceolate, narrowed into the short petioles at the base, ending each in a callous acute point, with reflexed inconspicuously serrated edges, shining above and russet beneath; racemes axillary, nearly terminal, erect, exceeding the leaves; lower bracteas foliaceous: superior ones coloured; calyce segments ovate, acuminate, or acutely triangular, and are, as well as the bracteas, ciliated; corollas cylindrical, downy on the nerves; filaments villous, shorter than the anthers. ½ S. Native of equinoctial Brazil. Inflorescence coloured.

Narrow-leaved Gaylussacia. Shrub.

17 G. pinifolia (Cham. et Schlecht. in Linnaea. 1 p. 536. and 8 p. 500.) quite glabrous and pruinose; leaves linear, acute at both ends, crenated; peduncles axillary, 1-3-flowered, furnished with small glandularily serrated bracteas; corolla urceolate, with short erect teeth. ½ S. Native of equinoctial Brazil. The young leaves at the tops of the branches and flowers are crimson. Calyceine teeth ovate, acuminate, cuspidate, with glandularly ciliated edges.

Pin-leaved Gaylussacia. Shrub ½ to 1 foot.

* * Corollas campanulate.

18 G. pseudogaultheria (Cham. et Schlecht. in Linnaea. 1 p. 535.) branches straight, hispid; leaves narrow-elliptic, subcordate, searous on both surfaces, obsolesely serrated towards the top; racemes axillary and terminal at the tops of the branches, approximate, second, erect, hispid, bracteate. ½ S. Native of Brazil, within the tropic. Stems rising from the root, biennial or triennial, about a foot high, branched. Flowers white, hardly crimson. Corollas campanulate, with hairy angles. Calyceine teeth narrow, lanceolate. Ovary hairy, glandular.

False Gaultheria Gaylussacia. Shrub 1 foot.

19 G. decipiens (Cham. in Linnaea. 8 p. 500.) branches hairy; leaves coriaceous, elliptic, obtuse, attenuated at the base, obsolesely crenated towards the apex; racemes from the axis of the ultimate leaves, second, erect; calyceine teeth triangular, acuminate; corolla campanulate, pilose on the angles, with erect triangular teeth. ½ S. Native of Brazil, within the tropic. G. buxifolia, Cham. et Schlecht. in Linnaea. 1 p. 528. but not of H. B. et Kunth. Leaves glabrous above, but pubescent on the nerves beneath. Corollas white, campanulate, not scarlet. This species has been referred to G. umbellata by Pohl, but it differs from it in the flowers being campanulate and white, on black, not scarlet.

Deceiving Gaylussacia. Shrub 1 to 1 ½ foot.

20 G. amena (Cham. in Linnaea. 8 p. 501.) branches, petals, and inflorescence downy; calyces glabrous, but are, as well as the bracteas, ciliated with glandular hairs; leaves on very short petioles, ending each in a callous mucron, searated in front, with reflexed margins covered with resinous dots beneath, having the veins and nerves prominent beneath; racemes nearly terminal, erect, elongated; calyceine segments ovate, acuminate; corolla campanulate, glabrous, filaments ciliated, half the length of the anthers; bracteas foliaceous. ½ G. Native of Brazil, within the tropic. Flowers white.

Var. a; leaves ovate-cuneated, rounded. Var. b; leaves narrower, blunt at the base, acute at the apex, oblong or lanceolate.

Pleasant Gaylussacia. Shrub 4 to 6 feet.

21 G. incana (Cham. in Linnaea. 1 p. 536.) clothed with hoary tomentum; leaves oblong, with revolute margins, quite entire; racemes axillary and terminal, approximate at the tops of the branches, secund, erect; corollas campanulate, downy. ½ G. Native of Brazil, within the tropic. Leaves cincinnus above, and white beneath. Calyceine teeth lanceolate. Corolla downy, as well as the filaments.

Hoary Gaylussacia. Shrub 1 foot.

Cult. For culture and propagation see Agarista, p. 538. All the species are extremely elegant when in blossom, and are therefore very desirable plants in every collection.

LIN. SYST. Decandria, Monogynia. Calyx urceolar; limb 5-lobed. Corolla tubular, coactate at the apex and 5-toothed. Stamens 10, inclosed; filaments very short, dilated; anthers 2-celled, shortly spurred at the base, drawn out into two tubes at the apex, near the mouth, opposite a linear sensory. Ovarium 5-celled. Style pentagonal. Stigma linear, peltate. Berry 5-celled; cells many-seeded. Seeds minute, angular, dotted.—Shrubs. Natives of Peru. Leaves evergreen, coriaceous, quite entire, nerves. Flowers drooping, bracteate, disposed in lateral corymbose racemes.

1 T. bracteata (Ruiz et Pav. fl. per. 4. t. 388. ined.) leaves ovate-lanceolate, acuminate, 5-nerved; bracteas large, permanent, coriaceous, 2-lobed; anthers spurred at the base. ½ S. Native of Peru. Branches angular, glabrous. Leaves rounded at the base, 2-3 inches long, petiolate. Flowers disposed in terminal thyrsoid coryms at the tops of the branches. Corollas scarlet, nearly an inch long. Bracteas imbricated. Filaments bearded at the apex.

Braecteata Thibaudia. Shrub.

2 T. mellifera (Ruiz et Pav. l. c. t. 387. f. b.) branches terete, downy; leaves oblong, obtuse, feather-nerved, acute at the base; flowers axillary, corymbose, bracteate; limb of calyx nearly entire; corolla short. ½ S. Native of Peru. Leaves 2-3 inches long, on short petioles, glabrous. Bracteas small. Peduncles downy. Limb of calyx essentially 5-lobed. Filaments glabrous.

Honey-bearing Thibaudia. Shrub.

3 T. punctatifolia (Ruiz et Pav. l. c. t. 387. f. a.) branches oblong-lanceolate, acuminate, 5-nerved, rounded at the base, dished beneath; calyx bluntly 5-lobed; racemes elongated, nodding; bracteas large, oblong, mucronate, adpressed; corollas ventricose; filaments glabrous. ½ S. Native of Peru. Leaves a hand long, glabrous. Petioles short, robust. Branchlets angular. Racemes a span long, many-flowered. Flowers drooping. Corolla ventricose, an inch long.

Dotted-leaved Thibaudia. Shrub.

4 T. coarctata (Ruiz et Pav. l. c. t. 385.) branches angular, glabrous, leaf-lanceolate, acuminate, 5-nerved, rounded at the base; flowers aggregate; bracteas 2-lobed, roundish, coriaceous; calyceine teeth acute; filaments glabrous. ½ S. Native of Peru. T. bicolor, Dunal. in herb. Lamb. Leaves 3-4 inches long, marked with white veins above. Flowers peduncu-
late, subcorysmbose, 5-10 together, drooping. Berries large. 
Corolla 1½ inch long.

Coarctate-flowered Thibaudia. Shrub.

1. T. caudalata (Ruiz et Pav. l. c. t. 386.) branchlets angular; leaves nearly sessile, cordate-oblong, obtuse, dentilicated; racemes few-flowered; bracteas lanceolate, acuminate; calyceine teeth short, acute; filaments glabrous. h. S. Native of Peru. Leaves 4 inches long, feather-nerved. Bracteae permanent, lanceolate, coriaceous. Corolla an inch long.

Wing-stemmed Thibaudia. Shrub.

2. T. elliptica (Ruiz et Pav. l. c. t. 384. f. b.) branchlets angular; leaves elliptic-oblong, with revolute margins; flowers aggregate; calyceine teeth acutish, very short. h. S. Native of Peru. Leaves 3 inches long, attenuated at the base, on short petioles, feather-nerved. Peduncles half an inch long.

Elliptic-leaved Thibaudia. Shrub.

3. T. emarginata (Ruiz et Pav. l. c. t. 384. f. a.) branchlets terete, glabrous; leaves ovateobovate, emarginate, briskly beneath; flowers solitary; calyx oblong-obovate, 5-toothed; corollas conical; filaments glabrous. h. S. Native of Peru. Leaves 1½ inch long, 3-nerved, acute at the base. Corolla ventricose, 3 lines long. Flowers pendulous. Peduncles glabrous.

Emarginate-leaved Thibaudia. Shrub.

4. T. floribunda (H. B. et Kunth, nov. gen. amer. 3. p. 269. t. 254.) branchlets terete, glabrous; leaves lanceolate, acuminate, reticulately veined, glabrous, as well as the inflorescence; racemes axillary, solitary; bracteas imbricated; filaments glabrous. h. S. Native of New Grenada, near Santa Fe de Bogota. Leaves 5 inches long. Calyceine teeth ovate, acute. Corolla ventricose, scarlet.

Bundle-flowered Thibaudia. Shrub.

5. T. longifolia (H. B. et Kunth, l. c.) branchlets pentagonal, glabrous; leaves long-lanceolate, acuminate, obtuse at the base, reticulately and quintuple-nerved, and are, as well as the calyces and corollas, glabrous. h. G. Native of the Andes, about Quindiu, near La Seja. Leaves 6-7 inches long. Racemes axillary, shorter than the leaves. Flowers size and structure of those of the preceding species.

Long-leaved Thibaudia. Shrub.

6. T. falcaria (H. B. et Kunth, l. c.) branchlets terete, glabrous, fuscous; leaves lanceolate, acuminate, falcate at the apex, acute at the base, reticulately and quintuple-nerved, and are, as well as the calyx and corollas, glabrous. h. S. Native of New Granada, near Almaguer. Leaves 8 inches long. Racemes axillary, solitary, shorter than the leaves.

Falcate-leaved Thibaudia. Shrub.

7. T. macrophylla (H. B. et Kunth, l. c. p. 270.) branchlets terete, glabrous; leaves ovate-lanceolate, acuminate, rounded at the base, reticulately quintuple-nerved, and are, as well as the calyx and corollas, glabrous. h. S. Native on the Andes, about Popayan, near Pindamon and Palace. Leaves on short petioles, 8-9 inches long. Racemes axillary, solitary, nearly sessile, 3 or 4 times shorter than the leaves. Corollas large, tubular, white, but red and ventricose below. Calyceine teeth short, acute.

Long-leaved Thibaudia. Shrub 10 feet.

8. T. repesstris (H. B. et Kunth, l. c. p. 270.) branchlets downy, striated a little; leaves lanceolate, blunish, acute at the base, reticulately veined, glabrous above and downy beneath, especially on the nerves; calyces glabrous. h. S. Native of New Granada, in Paramo de Saragura, near Loxa and Alto de Pulla. Leaves 3 inches long. Racemes axillary. Fruit nearly globose, about the size of those of Prunus spinosa.

Roeck Thibaudia. Shrub.

9. T. sitida (H. B. et Kunth, l. c. p. 271.) branchlets trigo-
nal, f glabrous, fuscous; leaves oblong, obtuse, rounded at the base, somewhat quintuple-nerved, shining, and are, as well as the calyces and corollas, glabrous. h. S. Native on the eastern declivities of the Andes, about Quindiu, between Quebrada de Tocheito and La Seja. Leaves on short petioles, 4 inches long, beset with minute dots beneath. Racemes axillary, solitary, almost sessile, 2 inches long, involucrated by large roundish-ovate, obtuse, concave, coloured bracteas at the base.

Shining-leaved Thibaudia. Shrub.

10. T. cordifolia (H. B. et Kunth, l. c. p. 271. t. 255.) branchlets furrowed, resinous, shining; leaves ovate, cordate, obtuse, quinquelobate or septuple-nerved, shining above, and are, as well as the calyces, glabrous; corollas downy. h. G. Native of New Granada, on the Andes. Bracteas oblong, obtuse, coloured, concave. Calyceine teeth ovate, acute. Corolla tubular, ventricose. Racemes axillary at the tops of the branches, sessile, hardly longer than the leaves. Filaments glabrous.

Heart-leaved Thibaudia. Shrub.

11. T. melastomoides (H. B. et Kunth, l. c. p. 275.) branchlets terete, smooth, brown, fuscous; leaves oblong, short-acuminated, rounded at the base, rather cordate, reticulately quinquelobate or septuple-nerved, and are, as well as the calyces and corollas, glabrous. h. G. Native along with the preceding. Leaves having minute scattered dots beneath, 3 inches long, and an inch broad. Racemes axillary, solitary, sessile, shorter than the leaves, covered with the imbricated bracteas before expansion. Bracteas oblong, concave, rounded at the apex.

Melastoma-like Thibaudia. Shrub.

12. T. strobulifera (H. B. et Kunth, l. c. p. 272.) branchlets downy, obsoletely angular; leaves oblong, acuminate, rounded at the base, reticulately triple or quintuple-nerved, and are, as well as the calyces and corollas, glabrous. h. G. Native of New Granada, in frigid places, between Rio Udchupa and Paramo de Saragura, near Loxa. Leaves beset with black dots beneath, reticulately 3-5-nerved, 2½ inches long. Racemes axillary, solitary, sessile, shorter than the leaves, strobiliform before expansion. Bracteas at the base of the pedicels, oblong, rounded and ciliated at top. Corolla tubular, ventricose at the base, red. Calyceine teeth short, ovate, acute. Filaments ciliated.

Strobil-bearing Thibaudia. Shrub.

13. T. scabriuscula (H. B. et Kunth, l. c. p. 273.) branchlets terete, roughish; branchlets angular, downy, fuscous; leaves oblong, acuminate, rounded and subcordate at the base, roughish from dots above, downy on the nerves beneath, and beset with minute black dots between the nerves; calyces, and corollas, downy. h. G. Native about Quindiu, on the Andes. Inflorescence like that of the preceding species.

Roughish Thibaudia. Shrub.

14. T. pursecula (H. B. et Kunth, l. c. p. 274. t. 256.) climbing: branchlets trigonal, hairy; leaves oblong, or oblong-elliptic, acuminate, rounded at the base, reticulately quintuple or septuple-nerved, glabrous above, but downy beneath, as well as the calyces and corollas. h. - S. Native near Caracas, on Mount Avila, between Puerta de la Silla and El P xual: also of New Granada, near Ibague and Boca del Monte. Branches red. Leaves 5 inches long and 2 broad. Racemes axillary, solitary, sessile, covered by the bracteas before expansion, 1 to 1½ inch long. Corolla white-red. Calyces with ovate-oblong, obtuse, spreading teeth. Filaments glabrous.

Downy Thibaudia. Shrub climbing.

15. T. quereime (H. B. et Kunth, l. c. p. 274. t. 256.) branchlets terete, glabrous, brown; leaves oval-elliptic, acumi-
nated, acute at the base, reticulately quintuple-nerved; branches, calyces, and corollas glabrous. \( \frac{\text{A.}}{\text{S.}} \) Native of South America, in the province of Choco, in one place near the town of Cali, towards Cerro de San Antonio, where it is called *Quereme de Cali*. Leaves 3 or 3\( \frac{1}{2} \) inches long. Pedicels trinervate at the base, red. Corollas tubular, ventricose at the base, red. Calyceous teeth ovate, acute, short. The flowers, bracteas, and wood, are very sweet scented when dried, and which scent is easily communicated to water, spirits, or wine. Spirits of wine saturated with this aroma smells like cloves, and is useful in mitigating tooth-ache.

*Quereme Thibaudia*. Shrub 5 to 6 feet.

20 T. *ARDISLEFOLIA* (H. B. et Kunth, l. c. p. 274.) branches terete, glabrous; leaves opposite, sessile, oblong, obtuse, subcordate, reticulately nerved, and are, as well as the branches, calyces, and corollas, glabrous. \( \frac{\text{A.}}{\text{S.}} \) Native of New Grenada, near Fusaguruga, in woody places. Leaves 3\( \frac{1}{2} \) inches long, with diaphanous edges. Racemes axillary, sessile, solitary, pendulous, girded by small imbricated bracteas at the base. Corollas cylindrically tubular, scarlet, with a white limb. Calyceous teeth ovate, acute, ciliated.

*Ardisia-leaved Thibaudia*. Tree 16 to 20 feet. Cult. For culture and propagation see *Agarista*, p. 838. Extremely elegant shrubs when in blossom.

**LVI. AGAPETES** (from ἀγαπέω, agapetos, beloved; in reference to the plants being showy). D. Don, mas. in herb. Lamb. Thibaudia species, Wall and Blume. Ceratos- tùma species, Roxb.

**§ 1. Corollas tubular.**

1 A. *setigera* (D. Don, in herb. Lin. soc.) leaves scattered, lanceolate, petiolate, acuminate, obtuse at the base; flowers disposed in racemose corymbs; peduncles and calyces hispid; filaments bearded; anthers bifid; segments of corolla ovate-oblong. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies, on the Pundua mountains. Thibaudia setigera, Wall. cat. no. 755. Leaves about 4 inches long, on very short robust pedioles, absolutely denticulate. Flowers numerous, in lateral and terminal corymbose racemes, furnished with bristly hairs. Corolla about an inch long.

*Bristle-bearing Agapetes*. Shrub.

2 A. *VERTICILLATA* (D. Don, l. c.) leaves verticillate, lanceolate, acuminate, finely denticulate, acute at the base; flowers corymbose; peduncles and calyces hispid; corolla glabrous, with short blunt lobes; filaments nearly smooth; anthers bifid. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies, on the Pundua mountains. Thibaudia verticillata, Wall. cat. no. 755. Leaves on very short pedioles, disposed in interrupted verticillate fascicles. Corolla scarcely an inch long. Stigma almost simple.

*Whorled-leaved Agapetes*. Shrub.

3 A. *LORANTHIFLORA* (D. Don, l. c.) leaves sessile, lanceolate, bluntly acuminate, quite entire; flowers generally solitary; segments of the corolla elongated; anthers emarginate at the apex; filaments and corollas smooth. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies. Thibaudia lorianthiflora, Wall. cat. no. 754. Leaves 3 inches long, cuneate-lanceolate. Calyx with ovate acute teeth, and is, as well as the peduncles, rather bristly. Segments of corolla ovate at the base.

*Loranthus-flowered Agapetes*. Shrub.

4 A. *VARIGATA* (D. Don, l. c.) leaves on short petioles, lanceolate, acuminate, denticulate, attenuated at the base, veiny; flowers lateral, coriaceous; segments of corolla lanceolate, revolute; filaments bearded; anthers bifid. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies, on the Pundua mountains. Thibaudia variegata, Wall. cat. no. 751. Leaves 6 inches long. Peduncles and calyces glabrous. Corolla glabrous, an inch long.

*Variegated Agapetes*. Shrub.

**§ 2. Corollas short, ovate.**

5 A. *ACUMINATA* (D. Don, l. c.) leaves petiolate, lanceolate, long-acuminate, toothed; flowers copious, coriaceous, lateral. \( \frac{\text{G.}}{\text{S.}} \) G. Native of Silhet. Thibaudia acuminata, Wall. cat. no. 6297. Leaves a span long. Calyceous segments ovate, mucronate. Calyx and peduncles finely downy.

*Acuminated-leaved Agapetes*. Shrub.

6 A. *SPRENGELII*; leaves petiolate, ovate-lanceolate, acuminate, denticulate, attenuated at the base, woolly; flowers racemose, glabrous; peduncles glabrous; calyceous segments ovate, denticulate; filaments downy; anthers bifid. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies. Thibaudia Sprengelii, Wall. cat. no. 6298. Leaves 3 inches long. Flowers drooping, from 5 to 7 in a cluster. Corolla ovate-oblong, about 2 lines long.

*Sprengel's Agapetes*. Shrub.

7 A. *SERRATA*; leaves verticillate, petiolate, lanceolate, acuminate, serrate, attenuated at the base; flowers racemose, pendulous, and are, as well as the filaments, glabrous; branchlets chaffy. \( \frac{\text{G.}}{\text{S.}} \) G. Native of the East Indies. Thibaudia serrata, Wall. cat. no. 6299. Leaves 2 inches long, on very short foot stalks. Calyceous teeth very short, mucronate. Corolla ovate-oblong, 2 lines long.

*Serrated-leaved Agapetes*. Shrub.

8 A. *SYMPLOCOSIFOLIA* (D. Don, l. c.) branchlets downy; leaves ovate, mucronate, serrated; flowers and calyces downy; calyx-cine segments rounded, mucronulate; filaments bearded. \( \frac{\text{G.}}{\text{S.}} \) G. Native of Java, on Mount Salak, upon trees. Thibaudia symplocosifolia, Blum. bijd. p. 659.

*Symplocos-leaved Agapetes*. Shrub.

9 A. *ELLIPITICA*; stem parasitical; leaves elliptic-oblong, acutish at both ends, biglandular at the base, coriaceous, veiny, glabrous; racemes secund, finely tomentose. \( \frac{\text{G.}}{\text{S.}} \) G. Native of Java, on the tops of the mountains, where it is called *Prut* by the natives. Thibaudia floribunda, Blum. bijd. l. c.

*Bundle-flowered Agapetes*. Shrub.

10 A. *FLORIBUNDA*; leaves elliptic-oblong, acuminate at both ends, coriaceous, glabrous, veiny; calyces ciliated. \( \frac{\text{G.}}{\text{S.}} \) G. Native of Java, on the top of Mount Burangrang, upon trees. Thibaudia laurifolia, Blum. l. c.

*Laurel-leaved Agapetes*. Shrub parasitical.

11 A. *LORANTHIFLORA*; leaves oblong-lanceolate, acutish coriaceous, glabrous, nearly veinless; racemes leafy, and are, as
well as the calyces, downy. \( \varphi \). G. Native of Java, on Mount Gede, where it is called by the natives Jatro-petel. Thibaedium variegatifolia, Blum. bijdr. p. 860.

*Varingia-leaved Agapetes*. Fl. Year. Shrub.

13 A. *lucida*; stem sometimes parasitical; leaves small, obovate, rather retuse, with recurved margins, coriaceous, glabrous, a little veined; racemes, calyces, and corollas downy. \( \varphi \). G. Native of Java, in the higher waters. Thibaedium lucida, Blum. l. c.

*Shining Agapetes*. Fl. Year. Shrub parasitical.

14 A. *coriacea*; stem parasitical; leaves elliptic or oblong-lanceolate, much acuminate, coriaceous, somewhat 3-nerved, and are, as well as the racemes, calyces, and corollas, glabrous. \( \varphi \). G. Native of Java, on the mountains, upon trees, where it is called *Kiligday* by the natives. Thibaedium coriacea, Blum. l. c.

*Coriaceous-leaved Agapetes*. Shrub parasitical.

15 A. *cuneifolia*; leaves cuneiform, obtuse, sometimes retuse, with recurved margins, coriaceous, nearly veinless, and are, as well as the racemes and calyces, glabrous. \( \varphi \). G. Native of Java, on the higher mountains, in woods. Thibaedium cuneifolia, Blum. bijdr. p. 861.

*Wedge-leaved Agapetes*. Fl. Year. Shrub.

16 A. *myrtoides*; branches downy; leaves ovate-elliptic, bluntish, with recurved margins, coriaceous, nearly veinless, downy on both surfaces at the midrib; racemes glabrous. \( \varphi \). S. Native of the Moluccas, on the tops of the burning mountains. Thibaedium myrtoidea, Blum. bijdr. 861.

*Myrtle-like Agapetes*. Shrub.

Cult. For cultivation and propagation see *Agarista*, p. 388.

LVII. CERATOSTEMA (from *keras*, kera, a horn, and *στεμόν*, stemon, a stamen; in reference to the anthers being bluntly spurred at the base). Juss. gen. p. 163. Ruiz et Pav. fl. per et Chil. vol. 4. ined.

Lin. syst. Decandria Monogynia. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, coarctate at the apex, 5-lobed. Stamens 12; filaments very short. Anthers bluntly spurred at the base; cells elongated at the apex, filiform, almost wholly free, dehiscing by a terminal pore each. Stigma simple, obtuse. Berry 5-celled, many-seeded. Seeds small, angular.—Evergreen shrubs, natives of Peru. Leaves oblong, on short petioles, almost veinless, coriaceous, rounded and subcordate at the base. Flowers almost sessile, lateral and terminal, pedunculate. Corollas large, scarlet.

1 C. *grandiflora* (Ruiz et Pav. fl. per. 4, t. 383. f. b.) branches and peduncles downy; leaves lanceolate or ovate, usually mucronate; calyce segments acuminate; corollas longer than the peduncles. \( \varphi \). G. Native of Peru. Leaves an inch or an inch and a half long, obtuse. *Great-flowered Ceratostema*. Shrub.

2 C. *hirsuta* (Ruiz et Pav. fl. per. 4, t. 383. f. a. ined.) branches and peduncles downy; leaves ovate-oblong, obtuse; calyce segments ovate, mucronate, reticulated; corollas about equal in length to the peduncles. \( \varphi \). G. Native of Peru. C. cordifolia, Dunal, in herb. Lamb. Leaves 1/2 inch long.

*Hairy Ceratostema*. Shrub.

Cult. See *Agarista*, p. 388, for culture and propagation.—Elegant shrubs, worth cultivating in every collection.

**Tribe IV.**

Lin. syst. Decandria Monogynia. Calyx 5-parted. Petals 5. Stamens 10. Anthers dehiscing at the base by 2 holes. Stigma 5-lobed. Capsule 5-celled; valves connected by fine intricate tomentum. Placentas lunate, with simple lobes. Cells many-seeded. Seeds narrow, scobiform, winged at both ends. Embryo transverse. Humble evergreen herbs with wide creeping roots. Leaves petiolate, alternate, smooth, and usually shining, coriaceous, crenulated, toothed or serrated. Scapes erect, furnished with a few scales, usually tripetrous or quadrangular, convolute. Flowers pedicellate, bracteate, pendulous, globose or campanulate, white or red, disposed in terminal racemes. All the *Pyrolæ* are possessed of strong astringent qualities, and were formerly much esteemed for supposed healing properties; they are now wholly disused.

§ 1. Stamens ascending. Style decinate, longer than the petals; stigma annular. Scapes erect. Flowers campanulate, pendulous, racemose, scattered, rarely somewhat secund.

1 P. *rotundifolia* (Lin. spec. 567.) leaves roundish, quite entire or crenulated, shorter than the dilated petioles; scape triquetrous; calyce segments lanceolate, acute; stigma clavate, bluntly 5-toothed. \( \varphi \). H. Native of Asia, Europe, and North America, in old woods, in stony or sandy soil. In Britain, in dry heathy woods, but rare; in the north of England and Highlands of Scotland. Smith, engl. bot. 213. exclusive of the syn. of fl. dan. Lam. ill. t. 367. f. 1. P. grandiflora, Blum. dis. p. 27. t. 3. f. 2.—Riv. mon. t. 137. and 136. f. 2.—Mor. ex. sect. 12. t. 10. f. 1. Leaves numerous. Scapes furnished with 2-3 lanceolate-acute scales. Racemes 10-16-flowered. Pedicels secund, rather remote, scattered. Flowers rather large, milk-white.

2 P. *asarifolia* (Michx. fl. bor. amer. 1. p. 251.) leaves reuniform, coriaceous, repandly crenated, twice shorter than the dilated petioles; scapes acutely triquetrous; racemes many-flowered; calyce segments ovate, acuminate, adpressed; stigma clavate, with an elongated 5-lobed disk. \( \varphi \). H. Native of Canada, in pine woods; and on the mountains of Pennsylvania, in beech woods. Leaves numerous. Scapes furnished with a few scarious convolute scales. Racemes elongated. Pedicels remote, scattered. Flowers greenish-white or yellowish-green, about the size of those of the preceding.

3 P. *chloranthra* (Swartz, in Stockh. trans. 1810. t. 5. Nutt. gen. amer. 1. p. 273.) leaves orbicular, retuse, obsolescently crenulated, twice shorter than the narrow petioles; raceme few-flowered; calyce segments very short, obtuse; petioles oblong; openings of anthers tubular; stigma clavate, with an elongated 5-lobed disk. \( \varphi \). H. Native of Sweden and Upper Canada. Lodd. bot. cab. 1542. P. convoluta, Bart. prod. fl. phil. p. 50. P. asarifolia, Rad. diss. p. 23. t. 4. f. 1. exclusive of the synonyme of Michaux. P. rotundifolia, \( \beta \), nummulária, Muhl. cat. P. minor, Pursh. mss. and perhaps of fl. amer. sept. 1. p. 299. Scapes tetragonal, furnished only with one minute scale in the middle. Pedicels curved, scattered. Flowers cam-
panulate, about the size of those of *P. elliptica*, greenish-white, pendulous.

4 P. occidentalis (R. Br. mss. in herb. Banks, ex D. Don, in wern. mem. 5. p. 232.) leaves roundish, membranous, obsoletly denticulate, twice longer than the simple petals; racemes few-flowered; calycine segments oblong, ob- 
tuse; disk of stigma 5-lobed. 2. H. Native of Sledge Island, 
the north-west coast of America, where it was collected 
by D. Nelson. Leaves numerous, one-half smaller than those 
of *P. minor*. Scapes triquetrous. Pedicels equal in length to 
the bracteas. Flowers globose, pendulous, milk-coloured, size of 
those of *P. rotundifolia*.

**Western Winter-green.** Pl. 1/2 foot.

5 P. elliptica (Nutt. gen. amer. 1. p. 273.) leaves elliptic or 
ovate, membranous, serrulate, longer than the dilated petals; 
racemes few-flowered; bracteas lanceolate, subulate, recurved at 
top; calycine segments very short, ending each in a recurved 
mucron; petals oval; stigma clavate, with an elevated 5-lobed 
disk. 2. H. Native of both Canadas, in woods; and around 
Philadelphia; and in the woods of New Jersey. Rad. diss. p. 
51. t. 5. f. 1. P. ovalifolia, Radd., mss. in herb. Lamb. 
Scapes acutely triquetrous, furnished with a solitary scarious 
node near the base. Pedicels scattered, distant. Flowers campanulate, 
white, with a grateful smell, smaller than those of *P. 
rotundifolia*.

Pl. 1/2 foot.

6 P. dentata (Smith in Rees’ cycl. D. Don in wern. mem. 
5. p. 235.) leaves cuneate-oblong, coriaceous, acute at the base, 
twice as much longer than the narrow petals, having the margin 
remotely toothed or quite entire; racemes elongated, few-flowered, 
rather secur; petals oval; disk of stigma elongated, 5- 
lobed. 2. H. Native of the Island of Nootka, on the north-west 
coast of America, where it was collected by Mr. Menzies. 
Leaves crowded. Scapes angular, naked. Racemes drooping 
at the apex, secur. Flowers campanulate, drooping, milk-
white.

**Toothed-leaved Winter-green.** Pl. 1 foot.

7 P. victa (Smith in Rees, cycl. D. Don in wern. mem. 
5. p. 235.) leaves ovate, mucronulate, coriaceous, somewhat 
serrate, equal to the narrow petals in length, red beneath, but 
dark green, and marked along the veins with whitish bands 
above; racemes many-flowered; petals roundish; stigma clavate, 
with a 5-lobed disk. 2. H. Native of the Island of 
Nootka, on the north-west coast of America; and of Japan, 
the town of Nagasaki. Scapes acutely triquetrous, 
reddish, never convolute, furnished with scarious scales. 
Pedicels scattered. Flowers globose, campanulate, pendulous, 
white.

**Painted-leaved Winter-green.** Pl. 1/2 foot.

8 P. phylla (Smith in Rees’ cycl. D. Don in wern. mem. 
5. p. 237.) leafless; scape angular, furnished with scarious 
seals at the base; racemes many-flowered, rather secur; 
calycine segments ovate, acute, mucronulate; petals roundish; 
disk of stigma elongated, 5-crenated. 2. H. Native of 
Nootka Island, on the north-west coast of America, where it 
was collected by Mr. Menzies. Scapes numerous. Flowers 
globe, pendulous, milk-white. This remarkable species, 
though wholly destitute of leaves, is not, strictly speaking, leave-
less; their place is supplied by a kind of foliaceous scales, of 
a greenish colour. In some of the fine specimens preserved in 
the Banksian herbarium, an approach to leaves may be distinctly 
observed.

**Leafless Winter-green.** Pl. 1/2 foot.

§ 2. Stamens erect, bent towards the pistillum. Style de-
cline, longer than the petals. Stigmas without a ring. Scapes 
erect. Flowers racemose, globose, pendulous, scattered, never 
secur.

9 P. meadia (Swartz, in act. holm. 1804. p. 257. t. 7. Smith. 
engl. bot. t. 1945.) leaves orbicular or roundish-oval, crenu-
lated, coriaceous, equal in length to the dilated petals; scapes 
spiral, acutely triquetrous; racemes many-flowered; calycine 
segments ovate, acute; stigma capitate, bluntly 5-lobed. 2. H. 
Native of Sweden, Scotland, and the north of England, 
among bushes and in woods; very common in Scotland, espe-
cially in mountainous districts. Rad. diss. p. 21. t. 3. P. 
rotundifolia, Fl. dan. t. 110.—Blackw. 594. Huds. angl. 
mon. 138. Leaves numerous. Pedicels scattered. Flowers 
pendulous, white tinged with red, much larger than those of 
*P. minor*.

**Intermediate Winter-green.** Fl. June, July. Britain. Pl. 1 
foot.

§ 3. Stamens erect. Style straight; stigma exanuated, 
or without a ring. Scapes erect. Flowers pendulous, racem-
ose.

10 P. minor (Lin. spec. 567.) leaves roundish or oval, coria-
ceous, repandly crenulate, longer than the petals, which are 
dilated; racemes spicate; bracteas much longer than the peti-
dels; calycine segments very short; style included; stigma flat-
shish, 5-lobed. 2. H. Native of the colder parts of Europe, 
and the north of Asia, on heaths, in bushy places, and in woods; 
in Britain, in mossy woods and thickets, in mountainous 
situations; in Yorkshire, and very common in many parts of 
Durham; woods near Brodie House, and at the Falls of Clyde, and 
many other places of Scotland. Fl. dan. t. 55. Smith,engl. bot. 
—Gmel. sib. 4. p. 128. no. 16. t. 56. f. 1.—Riv. mon. 
t. 136. f. 1. Leaves numerous, mucronulate at the apex. 
Scapes quadrangular, furnished with a lanceolate membranous 
scale in the middle. Racemes spicate, dense. Flowers glo-
bose, with a contracted mouth, white tinged with red. A 
variety of this species has been gathered in the Island of 
Unaschka.

**Smaller Winter-green.** Fl. June, July. Britain. Pl. 1/2 
to 1/3 foot.

11 P. secunda (Lin. spec. 567.) leaves ovate, acute, membranous, sharply serrated, longer than the narrow petals; racem 
secur or unilater; calycine segments round; petals oblong; style exerted; stigma flathish, 5-lobed. 2. H. Native 
of Europe, Asia; and North America, from Canada to New 
Jersey; among bushes and in alpine woods, particularly in 
dry, mossy, pine woods; in Britain, in mossy alpine 
winds; in Yorkshire; in many fir or birch woods in Scot-
land; on the hill of Dunnair; in Darway forest, near Brodie 
House. Fl. dan. t. 402. Smith, engl. bot. t. 517.—Gmel. 
sib. 4. p. 129. t. 56. f. 2. Riv. mon. t. 138. f. 2.—Mor. 
hist. 1. sect. 12. t. 10. f. 4. Stems rather woody. Leaves 
mucronulate. Pedicels bluntly angular. Racemes elongated, 
much-flowered. Flowers campanulate, white, tinged with pale 
green.

**Second-flowered Winter-green.** Fl. June, July. Britain. 
Pl. 1/2 to 1/3 foot.
Cult. All the species of Winter-green are very pretty when in blossom, but are extremely difficult to cultivate in gardens. They grow best in a sandy or gravelly soil, in a shady situation. They should be mulched with moss, and a hand-glass placed over them. They may be increased by division.

LIX. CHIMAPHILA (from χίμα, cheima, winter, and φιλειν, philo, to love; the plants are green in winter). Pursh, fl. amer. sept. 1. p. 300. Nutt. gen. amer. 1. p. 274.—Chimázza, R. Br. in herb. Banks—Pyrola species, Lin. and others.

1 C. corymbosa (Pursh. fl. amer. sept. 1. p. 300.) leaves cuneate-lanceolate, serrated, 4-5 in a whorl; peduncles pubescent, bearing a 5-6-flowered corymb at top; bracteas linear-subulate; appendages of filaments ciliated; style immersed. H. Native of Europe, Asia, and North America, from Canada to Carolina, in sandy and gravelly woods. Pyrola umbellata, Lin. spec. 468. Sims, bot. mag. 7781. Chimázza umbellata, R. Br. in herb. Banks.—Riv. p. 139, t. 2.—Mor. hist. 3. sect. 12. t. 10. f. 5. Root creeping. Plant evergreen, frutescent. Leaves green on both surfaces, acutely and distantly serrated from the middle to the apex. Flowers corymbose, pendulous, at length erectish, greenish-white, tinged with red. Anthers purplish.

Pl. 4 to 1/4 foot.

2 C. maculata (Pursh. fl. amer. sept. 1. p. 300.) leaves lanceolate, acute, with white bands on the upper surface along the nerve and veins, opposite, or 4 in a whorl; peduncles downy, bearing a 2-3-flowered corymb at the apex; bracteoles linear; appendages of filaments woolly; style very short. H. Native of North America, from Canada to Carolina, in sandy or gravelly woods; also on the north-west coast. Pyrola maculata, Lin. spec. 568. Sims, bot. mag. 897. Chimázza maculata, R. Br. in herb. Banks.—Pluk. mant. 157. t. 349. f. 4. Plant suffrutescent, evergreen. Root creeping. Stem procumbent at base and ascending at apex. Lower surface of leaves red. Pedicels and calyces red, clothed with clammy down. Flowers pendulous, white. Anthers yellow. This plant is in high esteem for its medicinal qualities among the Indians; they call it syp-i-seva. Mr. Pursh tells us, that he has witnessed the beneficial effects of a decoction of this plant in a very severe case of hystericis; and he says it is a plant eminently deserving the attention of physicians. We are also informed that its decoction has proved very serviceable in scrofulous diseases.

Spotted-leaved Winter-green. Fl. June. CIt. 1752. Pl. dec. 3 to 4 inches long.

3 C. Mënzieisi (Spreng. syst. 2. p. 317.) leaves alternate, or 3 in a whorl, lanceolate, acuminate, serrated, discoloured; peduncles 2-flowered, glabrous; bracteas broad-roundish; calyces segments elliptic, acute; style distinct. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Pyrola Menziesii, R. Br. in herb. Banks ex D. Don, in wern. mem. 5. p. 245. Plant suffrutescent, evergreen. Root creeping. Stems ascending, red. Pedicels glabrous. Flowers pendulous, white. Leaves deep green above and red beneath. This species has a striking resemblance to P. maculata.

Menzies' Winter-green. Plant ascending, 2 to 3 inches long.

Cult. See Pyrola, for culture and propagation, above.

LX. MÔNÊSEs (from µονος, monos, alone; flowers solitary on the tops of the scapes). Sal. mss. in Gray, brit. arrang. 2. p. 403. Pyrola uniflora, of authors.

1 M. grandiflora (Sal. mss. in Gray, brit. arrang. 2. p. 403.) flowers solitary, at the top of the scape; cells of anthers elongated and tubular; stigma acutely 5-toothed; leaves orbicular, serrated. H. Native of Europe, Asia, and North America, in alpine mossy woods; in Britain, in alpine woods and by the sides of trickling rills; in the western islands of Harris and Boreras; in a fir wood near Brodie House, by Forres. Pyrola uniflora, Lin. spec. 568. Fl. dan. t. 8. Smith, engl. bot. t. 146.—Moris. hist. 3. p. 505. sect. 12. t. 10. f. 2.—Riv. mon. t. 139. f. 1. Leaves 3, rarely 4 in a whorl, longer than the dilated pedicels. Scape furnished with an ovate scale above the middle. Flowers large, solitary, drooping, white, very sweet-scented. Stamens recumbent.

LXI. CLADOTHÁMUS (from κλάδος, klados, a branch, and θάμνος, thánmos, a shrub). Bongard, in mem. acad. petersb. 2. p. 155. t. 1.—Pyrola fruticosa, Eschol. mss.

Margins of the valves septif erous. Placenta 5-lobe d; lobes roundish. Seeds numerous, small, involved in membraneous aril.—A much branched shrub. Leaves sessile, entire, elliptic or oblong, glabrous, but when young finely cili ated, glaucescent beneath, 1/2 inch long and 5 lines broad. Flowers axillary, solitary.

1 C. pyroliflorus (Bongard, l. c.). H. Native of the north-west coast of America, and of the Island of Sitka.

Pyrola-flowered Cladothamnus. Shrub 4 to 6 feet.

Cult. For culture and propagation see Azalea, p. 851.

Tribe V.

—Leafless parasitical herb.

LXII. HYPOPTYS (from ἵπος, ὕπο, under ; and πτείς, πτής, a pine-tree; the species are parasitical on the roots of pine-trees). Dill. gen. 7. Nutt. gen. amer. 1. p. 270.—Monotropa species, Lin. and others.—Orobanchoides, Tourn. mem. acad. 176.

L. syst. Decándria, Monogynia. Calyx 3 to 5-parted. Corolla permanent, so deeply 4-5-cleft as to appear 4-5 petals; each segment with a cucullate nectariferous base. Stamens 8-10. Anthers small, horizontal, with 2 obtuse horns at their base, at length opening flat. Stigma orbicular, with a bearded margin. Capsule 5-celled, 5-valved. Seeds very numerous, minute, girded by a narrow wing or membrane. —Parasitical upon the roots of trees destitute of proper leaves and verdure. Roots composed of dense imbricating scales. Stems or scales aggregate, simple, furnished with alternate scales. Flowers racemose, pedicellate. Raceme bent at first, but at length erect.—Scent of the whole plant musky.—Habit of Orobanchae.

1 H. Europaea (Nutt. gen. amer. 1. p. 271.) scape spike-flowered; scales and flowers glabrous outside; lateral flowers octandrous. Z. H. Native of many parts of Europe, as Sweden, Denmark, France, Italy, Britain, &c., in woods, where the ground is covered with rotten leaves, at the roots of fir, beech, and oak. In North America, from Canada to Pennsylvania, at the roots of beech and other trees, in shady moist places. With us, in Oxfordshire, in Stoken Church woods, and between Nettle-bed and Henley, Bedfordshire, Buckinghamshire, Berkshire, frequent; Maidstone in Kent; Tring in Hertfordshire; in the beech woods of Sussex; in Selbourne-Hanger, Hampshire; Riley in Gloucestershire; Enville in Staffordshire; Shottesbome and Stoke in Norfolk; in Scotland, but not common. Monotropa Hypopitys, Lin. spec. 555. Smith, engl. bot. t. 69. Fl. dan. t. 232. Hipopitys multiflora, Seop. carp. no. 178. Dill. gies. 99. append. 154. t. 7.—Menz. pug. 3. f. 5.—Pluk. phyt. t. 290. f. 5.—Mor. hist. 3. sect. 12. t. 16. f. 20. The whole plant has a pale yellow or brownish yellow appearance; the American one is much smaller than the European one. In Sweden it is given dry to sheep that are affected with cough.

2 H. hypophysea; race me few-flowered; petals glabrous, jagged, about equal in length to the style, which is quite glabrous. Z. H. Native of Europe, in beech woods. Monotropa hypophysa, Wallr. sched. Monotropa hypophysea, Spreng. syst. 2. p. 517.

Beech Yellow Bird's-nest. Pl. 1/2 foot.

3 H. lanuginosa (Nutt. gen. amer. 1. p. 271.) scape spike-flowered; bracteas and flowers woolly. Z. H. Native of North America, from Pennsylvania to Carolina, in similar places to the preceding. Monotropa lanuginosa, Michx. fl. bor. amer. 2. p. 266. The whole plant is of a light tan colour, downy in every part. Segments of calyx inconstant in number.

Woolly Yellow Bird's-nest. Pl. 1/4 foot.

Cult. The species are not cultivatable.

LXIII. MONOTROPA (from μονος, monos, one; and τροπος, tropeo, to turn; flowers turned one way). Nutt. gen. amer. 271.—Monotropa species, Lin. gen. no. 536. Juss. gen. 430.

L. syst. Decándria Monogynia. Calyx none. Corolla permanent, so deeply 5-parted as to appear 5-petalled; each segment with a cucullate nectariferous base. Stamens 10; anthers reniform, horizontal, with 2 obtuse horns at their base, emitting the pollen near the middle by 2 transverse chinks. Stigma orbicular, naked. Capsule 5-celled, 5-valved. Seeds numerous, minute, surrounded by a wing.—Parasitical plants, mostly upon the roots of trees, destitute of proper leaves and verdure. Root roundish, composed of an agglomeration of intricate succulent fibres, producing many 1-flowered scaly scapes or stems. Flowers at first nutant. Plants white and smooth, destitute of the musky odour of Hypopitys, but having a nauseous liliaceous scent when bruised. Habit of Orobanchae.

1 M. morisoniana (Michx. fl. bor. amer. 1. p. 266.) scapes elongated, very straight, 1-flowered, furnished with distant scales; flower erect. Z. H. Native of Virginia and Carolina, in shady woods, parasitical on the roots of trees.—Mor. hist. 3. sect. 12. t. 16. f. 5. Flowers larger than in the following species, frequently with 12 stamens.

2 M. uniflora (Lin. spec. 555.) scapes short, thick, 1-flowered, furnished with approximate scales; flowers drooping. Z. H. Native from New York to Carolina, parasitical on the roots of trees, in shady moist places. Hook. exot. fl. t. 85. —Pluk. alm. t. 209. f. 2. Catesb. car. 1. t. 36.

Cult. The species are not cultivatable.

LXIV. PTEROSPORÀ (from πτερος, pteron, a wing, and σπόρα, spora, a seed; the seeds are surrounded by a membranous margin or wing). Nutt. gen. amer. 1. p. 269. Lindl. coll. with a figure.

L. syst. Decándria, Monogynia. Calyx 5-parted. Corolla ovate, with a 5-toothed reflexed border. Stamens 10. Anthers excentrically petlate, 2-celled, adnate to the filaments by the margin, bisetose at the base. Capsule 5-celled, imperfectly 5-valved; dissepiments and valves united towards the base, and joined with the central axis. Placenta 5-lobed. Seeds very numerous and minute, each furnished with a terminal wing.—An evanescent annual plant, destitute of verdure, with the habit of Monotropa, to which it is nearly allied. Leaves none. Stem simple, racemose. Flowers numerous, scattered, reddish, resembling those of some species of Andrómeda. Peduncles rather long, 1-flowered, drooping.

1 P. Andrómeda (Nutt. gen. amer. 1. p. 27.) O. H. Native of Upper Canada, near the Falls of Niagara, in clay soils; banks of Seneca lake; and near Albany, in the state of New
York. Plant covered with brownish viscid hairs. Stems brownish red or purple, furnished with lanceolate scales at the base. Peduncles filiform, mutant. Corollas white, with a red border.

*Andromeda*-flowered Pterospora. Fl. July. Pl. 1 to 2 feet.

*Cult.* The plant is not cultivatable.

S. Carolina'na (Ell. fl. car. vol. 2.) O. H. Native of North Carolina, in rich shady woods. Flowers sweet-scented, reddish-white.

*Cult.* The plant is not cultivatable.

END OF VOL. III.
